From the hin gates the rock is moved in a constantly flowing stream, hy means of a feeder helt, to a set of crushing rolls, which further reduces the sizes of the pieces of rock to that of peas or heans, and smaller—even to sand and dust. This is then elevated and caused to run hy gravity over inclined wire cloth sieves, called "separators," which separate the sand and dust for the next step of treatment. The coarser pieces which do not pass through the meshes of the sieve run into pulverizing machines, which reduce them to the size at which they pass through the sieve when again run over the separators. The rock is thus crushed, ground and pulverized so that it will pass through the meshes of a No. 30 wire cloth having 900 holes to the square inch.

This degree of comminution is necessary in order that the particles of copper ores impregnating the rock may he set free, or exposed, so that they may he acted upon hy the agents used in the next steps of the operation. These steps are roasting and lixiviation.

While the oxides and carhonates of copper are readily soluhle in dilute acids, the cuprous sulphide or chalcocite is not. Even strong and hoiling sulphuric—or hydrochloric—acid will not dissolve it. Boiling or hot nitric acid will. But the use of nitric acid is not admissihle for other reasons than its expense.

Therefore it is necessary to decompose the chalcocite hy expelling its sulphur and oxidizing its copper. This can hest he done hy roasting. The roasting takes place continuously, as the rock comes from the pulverizers, in a mechanical furnace having a hearth 200 feet long hy 10 feet wide, and fired hy coal in seven fireplaces arranged along its sides. Rahhles, or rakes, are caused to continually travel from end to end of the furnace, in their course stirring the powdered rock, exposing continually renewed surfaces to the action of heat and atmospheric oxygen, and moving it to the discharge end. From the discharge end the roasted rock is conveyed to the lixiviation or leaching tanks. The capacity of this furnace is ahout 125 tons of powdered rock per day of twenty-four hours.

The reactions which take place in the furnace are these: The carhonates of copper are decomposed, setting free CO_2, and their copper contents oxidized to CuO; the chalcocite is decomposed, the sulphur set free and oxidized, and its copper contents oxidized to CuO; the ferrous carhonates are decomposed and the oxides are further oxidized, which makes them less soluhle in dilute acids. The roasting of chalcocite (Cu_2S) does not produce any $CuSO_4$, as in roasting other copper sulphides—for instance, chalcopyrite, containing CuS. There is not sulphur enough in Cu_2S to supply the equivalent of S to form $CuSO_4$. The sulphur of the chalcocite either escapes with the gases of the furnace or unites as SO_3 with the earthy alkaline constituent of the rock—lime—as calcium sulphate.

There is some calcium carhonate, as calcite, in the rock, say ahout one-half of 1%. In order to economize in the use of acid it is necessary to mix with the rock as it passes into the furnace some powdered sulphide ores, preferahly carrying at least a small percentage of copper, which copper is recovered in the suhsequent steps of the process. This is an economic feature, hecause such ores are cheaply purchased and serve the douhle purpose of supplying sulphur to he oxidized and unite with the lime as $CaSO_4$, and a means of ohtaining their copper contents. Sulphur may he used in the same manner for the purpose of neutralizing or counteracting the lime. When sulphide—or sulphur—is used in the roasting much of the copper is sulphated, and as $CuSO_4$ is readily dissolved in water.

The practical result of the roasting is a powdered rock having disseminated therein some $CuSO_4$, some CuO, and some FeO and Fe_2O_3, the last of which list is practically insoluhle in the acid used.

To extract the copper contents the solvent used is primarily $H_2SO_4 + x\ H_2O$. HCl may he used as a solvent, hut there is a difficulty in ohtaining anodes which will not seriously deteriorate in the suhsequent electrolysis. The percentage of H_2SO_4 is determined hy the amount of solvent. The amount of H_2SO_4 may vary from 5% to 15% of the water of the solution.

As will he described further on, after the primary use of the solvent ($H_2SO_4 + x\ H_2O$) another solvent of the copper oxide takes part in the action, namely, $Fe_2(SO_4)_3$—ferric sulphate.

From the roasting furnace the rock is conveyed to one of four leaching tanks, filling them in succession. Each tank is cylindrical, 30 feet in diameter and 6 feet high, inside measurements. They hold 125 to 150 tons of the powdered and roasted rock. The rock is put in hot as it comes from the furnace.

In the hottom of each tank there is a filter hed of coarsely crushed rock, covered with canvas, which is calked tightly around the edges and around the outlets through which the powder is washed after the extraction of its copper contents.

From the center of the hottom of each tank, under the filter hed, a pipe, with a stop cock, serves through which to draw off the solvent to the electrolytic cells.

During the filling of each tank a suitahle amount of the solvent is admitted to moisten the rock, and finally, when filled to within ahout a foot of the top, the whole is flooded hy the solvent to the depth of a few inches ahove the hed of powdered rock.

The solvent hegins to run from the hottom of the first filled leaching tank as soon as filled, running through the filter hottom in a stream of perfectly clear greenish hlue liquid. From time to time, as the liquid on the top is lowered to the surface of the rock a few inches in depth, more of the solvent, drawn from the "stock solution tank," is run in.

The first solvent run in during the filling of the tank takes up nearly all of the copper, and runs out at the hottom fully saturated with $CuSO_4$. As the fresh additions of solvent pass through the hed of rock they carry decreasing quantities of copper, until all of it has heen taken up, and the solvent running out shows little or no more hy assay than does the solvent run in.

But meantime tanks Nos. 2, 3 and 4 have heen filled, and a like solvent action takes place in them. Then, in order to have a solution of nearly uniform value in copper to electrolyze, the richer liquors from No. 2. are run out simultaneously with the poorer from No. 1. This method is kept up in regular succession with the other tanks.

As soon as the rock in No. 1 has had its copper contents dissolved hy the solvent the outlet is opened and the solution runs into the deposition vats, and as the quantity of copper in the solvent from this tank decreases in amount the outlet of No. 2 is opened to allow a flow of strong solution to mix with that from No. 1, and so on with Nos. 3 and 4, and then from a new charge in No. 1, and so on, in a continuous cycle of operation. This procedure is for the purpose of supplying the deposition vats with a steady stream of lixiviate having constant percentage of copper.

The tanks are emptied hy opening passageways through the filter hed and hottom of each tank and turning a forcihle stream of water, pumped for the purpose, against the depleted powder, then called "tailings," thus washing them out, after the manner called hydraulicking in some kinds of gold mining.

The deposition vats are rectangular hoxes of wood, protected from the action of the lixiviate, now the electrolyte, hy a suitahle lining. They are arranged so that the electrolyte flows from No. 1 through Nos. 2, 3, 4, et seq, and finally out of No. 128, depleted of its copper, into a large tank called the "sump," from whence it is pumped up into the "stock tank" for re-use.

These deposition vats are so set, at different elevations ahove the floor of the huilding, that the electrolyte runs hy gravity from one to the next, and so on through the series to the end, through troughs, or spouts, hetween their ends, with this exception: As the vats are arranged in six rows, and one end of each row is at a greater elevation than the end next to it of the preceding row, it is necessary to raise the electrolyte from the one row to the next at those points. This is done hy means of air-lift pumps, which are easily managed.

The electrical connections are as follows: The electrodes in each vat are connected in multiple, and the several vats of electrodes are connected in a series of 128—exactly, so far, as is the case in large storage hatteries.

But for the purpose of insuring a retrogressive decrease of density of current at the electrodes of each vat, after the first of the series, the numher of electrodes is increased progressively from the first to the last of the series. The amperes of current are the same in each vat of the series, hut the current density is less and less in decremental order from the first to the last of the series, to compensate for the decrease of copper in the electrolyte in its course through the vats. Thus the density of current may he 15 or 20 amperes per square foot of cathode surface with a 6% copper solution, and 3 amperes per square foot with a 0.5% solution, provided proper circulation and sufficiently rapid movement of the electrolyte he kept up hetween the anode and cathode surfaces.

The evolution of free oxygen at the anodes keeps up a continual mixing movement of the electrolyte, in addition to the motion due to the flow through the vats.

During electrolysis there is a counter-electromotive force of 1.6 volt in each vat of the series, due to the difference of energy of comhination hetween the materials on the surfaces of the anodes and cathodes, respectively, and the constituents of the electrolyte. The generator is operated at approximately 240 volts, which gives $240 \div 128 = 1.87$ per cell. The voltage per cell required is $1.87 - 1.60 = 0.27$ volt for the resistance of conductors, etc.

The density of current must not exceed in any vat the limit heyond that required for the deposition of reguline copper.

Primarily both the anodes and cathodes are of sheet lead. But under the electrolytic action the anodes hecome coated with PhO_2, and the cathodes

*American Institute of Electrical Engineers, February meeting.

with copper. As soon as the copper deposit reaches the thickness of thin cardboard it is stripped off each lead cathode, which is then replaced in its cell, and the two copper sheets thus produced have suitable connections riveted to them, and they are then rehung as cathodes in some of the vats, where they remain a sufficient length of time to receive a deposit of copper to the thickness needful for the market.

The author has tested anodes of carbon, both such as are used for battery plates and the Atcheson graphite electrodes. There is much less oxidation and disintegration with the latter, but still too much for economy. There are also some other difficulties incident to the use of carbon. Under proper treatment the lead anodes do not sulphate and the formation of PbO_2 is merely superficial.

A certain proportion of the lead cathode plates is specially used for the purpose, as above, of producing the thin copper cathodes, it being a handier and a cheaper method than providing rolled thin copper sheets for the purpose.

The lixiviate running from the leaching tanks into the deposition vats consists of a solution in water of sulphuric acid, cupric sulphate and ferrous sulphate, expressed symbolically as follows:

$$xH_2SO_4 + 2CuSO_4 + 4FeSO_4.$$

The electrolytic action deposits the copper on the cathodes, perhaps by secondary action, without the evolution of hydrogen, but with the setting free at the anode of oxygen. But some of the oxygen and acid is appropriated by the ferrous sulphate, thus becoming ferric sulphate. When there is enough ferrous sulphate present at the anode no free oxygen is evolved, but is appropriated by the ferrous sulphate to form basic ferric oxide, which unites with the sulphuric acid to form normal ferric sulphate, as per this equation:

$$x\,H_2SO_4 + 2CuSO_4 + 4FeSO_4 = 2Cu + 2Fe_2(SO_4)_3 + x\,H\,SO_4.$$

Taking the latter half of the above equation for consideration, the two parts of copper are deposited on the cathodes and the solution of ferric sulphate and sulphuric acid runs to the sump tank, from whence it is raised to the stock tank, and from there is used on subsequent lots of powdered and roasted rock in the leaching tanks. While the starting of the plant involved the use of a solution of sulphuric acid for the solvent, all subsequent solvent actions take place in the presence of ferric sulphate and ferrous sulphate as well.

Now, ferric sulphate solutions are energetic solvents of metallic copper, oxides of copper and, to a limited extent, of some sulphides of copper, with reduction from ferric to ferrous solutions and ferric oxide. Take metallic copper and we have this equation:

$$Cu + Fe_2(SO_4)_3 = CuSO_4 + 2FeSO_4.$$

Take cupric oxide:

$$3CuO + Fe_2(SO_4)_3 = 3CuSO_4 + Fe_2O_3.$$

This latter equation shows that ferric oxide (Fe_2O_3) is freed by the solvent action in the leaching tank, and remains there undissolved, thus continually purifying the solution of iron.

The roasting process may sometimes fail to completely oxidize the Cu_2S. If so, then the following equation expresses a further action:

$$Cu_2S + 2Fe(SO_4)_3 = 2CuSO_4 + 4FeSO_4 + S.$$

It has been claimed that cupric oxide is dissolved by a solution of ferrous sulphate by double analysis and synthesis, per this equation:

$$CuO + 2FeSO_4 + H_2O = CuSO_4 + (Fe_2O_3 + SO_3) + H_2.$$

The sulphuric acid dissolves some cupric oxide, as per this equation:

$$CuO + H_2SO_4 = CuSO_4 + H_2O.$$

It will be seen that all of the reactions result in the production of cupric sulphate in the lixiviate which is to be electrolyzed. There is no deposition of iron on the cathode, even though its sulphate salts are present in the electrolyte in great excess, say near to the saturation of the solution.

Unfortunately, the expenses of the operation can not now be stated, because not yet obtainable. Just as the plant was starting financial difficulties intervened and caused a stoppage. Enough had, however, been done, in an experimental way, to make positive all of the principles of the process, and that, probably, the expenses of mining and metallurgical treatment need not exceed $2.50 per ton. It is probable that work will soon be resumed.

A COMPANY has been formed in Milan, Italy, for the electrolytic manufacture of caustic soda and of calcium chloride. The works will be at Varallo, using 600 H. P. from the River Sesia. The company expects, with 350 working days of twenty-four hours, to produce 2359 tons of calcium chloride and 2880 tons of caustic soda from about 1806 tons of salt and 1216 tons of quicklime.

The Rocker.

Written for the MINING AND SCIENTIFIC PRESS.

The rocker's field of usefulness in placer mining has widened rather than diminished with the lapse of the years since the early California miners first used it in the '49 days of placer mining in that State. It is everywhere the pioneer of other placer gold saving devices and is always to be found at work on the fringes of the new districts as they develop through sluices into hydraulics and dredgers. It is quite common among those whose ideas of efficiency and utility are limited to a servile awe of mere bigness, to refer slightingly to the rocker as an antiquated, wasteful device for gold saving. The fact is, however, that it is an exceedingly serviceable tool for which no real substitute has yet been invented and is, properly made and in the hands of a real placer miner, a very close gold saver.

The type of the rocker has not changed since it was invented. There are minor changes in details to suit the fancy or convenience of the maker. The sketches herewith show the simplest form of construction and will be found useful to beginners in the search for placer gold. The prospector, be it known, is and should be quite independent of having to buy a rocker. He should know how to make one and should make his own. It is not etiquette among prospectors to borrow rockers.

Figure 1 shows the rocker completed. A is one of

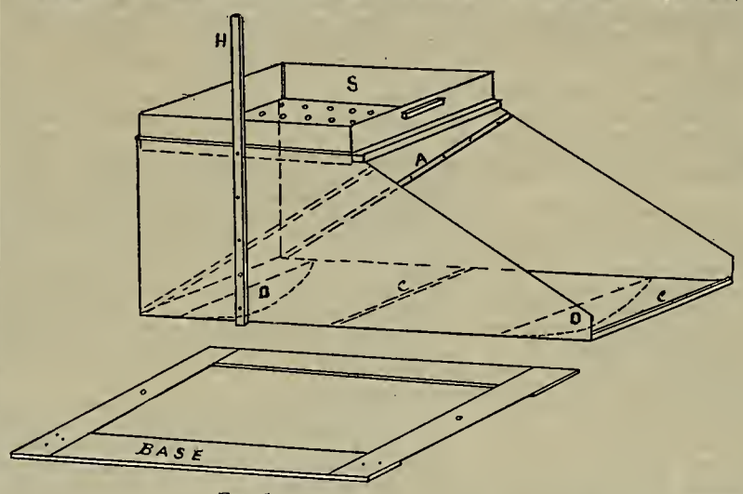

FIG. 1.

two cleats which are tacked inside of the box to hold a removable apron, which is shown in Figure 3; S is a screen hopper into which the gold bearing gravel or wash is dumped. It may be built of 1x4 surfaced board, or ¾x4 if the rocker has to be carried much. The bottom is a perforated sheet of iron or a coarse wire screen with ½-inch perforations. The writer, when nothing else was available, has used the tin of tomato cans to make a hopper bottom.

The hopper sets inside of the body of the rocker, resting on cleats nailed to the side, as shown at B (Figure 2). The apron is a frame of sticks ½ by ¾ inch, nailed strongly at the corners and having the side pieces projecting at the lower ends beyond the lower cross piece. Upon this frame a piece of canvas is tacked with a sag of an inch or so at the lower edge, making a sort of pocket. This sag is shown in the shaded portion of Figure 3. The fine stuff and water coming through the screen bottom of the hopper fall on the apron and a concentration takes place, the coarse gold being held by the pocket in the apron. Some black sand and other heavy minerals are caught here. The apron can be readily removed and its contents washed into a pan for final cleaning. To catch gold that passes the pocket two cleats are nailed crossways of the bottom, as shown at C C. Sometimes the bottom of the rocker is covered with canvas, which assists in saving the very finest flour gold. The handle, H, is in the sketch shown nailed to the side of the rocker box. A mode of attachment that is sometimes found more convenient is to fasten it to the side of the hopper. The latter can then be lifted out of its place and discharged without removing the hand from the handle.

Two rockers, segments of a circle, are nailed to the bottom of the box, forming the rockers on which the box is given the cradle or rocker movement from which the device takes its name. The rocker is set on a base made of four flat pieces of 2x4 or even 1x4. This frame has two holes bored at the middle points of the end pieces to receive the lugs on the bottom of the rockers. The catch of the lugs into the frame keeps the rocker from moving forward with the rocking motion. The frame is stationary, but is given a grade determined from trial.

In operation the hopper is filled with a shovel or two of the soil and gravel and water is poured on it, the rocker being given a rocking motion during the pouring. The soil and fine stuff washes through the screen onto the apron and thence into the bottom, where after passing the riffles it is discharged as tails at the lower end. The hopper, after the gravel is washed clean, is lifted out of its seat and its cleaned gravel discharged. The hopper is then refilled and the process is repeated. The gold and heavy stuff caught in the pockets and behind the riffles is from time to time carefully washed into a pan and worked down till nothing but the gold remains.

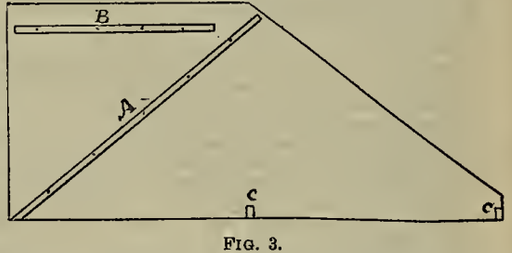

FIG. 3.

"A Marvelous Advertising Medium."

About fourteen months ago this paper published a clever article on "Cyaniding Rock in Place," which set every miner in the west half of America laughing. It was a humorous "take-off" on sundry solemn cyanide subjects, and everyone saw the joke.

Letters still come asking: "Who wrote that?" Under date of the 1st inst., the author of the article writes, saying, among other things:

"Although you buried me under your given pseudonym, 'A California Miner,' I was exceedingly pleased to receive letters from the ends of the world, from old mining chums, who had detected traces of my 'fine Italian hand.' Old Joe (whom I had lost track of for years) wrote from the Seven Devils district, Idaho; Chapman, from the Mother Lode, said: 'I've given it a post of honor in my Cyanide Clipping Book,' and others, nearer, wrote joshingly. I was, however, astonished that your circulation could reach and bring letters from C. A. Fletcher, secretary Apollo mine, Unga Island, Alaska, and from Billy Bell in South Africa—neither of whom have I seen for years. Truly, the MINING AND SCIENTIFIC PRESS is a marvelous advertising medium, when even a man's personality may be detected."

There is probably no part of the earth where mining men thrive that is not visited by this paper. Some time ago an advertiser personally told the writer that he had a $12,000 order for mining appliances from Siam and that the Siam man had written he had seen the advertisement "in the MINING AND SCIENTIFIC PRESS."

A Colorado advertiser writes this week telling that he had a fine order from Antofagasta, Chile, S. A., "secured by an advertisement in the MINING AND SCIENTIFIC PRESS," and the week before came a letter from an Ohio firm saying that a $6000 order from the island of Jamaica had been booked, the West Indian saying he had observed the advertisement in the MINING ANN SCIENTIFIC PRESS.

The best proof, however, of the world-wide circulation of this paper is afforded by the thousands of intelligent subscribers. Let a little misstatement or error occur in its columns, and it is like dropping a stone in water whose widening rings touch the most far-off shores. Some months ago, in "Concentrates," a slight misstatement of metallurgical fact was made. That week came several kindly corrections from California readers, the next came more from points farther East, and since then the inaccuracy has been courteously pointed out and the correct statement given from more distant points. It will probably be the close of the year before such corrections cease coming, for it takes a long time for this paper to get to its readers in some remote parts of Australia, the Philippines, Indo-China, Japan and Siberia, and for a communication to be received back therefrom. Truly, as our correspondent says, "the MINING AND SCIENTIFIC PRESS is a marvelous advertising medium."

Black Warrior Copper Plant, Near Globe, Arizona.

[STAFF CORRESPONDENCE.]

The proposition of the Black Warrior Copper Co. Amalgamated comprises a copper mine, acid plant, crushing mill, leaching plant, matte smelter and refinery. The property is about 7 miles west from Globe, Gila Co., Arizona. Jas. A. Fleming is president of the company, C. E. Colony vice-president, H. A. Fry treasurer, E. L. Tustin secretary, their Eastern office being in Philadelphia, Pa. The mine is about 1 mile from the reduction plant, and the two are connected by a tramline.

In the mine the ore body has a northeast and southwest trend, is between diorite and trachyte walls and is presumed to be on the same belt as that of the Old Dominion and Buffalo at Globe. The property is well opened up through a system of tunnels, open cuts and shafts, showing the ore ledge to run from 20 to 60 feet wide. Manager Fleming states that he has 200,000 tons of ore blocked out. In one place the work extends to 300 feet depth. The ores consist of copper oxides and carbonates, running about 60% silica, and are said to average 7% copper. The ore body is opened at various points for about 1 mile along its strike.

The crushing mill is equipped with rock breakers and rolls, capable of handling 500 tons of ore daily. The mill reduces the ore to ½ inch size and less for the leaching plant. The latter contains fifteen lead-lined leaching tanks, made of redwood, boiled in asphaltum. Each tank has ten tons capacity and is hung on trunions, provided with gearing so as to turn or dump it. Above the leaching tanks is a row of lead-lined acid solution tanks, reaching the ore in the latter from the bottom. On a level below the leaching tanks are a number of steel, lead-lined receptacles into which the exhaust solution is drained. By compressed air it is pumped up to the solution tanks, where it is standardized for use again. The solution is about 10% sulphuric acid, and it is stated thas the requirements are four to five pounds of acid to recover one pound of copper. The copper in solution is precipitated by means of scrap iron within two "copper barrels," each 10 feet long by 8 feet in diameter. The resultant precipitate is about 85% copper, the balance iron. This product of the leaching plant is refined on the ground and ingots of practically pure copper turned out.

One of the features of the work is a plant for manufacturing sulphuric acid from material on the premises, which it is claimed has a capacity of twenty-five to thirty tons of acid per twenty-four hours. The main plant is enclosed in a building 65x 210 feet in size, which contains two lead-lined acid chambers, each 200 feet long, 25 feet wide and 20 feet high; also one niter chamber 35 feet long, 20 feet wide and 20 feet high. In this construction about sixty-five tons of lead were used.

In a building adjacent to the structure just described there are four Herreshoff roasting furnaces, each 11 feet diameter and 10 feet high. Within the furnace are five shelves, extending from a center shaft to the circumference, with apertures next to the outer rim. Sulphide ores are fed from a central hopper above into the several furnaces at the top. The center shaft in each furnace is turned by gearing, and attached to it are rakes that circle around on each shell, stirring the ore and dropping it through the apertures to the shelf below. When the fires are once started in these furnaces the sulphur in the ore is supposed to supply the fuel for continuous roasting. The sulphurous fumes and dust pass from the furnaces to an adjoining dust chamber, thence into ovens in which nitrate of soda is boiled with sulphuric acid to convert the nitrate to a sulphate of soda; and by this the nitrous fumes are liberated and used in condensing the sulphur fumes into the sulphuric acid. The gases from the niter oven pass up through a quantity of quartz within a lead-lined Glover tower, thence through a flue into the main acid chamber. This tower is 10 feet square and 24 feet high. There is a second tower of same size.

Much of the ore roasted runs about 35% sulphur, the cinder, or desulphurized material, containing iron and copper, may be used as a flux in smelting siliceous gold and silver ores. However, a good deal of the material that is high in sulphur is chiefly valuable to the acid plant, as it is not high in anything else except iron. This is mined at an entirely different locality from the copper mine proper.

The company also has a reverberatory furnace for the production of a copper matte from certain grades of sulphide ores; also a concentrating mill of crushers, rolls and eight Bartlett tables. The idea is to be prepared to treat all classes of ore and send out nothing but a metal product. The matter of putting in a lead furnace is also being considered, as there are lead ores in this locality.

Water supply is pumped from Pinal creek, 4 miles away, through a 4-inch pipe line. The company's holdings comprise 1600 acres. Work on the group was begun seven years ago; and Manager Fleming states that thus far there has been an expenditure of about $700,000; but the equipment described, including the acid plant, is now practically complete and ready to operate.

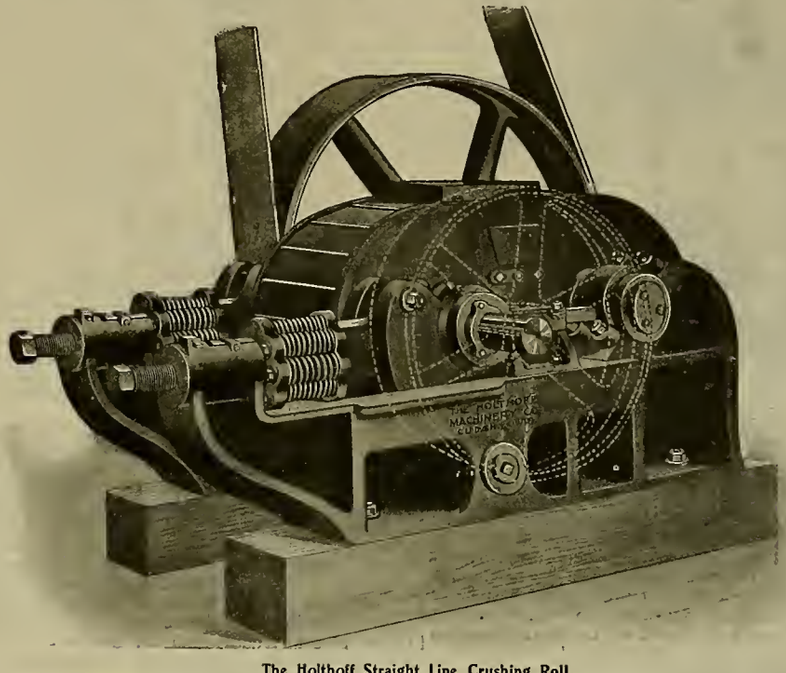
H. A. Hillman is superintendent, E. H. Benson has charge of the acid plant and J. B. Mugford the refinery.

Black Warrior, Ariz., March 1.

The Holthoff Straight Line Crushing Roll.

Among the many improvements made during the last decade in machinery used in connection with the reduction of ores, no one machine has undergone such a complete change as the crushing roll. The radical change in design and construction that is seen in the modern rolls when compared with the old style Cornish roll of twenty years ago is very marked.

This improvement applies alike to design, character of material and the workmanship entering into its construction. The old Cornish roll was constructed of cast iron throughout. It was driven by ponderous but unscientifically designed gearing.



The Holthoff Straight Line Crushing Roll.

The shells or tires, even when not cast in one piece with the hub and shaft, were made of iron uncertain in hardness and homogeneousness. Owing to faulty design and unsuitable material, these rolls could only be run at a slow speed and were only suitable for crushing comparatively soft material.

With the introduction of modern concentrating tables and the various leaching processes for the extraction of the precious metals chemically, the advantages of granulating an ore as compared with pulverizing became apparent and created a necessity for improved crushing rolls. This necessity has been gradually supplied by the manufacturers of mining and metallurgical machinery, as is evidenced by the numerous improvements in the crushing rolls that have been brought out within the last ten years.

Herewith is illustrated a late production in this line, namely, the Holthoff straight line roll, which is manufactured by the Holthoff Machinery Co. These crushing rolls are not entirely new in principle, nor are they calculated to revolutionize the construction of this type of machine generally, but they are the result of many years of experience in the operation and designing of rolls and, the manufacturers say, embody all the good features essential in a machine of this kind. In design and number of parts, they are simplified. The springs are located so that they exert pressure directly on the movable roll in a straight line without intervening tension rods, bolts, etc. The frame is made in one casting, strongly ribbed in such a form that the metal is distributed where the strains come. The adjustments are few and simple and can all be made while the rolls are in operation.

These rolls are designed for both wet and dry crushing. For further description and information address the Holthoff Machinery Co., Milwaukee, Wis.

A Trouble in Assaying.

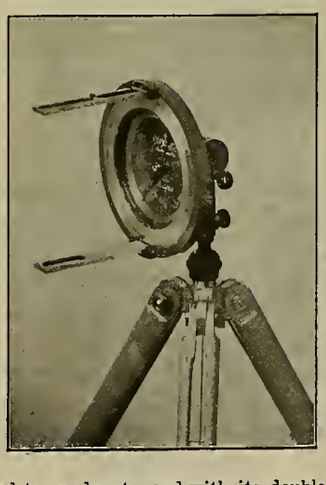
TO THE EDITOR:—I am assaying an ore here in which there is a great deal of sulphur and which makes a lead button about three times as heavy as I would like to have it. I have decreased the amount of ore for a charge until I cannot reduce it any more, as it is a low-grade silver ore. Now, nitre is not considered safe to use as a desulphurizer, and can you tell me if there is anything that I can use that is? I use nails at each charge, but as I understand it they are simply to refine the lead in a way, and keep the sulphur out of the lead button, but do not help at all in reducing size of lead button. Now, nitre not being advisable to use, and all authorities I believe agreeing on that point, what is to be done to reduce the amount of lead thrown down? I do not want to have to roast each sample in order to destroy the sulpbur, neither do I want to be obliged to cut a button up into three pieces in order to get it into cupels. If you do advise roasting each weighed sample, do you add anything to the pulp? Salt, for instance?

Try roasting at a very low temperature without adding any chemicals while roasting. If roasting is not desired and the lead button is too large to cupel, it could be scorified till it is sufficiently small to work to advantage in the cupel.

Lallie's Universal Transit Compass.

Herewith is illustrated Lallie's patent universal transit compass, in the construction of which, the manufacturer states, only such features have been adopted as will facilitate the work of reconnoisance and preliminary surveys, either on the surface or underground. Careful and painstaking attention to constructive detail are designed to earn for this little instrument the admiration of progressive engineers. Surveyors and civil and mining engineers are expected to find this instrument compact, practical, simple in design and easily manipulated. Location surveys of mining claims can be performed quickly, the engineer not being hampered with a heavy instrument.

The instrument is provided with a graduated cir-



cle figured to quadrants, and with its double vernier all horizontal and vertical angles are read to single minutes. A variation plate and levels are provided. A round extension tripod, with aluminum head and clamps, supports the instrument, and when "set up" at any point any horizontal angle can be deflected and any angle of elevation or depression can be read to single minutes, independent of the needle.

Owing to the change of topography, it is often difficult in certain localities to trace the apex of a mineral or coal vein, and to be able to definitely locate the apex or outcropping of any particular vein at a distance away from an opening already made upon the vein, without making tedious measurements and difficult calculations, is of value.

Lallie's transit compass is made of hardened

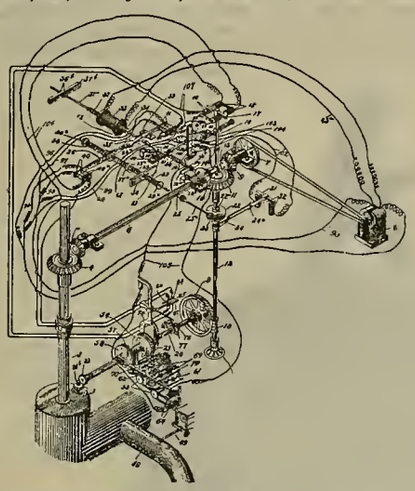
aluminum. It reads all angles independent of the needle. Tangent lines can be extended up or down hill, and vertical sighting can be done, as with a side or top telescope to a transit. Any line can be extended by back or fore sight, or deflected, as with a large transit. It weighs four pounds, complete with tripod and sole leather sling case. The Lallie Instrument Co., Denver, Colo., are the sole manufacturers and dealers.

Mining and Metallurgical Patents.

Patents Issued March 11, 1902.

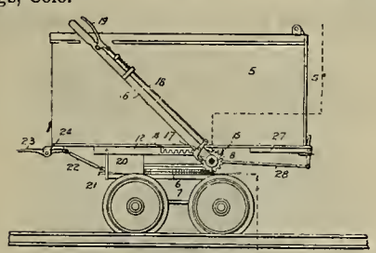
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ELECTRO-MECHANICAL WATER WHEEL GOVERNOR.—No. 695,220; L. Lyndon, New York, N. Y.



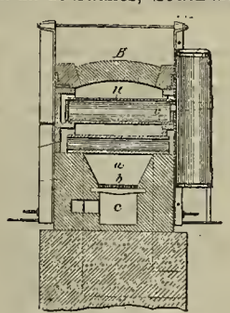
A water gate operating shaft, driving shaft and reversing clutch gear, adapted to connect shafts so as to cause water gate operating shaft to move in either direction, dynamo operatively connected to produce an electro-motive force responsive to speed of water wheel, selenoid device energized by dynamo, core for selenoid and circuit controller actuated thereby, springs for holding circuit controller in normal position, two electro-magnetic devices for reversely operating reversing clutch gear, returning device adapted, when operated, to return circuit controller to normal position, clutch adapted to bring returning device into operative connection with water gate operating shaft, magnet controlling clutch, circuit for magnet including a circuit closer operatively connected with aforesaid circuit controller and adapted to energize magnet on movement of circuit controlling in either direction.

ORE CAR.—No. 695,344; P. J. Smith, Idaho Springs, Colo.



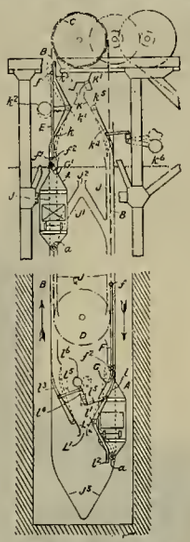
A car truck, platform and car body, car body being slidable on platform and having hinged door, shaft journaled on platform, on which car body is pivoted, connection between shaft and car body whereby latter is shifted by turning shaft, block slidable on bottom of car body, dog pivoted on block and arranged to lock car body in closed position, and a rod connecting dog with shaft whereby dog is automatically actuated as car body is shifted.

PRODUCTION OF ZINC DUST.—No. 695,376; G. G. Convers and A. R. de Saulles, South Bethlehem, Pa.



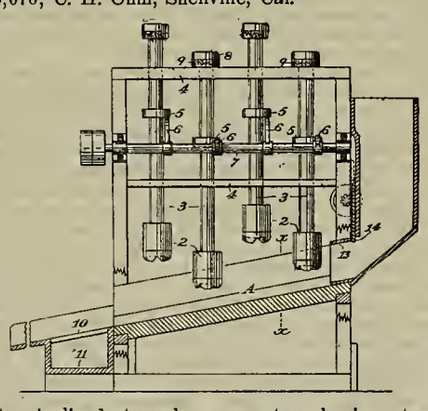
Process of obtaining maximum yield of zinc dust or blue powder from a given retort charge, while excluding injurious admixture of zinc oxide therewith, by heating charge to effect distillation of zinc, conveying off separately preliminary oxide of zinc vapors generated in retort, then receiving metallic zinc vapors given off from charge, from muffle directly into collecting chamber, thereby maintaining their temperature throughout above point of liquefaction of any substantial portion of vapor until they have entered the collecting chamber, immediately expanding and condensing them to zinc dust in chamber; and interrupting flow into collecting chamber when, at final stage of operation, oxide of zinc vapors reappear therein.

RAISING OR LOWERING APPARATUS FOR MINES OR THE LIKE.—No. 695,287; D. Davy, Sheffield, England.



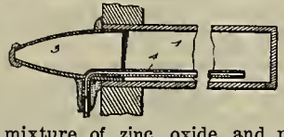
Pendulous cage carrying slings, pair of endless chains to which slings are pivoted, pairs of upper and lower pulleys upon which chains run, guides adapted to bring cages and lower ends of slings to mid-position between ascending and descending chain members at upper and lower landing points, means of temporarily supporting cages at landing points, means of detachable connection between slings and cages, means of effecting connection consisting of hooks pivoted to slings, hooks of successive slings pointing in opposite directions, adapted to be pivotally controlled by guides so as to be thereby caused to enter into engagement with or become disengaged from cages.

CEMENT GRAVEL CRUSHER AND SEPARATOR.—No. 695,076; C. H. Ohm, Shellville, Cal.



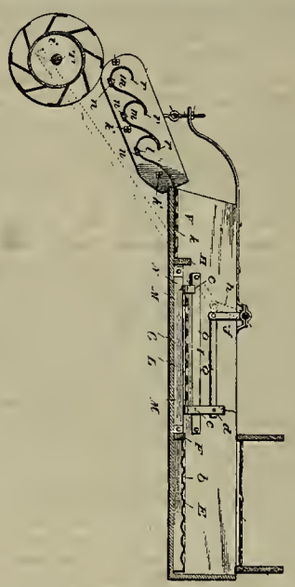
An inclined trough or mortar having transversely curved bottom, hopper, feed pipe discharging into upper end of trough and controlling gate therefrom, stamps having corrugated bottoms, vertically guided stems to which stamps are attached and mechanism by which they are raised and allowed to fall, heads carried by stamp stems and cushioned stops upon which they fall before stamps strike bottom of trough whereby cement is separated and pulverized without breaking stones, screen inclined in general direction of trough through which pulverized material falls and over which stones are discharged.

PROCESS OF SMELTING ZINC.—No. 694,947; S. Davies, Iola, Kans.



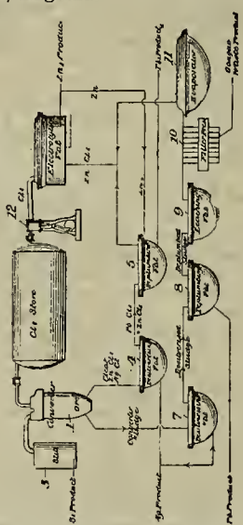
Placing mixture of zinc oxide and particles of non-metallic refractory substances within retort, exteriorly heating latter, passing current of hydrocarbon gas through charge, whereby reduction is effected, conducting gas and vaporized metal carried thereby through a condenser to deposit metallic zinc, and finally permitting gas to escape.

SLUICE BOX.—No. 695,085; L. B. Tanner, Seattle, Wash.



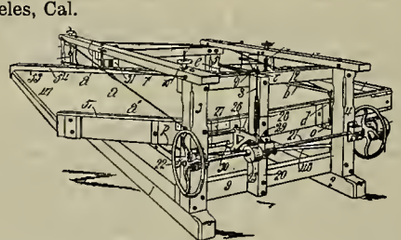
Sluice box provided at one end with raised amalgamating plate E formed with circular cups in its surface, transverse partition F forming support for one end of plate and constituting one end of chamber G which receives water and dirt from plate, gate H constituting opposite end of chamber and being higher than partition F, flume A having perforated bottom above plate E and extending transversely across sluice box.

PROCESS OF EXTRACTING METALS FROM SULPHIDE ORES.—No. 695,126; J. Swinburne and E. A. Ashcroft, London, England.



Treating sulphide ores by passing chlorine through bath of ore and a fused chloride, thereby producing free sulphur, the chlorine combining with metals of ore.

ORE CONCENTRATOR.—No. 695,064; L. Look, Los Angeles, Cal.



A frame; concentrating table which slopes longitudinally downward from head to tail and discharges over edge at tail; yoke; flexible means at middle of yoke connected with frame at one end for supporting yoke; links at ends of yoke, respectively, loosely connected with yoke and with opposite sides of table at one end thereof; two table-supporting links at other end of frame, which are respectively loosely connected with frame and with table at opposite sides; intermittent means for moving table in one direction; resilient means for returning table; means for stopping table at its return; table also sloping transversely downward from concussion side to opposite side.

MINING SUMMARY.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

JUNEAU.

Manager C. H. Pearce of the Alaska Perseverance group of mines, in Silver Bow basin, near Juneau, is en route to San Francisco to buy machinery for use in driving a mile long tunnel recently started. Its primary object is to provide an outlet at depth for large ore bodies on the opposite sides of the mountain. The tunnel has cut through a large vein of good paying ore at 300 feet from the tunnel entrance.

The machinery for the 5-stamp mill in the Unuk river district, near Ketchikan, is being taken from that place in a scow, which will be towed 40 miles up the Unuk river, to the millsite of the Unuk River M. Co.

ARIZONA.

COCHISE COUNTY.

Hands Bros. of Galeyville have sold their mining property in the Chiricahuas to P. H. Clark of Los Angeles and associates. The ores from the group carry high percentages in lead and silver. Shipments of ore made are claimed to have paid for the development work so far.

GILA COUNTY.

J. Pascoe, owner of four copper claims at Black Warrior, is now doing development work, that is opening up a body of carbonate and chrysocola ore. A shaft is now down about 60 feet. W. H. Hender is Supt.

W. N. Bowen, vice-president of the Pinto Creek M. & S. Co., and T. Crandall, consulting engineer, have been to Del Shay basin, north of Globe, examining some property on which the company has a bond. They have made a shipment to test its values and to find out what kind of a process is best adapted for the treatment.

MARICOPA COUNTY.

The discovery of a rich body of gold ore in the Oro Grande group at Wickenburg is reported. The ledge is said to be 120 feet wide, all ore showing pay values.

The Denver Group G. & C. Co. at Wickenburg has its tunnel in nearly 450 feet. The contractors have finished over 150 feet of their last 200-foot contract. Additional contracts will be let and the development work continued until the ledge is crosscut. A. H. Gamage is manager.

The Chicago, New York & San Francisco group at Wickenburg, owned by J. W. Munchus and S. Powell, which is bonded to a London company, are in an immense quartz porphyry dike 300 feet in width, which seems to have gold, silver and copper distributed pretty evenly all through it.

A 12 H. P. gasoline hoist for the Angel mine at Wickenburg has been installed and sinking toward the 300-foot level started. It is probable that several electric drills will be used in the work.

MOHAVE COUNTY.

The tunnel on the Leland vein, in the San Francisco mining district, owned by T. Ewing, is in 500 feet and has cut a large ore body. S. Bedell is Supt.

The C. O. D. mine, near Kingman, has opened up on the 400 level a very large ore body. The ore at present being worked through the mill comes from winzes and drifts, no stoping being done. A larger and more complete plant is considered necessary.

At the Gold Road mine, under Supt. Stevens, about 100 men are employed. This, it is stated, is in anticipation of the erection of a milling plant near the property. In the shaft the water is increasing. The tunnel is showing very rich ore bodies and in the crosscut at the bottom of the shaft there is a solid body of ore 15 feet in width which, it is claimed, averages $18 a ton.

YAVAPAI COUNTY.

The stockholders' meeting of the United Verde C. Co., held in New York, received a financial report showing that the profits of the company for the year ended December 31, 1901, were $3,235,845. Out of that dividends amounting to $2,924,142 were paid, and there was carried to surplus account $313,703, which, added to the previous surplus of $935,843, makes the total surplus $1,247,186.

Mrs. A. V. Kautz of Tacoma, Wash., has sold the Gopher gold mine, near Prescott, to the McCook Extension M. Co. for a large sum. The mine has been developed by her and a number of associates, who have advanced $45,000. Mrs. Kautz, it is stated, personally superintended this work. Mrs. Kautz also owns silver property in the Bradshaw district and proposes to undertake its development this summer.

The Dutton property, on Cherry creek, near Prescott, which is equipped with a mill, is starting up, after lying idle for four years, under the control of a newly organized company, with M. Ralston as manager.

YUMA COUNTY.

The Rio Del Monte G. M. Co., which owns the group of mines near Harqua Hala, is reported to be about to commence the erection of an 80-stamp mill. Ex-United States Senator Pettigrow of South Dakota is general manager of the company.

W. E. Defty has sold the Mountain Chief mine at Harqua Hala to Eastern people. The ores mined are milled in a stamp mill situated about 3 miles from the property.

CALIFORNIA.

At a meeting of the executive committee of the California State Miners' Association in San Francisco March 19, the following resolutions were unanimously adopted:

Resolved, That we earnestly urge upon our Senators and Representatives in Congress to use their utmost efforts to secure the enactment of the so-called Mineral Lands bill now pending in Congress, to the end that there may be a prompt, effectual and final classification and segregation of the mineral lands within the railroad land grants of California, and that such mineral lands may be again thrown open to exploration and purchase as part of the public domain. No effort should be spared to secure the enactment of this legislation at this session of Congress.

Resolved, That the mining industry of this country, with its enormous output of raw material, its momentous significance to the industrial prosperity of the Nation and its vast possibilities of future development, warrants and demands the Governmental protection and aid that can be adequately extended through a Cabinet office of the Executive Department of the Government.

Resolved, further, That we heartily endorse the bill now pending in Congress for the creation of a Cabinet Department of Mines and Mining, and in behalf of the miners of California we demand the passage of said bill.

The executive committee asked the Board of Supervisors of the mining counties to appoint committees to assist the State Mining Bureau in securing ores and specimens to be placed by the Mining Bureau in California's mineral exhibit at the St. Louis Exposition which opens in April, 1903.

AMADOR COUNTY.

The Cranmer Bros., at Pine Grove, are operating a small mine with a 2-stamp mill. It is reported that they have struck a body of high-grade ore.

Supt. Hyner of the Mitchell mine, at Pine Grove, has bought a 20-stamp mill which is to be added to the present milling capacity of ten stamps. The 10-stamp mill has been crushing rock for eighteen months with satisfactory results. Improvements in the shape of additional machinery are being made.

At the Bunker Hill, near Amador, prospecting operations continue. At the 800 level fairly good ore has been uncovered in the bottom of the drift. Since the present company started work they have expended $90,000 in development work.

BUTTE COUNTY.

The Clark Old Channel mine, near Yankee Hill, is shut down as the result of a landslide from the hill above the claim, which took the mine buildings and all in its course and smashed everything to pieces.

CALAVERAS COUNTY.

The Sultana M. Co., operating the Bovee mine at Angels, is building an engine house and other buildings at the mine. Cement foundations are being laid for the 90 H. P. compressor and the electric motor for it. The shaft is to be sunk deeper.

In the Prince mine, at Altaville, the vein is 8 feet in width at a depth of 100 feet and is said to be rich.

The postoffice at Robinsons Ferry has been changed from the name of Robinsons to Melones and after April 1 will be known by the latter name.

DEL NORTE COUNTY.

J. White and M. E. Moore of Crescent City, who have a free gold prospect in Shelley Creek, eastern Del Norte county, propose to put in a stamp mill on their claims in the near future.

A. A. Davis, of Medford, Oregon, has bonded the Monumental mine at Shelley Creek from Baker & Jackson, at $60,000.

HUMBOLDT COUNTY.

The Gold Sand M. Co. has completed arrangements for working the sands in Big Lagoon, situated on the coast above Trinidad. Recent tests of the granite sand in the lagoon are reported to show that it can be worked at a profit on a large scale. The company has shipped a dredger and other machinery to the property.——Another company, Connecticut people, of which S. Whitlock of Eureka is the head, is also preparing to operate in the same district and is shipping material to the Big Lagoon from Arcata.

NEVADA COUNTY.

J. Eddie, formerly Supt. of the Pennsylvania mine, at Nevada City, is Supt. of a company to develop the Iowa mine, near Graniteville. The mine will be worked for both gravel and quartz deposits.

The Gold Bank mine, near Maybert, owned by C. Belden and others of Nevada City, is to be operated soon by a company represented by H. J. Griffin.

Dr. Puscheck of Chicago Park, who owns the Puscheck mine near You Bet, states that the mill has started crushing.

In the Federal Loan mine, in Willow valley, near Nevada City, the lessees have opened up a strong ledge of high-grade ore in the drifts off the 300-foot level.

Supt. Graham, C. L. Canfield and E. W. Spencer of San Francisco have been out to the Blue Tent gravel mine, near Nevada City, which is being reopened. The new tunnel is being driven ahead toward the channel.

The Gaston Ridge M. Co. has bought from D. Harmon four quartz claims near Graniteville and has bought from Mr. Harmon all his mines and real property in that district, deeds having been filed with the recorder recently.

PLUMAS COUNTY.

(Special Correspondence).—Snow blockade for two weeks; snow at the Diadem mine, 5 feet deep; on the high mountains, 8 to 10 feet—all fallen since Feb. 15; precipitation for February, 25.42 inches; March to date, 9.35 inches; total precipitation for season, 62.44 inches—about normal; water supply moderate; few mines here have been started up.

Meadow Valley, March 12.

C. L. Adams states that, as the agent of the Cataract G. M. & Power Co. of Minneapolis, Minn , he has bought the gravel mining claims owned by C. Giraud at Indian Bar, on the North Fork of Feather river, near Quincy. It is proposed to mine the ground by the hydraulic elevator process, and, in order to secure power, a ditch will be cut a distance of a mile or more.

SACRAMENTO COUNTY.

The Blue Ravine mine at Mormon Island has installed a power drill and is opening up new ground.

SAN DIEGO COUNTY.

(Special Correspondence). — The California King Gold Mines Co. are now building a 1000-ton cyanide plant at this place and connecting same with their mines with a 6-mile railroad. E. Gee, the new manager, has taken charge.

Picacho, March 13.

The Goldfields of California, Ltd., has been incorporated in London, capital £550,000, to take over and operate the Golden Cross group of mines at Ogilby.

It is stated by S. H. Lucas of Los Angeles that he has bought the Stonewall gold mine for a New York company, who have made the first payment. The property is one of the best known in the county, as it has produced nearly $3,000,000. It has been idle for the past twelve years.

The excavation for the 1000-ton reduction works at the Gold King mine at Picacho is about completed. The five large boilers are in place and the erection of the building is under way. M. Greenleaf, formerly section foreman on the Southern Pacific, is superintendent of construction on the railroad from the mines to the reduction works, a distance of 5 miles, and work on the line is now under way.

SHASTA COUNTY.

Work has been resumed on the Balaklala copper property in the Flat Creek district, near Kennet. Development work commenced on a large scale was suspended Feb. 1. Supt. Adams has returned and has started the work again.

A company composed of Salt Lake people has bought the Wynne placer claim of 160 acres near Horsetown, and is negotiating for other properties in the same vicinity. A powerful dredger will be installed on Clear creek and operated by electricity.

SIERRA COUNTY.

The Alaska mine at Pike City is reported to have been sold to a San Francisco company. It is stated that the new company will reopen the mine at once.

A. F. Eaton of San Jose, representing the Tabor M. Co. at Gibsonville, says that the Tabor mine tunnel, E. G. Squier Supt., is going steadily ahead. The rock is hard, but 50 or 60 feet a month is being made.

SISKIYOU COUNTY.

The Jillson mine at Hornbrook is employing ten men engaged in blocking out ore and getting ready to stope. They have enough in sight now to keep the 10-stamp mill running for seven or eight months, it is reported. The La Flesh mine in the same district is having a crushing made of about 80 or 100 tons of first-class ore.

In the Empire mine, on Empire creek, near Gottville, owned by C. Junker, Sr., of Yreka, a shoot of fine ore has been struck showing free gold.

TUOLUMNE COUNTY.

T. F. Coyle and C. Shafer have started work in the Never Sweat drift mine near Big Oak Flat.

It is reported that the Cosmopolite mine at Big Oak Flat is to start up. The intended improvements include the erection of a 30 H. P. engine and 50 H. P. boiler; also the sinking of a vertical two-compartment shaft to the depth of 300 feet.

At the Republican mine, near Jacksonville, stoping is in progress and the 10-stamp mill is crushing high-grade ore. R. Deleray is Supt.

B. Rucker of San Francisco has bonded to C. S. Shafer of Big Oak Flat the Never Sweat quartz mine, situated at Big Oak Flat, until March 6, 1903, with price fixed at $5000.

The shaft on the Platt & Gilson mine at Soulsbyville is being gleaned out preparatory to an examination with a view to purchase by a Colorado company. The mine has lain idle for twelve years.

It is stated that operations will be commenced shortly on the old Mount Brow gravel claim on Table mountain at Sonora. The claim has not been worked for twenty years. C. L. Lang owns the property.

At the Lost Fox mine at Carters the shaft is down 250 feet and drifting is in progress. A 20-stamp mill is under construction.

COLORADO.

(Special Correspondence).—The United States Red. & Refin. Co., with general offices at Colorado Springs, own and operate a large chlorination plant at Colorado City and two similar reduction plants at Florence. The management of this corporation is largely in control of C. M. MacNeil, C. L. Tutt and S. Penrose. Large additions have been made to this company's property within the last few days by the purchase of the Granite mine, at Victor, Cripple Creek district, at a price stated to be $500,000, and the purchase of the smelting plant and mineral holdings of the American Zinc-Lead Co. at Canyon City at a price reported to be $600,000. It is announced that the Granite mine will be operated vigorously and its large tonnage of blocked-out ore drawn upon. The smelting plant is to be enlarged and operated under the name of the United States Smelting Co., with main offices at Colorado Springs in connection with those of the present company. D. C. Jackling is to be manager of the Canyon City plant.

Colorado Springs, March 12.

BOULDER COUNTY.

R. S. Earhart of the Colorado Northern G. M. Co., at Sugar Loaf, reports that the company will run the southeast branch of its tunnel some 2000 feet farther, in order to intersect the Dime, Logan, Grand Republic, Yellow Pine and all the mines of Sunbeam gulch. The southwest branch of the tunnel will also be extended between 2 and 3 miles in order to cut the Livingston, Amalgam Thief, Smoky Hill and other mines south and west of Sugar Loaf mountain. Five electric drills will be added to the present equipment. The mines at the present time are hauling their ore by wagon to the cars at a cost of from 75 cents to $1.50 per ton; but, with the tunnel, will be able to save at least 50 cents per ton of this.

A stamp mill is to be erected to treat the copper ore being found in the vicinity of Lyons. C. A. Tripp and C. W. Strong, Supt. of the Croma Copper Co., are at the head of the enterprise and expect te have the mill completed by July 1.

CHAFFEE COUNTY.

J. S. Goodenough and G. Wooden of Parsons, Kans., have located several mining claims near Salida and are preparing to do prospecting work. They propose to do sinking and will secure all the necessary equipment.

CLEAR CREEK COUNTY.

The Sierra Nevada tunnel is projected, starting at Silver lake, near Yankee, and running in 8000 feet, cutting the Surprise group at a depth of over 1000 feet. Options are held on over 100 locations by the promoters. The tunnel is now in some 600 feet, with two pay veins of mineral opened up. If pending business arrangements go through, heavy machinery will be installed. It is said that electricity will be the power, the supply station being located on Fall river, using its water power.

The mill of the Idaho Springs Reduction Co. has started up under the management of Mr. Roller. The process comprises wet crushing, amalgamation and concentration by Bartlett tables.

W. W. Cannady has bought the Silver-

ine lode and tunnel site at Cascade from W. Graw and has started development. There is a shaft sunk on the property and a tunnel in 155 feet. A test of 1000 pounds of the ore milled netted $72.

The Lombard-Polaris mines at Yankee have been bought by the Con. Yankee Co., of which H. I. Seemann is manager. The mine has been developed by Dr. Ashbaugh of Central City and opened to a depth of 400 feet. With the mine was sold the Ashbaugh mill, which works the ores from that property. Mr. Seemann has been consolidating claims around his Manhattan tunnel and now controls a large group. Plans are on foot for heavy work and it is proposed to install an air compressor at the tunnel.

GILPIN COUNTY.

The 80 H. P. boiler for the new mill of the Bonanza mine, in Chase gulch, near Black Hawk, has been installed, work on the mill being well advanced. It will be a 25-stamp slow-drop.

Ore assaying over $50 per ton has been opened up 170 feet down in the shaft of the Katie and Francis mine at Eureka. The company will build an addition to their shafthouse and will put on a gasoline plant of from 10 H. P. to 12 H. P.

McCullough & Co., leasers on the East Notaway, near Central City, made a shipment of ore taken from the 420-foot level. The company has decided to install a new engine of about 75 H. P.

Timbers are being hauled to the Gould mine, at Nevadaville, which is being operated under a bond by G. H. Graham and associates of Denver. The shaft is down 800 feet. The operators propose to install a large plant and erect a large shaft building to put the shaft down a farther depth of 500 feet. W. Parenteau is Supt.

Manager J. A. Gilmour of the Stewart mine, near Wide Awake, has received from a run of 14⅛ cords 49.45 ounces gold and 13 tons of tailings, which sold for $18.80 net per ton. On account of the long haul to Black Hawk, it is thought that the company will decide to erect its own mill some time this summer.

Black Hawk people are interested in a lease and bond on the South Fork Running Lode at Gregory. At a depth of 75 feet they have opened up about 4 inches of a pay streak showing copper, iron and lead. The property is being worked with a whim, but the lessees expect to install a hoisting plant soon.

Stoping is being done at the O'Neill mine, at Central City, in the 464 and 666-foot levels. The average daily production is about twenty tons, mostly milling ore. It is the intention of the company to sink the shaft down to a depth of 1000 feet during 1902. H. C. Eastman is in charge for Canadian people.

HINSDALE COUNTY.

H. F. Wells, secretary of the Henson Creek Lead Mines Co., operating near Lake City, with Supt. Wearne, has been looking into the question of a concentrating mill which, he states, will be built this summer. A thorough sampling and test treatment of the ore is to be made for the purpose of determining the mill system to be installed.

LAKE COUNTY.

The Sedalia mine, which has been closed down during the winter, is to start up in April.

LARIMER COUNTY.

C. R. Hall, president of the Boston & Colorado Copper Co., and W. J. Smith of Denver, have been inspecting the Empire mine, 10 miles west of Fort Collins, with the view of putting up reduction works near the mine.

MINERAL COUNTY.

(Special Correspondence). — The new Humphreys concentrating mill at Creede is now running and is in charge of Raymond Whinnerah. It makes two products, a lead-silver concentrate and an iron-zinc material carrying silver. This mill was illustrated and described in the MINING AND SCIENTIFIC PRESS November 23, 1901.

Creede, March 15.

SAN JUAN COUNTY.

J. H. Robin of Silverton of the Ledge Mining Co. at that place says the company is ready to build the new concentrating mill and that the work would be started as soon as the snow disappears. The company has bought a new mill site on the railroad. The capacity of the mill will be made 200 tons a day. J. B. Warner, the manager of the company, will have charge of the construction.

IDAHO.

BOISE COUNTY.

The Idaho Last Chance G. M. Co., capital $300,000, has been incorporated at Salt Lake City, Utah, to take up a bond and lease on the Last Chance mining claims at Quartzburg. J. W. Burton is president and W. H. King secretary and treasurer.

CUSTER COUNTY.

J. Gauer and A. H. Tarbet of Salt Lake City, Utah, are preparing to work on the placers of the Snake river by the dredging method.

IDAHO COUNTY.

(Special Correspondence).—The Golden Rule Placer Mining Co. has been organized in Denver, Colo., by H. Riddell, C. L. Hathaway, E. W. Hurlbut, H. Thorpe, H. A. Hicks and others, to operate placer properties on Grouse creek. The company have options on the B. & B., John Claire, Ault & Kelley and Flint groups, which practically cover the Grouse creek placers from the head of the creek to the point where it flows into the Secesh. The gravel beds are said to be from 6 to 25 feet deep. Sixteen B. & B. samples averaged $2.11 per cubic yard. Twelve John Claire samples averaged 30 cents per yard. The idea of the management is to equip the property with modern facilities for hydraulic work. It is claimed the volume of water is ample. This ground is 12 miles west of Warren and about 70 miles from the railroad terminus at Council.

Warren, Idaho, March 4.

OWYHEE COUNTY.

E. F. Stuart of the Trade Dollar Con. M. Co. at Silver City has devised an electric powder thawer for use in the mine, which is very simple in construction and claimed to be perfectly safe in operation.

A large body of ore has been struck in the Davis mine, at DeLamar, in the tunnel at about 600 feet. It is reported that a mill will be built early in the spring.

The War Eagle tunnel is in 6400 feet. From the dip of the Chariot ledge in its surface workings, it has been estimated that the tunnel would cut the lode at a length of about 6300 feet. As the old works are full of water, no accurate survey can be made; and as the tunnel is 1000 or 1200 feet deeper than any workings on the vein, its dip is a matter of conjecture. The management has stopped driving the tunnel and has started a diamond drill to prospect the country ahead of their tunnel. The force of miners will be taken back to the 6180-foot station and drifts started on a cross vein at that point.

MONTANA.

FERGUS COUNTY.

C. Deyo and A. B. Hopkins, operators of the American group, in Bald Butte district, near Kendall, state that development work is being pushed rapidly. A large body of ore suitable for the cyanide process has been encountered.

On the Barnes-King property, near Kendall, the mill, which has been running since October 1, 1901, has treated 110 tons per day at an expense of not over 78 cents per ton for mining and milling. The Kendall mine people say they expect to reduce this expense before the year is over.

GRANITE COUNTY.

D. Lewis of Butte has bonded a mine in Garnet district and will proceed to develop it at once. The bond is for $10,000 and runs for a year.

MADISON COUNTY.

H. S. Gilbert has discovered a ledge of chalcedony or onyx on the divide near California gulch, Virginia City, and intends developing it this spring.

C. E. Damours of Summit is preparing to engage in extensive mining operations at the head of Alder gulch this summer. He is negotiating to buy the Eagle Hill M. Co.'s properties at Summit. Besides the erection of a mill, he will engage in placer mining.

MISSOULA COUNTY.

T. S. Letterman has bought for his company the Little Morgan lode, near Plains, and proposes to start opening it up at once. The character of the ore is a free-milling gold-bearing quartz. The company have decided to install a 10-stamp mill and plans are now ready for it. T. S. Letterman of Missoula is manager of the company.

SILVER BOW COUNTY.

The Nipper Con. Copper Co., organized in New York, has filed articles of incorporation at Helena; capital $3,750,000. The directors are S. Gifford, A. P. Heinze and R. S. Harvey, all of New York.

The 1901 report of the Butte M. & Dev. Co., operating at Butte, shows: Total cash received, $130,794; total disbursements, account Emma mine, $61,282; disbursements on the West Olive branch, $16,511; miscellaneous, $36,548; cash on hand Jan. 1, 1902, $16,452. President Lee Mantle says nothing but actual development can justify positive statements, and the present development in the Emma, while in many respects encouraging, do not warrant positive statements. The enterprise is still in a speculative condition, and it will, in my opinion, require a depth of at least 800 feet, and probably 1000 feet, to fully and satisfactorily demonstrate its value as a copper mine.

NEVADA.

HUMBOLDT COUNTY.

A large air compressor has been installed at the Imperial mine, at Kennedy, which Wynn & Lasher are operating.

The Tonopah & Golconda S., M. & R. Co. has been incorporated in Salt Lake City, Utah, to build and operate a smelter at either Battle Mountain or Golconda, to reduce the lead-silver ores of those camps and the siliceous ores of Tonopah.

LINCOLN COUNTY.

About 12 miles west of Sandy, in the vicinity of Horse Springs, N. Kuntz and C. Garrett have made a discovery of a strange ledge, one side of which carries gold and the other side gem turquoise.

A. G. Campbell of Sandy is the owner of twenty-four patented claims, besides a number of unpatented claims. A portion of this ground was recently under bond for $225,000. It is reported that Mr. Campbell is planning the erection of a smelter at Goodsprings.

NYE COUNTY.

At Ray, the new district 10 miles north of Tonopah, three important finds along the lead have been made. The company shaft now has in the bottom a good sized ledge of ore that will pay to ship. On Lease 8 a pocket of coarse gold in quartz has been found. Miller & Congdon on Lease 14 have uncovered a shoot of ore 16 inches wide that will average $400 per ton.

The prospectors in old Long Valley mining district, which is attracting attention, recently held a meeting and organized a new mining district, calling it Viola mining district, and elected S. Allen district mining recorder. The district is 15 miles square, extending 7½ miles in each direction from the Viola claim. The Viola claim, owned by J. Kiernan and S. Allen, has its shaft now down 125 feet. The ore in the shaft is from 12 to 14 inches in thickness, and is of a dark green and blue color, the average assay returns showing 115 ounces in silver and 18% copper.

WASHOE COUNTY.

The Pacific Con. M. Co. of New York has bought the J. & K. and six other mines in the Pyramid Lake district, near Reno. R. M. Parry is Supt.

The Boston mine, near Reno, owned by J. W. Carroll and C. E. Mickell, has been bonded by Miller & Price of Denver, Colo. Three extensions to the Boston, owned by Palmer, Carroll, Folsom and Mickell, are included. The price is said to be $10,000, payable in installments running throughout a year.

WHITE PINE COUNTY.

At the Joanna mine at Cherry creek, owned by J. Farren of Salt Lake City, a strike is reported of very high-grade gold ore.

NEW MEXICO.

BERNALILLO COUNTY.

The Home M. & M. Co. has been organized at Bland, in the Cochiti district, and will erect a 10-stamp mill. V. V. Clark is manager.

TAOS COUNTY.

The La Grande G. M. Co., incorporated in South Dakota, is owned by Bloomsburg, Pa., people, with its principal office in that town. The company proposes to do placer mining on its claims bordering on the Rio Grande river and in the bed of the river itself. C. B. Robbins is the secretary and treasurer of the company.

OREGON.

JACKSON COUNTY.

W. H. Maultby and A. Gilson, who are working some new placer mines at Sterlingville, think they have struck the old boulder pay channel. They have run a drift 180 feet long and found good pay dirt. The gold is coarse, some of the pieces weighing as high as $4 and $5 each.

JOSEPHINE COUNTY.

F. D. Russell, secretary of the Oregon Con. M. Co., operating near Glendale, says his company is prospecting a piece of placer ground, working with one giant, and is building a 4-mile flume to bring more water to the property from Rift creek.

I. Coffman recently took out twenty ounces of gold from a pocket on Dumpy gulch, in the Forest Creek district, near Grants Pass.

A ledge of free milling quartz running $10 to the ton has been struck in the Sunset mine, near Grants Pass.

Two engines, a small sawmill, large cables and other machinery have arrived at the Golden Drift mine in Dry Diggings district, near Grants Pass. A dam will be built across Rogue river and six water wheels installed to furnish 3000 H. P. A battery of pumps will furnish water for six giants and an irrigating ditch.

A new cyanide plant has been recently installed at the Gold Bug mine in the Mount Reuben district, near Grants Pass, and the tailings of the mill, the savings of several years of its operation, are being worked over, yielding an average of $15 per ton.

The Oviatt hydraulic mines on Pickett creek, near Grants Pass, have been bonded to San Francisco people for sixty days by G. W. Trefern at $35,000.

SOUTH DAKOTA.

PENNINGTON COUNTY.

The plant built at Deadwood for the Imperial Co. has been finished and the machinery was started and tested. The plant is a 200-ton cyanide with all the late improvements. The boilers that have been installed will handle 250 tons a day, but only tanks to handle 200 tons a day are in it at present.

UTAH.

BOX ELDER COUNTY.

The Hot Springs M. Co. of Ogden has been incorporated, capital $50,000, with T. W. Jackson president and G. Gould secretary and treasurer. The company owns four mining claims in Park valley.

IRON COUNTY.

The mines and mills of Stateline are to be provided with a pipe line supply of water and contracts for 16 miles of pipe will be let, as soon as the business details are arranged. H. Rives, who owns the springs in Hamlin valley, will build the pipe line.

The Venus G. M. Co. has been incorporated in Salt Lake City, capital $500,000, with J. F. Hittle president and C. T. Candish secretary and treasurer. The company owns the Goodwin, Pioneer and Volunteer lode mining claims at Stateline.

SALT LAKE COUNTY.

The directors of the Silver Shield M. Co. have approved a contract with the United States M. Co. for the use of the old Franklin tunnel by the Silver Shield Co. at Bingham and will resume operations at once. H. Joseph has been elected manager.

When the United States smelter at Bingham Junction starts up in August the recently constructed smelters will handle about 3300 tons of ore daily. The minimum tonnage will probably be: A. S. & R. Co. 1000 tons, United States 1000 tons, Bingham Con. 600 tons, and Highland Boy between 500 and 600 tons. Of the total, Bingham should be producing nearly 2000 tons daily.

To perfect the mechanical equipment at its milling plants, the Bingham Con. Co. has decided to provide the Dalton & Lark group of mines at Bingham with a concentrator, and experiments are now being made by J. D. Flemming, the company's experienced metallurgist, to determine the desirable construction.

SUMMIT COUNTY.

The Little Bell Con. M. Co. of Wyoming has been incorporated, to buy and operate the Little Bell and several adjoining claims in Uintah mining district. The trustees are J. H. Kirk, H. Bamberger and A. A. Rudy of Salt Lake City.

WASHINGTON.

FERRY COUNTY.

Supt. W. M. Crummer of the Gold Ledge mine at Republic states that work on the tunnel will be resumed in a short time with a diamond drill to explore ahead for ore.

OKANOGAN COUNTY.

A Spokane company is planning to construct an aerial gravity tramway from the Big Bend plateau to a point near Entiat, on the Columbia river, to open up the Waterville section of the Big Bend country. The incorporators are E. D. Olmstead, G. F. Crane, G. F. McKinney and C. G. Betts, all of Spokane. The road will be run on the two cable system by gravity.

Fire at the Mineral Hill mine, near Conconnully, destroyed $15,000 worth of new machinery lately installed, and $5000 worth of new mine buildings. The Mineral Hill mine is owned by Dr. J. May of Bridgeport, Conn., and associates. The engine house, two shaft houses, tool shed, blacksmith shop were destroyed, but the boarding house was saved. There was no insurance. The company will resume operations as soon as new machinery can be brought in.

FOREIGN.

BRITISH COLUMBIA.

The Mines Exchange, Ltd., of Nelson says: The Farrel Bros., owners of the Society Girl mine in East Kootenay, have been working their property all winter, and will increase the force with the opening of spring.

Development work is being done on the Estella mine. Over 2000 feet of tunnels, shafts and adits have been run, and a large amount of ore has been blocked out. It is the intention of the owners to erect a concentrating plant at the mine. The ore will concentrate 3 to 1.

The Silver King group on McDonald creek, producing silver-lead ore, was recently bought by T. Starbird, represent-

ing an American syndicate. The property is a producer of very rich silver-lead ore.

The shipments of ore from Slocan City for January and February are as follows: Arlington 670 tons, Enterprise 80 tons, Ottawa 7 tons, Neopawa 20 tons, May 5 tons; total 782 tons.

The B. C. Coal Co. will undertake an extensive schemo of coal mine development on the North Fork of Kettle river, in Yale district. Diamond drills will be used, and it is intended to sink at various points to a depth of 400 or 500 feet. Two veins 3 feet and 6 feot, respectively, outcrop and can bo traced for miles. The coal is bituminous, containing 70% fixed carbon.

Nelson, March 8.

From the Slocan it is reported that a strike has been made on the Ruth mine of a body of ore that runs about 200 ounces in silver to the ton. Reports add that there are 500 sacks of this ore ready for shipment.

The White Moose group of mineral claims on Taku Arm, near Atlin, is reported bonded by J. Caplice at $105,000, and work is expected to begin immediately. Caplice has the erection of a smelter under consideration.

The manager of the Le Roi No. 2 mine, at Rossland, reports tbat in the Josie mine, 700-foot level crosscut, the vein on the hanging wall side gives assay of $25 per ton. Heretofore the principal ore bodies in the camp have been located on the east side of the dyke crossing the Josie ground. The strike in the Annie ground indicates that values prevailing on the east continue west of the dike mentioned, therefore the ore bodies are much greater than had been supposed up to the present time.

Personal.

HENRY BUTTERS has left San Francisco for London.

CAPT. J. R. DE LAMAR goes from Los Angeles to Redding, Cal.

WM. ARMSTRONG is now superintendent Mulatos mine, Mexico.

J. H. DURST of Plymouth, Cal., has returned there from San Francisco.

J. WING has resigned as Supt. Gray-Wing drift mine, near Folsom, Cal.

J. W. ABBOTT, of Lake City, Colo , has left California for Phœnix, Arizona.

F. MOREHOUSE has been appointed manager Beaver C. & G. M. Co., Milford, Utah.

GEORGE E. LANE, Supt. Horn Silver tunnel, at Frisco, Utah, is at Duluth, Mich.

W. R. SHILLING, Supt. American Girl mine, San Diego county, Cal., is in Los Angeles, Cal.

J. WILDS, late Supt. Mountain Maid mine, near Colfax, Cal., is sojourning at Amador, Cal.

C. H. PEACE, manager Alaska Perseverance mine, at Juneau, Alaska, is in San Francisco.

J. B. LIPPINCOTT of the United States Geological Survey is sojourning in San Francisco, Cal.

T. H. SELBY succeeds J. D. Burgess as manager Calabasas Copper Co., near Tucson, Arizona.

S. F. OWENS of Los Angeles, Cal., was lately in Siskiyou county, Cal., examining a mining proposition.

T. B. LUDLUM, formerly of Dutch Flat, Cal., is in charge of the Keystone placer mine at Telluride, Colo.

S. E. BRETHERTON, of Denver, Colo., is now consulting engineer Val Verde smelter, near Prescott, Arizona.

BERNARD MACDONALD, general manager Le Roi No. 2 mine, Rossland, B. C., has returned from London thereto.

H. L. COWLES of New York, general manager Pacific Con. Co., Reno, Nev., has returned from the mines to New York.

R. ALLISON, manager Puyallup mine, at Hollis, Prince of Wales Island, Alaska, has returned from a trip to New York.

C. E. PRINDLE, Supt. Mokelumne & Campo Seco Canal & M. Co., Calaveras Co., Cal., has returned from San Francisco.

JAMES H. HENLEY, formerly Supt. of the Ibex mine, Leadville, Colo., is now Supt. of the Elkton mine, Cripple Creek, Colo.

W. POLLARD has resigned as foreman South Eureka mine, at Sutter Creek, Cal., to accept a position at Coolgardie, West Australia.

W. H. MERCER, Supt. Mercer tunnel, Globe, Ariz., has gone to Gaffney, S. C., and other Eastern points, to be absent a month.

JOHN F. SUGRUE AND ARTHUR WILSON, two members of the committee selected by the miners at Dawson to protest against the Treadgold concession in the Klondike, have arrived at Ottawa, Canada.

A. S. ADDITON has returned to California from New Mexico and will open an office with the Pacific Tank Co., San Francisco.

A. J. GOODWELL, of Pueblo, Colo., has been offered the managership of the Standard Pyritic Smelting Co., Boundary Falls, B. C.

LEO VON ROSENBERG has gone to Arizona to examine some gold properties in the vicinity of Prescott. He goes thence to New York.

DEW R. OLIVER, president Zubiate M. Co., La Colorada, Sonora, Mexico, is in San Francisco to attend the company's annual meeting.

A. H. GRACEY, managing director Imperial Development Syndicate of B. C., is in California, and will visit Nevada county mines next week.

J. H. PRATT, professor of geology and mineralogy in the University of North Carolina, has been examining mines in Washoe county, Nev.

E. A. CARTER, president, and W. B. Thompson, financial agent of the Shannon Copper Co. of Boston, Mass., are at the mines at Clifton, Ariz.

W. H. LEFFINGWELL, formerly at Cripple Creek, Colo., has charge of railroad engineering in the Southwest, with headquarters at El Paso, Texas.

G. L. HEDGES has resigned as general manager of the Wauconda mine at Wauconda, Wash., on account of ill health. J. B. Rossman is temporarily in charge.

C. SULLIVAN AND W. FUSHER, of Grass Valley, Cal., have been appointed respectively superintendent and foreman of the Gold Hill M. Co., at Boise, Idaho.

F. SAXTON of Bodie, Cal., has been summoned by cable to resume the duties of his former position with the Transvaal M. Co., which employed him before the war.

S. W. TRAYLOR of the Colorado Iron Works Co., Denver, Colo., who recently made a trip to central Nevada, returned on the 17th inst. to that company's New York office.

W. H. GILLARD, late foreman and chemist in charge of the Quartette M. Co.'s plant at Quartette, Nev., is sojourning in San Francisco, Cal., en route to Seattle, Wash.

EMIL SARLIN, M. E., of the Russian Geological Survey of Finland, was in Telluride, Colo., last week, examining American mines and mining methods in the interest of his government.

R. W. MACFARLAND, a mining engineer, with a party of four miners from Ymir, B. C., will sail from Vancouver, B. C., on the 24th inst. for Singapore, Straits Settlement, whence they go north into Siam to prospect little known gold fields in that country.

J. G. HOPPER AND D. A. JONES, civil engineers of Sonora, Cal., will do the surveying of the boundaries of Yosemite National Park—a line of 300 miles. The new survey to be made provides for blazing trees all along the boundary lines and also the placing of copper sign plates at short distances apart.

Commercial Paragraphs.

H. R. AYRES, 342 So. State St., is manager of the Salt Lake City, Utah, branch office Colorado Iron Works Co., Denver, Colo.

THE Stillwell-Bierce & Smith-Vaile Co. of Dayton, Ohio, has an order for a 1000 H. P. outfit of turbine water wheels to be installed in an electrical plant at Santos, Brazil.

THE Paraffine Paint Co. of San Francisco was incorporated this week with a capital of $300,000. Its directors are Robert S. Moore, James S. Manley, Charles E. Green, Richard S. Shainwald and Alexander F. Morrison. The par value of the capital stock is $20 per share.

THE Krogh Manufacturing Co. has established a salesroom and office at 519 Market street, San Francisco. The premises run through to Stevenson street, with a rear entrance opposite the works, Nos. 9 to 17. The Krogh Manufacturing Co. is doing a large business in mining machinery and pumping plants.

JEAN F. WEBB, Denver, Colo., owner and patentee pneumatic cyanide process, has sold a half interest therein to the Colorado Iron Works Co. of Denver, Colo. To handle and exploit this process a new company will be organized, capital stock $500,000. John W. Nesmith, president Colorado Iron Works Co., will be president, and Jean F. Webb, Jr., secretary. It is announced that the new company will erect plants to operate with this process, giving a special guarantee.

A. LESCHEN & SONS ROPE CO., of St. Louis, Mo., write that the contract for the machinery of an aerial wire rope tramway connecting the Ferris-Haggerty group of mines with the Boston-Wyoming smelter at Grand Encampment, Wyo., has been let to them. The tramway to be installed is the Leschen Co.'s patent, which operates automatically in receiving and discharging. They say this will be the longest aerial tramway in the world. Its length is stated to be 16 miles. There are several tramways of the Leschen Co.'s patent automatic type now in successful operation.

THE George A. Treadwell M. Co., for their Iron Queen mine bave secured a site at Mayer, Ariz., and are preparing to push the construction of a 100-ton oil smelter as fast as possible. Part of the contracts have already been made and the excavation work will be started this week. This oil smelter is along new lines and is expected to radically affect smelter practice. The installation is the largest and most extensive that has been made in that section for some time. The Treadwell Co. will be in the market for supplies extensively, for several miles of pipe, iron, wooden tankage, etc.

THE McKim gasket, manufactured by McCord & Co., Chicago and New York, is an article which seems to combine all the necessary requisites of a good gasket. The gasket is constructed of a special packing encased in soft rolled metal. The ordinary materials used are rubber compound and copper, but the gasket is also made of copper and asbestos, aluminum and asbestos, or any kind of metal or packing which is best for the particular purpose for which the gasket is wanted. It is guaranteed to stand 450 pounds steam pressure and has been tested to 1100 pounds hydraulic pressure. One advantage of the gasket claimed by the manufacturers is that it can be reapplied a great many times, which makes it valuable for manhole and handhole plates for boilers. McCord & Co.'s catalogue, which will be sent on application, has many pages of flattering testimonials.

THE seventh annual convention of the National Association of Manufacturers will be held in Indianapolis, Indiana, April 15th, 16th and 17th. Local arrangements for the convention are being made by a committee of Indianapolis business men under the leadership of D. M. Parry, who has been for many years a member of the executive committee of the Association, and a hospitable welcome to visitors is assured. Members of the Association are manifesting more than usual interest in this year's convention and there is promise of a large attendance from all parts of the country. The National Association of Manufacturers was organized in Cincinnati in 1895, and its annual conventions have been held in Chicago, Philadelphia, New York, Cincinnati, Boston and Detroit.

Latest Market Reports.

SAN FRANCISCO, March 21, 1902.

METALS.

SILVER.—Per oz., Troy: London, 24⅛d (standard ounce, 925 fine); New York, bar silver. 53⅞c, refined (1000 fine); San Francisco, 53⅞c; Mexican dollars, 44½c San Francisco, 43½c New York.

COPPER.—New York: Lake, 1 to 3 casks, $12.50; carload lots, $12.25; Electrolytic, 1 to 3 casks, $12.25; carload lots, $12.50; Casting, 1 to 3 casks, $12.00; carload lots, $12 25. San Francisco: $14.00. Mill copper plates, $17.00; bars, 18@24c. London: £54 per ton.

On the 1st inst. there were 18,948 tons copper in France and England and 6080 tons on the way there. Copper imports into England for the first sixty days of the year totaled 38,605 tons. Liverpool and South Wales imported 11,627 tons copper from the United States in January and February, 1902.

LEAD.—New York, $4.12½; Salt Lake City, $3.60; St. Louis, $4.00; San Francisco $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, $4.75. London, £11 10s per ton.

SPELTER. — New York, $4.35; St. Louis, $4.00; London, £17 12s per ton; San Francisco, ton lots, 5¼c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, $26.50; San Francisco, ton lots, 27c; 1000 lbs., 27½c; 500 lbs., 27¾c; 200 lbs., 27½c; less, 28c; bar tin, ℔ lb, 30c.

PLATINUM.—San Francisco, crude, $17 ℔ oz.; New York, $18 per Troy oz.

QUICKSILVER.—New York, $51.00 large lots; London, £8 15s; San Francisco, local, $47.50 ℔ flask of 76½ lbs.; Export, $45.00

BABBITT METAL.— San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER.—Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 14.20c.

NICKEL.—New York, 50@60c ℔ lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $16.75; gray forge, $17.50; San Francisco, bar, 2.75 ℔ lb .,3c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $31.50; open hearth billets, $32.00; San Francisco, bar, 7c to 12c per lb.

CEMENT.—Germania, $2.65; K. B. & S., $2.65; Hewmoor, $2.50; Trowell, $2.50 per bbl.

LIME.—Santa Cruz, $1.60; Roche Harbor, $1.60 per bbl.

GENERAL SUPPLIES.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.50; Cut, $3.50; 10d to 16d, Wire, $3.55; Cut, $3.55; 8d, Wire, $3.60; Cut, $3.60; 6d and 7d, Wire, $3.70; Cut, $3 70; 4d and 5d, Wire, $3.80; Cut, $3 80; 3d, Wire, $3.95; Cut, $3.95; 2d, Wire, $4.20; Cut, $4.20. Special rates for carload lots.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one toss 15½c. No. 1** 50%, carload lots, 11½c; led, than one ton, 13½c. No. 2, 40%, carloan lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ℔ set; 14 oz., 40s., 9c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $6.50; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.00. Coke, $15 per ton in bulk; $17 in sacks.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 30@31c ℔ lb.; carloads, 28@29c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c ℔ lb.; soda ash, $1.90 ℔ 100 lbs.; hyposulphite of soda, 2½@3o ℔ lb.; blue vitriol, 5½@6½c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2½@ 2½c; California refined, 1½@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.25 @1.50 ℔ 100 lbs.; sks, $1.05; chloride of lime, spot, $2.50@2.60; nitrate of potash, in bbls. 8c: caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, boiled, bbl., 76c; cs., 81c; raw, bbl., 74c; cs., 79c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 66c; cs, 71c; raw, bbl., 64c; cs, 69c. Kerosene —Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bbls, 19c; wooden bbls., 22½c; cs, 25c; Mineral Sperm, cs, 26½c; Deodorized Stove Gasoline, bulk, 15c; do., cs., 21½c; 86° Gasoline, bulk, 20c; do., cs., 26½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14c; do., in cs., 20½c; Lard Oil, No. 1 bbl., 60c: cs., 65c; Neatsfoot Oil, bbl., 67½c; cs., 72½c; No. 1 bbl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6¾c; 1 ton and less than 5 tons, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7¼c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6¾c; do. in kegs, 7¼c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7¼c; less than 500 lbs., 7½c.

WHOLESALE.

ASSAY LITHARGE.—Per lb , 10c.

BISMUTH.—Subnitrate, per lb., $1.60.

CHROMIUM.—(90% and over) per lb., $1.25.

COPPER.—Red oxide, ℔ lb., 60c.

MAGNESIUM.—Per lb., $3.00.

MANGANESE.—(90% and over) ℔ lb., $1.25.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—25c. ℔ gramme; 1000 grammes=2¼ lbs.

PHOSPHORUS. — (American) ℔ lb., 80c.

SILVER.—Chloride, ℔ oz., 75c.

SODIUM.—Metal, ℔ lb., $1.00

URANIUM.—Oxide, ℔ lb., $3.50.

ZINC.—Metallic, chemically pure, ℔ lb., 50c.

ZINC.—Dust, ℔ lb., .07c.

ZINC.—Sulphate, ℔ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco.)

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING MARCH 11, 1902.

695 263.—SASH FASTENER—W. R. Abrams, Portland, Or.
695,135.—SAW SET—Baggs & Cummin, San Jose, Cal.
695,136.—WATER HEATER—M. A. Baker, Stockton, Cal.
695,269.—SEWING MACHINE—F. O. Berg, Spokane, Wash
694,939.—CAISSON—C. Blagburn, S. F.
695,034.—BOILER CLEANER—J. H. Connolly, Clifton, Ariz
695,096.—BROILER—J. P. Falvre, S. F.
695,382.—HEATING ORCHARDS—C. Froude, Riverside, Cal.
695,383.—MAGNETIC TRACTION—S. A. Gibbs, Tacoma, Wash.
695,206.—ELECTRIC REHEATER—G. Grieschc, Berkeley, Cal.
695,047.—NUT WRENCH—W. F. Hamilton, Ventura, Cal.
695,306.—LAMP HANGER—H. J. Harrison, Juneau, Alaska.
694,971.—RECTAL INSTRUMENT—S. L. Kistler, Los Angeles, Cal.
695,157.—BRONZING MACHINE—G. Klaiber, Los Angeles, Cal.
695,063.—MOP BEAD—J. C. Look, Tudor, Cal.
695,064.—CONCENTRATGR—L. Look, Los Angeles, Cal.
695 162.—CARPET CLEANER—A. Lotz, S. F.
695,329.—CHUTE—W. L MCCABE, Tacoma, Wash.
695,167.—MEASURE STERILIZER—J. C. F. McGriff, S. F.
695,169.—CASING SPEAR—E. Nortb, Los Angeles, Cal.
695.076.—GRAVEL CRUSHER—C. H. Obm, Shellvil e, Cal.
694,984.—NEEDLE THREADER—A Olson, San Diego, Cal
695,343.—ROUTING MACHINE—W. S. Richsrds, Albany, Or.
695.416.—RGLL PAPER PRINTING—B. Ring, S. F.
695,085.—SLUICE BOX—L. B. Tanner, Seattle, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BROILER.—No. 695,096. March 11, 1902. J. P. Falvre, San Francisco, Cal. This invention relates to improvements in hrolling devices. It includes two grid members hinged at one side having the hinges so disposed that these members may be separated to a greater or less distance as they are folded upon themselves, to handle support in which members are turnable and a latch within the handle extending lengthwise and elidable eidewise, so that its inner end engagee and locks the parts together to allow articles of any varying thickness to be held within the broiler.

ELECTRIC STEAM RE-HEATER.—No. 695,206. March 11, 1902. G. Grieschc, Berkeley, Cal. This invention relates to a means for superheating eteam after it has been deflected. It consists in the application of electrical resistance plates. and means for suspending them within tbe space included in the walls of the engine casing. Wires lead from the plates outwardly through tbe engine casing to a source of electric energy whereby the resistance plates may be heated. and the steam passing over them dried and super-heated.

LIQUID MEASURE AND STERILIZER.—No 695,167. March 11, 1902. J. C. F. McGriff, San Jose, Cal. This invention is designed for the purpose of measuring and sterllizing liquids at a single operation. It consists of compartments formed in a single structure whereby different quantities of liquid may be measured in tbe different compartments, and discharge passages so that the liquid from either compartment may he p ured through a common discharge, and in conjunctlon with this a means for sterilizing the milk or other liquid by forming the double walls of the compartment so that boiling water may be introduced into the spaces surrounding the milk-containing compartments.

Annual Meeting.

The Regular Annual Meeting of the Stockholders of the SPANISH CONS. QUARTZ MINING COMPANY will be held at the office of the Company, 113-114 Crocker Building, San Francisco, California, on TUESDAY, the 6th day of April, 1902, at the hour of 3 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the Meeting.

Transfer Books will close on SATURDAY, March 29, 1902, at 12 o'clock noon.

B. N. SHOECRAFT, Secretary.

Office—113-114 Crocker Building, San Francisco, California.

SITUATIONS WANTED.

A YOUNG MINING ENGINEER desires position with reliable mining or milling company as assayer, chemist, or surveyor and engineer Technical graduate; practical miner before graduation, mill and smelter work since; cyanide preferred. Can handle men. Prepared to develop small properties Good references. Address "A," Look Box 772, Florence, Colorado.

YOUNG MAN 22 YEARS OLD, JUST COMpleted four years' University course in mathematics, wants situation as helper in surveying party in the field, to earn money to take a course in mining engineering. Best references. Address "Willing to Work," care of this office.

WANTED.—Position as Superintendent or Foreman of an amalgamation and concentration mill. Have had eighteen years' experience. At present time engaged as foreman with one of the largest companies in Colorado. Best of references furnished. Address "Millman," care of this office.

AN ALL-ROUND PRACTICAL MINER, TIMberman and Tool Sharpener wants position as Foreman; also good Surveyor. Twenty-two years' experience. Successful in handling men. Regular habits. Can earn my pay. Address L. A. P., this office.

MINING ENGINEER, practical miner and mill man, assayer, etc., desires position of superintendent or assistant manager of a big property. Eleven years' experience. Best references. Now working in southern California. Address A. M. P., care of Mining and Scientific Press.

WANTED.—Position as superintendent of quartz mine. Worked as miner, engineer, mill man and superintendent. Superintendent at present Would engage for foreign service. References given. Address Economy, this office.

WANTED.—POSITION AS MILL SUPERINtendent or Foreman. Understand concentration, amalgamation, cyaniding and assaying. Seventeen years' experience. Address "Mill Foreman," care of Mining and Scientific Press.

WANTED.—POSITION AS ASSAYER, SURveyor, or Assistant Superintendent by technical graduate; three years' experience in mines of California and Colorado. Address I. E. D., care of Mining and Scientific Press office.

WANTED.—SITUATION AFTER MARCH 15, 1902, as Manager or Superintendent of mine. Have had five years' experience in manufacturing and constructing mining machinery and plants. Three years' experience in underground work. Four years' experience as manager and superintendent. Treatment of low grade ores a specialty. Practical in every detail. State location of mine and salary Best of references. Address X. Y. Z., this office.

OPEN FOR ENGAGEMENT, A MINING AND Metallurgical Engineer. Eleven years' experience as Consulting Engineer and Manager. Graduated from the best technical schools in Europe Specialty: examination and management of gold and silver properties. Location must be in California, Arizona or Nevada. Salary $5000 per year. Address C. A., care Mining and Scientific Press.

Annual Meeting.

The Regular Annual Meeting of the Stockholders of the CONS. ST. GOTHARD GOLD MINING COMPANY will he held at the office of the Company, 113-114 Crocker Building, San Francisco, California, on WEDNESDAY, the 9th day of April, 1902, at the hour of 2 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the Meeting.

Transfer Books will close on SATURDAY, March 29, 1902, at 12 o'clock noon.

B. N. SHOECRAFT, Secretary.

Office—113-114 Crocker Building, San Francisco, California.

Annual Meeting.

The Regular Annual Meeting of the Stockholders of the CHAMPION MINING COMPANY will be held at the office of the Company, 113-114 Crocker Building, San Francisco, California, on TUESDAY, the 6th day of April, 1902, at the hour of 2 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the Meeting.

Transfer Books will close on SATURDAY, March 29, 1902, at 12 o'clock noon.

B. N. SHOECRAFT, Secretary

Office—113-114 Crocker Building, San Francisco, California.

DELINQUENT SALE NOTICE.

CONSOLIDATED ST. GOTHARD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 20) levied on the 1st day of February, 1902, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
Block, Samuel	350	500	$25 00
Bauer, Teresa	518	200	10 00
Koch, C. A	116	100	5 00
Koch, G. A	138	11	55
Koch, August	139	11	55
Koch, August	329	100	5 00
Raahe, Geo. A	354	200	10 00

And in accordance with law, and an order of the Board of Directors, made on the 1st day of February, 1902, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Rooms 113 and 114, Crocker Building, San Francisco, California, on MONDAY, the 24th day of March, 1902, at the hour of 2 o'clock P. M. of said day, to pay delinquent assessment thereon, together with cost of advertising and expense of sale.

B. N. SHOECRAFT, Secretary.

Office—Rooms 113 and 114, Crocker Building, San Francisco California.

DEWEY, STRONG & CO.,

Patent Agents, S. F.,, Cal., and Washington, D. C.

WANTED.

CAPITAL WANTED.—I am in a position to secure a valuable quartz proposition (gold). Can get a good working bond on esme. Will give best of reference as to character and ability. W. B. GRANT, Tuttletown, Tuolumne Co., Cal.

WANTED.—Five or Ten Stamp Mill in Good Condition.

LANDERS' SONS, 275 Madison St., CHICAGO.

STAMP MILL WANTED,

either ten or twenty stamps, second band, as near Amador County, California, as possible. Must be in good condition, and low as to price—advertiser has himself built mills and then tried to sell. so don't quote fancy figures Water-power mill preferred; steam no objection, however. Give full details, price, location, condition. Concentrators acceptable if with plant. Will also buy small boiler and any good second band mine equipment. Address E. N. DARLING, 9 Pine St., New York.

ASSESSMENT NOTICES.

TANANA MINING COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 4th day of March, 1902, an assessment (No. 5) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 405 Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of April, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 29th day of April, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.

Office—405 Claus Spreckels Building, San Francisco, California.

LARKIN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of March, 1902, an assessment (No. 12) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 112 Main street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of April, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 5th day of May, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

N. F. REMINGTON, Secretary.

Office—112 Main street, San Francisco, California.

MARINA MARICANO GOLD MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of March, 1902, an assessment (No. 29) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day April, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 12th day of May, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. BOYSEN, Secretary.

Office—217 Sacramento street, San Francisco, California

LITTLE STANDARD OIL COMPANY.—Location of principal place of business San Francisco, California; location of works, McKittrick District, Kern County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 4th day of March, 1902, an assessment (No. 3) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 40, Chronicle Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of April, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 12th day of May, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors

R. L. CHENEY, Secretary.

Office—Room 40, Chronicle Building, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 25th day of February, 1902, an assessment (No. 34) of one-half (½) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 31st day of March, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of April, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, 214 Pine street, San Francisco, California.

YUBA CONSOLIDATED GOLD MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 19th day of February, 1902, an assessment (No. 6) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Rooms 58-59, 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of March, 1902, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 14th day of April, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JAMES B. BROOKS, Secretary.

Office—Rooms 58-59, 214 Pine street, San Francisco, California.

DELINQUENT SALE NOTICE.

SILVER KING MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Pioneer Mining District, Pinal County, Arizona Territory.

Notice.—There are delinquent upon the following described stock on account of assessment (No. 23) levied on the 31st day of January, 1902, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
F. Avery, Trustee	7393	1000	$250 00
F. Avery, Trustee	7415	400	100 00
F. Avery, Trustee	7416	300	75 00
Michael Levy	7353	100	25 00
Nat. Stein, Trustee	7243	50	12 50
Nat. Stein, Trustee	7247	50	12 50
John Turnbull, Trustee	6754	100	25 00
New York Issue.			
Wm. Hyndman	89	100	25 00
R. H. Merrick	188	100	25 00
Michael Levy	1015	100	25 00

And in accordance with law, and an order of the Board of Directors, made on the 31st day of January, 1902, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, No. 310 Pine street, Room 36, San Francisco, California, on TUESDAY, the 8th day of April, 1902, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. W. PEW, Secretary.

Office—310 Pine street, Room 36, San Francisco, California.

DELINQUENT SALE NOTICE.

WILLIETTA MINING AND MILLING COMpany.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the 20th day of January, 1902 the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
Nolden, William	104	1 000	$10 00
Nolden, William	107	1,000	10 00
Nolden, William	108	1,000	10 00

Freak Mining Locations

Some big head-line type in a late paper announces "Thunder's 7000 Locations," and the text that follows says, on the authority of a pioneer prospector of the district who has just mushed out over the snow, that "almost every foot of ground for a radius of 7 miles in every direction from Thunder mountain," which is, by the way, at the top of the most inaccessible unexplored part of Idaho, has been staked out into mining claim "locations." The prospector is credited with the additional statements that everybody in the district is making locations, doing on nearly all of the claims the work required by law to make the locations valid, and that there is no claim jumping. All of this is quite enthusiastic, and probably the prospector believes all that he says is true. Is it?

Thunder Mountain district has been known for several years as gold bearing, but did not become prominent in repute for extraordinary richness and extent until late last fall just as the winter snows commenced to pile up. Up to that time, aside from the close neighborhood of the original discovery, practically no locations had been made, and there were few people in the district. The consensus of all statements as to the prospectors in the district, through the five or six months of winter, would not make the number average fifty for the entire period. This would require to make the total of 7000 valid locations that each of the fifty prospectors should make each day a valid location and sink a shaft on it 10 feet deep. The mere statement of such a proposition is its refutation as an absurdity. Under the climatic and physical conditions not a tenth part of it is reasonably possible, and not more than a twentieth part of it is probable.

Such wild, careless statements are not new with the Thunder Mountain discoveries. It is but a few years since the Buffalo Hump discoveries in the same section of Idaho were the subject of similar tales. When, in the spring following the winter of the first rush in of prospectors, the clean-up of claims was made, some freaks in locations were found that Thunder mountain is very likely to reproduce this spring. As in Thunder Mountain district, the winter snow in the Buffalo Hump country was deep—18 feet or so where the mines were. In making locations, trees projecting above the snow were blazed and marked as location and corner monuments. If the tree was not too big the top was cut off and the stump was squared down into a corner post. It happened that a locator did this in locating a claim late in the winter on top of 18 feet of snow. It is even reported that he sold it immediately for cash, the buyer going out to organize his company. He had a valid location sure, for he had himself seen the claim and the properly marked monuments on it. Later in the spring, when the snow had melted down to 10 feet or so of depth, the same location tree was seen to have another blazing, marking and discovery location notice at the 10-foot snow level, antedating, by several months, the location notice described as posted on the tree 18 feet above the surface. The original locator under this notice naturally took possession of his own location, and to save trouble topped off the tree just above his notice. It is related that he made a cash sale before the snow disappeared down to the ground, the purchaser going out of the district with the deed in his pocket to buy a stamp mill. In his absence the snow all melted and on the same tree-stump, about 4 feet above the ground, was disclosed a marking and notice of location made in the preceding fall, clearly the original location of the ground. The locator who made this original claim then appearing, resented the attempt to jump his claim, and to save further trouble topped the tree stump off about 5 feet from the ground and sold his location to a company.

It was quite a misfortune that the tree, with its three location notices, was not preserved as a freak. At the time, however, the attempted claim jumping was taken seriously, so nothing was preserved but the story, which is true, even if it has not had the publicity of print before this.

It is, of course, highly improbable that such a triple-decking of mining locations should occur at Thunder mountain, but the spring clean-up may disclose quite a little double-decking of locations made during the winter. This possibility adds a touch of humor to the vigilante notice of the old resident locators directed to the new comers, advising them for their health's sake not to make locations in Thunder Mountain district.

Whether or not the hundreds, or, it may be, thousands, of new comers will take the notice seriously is yet to develop. It is not likely that they will. The premium on sales next to the original discovery is too much of an inducement for the opportunity to be overlooked as long as the snow that remains can be banked around location trees.

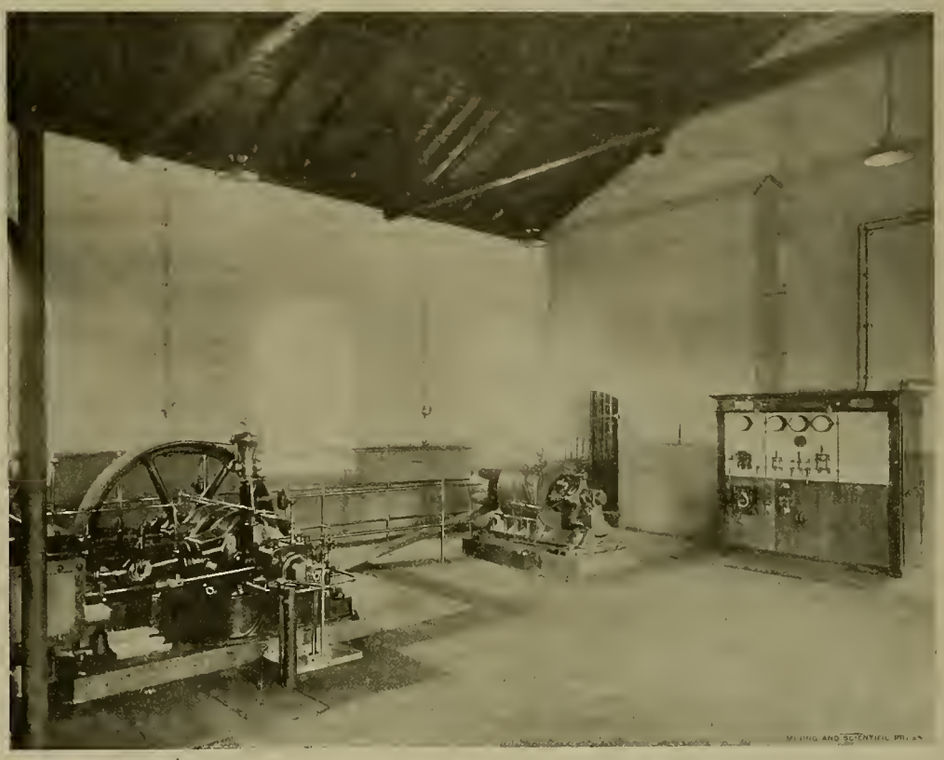

Fig. 1.—Power Plant, Thiederhall Mine, Braunschweig, Germany.—(See Page 176.)

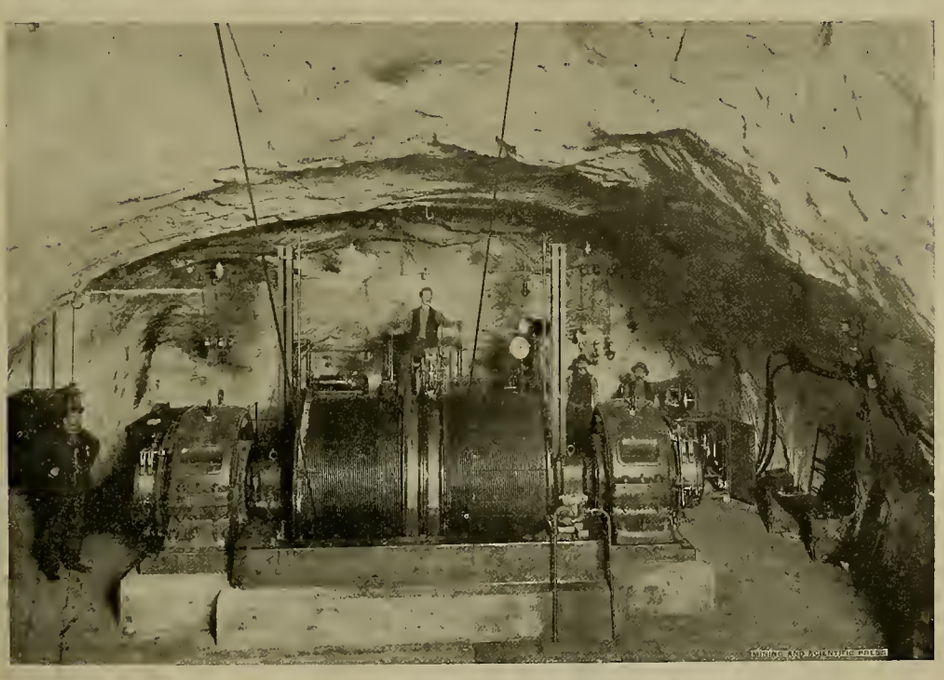

Fig. 2.—Electric Double Drum Hoist, Thiederhall Mine, Braunschweig, Germany.—(See Page 176.)

ELECTRICAL ENGINEERING is unique in the fact that while all other branches of science and engineering have had thousands of years of activity, there was nothing in ancient discoveries or inventions that led up to it. It is a product of the last fifty years.

THE sub-committee of the Senate framing the United States mining statutes for the Philippine Islands has reported back a code under which lode locations will have no extralateral rights. A square form of location is provided for lode claims, the maximum dimensions heing 1000 feet square. It is suggested that as the metric system of measures is in use in the Philippines already that the 1000 feet he changed to 300 meters. The twenty-acre placer claims could he made ten hectares. This last would be nearly twenty-five acres. An excellent provision of the proposed law is the one limiting one person to one location on the same lode. The assessment work and patent work provisions are the same as in the United States.

THE attitude of this journal is constantly more creative than critical. It is so easy to criticise. The critic is horn ready made. Any other art or trade has to he learned. While a man, a method or a process is always the just suhject of comment, yet, ohviously, the critic is expected to do something more than merely criticise; he is naturally expected to proffer something hetter than which he condemns. This journal prefers to create and chronicle successes, and occasionally failures, which, rightly regarded, are hut stepping stones to success. Through the years it has created thousands of millions of dollars in values of mineral development, has created many splendid husiness successes in mining and metallurgy, such material creative aid heing in its line of work and field of usefulness.

THE District Court in Idaho, in a recent case arising over timher cutting on puhlic lands for mining purposes, gave instructions to the jury which defined mineral lands as a mineral vicinity where a prospector could go with a reasonahle hope of finding a mine. The decision has heen appealed in order to have the ruling of the appeal court on this definition. The question is not a new one. The definition is novel, however, as decisions in other cases which have made a definition of mineral lands, have as a rule defined them adverse to the interests of prospectors and the mining industry. This has notahly heen the case where railroad land grants were involved. A common definition has limited mineral lands to such tracts as were capahle of immediate commercial exploitation. The mines had to be known to be payahle to make the lands in which they existed mineral lands. Under this narrow, hard construction hundreds of thousands of acres of land have heen declared agricultural, patented and removed from the puhlic prospecting area by the land grant railroads, which the definition made in the Idaho case would have classified as mineral lands. A still narrower definition was that made in rulings of the Interior Department requiring that land to he classified as mineral land must he worth more, that is more payahle, for mining than for any other purpose. The decisions of the courts are superior to the rulings of the Interior Department. It connot be held that a definition of what constitutes mineral lands, with mine timher cutting the issue, can he any different from the definition with mining in the land the issue. If the Idaho District Court definition is sustained by the decisions of the higher courts, the segregation of mineral lands from railroad land grants hecomes a simpler matter and will throw open to prospecting indefinitely, much greater areas than would he the case under the other definitions.

IT is reported that the New Caledonia and Sudhury nickel mines have heen consolidated into one ownership. This makes a practical monopoly of the supply, and as the president of the United States Steel Co. is reported to he the organizer of the consolidation, it prohahly anticipates ultimate absorption hy that company. It may he assumed that the sale price of the metal will he kept where it is if not increased. The owners of nickel claims should find in this situation much encouragement to the development of their properties. It is quite probahle that under the stimulus of necessity invention will supply a cheap process of nickel ore reduction which can he installed at the mines. The successful commercial production of steel in the electrical furnace is suggestive of the direction of investigation. Much of the existing difficulty of exploitation of nickel mines has come from the large capital required to commercially reduce the ores and the fact that while there are many huyers for nickel there are very few for nickel ores.

THERE are two solutions of differences that may arise over the question of the apex, that have heen successfully applied hy mine owners interested. Some months since two large Arizona copper companies eliminated the possibility of future differences over the apex of ore veins hy making deeds, each to the other, which estahlished forever the houndaries between them as heing the vertical planes of the common surface houndary lines. The companies hoth dispossessed themselves of extralateral rights as hetween themselves. The other solution has heen by the consolidation of the ownership of the mines over which questions of the apex invite litigation. The instances in which the conflicting interests have litigated the issue to a finish hefore consolidating are more conspicuous than those in which the consolidation has heen made to avoid the litigation. Lately a disposition is developing to take the latter course. Both solutions of these possihle apex differences are to be commended. The avoidance of litigation in the operation of a mine is an economy that outweighs almost always the possible profit of successful litigation. Particularly is this the case with questions of the apex. There is hardly a known instance where the successful litigant over this question escaped serious money loss, indirect if not direct.

THE directors of the Osceola Copper M. Co. of Michigan state in their report to the stockholders of the company that the general cost of producing copper has increased nearly 2 cents a pound in the last two years, owing to the higher prices of lahor, machinery and all kinds of supplies. The statement is exceedingly interesting to copper miners, hut it is douhtful, at least, if the broad generalization should he accepted. It is assumed that the comparison is made with the ore yielding the same amount of copper, though the amount is less per ton of ore now than several years since. The ore at present being reduced yields ahout twenty-five pounds of copper to the ton. With this small quantity paying all the costs, it is apparent that a small increase in the wages of miners and a small advance in the cost of supplies could add 40 to 50 cents to the cost of mining and milling a ton of ore, which would increase the pound cost of copper produced at this mine. But if the copper product per ton of ore were 100 pounds, which is not uncommon in the Western mines, an advance of 50 cents a ton in the cost of mining would only add half a cent to the pound cost of copper. It must also he taken into account that wages of miners have not increased in Western mining districts as they have in the Lake Superior region. Wages in this region have heen and are still, with the advances made, less than in the West. It would appear, then, that while the cost per pound of copper produced has heen increased in the Lake Superior region as a result of increased wages and prices of mine supplies, there has heen no corresponding increase in the pound cost of copper produced hy Western mines from these causes. The net effect on the copper mining industry of increased pound cost of production in the Lake Superior region, coupled with lower pound sale prices, will he but to reduce the aggregate of Lake Superior copper production and increase the aggregate of production from the Western copper mines.

IT is just as important to save hrain lahor as it is hand labor. The former has very successfully applied itself to saving and economizing in the latter. It should not overlook the importance of lahor saving devices in its own processes. The value of standardization of machines and tools, the specializing of them to satisfy particular services without departing from the standards, is well understood. The reason of it is equally applicahle to the consideration of mental processes. There is so much to learn, and so much of learning that must be retained and used, that its simplification hy standardization of forms of records is hecoming of vital importance. The adoption of a standard form of commercial assay return certificate has heen suggested by this journal as heing one of the things that could he done to lessen the waste of hrain labor. The standardization of the form of keeping the accounts of mining operations would he another step toward simplifying the hrain work of mining engineers and mine managers. It should not he necessary for the latter to learn a new system for each new mine, or for the former to he familiar with all possible systems. The mine accounts kept hy a standard system would not require auditing to make them comparahle and intelligihle. A standardization of the scales of mine map drawing is a small matter, yet if there were such uniformly applied rules, the eye would soon unconsciously make the direct comparisons that without such uniformity now require the conscious, lahorious effort of the mine manager to make indirect comparisons. There is a suggestion in the proceeding for the consideration of the great engineering associations. Their adoption of standard forms would rapidly make them common and ultimately exclusive in application. There are always special interests that oppose changes. The general interest is, however, so superior that it should he controlling in this matter.

ONE of the provisions of the Treadgold concession to the Klondike placer mining territory created a monopoly of the water supply for mining. Treadgold and his associates are to bring in to the mines a stated water supply, one-half of which they may have to provide for the working of their own claims and the other half they are to sell to other mine owners at 25 cents per miners' inch per hour. This price is out of all reason for the service. For ten-hour water service it means $2.50 an inch. A ten-hour inch of water in sluicing will not wash much if anything in excess of 1½ cuhic yards, making the water charge to the yard of pay dirt from $1.50 to $1.75. Even fairly rich drifting ground will not stand such a cost charge for water to wash up the dumps, and it is absolutely prohihitive of hydraulic mining when overhurden has to he washed off to get down to the pay. The effect of the high charge permitted will he to cause the ahandonment of all hut the richest claims, the ahandoned claims hecoming at once the property of Treadgold and his associates. In early mining days of California $1 for the ten-hour inch of water was paid in a few instances to work rich gulch diggings. Later, when hydraulic mining was started, prices for the ten-hour inch ranged from 5 cents to 15 cents. There is nothing so different in Klondike conditions from those of placer mining elsewhere to justify such extraordinary charges as are fixed hy the Treadgold concession. Ditch and flume construction is not excessively costly there nor is the water season any shorter than in other districts. It is quite interesting to note that as reported the Treadgold concession does not directly mention the quartz mining which is just heginning. The 25-cent price per hour inch of water means, however, that hattery water for amalgamation will amount to $2.50 per ton of ore crushed. It would seem that the Treadgold concession has quite a good sized water bug in it.

Concentrates.

"MUSHET" steel contains 9% of tungsten.

SPIEGELEISEN is pig iron containing between 20% to 30% of manganese.

THE quicksilver production of the Almaden mines in 1900 was 30,612 flasks.

OCTAGONAL drill steel, ⅞-inch diameter, weighs 2.62 pounds to the linear foot of bar.

THE Kennedy, Amador county, is the deepest California mine shaft—2550 feet vertical.

WORK done in prospecting for placer gold on a quartz claim is assessment work for the latter.

A CUBIC INCH of water evaporated at atmospheric pressure will make a cubic foot of steam.

A PLACER CLAIM may embrace twenty acres, and eight persons can jointly locate 160 acres placer ground.

THE development of a mine is exploration. The stoping and working of a mine after it is developed is exploitation.

IF the shanks to machine drills crystallize and break, heat the shank to low red heat and cover from the air in ashes or dry sand to anneal.

THERE is danger in grasping the conductors of two alternate currents with the hands while in a dry condition whenever the difference between the intensity of the two conductors exceeds 100 volts.

UNDER U. S. Rev. Statutes, Sec. 2320, a vein or lode in a mining claim must be found in the discovery shaft, and it is not sufficient that a discovery be made on some other vein within the limits of the claim.

WITH 130 feet fall 450 cubic feet of water per minute would give, with a good water wheel, a practical efficiency of about 85 H. P. A 24-inch pipe would carry the water 1200 feet with a head loss of about 2%.

ANY citizen of the United States who may locate a claim on land in the State of Nevada, for which the State has given an agricultural patent, may hold the same providing he discovers valuable mineral thereon.

THE capacity of air for carrying moisture depends upon its volume and temperature and not upon its pressure. Air compressed to 1000 pounds pressure will contain about the same amount of moisture as the same air at atmospheric pressure.

MEANDERING a stream by an official surveyor consists in running a line on both sides which defines the channel. When not meandered by a Government surveyor, a mining claim may be located along or across its bed and patent secured in the usual way.

THE validity of land patents can only be tested by direct proceedings brought in behalf of the United States, for the reason that the Federal Government is most directly interested in seeing that the patents issued by its sanction are supported against all comers.

THE reopening of the Great Falls, Mont., smelter, is because the Great Northern railroad will change from Great Falls to the Canadian line from narrow to broad gauge, when the smelter will bid for Canadian ores. It will be rebuilt and water power substituted for steam.

A CUBIC FOOT of water heated to a temperature corresponding to sixty pounds pressure has as much explosive energy as a pound of gunpowder. It has been said that water could be boiled in a paper bag without burning the bag, but "Concentrates" has never seen it tried.

A MINING claim located in 1900, on which no assessment work was done in 1901, is again locatable in 1902 The original locator can make the relocation unless some local, district or State law prohibits it. The original locator can be a witness to a location made by some one else.

WHEN sharpening and tempering drills, leave the sets on the forge until all are finished, then heat the bits cherry red, but not the body of the steel; dip in clean water, moving slowly down, then out, leaving heat enough in the body of the drills to toughen the bits by starting temper to show color. Check color by cooling in slack tub.

ON driving pulleys of 4-inch diameter or less, a belt should be a scant ⅛-inch thick; on pulleys from 4½-inch to 8-inch diameter, the belt should be $\frac{5}{32}$ inch thick; 8½-inch to 12-inch diameter, $\frac{3}{16}$ inch thick; 12½ to 18 inches diameter, ¼-inch thick. Belts running at speeds over 4000 feet per minute should be made of single, pliable, tough, thin leather.

AS MOST of our readers know, these "concentrates" are mostly condensed technical answers to a multitude of questions weekly received from all parts of the country, the idea being to omit the question itself for the sake of space and give as correct an answer as possible, the answer being ofttimes of value to many others who want the same information as the questioner.

IN a case arising over the occupancy of land by poles and wires of an electric power line the Placer Co., Cal., Superior Court ruled that where one grants to another an oral license to enter upon his premises to establish a right of way, and that other party relies upon it, enters and makes expenditures upon the faith of it, that then the owner of the premises is estopped to revoke the license.

A LOCATION of a lode mining claim lawfully made, the center line following the known or presumed course of the apex of a lode, will hold all ledges apexing within the side and end lines together with the extralateral rights to all of them. Cross ledges will have for their end lines the side lines of the location, and their extralateral rights will thus come within a different set of planes from the planes determining the lode on which the location is made.

A LITTLE less than eleven pounds of steam and a little more than one pound of coal to the horse power appear to be the ultimate limits of steam engine economy. Gas engines using producer gas regularly yield 1 H. P. to about seven-eighths of a pound of coal. In each statement the terms are indicated horse power. The mechanical efficiency of the gas engine is now about the same as that of the compound, triple-expansion steam engine.

HEATING for forging is, in its way, quite as important as heating for hardening; care and uniformity in the application of heat in the first instance is very essential. should the steel be overheated in this operation no care afterward in hardening or tempering will remedy the evil. The blast should be watched to see that thin or exposed edges of metal do not get too much fire. In tools carrying a cutting edge, finishing cold and hammer hardening is beneficial.

THE description of screens by the number of mesh to the linear inch may be confusing unless the diameter of the openings and the kind of wire are kept clearly in mind. A mill may be crushing to 30 mesh through 30-mesh screens, No. 28 steel wire, the opening being .0171 inch, whereas a 30-mesh brass wire screen, No. 27 wire, would have openings or mesh .01458 inch, or about 15% finer. The 35-mesh, No. 27 steel wire, is about equal to a 30-mesh No. 27 wire brass screen as regards size of opening.

IN an Oregon case, Gohres vs. Illinois & J. G. M. Co., the court ruled that where a mining location was greatly in excess of the statutory limit, and the locator procured another to locate a certain part of the original tract in his own name for the purpose of making a conveyance, such action was a declaration as to where the excess in the original location lay, so that, the location of it being discovered to be void, a subsequent locator was entitled to claim that identical portion of the original location as the excess.

NATURAL DRAFT depends upon the difference in temperature between the gases inside and outside the chimney, and is greater accordingly as the smoke and gas from the furnace pass out in a more highly heated state. By use of a fan or centrifugal blower the combustion can be made more perfect, owing to a nicety of regulation of the air supply, enabling the gases to reach their maximum temperature, there being a recorded saving of 15% in some cases where fuel was expensive and the feed-water low in temperature.

A GROUP of claims is simply a working unit. Where assessment work is done on one claim of a group, or on one claim for several under the same ownership, the record of the assessment work should designate the names of the claims for which the work is done. A good way to describe them is to make a reference to the book and page of the record of the location notice. There is no legal requirement of recording several claims as a group, and it is not desirable to do it except in making record of the assessment work.

IT has been established that compressed laminated zinc made in the form of thick plates for application as an inside boiler lining is greatly superior to the old method employing pigs of raw zinc. The application of the laminated plates is made to the walls of the boilers by means of fastening strips, and are so distributed when possible that the galvanic action developed is distributed evenly over the entire surface of the iron. When oxidization is produced in any part of the boiler it is because the nearest zinc plate is too far away.

A ROUGH REFINING of crude gold bullion can be made by first melting it and pouring the melted metal into cold water, which granulates it. The granulated metal is then boiled with sulphuric acid, which dissolves out silver and copper and leaves the gold in the form of a black powder, which can be collected on a filter and melted into a bar. The silver can be obtained from the solution by precipitating it with copper. It is collected as a powder, melted and run into a bar. The copper can be recovered from the solution by precipitating with scrap iron.

A SINGLE piece of ore represents nothing but itself, and an assay made from it tells nothing except as to that single specimen. A true sample must be composed of some of each part of the original mass and in proportion which that part was of the original. It must be identical with the original on a smaller scale. In applying this to sampling ore, it must all be brought to a size, the smaller the better, thoroughly mixed and then quartered (‡) down repeatedly until the final sample is as small as is convenient to carry away. If ore is worth sampling at all it is worth sampling well, and nothing but an average sample is of any value to any one.

SOME importations into the United States of cyanide of potassium have been at different times tested for their content of sodium cyanide. Of eighty samples of commercial potassium cyanide examined, twenty-four contained no sodium cyanide, while the remaining fifty-six contained from 10% to 54% of the sodium salt, with an average in the neighborhood of 23%. It is apparent that some of the cyanide treatment of ores has been carried on not with potassium cyanide, but with a mixture of solution of potassium and sodium cyanides. A simple qualitative test for the presence of sodium cyanide in commercial cyanide of potassium is the color of the flame. A comparatively small quantity of sodium will give the characteristic yellow color to the flame, which if potassium alone were present would be blue.

FOR tempering tools heat slowly and uniformly in a charcoal or coal fire or in a furnace, so that the steel gets the same temperature throughout. If possible dip on a rising heat; that is, do not take a chisel, for example, from the hearth and wait until it becomes a little colder, but take it out of the fire at the required heat and dip at once, always remembering that the lower heat at which a steel will satisfactorily harden gives the best result both in hardness and toughness, therefore do not exceed a low red. Plain water, if clean and in good quantity, will generally harden sufficiently; if not, brine may be used.

BY a recent amendment to the corporation law of New Jersey the stock book and transfer book of every corporation organized under the laws of New Jersey are required to be kept in the regular office of the company in charge of their agent within the State. In the annual report, it is compulsory upon the officers making it to state under oath that the stock and transfer books of the company have been continually at their office within the State of New Jersey. The penalty fer a failure to make the report is a fine of $200. The law imposes a further penalty for this omission, in that it disqualifies all the then directors from holding office for the ensuing year.

THE required percentage of lead in the ore designed for a blast furnace charge is reckoned on the whole charge, ore, matte, resmelting slag and flux. With little or no zinc, arsenic or antimony, and small percentage of sulphur, there should be at least 7% lead in the charge. With silver present 10% lead would obviate considerable loss of silver. Where there is much zinc, arsenic or antimony 12% to 14% lead by dry assay is requisite. From 12% to 15% is an ordinary lead percentage for such a blast furnace charge. Usually the lower the lead contents, the higher, proportionately, the lead losses in smelting. Ordinarily, lead losses range from 6% to 12%.

SULPHIDE ORES can not, as a rule, be reduced directly by carbon, but must undergo a preliminary roasting operation to remove the sulphur, all traces of which are eliminated with difficulty. Pyrite, tetrahedrite, galena, stibnite and sulphide of magnesium are readily reduced by calcium carbide, the stable monosulphide of calcium remaining in the crucible, the metals of the ore being liberated, and, in the case of compounds of lead, antimony and magnesium, volatilize, aluminum sulphide alone being capable of resisting the powerful reducing agent. In an extension of the foregoing principle, the metals are recovered directly from the mixed sulphide ores and an efficiency of nearly 90% is obtained. If copper sulphide be fused in the presence of a suitable flux for which a blast furnace slag, melting, at about 1500° C., is found available, and calcium carbide added in theoretical proportions, the reduction occurs readily, the calcium sulphide dissolving in the slag and the copper being recovered as an ingot free from sulphur. If copper pyrites be subjected to the same treatment, it is found that the ingot obtained is composed by two sharply separated layers, of which the lower is copper and the upper iron, saturated with carbon. For ores containing zinc or other metal volatile at the temperature used, a closed retort may be employed and the vapors condensed in the usual manner. The reduction of copper pyrites by this method requires an amount of 80% carbide, somewhat exceeding the weight of the ore; for copper sulphide the carbide and ore are used in the ratio of 1 : 2.

IN the reduction of refractory metallic oxides to the metallic state, the method of Goldschmidt, of Essen, Germany, consists in mixing the metallic oxide with powdered or granulated aluminum and igniting the cold mixture in a cold crucible. The heat thus generated is sufficient to melt the reduced metal and even the resulting alumina; the danger of explosion is small. To ignite the mixture, a small hole is scooped in its upper surface, into which is put a mixture of barium peroxide and aluminum powder, relatively easy to ignite. A strip of magnesium ribbon or flash-light paper is stuck into this mixture and lit by a match. The magnesium sets the peroxide mixture off, and this starts the oxide mixture reacting next to it, and the heat thus spreads through the whole mass. In five to ten seconds the entire contents have reacted; the generation of heat is so rapid that the crucible does not become warm outside for some minutes, and it is so intense that it is unbearable to the eye, and is probably between 3500° and 3000° C. In operating on a large scale, a small amount of the powder is first ignited in the crucible, then more is continually added and the reaction kept up until the crucible is full. Then the melted alumina slag is poured off and the melted metal beneath poured out. The method is applicable to reducing to metal almost all metallic oxides, except those of magnesium, the alkaline earths and earths, and has been applied to the more expensive metals which are ordinarily considered as difficult to reduce, such as manganese, chromium, titanium, tungsten, molybdenum, vanadium, uranium and boron.

Looking for Principles Amid the Details.

Written for the MINING AND SCIENTIFIC PRESS by C. H. FITCH.

Some one has said that we can complete nothing in this world, and at most can only make a beginning and bequeath a good example. This fact of human limitation both in span of life and energy for work gives added force, when we think upon it, to a recent editorial in the MINING AND SCIENTIFIC PRESS on the subject of "Doing and Telling." The man who secretes his information is like a refractory element which resists solution. The question with him is what money the idea will bring, and if the adequate fee is not forthcoming the values die with him, as the gold which does not go into solution is carried "down the creek" in the form of tailings. The possession of money is a means to an end, an essential part of the machinery, but the real things are those that make larger men and women with greater resources for power, comfort and happiness. Money is just as necessary as a crank to an engine, but we would consider him a crank rather than an engineer, who should devote his time and talents to making a collection of cranks.

It is the greatest truth that is being "writ large" in the events of our day and generation, that we must combine, and sink the narrow proprietary thread in the broad warp and woof of goods that are "all wool and a yard wide." In the emergency of national defense, some are drafted and some volunteer. The question of the future is not whether or not we shall combine, but whether we shall combine cordially and intelligently and blend our services in the most effective way.

In mining more than in any other field the question, unweakened by levity or shifting purpose, is how to do it, to get value from the rocks. The getting of value is more serious, more "dead earnest" in mining than in other gainful pursuits. It comes closer to the fountain of gain. Unlike agriculture, it holds promise of gain by leaps and bounds, and unlike trade it is not distracted by personal relations. It brings great hopes to a focus in a single absorbing object.

In its possession of a standard of value accepted as absolute it holds the latch of the door which admits or shuts out general wealth, and general stimulus to labor and productive activity. When gold mining gains, everybody pushes forward in the hope of profit, and when gold mining lags this hope of profit is severely clipped or absolutely denied, and business effort falters, sickens, and in some measure dies, as it did when silver was demonetized.

The adventurer in mining, while pursuing his own profit, is in a larger sense keeping up the barometer of general prosperity. I do not care anything about cranks except as necessary to engines, and I care little about the profits of mining except as the means of maintaining the vital activity of all the people on a high plane.

We extol the contribution of mining to general prosperity. It is a game at which adults will play harder and keep healthier than at some other games. It is a game with rules. The rules are laws of nature, mental as well as material. To find them out and play in accordance therewith requires experiment and thought. Experiment is often expensive, and while thought will not take its place, it will go a long way toward it with a knowledge of other men's experiments. It is "up" to the poor man, or to the man wanting to become richer, to do a great deal of thinking. One of your advertisers says that no investment pays better returns for the money than printers' ink. The only exception I would make to this statement is in favor of a good thinking cap. And by that I do not mean one of these black skull caps with square pasteboards glued on to them which are worn by college alumni in processions—these are to conceal the absence of thought.

A very simple, very fruitful thought is this: Great success in mining development depends upon the combination of two elements, principles and details.

It is a matter of difficulty to grasp and hold for use the information necessary for practical success in any line of metallurgy. If we can get a working model of details which another man has proved, and duplicate these details on a similar mine with similar ore, we have a "snap," and in the success which follows we may get the maximum credit with the minimum effort. But, as observed by C. M. Fassett in a paper on ore treatment, every new case is like another blade of ribbon grass; two cannot be found alike. The man who leads his clients on the easy practical road of following details often leads them to financial disaster, and in any case fails of the best application of those details.

I have a large accumulation of articles giving details of cyanide processes, vats and tanks, slats, filters, rates of solution by agitation and percolation, and methods of precipitation, gleaned from the MINING AND SCIENTIFIC PRESS, which has more original matter on these and kindred subjects than any other paper I know, and from other papers, for example the Australian Mining Standard, in which I find many original articles by Watson, Weinburg and others as well as judicious reprints from American papers, so that if I want an extra copy of a good article from the latter, after waiting a little it comes up again like an echo from the Antipodes.

Such an accumulation is rich but exhausting; it invites so much work in codifying and comparison of its details. In business the significant thing is the price, and in the mass of ordinary correspondence of a business house it is customary to brand certain letters with a red stamp—"Quotation." So in going over these valuable records of practical experience, the whole mass of which I could never begin to remember, I occasionally put a mark "Idea." We thresh the grain, the kernel separating from the husk which has served its purpose. Many details may well be forgotten, but the ideas will add to our equipment.

The ideas designated are principles. Their only distinction from details is that they are not as rigidly definite, but are much broader. A man who grasps such a principle has in it a fist full of details, and can reproduce the details from the principles. It is a difference of degree rather than of kind. Principles may be considered as units, details as decimals. If our units figures are right we are not greatly estray, but if our figure in the third decimal place is right and the units figures are wrong, the third decimal detail does not help us a little bit in the blunder we have made.

Principles have these advantages. They are fewer, can be more easily remembered, are of more general application, safer for guidance, give one the power of reproducing details approximately in a great many different cases.

Next point. How can we get principles? If a valuable principle suggests itself to us we do not turn it out, but we do not work to pull it our way. We expect it to be heaven sent. We expect it to happen like a volunteer crop. A little boy in my family, having never before seen a colored person, came home breathless and alarmed at the sight and made the following odd statement: "I never saw him till I saw him. Pretty soon I saw him. When I saw him I run." We may say this was a child's way of putting a discovery, but we discover principles in a child's way. Some one comes along and sees and perhaps gets rich over something which we have been looking at familiarly and not seeing for many years.

Finding principles is like prospecting. It may not be certain, but the man who sits in his library is not likely to discover any actual reefs or veins. Principles come from wide observation and comparison.

The first time I read an article I often fail to see some useful principle which stands out strongly on a subsequent reading, after I have perhaps read other articles from different points of view, or allowed the subject to mellow in "unconscious cerebration."

In detail work a man is limited, even if he does an enormous amount of it. In leaching practice Mr. Tays has one line of experience and Mr. Alderson another, and their articles give us some principles and many details—much food for comparison and thought looking to results. I have seen a summary of the life work of a marine engineer, designer of a long list of steam craft. This detail work would have covered acres of paper, but it followed the lines of one general model of arrangement, and an amount of labor staggering enough to "stop the clock" of a beginner figured out in about this way. The engineer had an inventive period during which he laid down some new and good principles. His later life was spent in gardening among those same principles, and it was a very useful work. For some years I kept count of drawings which I made up to a number of about 7000—then quit, concluding that I ought to use my fingers less and my wits more.

Yet every detail that I see in proposed work calls to mind some detail of past work, something that gives me a basis of comparison even though it be foreign to the subject in hand, and the more foreign the more radical my basis of criticism and the more leverage I can bring to bear.

Many of us have accumulations of articles giving a great wealth of technical details. Most of us have these filed away for a reference which may be forever postponed. My suggestion is that we get the values out of these accumulations, that is, that we search them for principles of operation, comparing one man's experience with another's, and doing our own thinking. They are like pre-digested food, prepared for us. To provide them for us other men have spent thousands in building mills and have traveled many wearying miles. They are the fruits of a vast laboratory with some costly successes and many more costly failures, and the failures as instructive as the successes. And in them, still undiscovered, there lie valuable principles to be found by methodical search.

Details are valuable ground in which to find principles. A good principle is a nugget. Published it is a nugget that grows like the tree, which once planted will be growing when we are sleeping, aye, and when we are dead.

THE Senate Committee on Mines and Mining has reported favorably the bill devoting a portion of the proceeds of the sale of public lands to the maintenance of State and Territorial mining schools.

Smelting Arsenical Ores in Blast Furnaces.

Written for the MINING AND SCIENTIFIC PRESS by HERBERT LANG.

Some ten years ago, when engaged in smelting silver ores in a pyritic furnace, I had occasion to run down small lots of arsenical speiss at various times. Observing the facility with which this substance is decomposed, I drew the inference that arsenical materials in general might prove very easy of reduction by this means; and the corresponding one that as far as the arsenical elimination went, the products of pyritic smelting would prove purer than are usually got by the ordinary method of smelting. Subsequent experience has amply verified these conclusions, and I incorporated in my little treatise, "Matte Smelting," a resume of these views as far as they were proved at that time. During the intervening years I have collated the experiences of many persons in the various branches of smelting, but I have never been able to learn of an instance where a comparatively pure arsenical ore was subject to treatment by itself, under such conditions that the reactions and results were unmistakable. But it has happened during the past winter that an opportunity has been afforded me to observe, under desirable conditions, the behavior of such an ore.

The Slate Creek Mining Co., of Cleveland, O., owns the Blue Dick mine, a somewhat noted mineral deposit near Prescott, Arizona. The property is of considerable extent, but since the time of its early working, when the richer and more tractable ores were taken away, it has attained the name of a tough proposition. The existing ore is essentially a mixture of quartz and mispickel, containing some small quantity of other substances, such as iron pyrites, galena, chalcopyrite, a very little gray copper, spathic iron and barite. The values are in gold and silver, the copper being too small in quantity to affect the general process or result. As to the proper mode of treatment, the question has been much studied, and there has been much conflict of opinion on the matter. For lack of water and for other reasons, concentration was considered out of the question, and smelting was resolved upon. For this work I designed a furnace of advanced construction to meet the conditions, which were peculiar in these respects: The amount of water to be had, being the drainage of an old tunnel, is but a few gallons per hour, probably not one-tenth of the quantity usually devoted to cooling the jackets of even an ordinary sized blast furnace. Next, the ores, after rejecting the more siliceous part, ran nearly as follows: Silica, 45%, and nearly 17% each of iron, arsenic and sulphur; the remainder being made up of lead, copper (less than ½%), carbonic acid, etc. Limestone, which is found not far away, is the proper flux for such a mixture, and of this it is necessary to use about half the weight of the ore, in order to form a suitable slag, which by the way must, under the conditions, be quite acid in order to do the best work.

Having decided upon what slag to make, I designed the furnace to correspond, contrary to the almost universal practice, which is to buy the furnace first and then make whatever slag you can in it. I do not say that my way is the best, but I generally prefer it. As these slags were to be high in silica and lime it is obvious that they would not corrode firebricks, so that I was enabled, as a matter of economy of water, to use a brickwork lining to the greater part of the stack; and also, on account of the acidity of the slags, I made the stack of considerable height above the tuyeres, because such slags always cause fire tops on low furnaces. There is a strong reason outside of these for making an acid slag, in this, that with so much arsenic, and with the lead in the ore, there might easily be formed a quantity of speiss, which would under the present conditions of the market be quite unsalable and cause a loss by tying up values, to the company's embarrassment. The connection is not obvious to the average reader, but it lies in this, that the higher the silica the more certainty of the total decomposition of the arsenical iron and volatilization of the arsenic, which with a basic slag would undoubtedly remain to form speiss.

The furnace is a round one, 3 feet in diameter at the tuyeres, with cast iron jackets 30 inches high. Above them comes the brickwork, which extends to the feed floor, 9½ feet above. The depth of shaft from feed floor to tuyeres is 11 feet, the tuyeres being 5 feet above the slag floor. Thus the total height of the furnace is 16 feet, an unusual height, but made necessary by the character of the slags which were to be made, taken in connection with the fact that cold blast was to be used at first. The furnace is my own patented construction, having approved arrangements for handling hot air, such as covered tuyeres of a new and extremely convenient pattern; concealed blast pipes and water pipes, cast iron wind box, and underground blower pipe, etc., to obviate cooling of the blast and discomfort to the men. The crucible, according to my invariable construction, is removable, and everything about the furnace is of so convenient a character that the

stack can be blown out and in again in from two to four hours, by tbe efforts of two or three men. The jackets present an interesting feature, in that they are arranged to evaporate the water that cools them instead of discharging it hot. By tbis means the quantity required is much diminisbed, and it is found quite as practicable to run tbis stack witb tbe small amount available as it would be to use ten times as mucb and let it run away bot. Knowing tbe peculiarly penetrating effect of arsenical iron compounds I took the precaution to make tbe crucible 4 feet deep below the tuyeres. Even this inordinate depth did not save the cast iron bottom from being burned througb.

A furnace of this size is commonly regarded as having a capacity of about thirty tons a day and is spoken of as a thirty-ton furnace; but tbis apparatus smelted, witb a nine-ounce blast, fifty tons of charge per day, witb every prospect of reacbing sixty tons or upwards when everytbing falls into steady working. In tbese preliminary trials the blast is cold. Were it heated I have no doubt tbat I could put througb 100 tons a day with ease, and I see no reason wby a still greater quantity migbt not be smelted in tbis small furnace. I do not know of a single instance in tbe wbole history of smelting where a capacity of fifty tons of such an acid mixture bas ever been reacbed in a stack of this size, and as a rule attempts to make so acid a slag in a blast furnace are a failure.

The slag tbat fell from tbis smelting ran from 40% to 45% silica, along witb ferrous oxide 24% to 27%, and 20% to 24% lime. Analysis seemed to show that it was a mixture of bisilicate of lime witb sesqui-silicate of iron, witb a few per cent of sulphur, etc. As tbere was very little alumina present, tbe make-up of the slag is not obscured, and we can, for perbaps the first time, see wbat kind of slag tbe pyritic furnace makes wben left to itself.

As gratifying as is tbe quantity smelted, as well as the successful handling of acid slags, not tbe less so was the extremely bigb concentration effected—a concentration far beyond any recorded in the annals of pyritic smelting. Twenty-seven tons of ore, with its proportion of flux, produced one ton of matte. As one-balf of tbe ore consists of combustible matters (the iron sulpb-arsenides and sulpbides) it appears that the decomposition was very extensive. Nearly 90% of tbe iron was oxidized and slagged off. Fifteen-sixteentbs of tbe sulphur went up tbe chimney or into the slag; while all the arsenic was volatilized in some form or other. Vast quantities of deep yellow or red sulphide of arsenic, presumably orpiment, pass out of the smokestack, succeeded by thick masses of pearl gray fumes containing arsenious oxide, etc. A good deal of metallic arsenic also is sublimed, but tbis speedily becomes oxidized and permeates tbe atmosphere as gray smoke. Not a single particle of speiss or any otber indication of arsenic appeared at the bottom of the furnace.

Tbe matte presents no peculiarities except its brittleness, arising, I presume, from the absence of metallic iron, due to tbe bigbly oxidizing action of the blast. It carries about 10% copper, wbich is not enough for a clean saving of the silver. Measures are being taken to procure a quantity of copper-bearing ores for admixture, so as to bring the copper contents of the matte up to 25% or 30%, wbich will produce a cleaner separation of tbe silver.

I have not heard previously of such an extensive oxidation taking place in pyritic or otber furnaces as is bere indicated. The fact tbat tbe combustible components of an ore forming one-half its mass are so completely decomposed must be quite surprising to those wbo are still wondering if there is anything in pyritic smelting. Tbe pyritic principles have bad a very close application in this work, and the furnace was especially applicable to it; but I do not ascribe the success wholly to these causes. I think it is largely owing to the favorable ratio existing between tbe quantities of sulphur and arsenic existing in tbe ore, whicb in my opinion was such as to induce a very extensive sublimation of the two witbout leaving a large residue of either to combine with tbe iron. One constituent seemed to remove the otber, leaving the iron a prey to the oxygen of the blast and tbe silica of the ore, they then uniting comfortably to make the slag. I think that if tbere had been more of eitber the sulphur or tbe arsenic tbere would have been a larger proportion of matte formed and consequently a lower concentration thereof.

Tbe question of speiss formation came up simultaneously at the neighboring smelter of Val Verde, Arizona. The ores there are very easy to smelt, but certain of them carry arsenic to a small but sometimes troublesome extent. Mr. Jewett, the metallurgist, was able to smelt these without the formation of speiss, but subsequently a certain amount of trouble was experienced and my advice was sought by the manager. I advised the recalculation of the charge, establishing the silica at such a proportion as to withdraw iron from the most decomposable part of the product, which of course would be the speiss. Tbis is the same, of course, as cutting down the flux to the proper degree, which can be done by the cut and try method, the practice being in effect just what is meant by the phrase, "running a furnace by experience." The same advice, I dare say, would be applicable to very many of the furnace plants running to-day on arsenical ores. As far as I can see there is nothing necessary to the elimination of this metal than a proper composition of tbe charges, whereby silica enougb is furnisbed to take up tbe iron, which, given time enougb, will ultimately combine with tbe oxygen and tbe silica and be slagged off.

I would ask the reader's attention to the cbaracter of tbe work as I have outlined it, and tbat of the work practicable, let us say, before pyritic smelting was invented by Mr. Austin. Without the application of tbe pyritic principles, what treatment could bave been applied to the Slate Creek sulph-arsenides to extract tbeir values? In the first place they would bave bad to be roasted, as was recommended for these same ores very lately by men of experience who were dismayed at tbe amount of arsenic and sulphur in tbeir composition. Next, if the roasted material were smelted in tbe ordinary way abundance of speiss would bave been formed, difficult and sometimes impossible of sale, and then only with an attached penalty for the arsenic, wbich would bave eaten up mucb of tbe profits of the work. It was maintained by several persons, familiar with the old process but not witb tbe pyritic method, that we would get by our smelting notbing more than a very large quantity of speiss, of necessarily low value because, in their opinion, not more than four or five tons could possibly be put into one.

Tbe work at the Slate Creek property has not proceeded far, but we can reasonably claim complete success in several directions, namely, (1) as to tbe saving of water, (2) in tbe unexpected bigb smelting capacity of tbe small stack, (3) in tbe thorougb elimination of the arsenic, (4) in tbe siliceous nature of the slags wbicb the furnace successfully handles; and finally, in the unequaled concentration which it produces, putting twenty-seven tons of ore into one of matte.

A California Made Telescope.

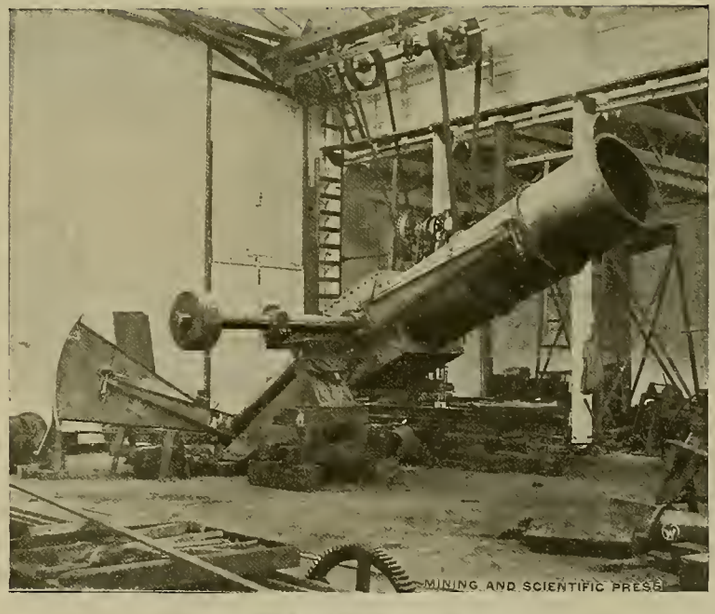
Harron, Rickard & McCone, who bave taken over tbe business of Parke & Lacy Co., tbe long established machinery firm of San Francisco, Cal., have completed a contract with tbe Lick Observatory at Mount Hamilton, Cal., for the mounting of a large reflecting telescope as represented in the accompanying illustration. Tbe great 36-inch refracting telescope of the Lick Observatory has been in use three nigbts a week since the year 1896 in connection with a photographic spectroscope presented to the Lick Observatory by D. O. Mills for determining tbe motion of the stars to and from the observer. It is one of tbe fundamental laws of the universe that every celestial object is in motion. One star is moving in this direction, anotber in that, and so on indefinitely, some with a velocity almost zero, others witb velocities as great as 60 miles a second away from the solar system. If a star is moving at right angles to the line of sight, its motion can, in the course of a few years, be detected by the usual telescopic metbods; but the component of motion toward or from tbe solar system must be measured by means of the spectroscope.

Tbe velocity of the stars are measured at tbe Lick Observatory, not from a great interest in the motion of each star, but that tbe results may be combined for many years and therefrom tbe motion of our own solar system through space may be determined. For this purpose it is desirable that observations be secured of as many stars as possible, and tbat they may be observed over the entire sky. From the Lick Observatory one can observe stars situated between tbe Nortb pole and a circle 30° soutb of the equator; but tbe stars from 30° south on to the South pole cannot be observed from tbere. It is therefore needful that a powerful telescope be located in tbe southern bemispbere, in order to extend the work to tbe Soutb pole.

In November, 1900, Dr. Campbell called the attention of D. O. Mills to the desirability of furnisbing sucb an observatory in tbe southern bemisphere, and he, with great generosity, gave a sum of money to construct tbe telescope-spectroscope, a dome to cover tbem, to defray the expense of installing the observatory in tbe southern hemispbere, and to pay the salaries of the astronomers engaged in tbe work.

As the investigations are to be made entirely by photography, it is more advantageous to make use of a reflecting telescope tban of a refractor. Acting upon tbe advice of Warner & Swasey, tbe most successful telescope builders in America, Dr. Campbell intrusted the task of constructing tbe mounting for the 37-inch reflecting telescope to tbe Parke & Lacy Co. of San Francisco. Tbe general features of the mounting, togetber with many of tbe more important tecbnical details, were designed by Dr. Campbell, but the designers of tbe Parke & Lacy Co. unified tbese plans and adapted them to the requirements of modern construction, besides supplying many devices of value.

The John A. Brasbear Co. of Allegheny, Pa., manufacturers of optical apparatus, are constructing tbe mirrors to be used in the telescope mounting. Tbe principal mirror to be placed in the lower end of tbe great tube will be of glass, 36½ inches in diameter, witb a hole 5 inches in diameter in its center. The thickness of tbe mirror will be 4½ inches, its upper surface will be ground to a parabolic form and covered with a thin deposit of silver. When tbis silver is polished it will reflect tbe light from a star, bringing it to a focus of 17½ feet from tbe surface of the mirror. If an eyepiece were placed at this point tbe image of tbe star could be observed. Such, bowever, will not be the construction of this telescope. In the axis of the tube at a distance of 4 feet below the focal point, wbere tbe diameter of tbe beam of light is still 9½ inches, a convex silver-on-glass mirror will be placed. Tbis will turn the ray backward through tbe hole in the center of the great mirror; and these rays will come to a focus 18 inches below the reflecting surface of the great mirror. Tbis point is 13 inches below the lower end of the great tube.



A California Telescope for Chili, S. A.

Tbe illustration shows the telescope so far as completed. Considerable work is still manifestly necessary, and after completion it will be erected, tested and finally sent to its destination in the vicinity of Santiago, Chile.

THE Idaho law of mining claim location requires the sinking of a sbaft or an excavation of 10 feet depth below the lower rim, and in this work 160 cubic feet of eartb or rock must be removed. Tbe ordinary shaft, 4x4 feet and 10 feet deep, or a tunnel 4x4 feet and 10 feet long, complies with the law, and 160 cubic feet is thereby removed. Sixty days from notice of discovery and location is allowed for tbis.

THE eye works equally well and sees witb equal facility witbin a very wide range of illumination. With the immensely powerful sources of light now at our command the constant tendency is to turn on more and more light irrespective of actual needs until the net result is a loss and not a gain and tbe eye suffers from over stimulation.

Placer Mining Kinks.

Written for the MINING AND SCIENTIFIC PRESS by CHAS. P. RICHARDSON.

I claim neither that the following little tricks are of the hest practice, nor that I am the original discoverer. How many other chaps in similar exigencies to mine have worked out the same ideas to the same or hetter ends, I have no means of knowing; hut never having seen any of them in print, and but one or two in practice, I send them, trusting they may save some other fellow the necessity of putting up with worse methods, or suggest to him something hetter. They have served me on a property which at the heginning of my connection with it was 120 miles off a railroad, 45 miles from a general store, 30 miles off a wagon road, with which from January to June snowshoes offered the only method of communication, and which was very crudely equipped with shops, tools and materials. If you couldn't make what you needed out of a tree, a nail, and a piece of pick steel or haling wire, you mostly went without, so I think that devices simple enough to he made there, would he practicable in most camps.

SHAPES OF SLUICES AND SLUICE PARTITIONS.—(See Figs. 1 and 2). I have heard more or less argument amongst "old timers" on wide and shallow versus narrow and deep sluices. To my mind there is no question hut that the wide and shallow is the proper sluice in any case I have seen, hoth as a gold saver and as a material handler. If not as a gold saver why have we undercurrent tahles of wide expanse for the saving of difficult materials? The wider the sluice the greater the amalgamating or riffle surface to the mining foot, and consequently the greater opportunity for every particle of gold carried through it to find a settling place. As a material handler it is equally efficacious. Irregularly shaped rocks rolling through the sluices do not travel in a straight course down the flume, hut roll more or less irregularly, now straight ahead, now diagonally, from one side to the other. As long as the rock once started holds to the middle of the flume there is little danger of its stopping, harring especially irregular riffles. It is when the rock engages the side of the flume where the current is less swift and flume side helps to impede motion that trouhle results. The wider the flume the smaller the probahility that a rolling rock will touch either side. Equally, the wider the flume the less the prohahility that a single lodged rock will result in the hlocking of the whole flume width. To my mind the desideratum is: Granted a certain flow of water, then give us the widest flume that will leave us depth and velocity enough of water to roll the largest rock that may ordinarily he piped into the flume. After this is attained then every additional inch of depth of water is a detriment, hecause the greater the superincumhent weight of water the greater the tendency of the sand to "bake" in the riffles to the prevention of amalgamation, and to form in waves on the top of the hlocks to the prevention of the free running of material. At the Moose creek placers, near Newsome, Idaho, with our best water, 600 inches, 900 cuhic feet per minute, our 30″ flume with 6½″ grade per 12′ runs 8″ deep with a surface velocity—as shown by chips dropped in—of 11′ to 12′ per second, and this handles houlders of 14″ to 16″ long and wide, by half as thick, weighing hetter than 100 pounds, though as a matter of fact we do not plan to run such heavy material ordinarily. On this same property we formerly used a 20″ flume on the same grade with water 16″ deep. I think about 700 inches—though I had no water measurements taken at the time—and we could handle neither the amount of material, such coarse material, nor with so little stoppage as with the 30″. I know of one flume 24″ wide, 60″ deep, and when the heaviest flow of water is on, the operators have almost constant difficulty with their material and amalgamation. Moreover, from the depth and velocity of the water, and the consequent inahility to work in it to advantage with hand tools, a bad jam of material in the flume necessitates the shutting the water out of the flume until the jam can be opened. This shape of flume is advocated because it will accommodate varying amounts of water.

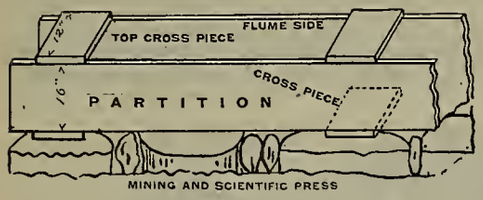


FIG. 1.

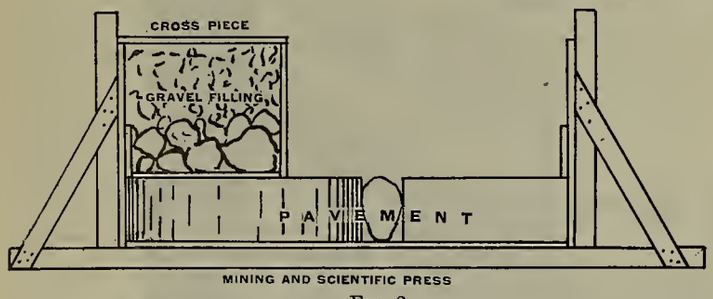

FIG. 2.

I think, however, that where there is a great variance in the flow of water available for hydraulicking at different times in a season, and a lack of proper storage or ditches to maintain a comparatively even flow, it is decidedly preferable to hold to the wide and shallow sluice and to adjust the width of one's sluices to fit the available amount of water.

I use at Moose creek placers sluices 30″ wide, 24″ deep, set on 6½″ grade to 12′ with a round hlock and rock riffle 7″ high. At the best of the season we have 600 miners' inches of water. Formerly, through antiquated reservoir ditches, we were able to throw less than 250 inches into the diggings toward the end of the season. With this small head spread over a 30″ flume bottom it was impossible to wash houlders of any size through the sluices, hut with it confined to 20″ width we could do quite a hit of effective work. I made a removable partition to reduce the width and confine the water for use with the small flow available. Taking 1″x16″x12′ lumher we nailed cross pieces 1″x6″x9″ long at distances of 3′ on one edge—which we will call the hottom edge—and at right angles to the plane of the hoard, and similarly placed cross pieces 1″x6″x11″ on the top edge. Standing the 1″x16″ on edge in the flume with the free end of the hottom cross pieces against the flume sheeting we tacked this cross piece to the top of the riffle hlocks with one or two nails, the free end of the top cross pieces was nailed to the top edge of one of the flume sides. (See detail sketch Fig. 1 and cross section sketch Fig. 2).

To prevent a tendency to rise and float off, and to make the partition more rigid, we used to fill hehind the partition with tailings by jamming the flume and overflowing the tailings hack of the partition. Short hoards set upright behind the cross pieces served as gates to hold the tailings. By removing the gates and turning clear water hack of the partition the tailings were readily sluiced out for the removal of the partition. With the cross pieces ready cut and nailed on the 1″x16″s it was the work of hut two or three hours to set up or remove the partition in a twenty-hox flume. This cut the cross section of the flume—ahove the riffle hlocks—from 30″x17″ to 20″x17″. Of course any other dimensions could he treated likewise. At first I set in the hottom cross pieces to make them flush with the edge of the 1″x16″, hut found that irregularities in the wear of the riffles nullified any such niceties, and afterward simply nailed them on, and the gravel filling did the rest.

SLUICE Y OR FORK.—I first saw Henry Pope, superintendent of American Hill placers at Elk City, Idaho, use this form of fork, and it is not unlike my partition scheme in one way. He desired to fork a 36″ hedrock flume—if I remember the dimensions—to enahle the hranches to run to different hreasts in the pit. In place of huilding half hoxes, or letting one flume into the side of the other, he began helow the proposed fork to flare the main flume. This he widened, as a head box is flared until it was 78″ hetween the standards (sides were 1½″ lumher), which would permit the entrance of hoth 36″ hranches inside the standards of the flared box without champfering the sides, or otherwise disturhing the standard size hox. After the pavement is set a removable partition similar to the one described above can be placed on the hlocks from point C in Fig. 3 to the side of the lower end of the flared box to confine the water and material to a 36″ width. This partition can readily he moved from one side of the flared box to the other to permit the use of either fork of the flume. By flaring the main flume gradually for several hoxes, and changing the angle of the flare as shown in the line D E F, as gradual and nice a curve to either or hoth the forks can be established as may be wished for, which, of course, is very essential when light grades are a necessity.

PIPE LINE PROTECTION.—In taking a hydraulic pipe line through a country with much timher which was apt to fall on and crush the pipe, and where it was inadvisable to trench and hury the line, I felled trees alongside the line, and rolled up the logs one on each side of and larger than the pipe, or raised on logs until the lengthwise log's surface was higher than the top of the pipe at that point. Smaller poles laid lengthwise on top of the pipe prevented punctures from limhs on trees falling across the line. An occasional spike or notched log kept the logs or poles from slipping down hill where the hills were steep. Although considerahle timher fell across the line, it occasioned no damage.

OPEN CUT BLASTING FOR SLUICES.—I have put in a good many hundred feet of open cut in which to lay sluices in preference to tunneling. The cut illustrated in the photograph is over 40′ deep. I prefer an open cut at even some advance in cost over a tunnel. But granted a rock that breaks well with powder and will take long drill holes, and a situation where your water can he hrought on the ground on the line of the proposed cut, and very prohahly used there in mining your higher ground, before the completion of the cut into the channel down to flume grade, then a very deep cut can he made at a very slight cost.

Open Rock Cut for Hydraulic Sluice.

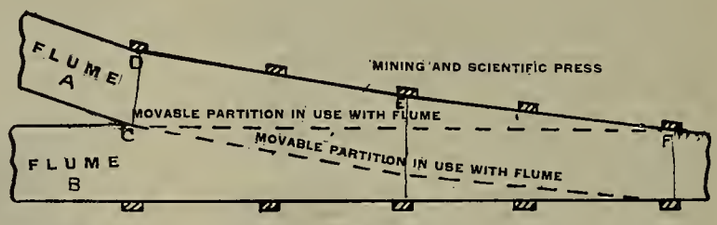

FIG. 3.

Starting the hedrock flume at the dump, running it up to the face of the rock on the line of the cut and hringing on the water, we turn the latter down the line of the cut and ground sluice all surface detritus and all picking rock through the sluices. Then heginning with hammer, steel and powder we carry forward the cut down to flume grade in one or more henches. We hreak up the large fragments of rock after each hlasting, turn on the water and ground sluice the cut clean. In the portion shot down to grade we set one or more hoxes of sluice, and repeat the operation. As soon as enough of the hedrock flume is completed to save our gold values, we begin hydraulicking such ground as lies trihutary to the uncompleted cut. By using stagings to work from, holes are drilled at the water's edge into the bottom of the cut and hlasted, and the carrying forward of the cut and hydraulicking go on together. The passage of the gravel washed down the cut helps to wear down the softer portions of the rock. The hard reefs are shot, to induce further wear in the softer portions. The ahility to handle the debris from the hlasting through the sluices hy water reduces the cost of the cut driving practically to the cost of the drilling and hlasting, and makes it possihle to put through a cut, especially if it he a long one, involving the handling of an enormous amount of material at a lower cost than the driving of a tunnel of similar length. This, of course, is especially true where hydraulicking can be carried on simultaneously with the cut making.

We use practically no timher. Occasionally a had

point is held up hy a stull or two until the necessity for the frequent passage underneath of men is past. Then we knock the stull out and let the sides come in until they reach a safe slope. Some breakage of flume sides results from these caves, but I have yet to have the important thing, the flume hottom, injured. With the cut filled and tamped solidly on the sides of the flume to the top of the latter with rock and gravel, which incidentally prevents the flume from rising in case of a flooded cut—the force of the caves largely goes over the top of the flume sides, and filling the flume results in comparatively little damage. With a flume thus set you can rest calmly when you see it filled and covered over 20′ deep with a cave, knowing that when the water finally hacks up and goes over that cave it will take it out with no damage to flume or works. No cave from the top can "plug your tunnel" in case of an open cut, nor can the washing down of stumps, timhers, houlders, or the efforts of an enthusiastic pipeman do the same thing, necessitating hours of anxious, and, if a hody of water he held hack of the plug, extremely hazardous, work to all engaged in reopening the plug. Under ordinary conditions with an open cut the pipeman can adjust his work and the running of the whole diggings by watching the way in which the sluices are handling the material piped to them. There is no call for repairs on the cut itself, the necessity for repairs on the sluices is more readily seen than in a tunnel, and one has daylight to assist him in his most delicate work—cleaning up. He also has daylight to assist in the protection of the sluices against the employe with hazy notions as to whose property the amalgam ought to he, especially at clean ups. Of course where the depth of the rock to be driven through is excessive, an open cut is out of the question.

(TO BE CONTINUED.)

Patching Old Boilers.

A much ahused piece of mechanism is the ordinary every-day steam hoiler. Where the fuel expense is as a whip to induce attention, it is had enough, but if some of the boilers that serve long periods in the country, where fuel is no object so long as the steam is supplied, could talk, what tales of abuse they could tell. The ahuse may hegin hy the purchaser objecting to first cost and wanting one cheap, the consequence heing that to please him must lead to inferior workmanship or material, or hoth; the hoiler starting out on a sort of false standing, for the purchaser will expect as much out of it as if he had paid the highest price, and will feel that the saving in price is to the credit of his business tact alone. Then when the end comes, when it is desired to replace the old hoiler with a new one, the owner asks the dealer what he will allow for the old one in exchange, and the poor old hoiler receives an insult on top of its long line of injuries hy having itself rated at the same price as old iron or junk.

In the first place, that called a safety plug with which all well regulated boilers are supposed to be supplied, is not always safe; that is, it does not perform its functions. In theory, the safety plug is all right, heing a plug of fusihle metal put into the hoiler at such a point that when the water gets so low as to he called dangerous, the plug will he left dry, and the heat of the fire will melt it out hefore any serious danger arises to the rest of the hoiler. In practice this is not horne out, still it is generally used, and retains its name of a safety plug. That this same safety plug is closely connected with hoiler patching is too plain to escape notice. There is a continual exemplification of it in the everyday life of hoilers that go out for service when the safety plug is put in the crown sheet over the fire. These boilers generally fail first in the crown sheet, and then comes the patch.

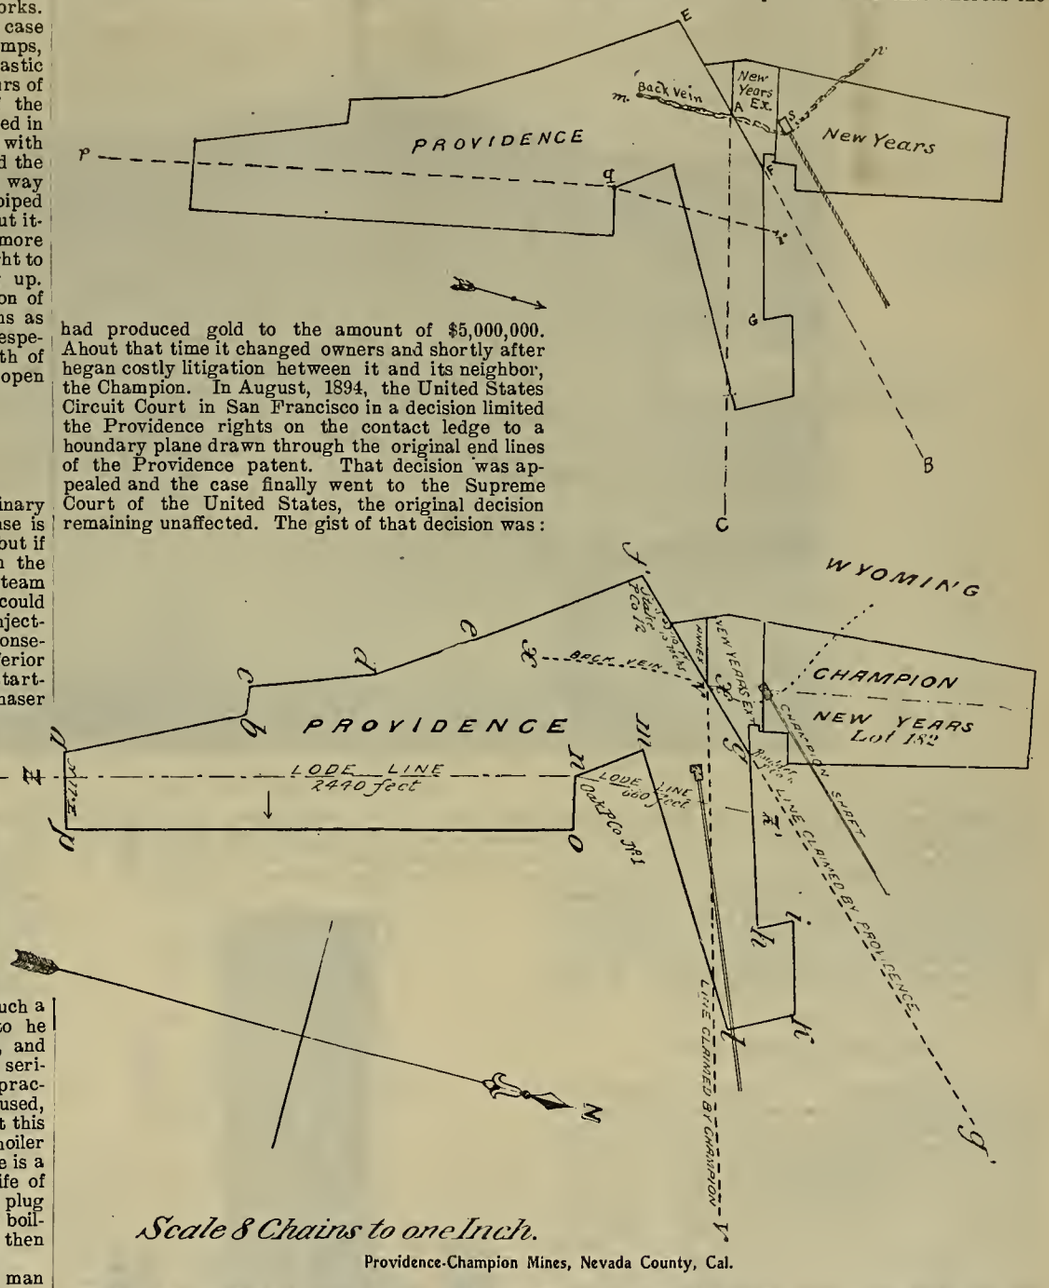
The same idea of "economy" that induces a man to get his boiler at as low a price as possihle will likely prevent him from sending for a hoilermaker to come and put on a patch, if there is any possible way to avoid it; and it is often avoided hy calling in the local hlacksmith to do the work. There is a case in point in a hlacksmith journal, in which a blacksmith tells his hrother smiths how he patched a hoiler. He says the crack was in the top of the fire hox, right in line with and a little hack of the safety plug (note the position of safety plug). He drilled holes at the ends of the cracks to prevent spreading and then put on a patch of plow steel, with a coating of lead and horings between it and the shell to insure against leaking. In fact, he simply did what is known to the engineering trade as soft patching, which should never have a place where it comes in contact with the fire, and this one was evidently in the extreme heat of the fire. An engineer would say that the thing to do in a case of this kind is to cut away the old metal, avoiding square corners in the hole, and then put a hard patch on the inside and calk the seam in the old shell. True, circumstances might he such that the patch could not he put in the inside, but if it could not and a good job could not he had hy cutting away the old metal and putting a patch on the outside it was time to put in a new sheet altogether.

Two California Gold Mines.

Written for the MINING AND SCIENTIFIC PRESS.

The reported sale of the Providence mine, Nevada county, Cal., to its neighbor, the Champion gold mine, is of interest, even in a county and section where continuous yield of gold for fifty years is of usual occurrence.

The Providence mine, on the opposite side of Deer creek from its purchaser, the Champion, was located in 1858 and followed the usual course of California gold mines, at one time all operations having heen suspended and the property offered for sale for $60,000. Up to 1890 it was estimated that the mine had produced gold to the amount of $5,000,000. Ahout that time it changed owners and shortly after hegan costly litigation hetween it and its neighbor, the Champion. In August, 1894, the United States Circuit Court in San Francisco in a decision limited the Providence rights on the contact ledge to a houndary plane drawn through the original end lines of the Providence patent. That decision was appealed and the case finally went to the Supreme Court of the United States, the original decision remaining unaffected. The gist of that decision was:



Providence-Champion Mines, Nevada County, Cal.

"When the end lines of a mining location are once fixed, they hound the extralateral rights to all the lodes that are thereafter found within the surface lines of the location."

In a former decision of the United States Supreme Court, in the case of the Iron S. M. Co. vs. Elgin M. Co., it was decided that the same end lines hound all extralateral rights as to all veins or lodes within the surface houndaries of the claim. In delivering that opinion Justice Field, speaking of the rights of locators of mining ground to follow the lode in its depth, said: "It often happens that the dip or apex of more than one vein lies within surface lines, and their veins may have different courses or dips, yet his right to follow them outside of the side lines of the location must he hound by planes drawn vertically through the same end lines. The planes of the end lines can not be drawn at right angles to the courses of all the veins if they are not identical."

The Providence-Champion suit was for $300,000 and damages, the former claiming that the Champion had gone under the surface into the Providence ground and unlawfully extracted ore therefrom. The decision noted was in favor of the Champion.

Under the circumstances some details and diagrams are of interest:

A patent was granted hy the United States in 1870 to the Providence lode, shown on the diagram at P, Q, R (Cut No. 1); also to the piece of surface ground marked Providence. On this vein an incline shaft was sunk 1500 feet deep and extensive mining operations carried on. From this shaft two crosscuts were run 600 feet to the west, and another vein opened up and worked hy the Providence M. Co., this back vein having its apex on the line M, S, N.

On this vein, at the point S, the Champion M. Co. sunk a shaft 1000 feet deep on the pitch, extended its works and took out ore south of the line E–B.

The plaintiff asked for an injunction to restrain defendant from working south of the line E–B, and for damages for ore removed south of said line, placing damages at $300,000.

The contentions of plaintiff were that whereas the Act of 1866 only granted to the Providence claim the lode P, Q, R, the mining Act of Congress of May 10, 1872, gave it the additional grant of all other veins the apexes of which were situated within the surface lines of said claim, with the right to follow the same on their dip to any depth, and that the line E–F, which is crossed hy the apex of said vein, is the end line on said vein, and that the right to follow said vein on its dip and strike is limited by a plane through said line E–F and its continuation.

It was further claimed that a location made by the Champion M. Co. in the year 1884, containing a clause of abandonment south of the line E–F, made said line a compromise line, and that defendant was deharred from asserting any rights south of said line. The defendant contended that the line E–F is a line which limits the claim of the Providence mine to said vein on its strike, hut that the rights on the dip are limited hy a plane passed through the point A and parallel with the line F–G, being the line crossed hy the patented lode P, Q, R; that the claimed abandonment was not of such a nature as to make the plaintiff a party to same, and that when defendant ohtained from the land office the receiver's receipt for a patent it gave a new title, which barred any claimed compromise.

The portion of the mine in dispute was that portion

of the back vein included in the lines A–B and A–C. The peculiarity of this action relates to the numerous irregular shaped pieces of surface ground which were patented to mine owners under the Act of 1866 and the application of the Act of 1872 and the decisions of the courts thereunder, the difference between the two Acts being that under the law of 1866 a patent was granted for a number of feet of a vein, with a piece of ground for working purposes, which could be taken in any shape. Under the Act of 1872 a piece of ground is patented which is practically supposed to be a parallelogram containing a vein.

In Cut No. 1 the line E–F–B is the one claimed in the original suit by the Providence; the line A–C is the one claimed by the Champion; the line F–G shows the boundary fixed by Judge Hawley in the decision from which appeal was taken. The United States Circuit Court of Appeals affirmed the decision of the lower court.

The Champion, which now acquires 147 acres additional, is a notable mining property. It now owns twenty-four claims. Its hoisting plant is of capacity to sink 3000 feet. Its methods are modern and it has a lifetime record for profitable yield. The property is typical of the best class of California gold mines, well equipped and well managed.

Champion Mine, Nevada County, Cal.

Electrolytic Separation of Tin.

A curious parallelism is presented between the well-known Hoepfner process for the extraction of copper from its ores and compounds, and a method just patented to Paul Bergsoe of Copenhagen for the electrolytic recovery of tin from scrap and waste alloys. The Hoepfner process, it will be recalled, depends upon the varying valence of copper, and consists in bringing a salt of copper in its higher state of oxidation into contact with the ore, whereupon copper passes into solution and the solvent is reduced from the cupric to the cuprous condition; this solution is then electrolyzed with insoluble anodes to deposit one-half of its metal, restoring the remainder to its original valence and reconstituting the solvent. Bergsoe reacts upon tin-bearing materials with stannic chloride, and subjects the stannous salts formed to electrolytic treatment as above, restoring its valence and solvent power, and recovering an amount of metal equivalent to that dissolved. Both methods are simple, and indeed identical in theory. The Hoepfner process has encountered in practice the very serious obstacle of a low-reaction velocity—a solvent action so slow as to render its application to the most commonly occurring ores of copper, the sulphides, of doubtful practicability. From this defect the new process is free, for the stannic salts are energetic solvents. The successful treatment of tin scrap, however, has proven in the past a difficult problem, not only on account of its very low tin content, but because of the tendency of the iron to pass with the tin into solution. As applied to this purpose, therefore, the industrial value of the new process is yet to be demonstrated.—Electrical World.

It is estimated that $90,000,000 represents the investment in machinery in the gold mines of South Africa.

The Hardy Motor.

In the sectional view of the Hardy motor herewith Fig. 1 shows the balance wheel magneto side; Fig. 2, governor side; Fig. 3, combustion chamber; Fig. 4, combustion chamber stud; Fig. 4, connecting rod, made of steel, adjustable bronze sleeves at each end; Fig. 6, countershaft for pump and exhaust valve rod; Fig. 7, crankshaft; Fig. 8, crankshaft bearing; Fig. 9, cylinder; Fig. 10, cylinder cap of brass; Fig. 11, exhaust valve; Fig. 12, exhaust outlet; Fig. 13, exhaust valve arm; Fig. 14, exhaust valve rod; Fig. 15, exhaust valve cam; Fig. 16, exhaust valve roller on end of exhaust valve rod to prevent friction and side motion; Fig. 17, gasoline reservoir, holding about six quarts; Fig. 18, gear on countershaft; Fig. 19, gear on crankshaft; Fig. 20, gasoline and air mixer; Fig. 21, generator needle valve for regulating gasoline and air mixture; Fig. 22, governor, ball type, two movements, straight line; Fig. 23, governor speed adjustment for changing speed of engine while running; Fig. 24, inlet valve, opens only when governor allows exhaust valve to close; Fig. 25, igniter; Fig. 26, magneto for making spark; Fig. 27, magneto friction wheel, operates by contact with balance wheel; Fig. 28, piston, three spring rings, wrist pin for connecting rod, adjustable to wear, receives oil from cylinder lubricator; Fig. 30, pump for pumping water to cylinder and combustion chamber water space; Fig. 31, pump eccentric strap; Fig. 32, water reservoir, holding three gallons, to keep engine at proper temperature on all day run; Fig. 33, water space around cylinder.

The Thiederhall Electrically Operated Mine.*

Among the practical electrically operated mines in ermany is that at Thiede, near Braunschweig, hich is equipped with direct current dynamos and motors constructed by Siemens & Halske of Berlin. The mechanical apparatus was installed for the Thiederhall Co. by the Nordhauser Machiue Co., formerly Schmidt, Kranz & Co. The electrical generating plant, noted in Fig. 1, is equipped with a high-speed engine operating by belt transmission a continuous current generator. The current is conducted through the switchboard noted in the background of the illustration to a storage battery plant located in an adjoining room. This set of accumulators is used as a regulating battery, and the current is conducted through cables to the various mining machines, pumps, hoists, etc., in different parts of the mine.

The electrically-driven hoist is shown in Fig. 2, and one of the two motors will be seen, which are directly connected to the winding drum of this hoisting apparatus. These motors are operated upon a 500-volts power circuit, and each have a capacity of 150 H. P. normal load, but are able to carry a heavy overload without difficulty.

These motors are shunt-wound, and are intended to work and elevate the various loads at different speeds from 113 mm. to 7.1 m., about 25 feet, a second. The weight of the hoisting cable per metre of length is 1 5 kilograms. The cable operates at normal speed of 6 m. per second, while the cages make 32 trips an hour. The weight of material handled during each eight-hour shift is about 200 tons. While conveying men up and down the shaft the highest speed allowed is 3 m. a second. The total depth of winzes operated by the electric hoist is 200 m.; its extreme depth below the surface is 500 m. In the upper shaft, 300 m. deep, a steam hoist is used.

The variation in speed of the hoisting motors is accomplished without using a controlling rheostat or resistance of any kind. For normal working two speeds are secured by placing the motors either in multiple or in series. While working at the high speed hoisting ore a speed of 6 m. a second is possible, while the lower speed of 3 m. a second is always used in taking the miners in and out of the mine. The two hoist cables operate two cages at the same time—one drum winding while the other unwinds. On the outside of the motor the commutator is arranged, and the armature is connected to the drum so that a new one may be placed in position in the shortest time possible. An extra armature is always at hand which can instantly replace an old one in case of accident.

Great braking effect when necessary is produced

*See Illustrations on Front Page.

by the operator at the switches which connect the motors, so as to operate them as generators supplying current to special resistance, bringing the hoisting drum to an almost instant stoppage. The absolute control of the hoisting apparatus by the electric motors is beyond the possibility of a hoist worked by steam. The hoist is fitted with two special brakes—one for usual work and another for use in case of accident as a safety brake. The first can be directly set by a foot lever controlled at the operator's stand, or indirectly by hydraulic apparatus. The water pressure required for the hydraulic operation of this brake is supplied by a small pump connected to the hoisting-drum shafting by an eccentric. The safety brake begins to operate when the cage is within 20 m. of the end of the shaft. An automatically tripped lever controls the motors, operating them as generators, thus constituting an electric brake. This lever may also, in case of emergency, be operated by the engineer.

Besides this arrangement an electric-signal gong is rung as soon as the cages arrive at the 20 m. mark in the shaft, thus notifying the operator to apply the foot or hydraulic brake at once. The upright instrument standards, shown in Fig. 3, support a voltmeter, an ammeter and a tachograph; this last mentioned indicates the speed of the cable.

The capacity of the generator in the power house is 60 H. P., while the motors sometimes take 300 H. P. in raising at their full capacity through the shaft. Of course, in this case, the storage batteries take care of the additional load for the required brief space of time. Such a plant, it is stated, is not only extremely reliable, having always a current supply in the accumulators in case of accident to the dynamo plant, but also that the original cost is much less for boiler, engine and generator machinery.

The steam hoisting apparatus even, in the first shaft, may be electrically operated, if required, because the dynamo in the generating station may be worked as a motor from the accumulator, in turn driving the hoisting machine of this shaft.

The highest speed at which this electric hoist is capable of working is 7.1 m. a second, by regulation with motors in parallel, while there is a medium speed with the motors connected in parallel at 6 m. a second. The greatest speed, when the motors are connected in series, is 3.6 m. a second, with a medium-series speed of 3 2 m. a second. The speed may be lowered to 113 mm. a second for repairs and inspection. The manufacturers guaranteed a total speed of 32 trips an hour, while in actual practice it has been found possible to guarantee 81 trips, or 2.5 times as many.

In the power house the generator is kept running continuously, whether or not the hoisting or other mining machinery is at work. The accumulator is steadily charged by the surplus current, while the apparatus in the mine is working under light load, or the hoisting machines are not in operation.

A most essential feature of a great mining system is the telephonic equipment and signal apparatus, which must be durable and of the highest grade. It is essential that all signals be accurately transmitted, and that it be possible to hold communication with all parts of the mine unfailingly and instantaneously. The serious consequences which would many times result from any failure of this class of apparatus have caused great care to be taken in the installation of the telephones and signalling indicators. Means are provided for connecting the telephones under ground to the cables by metallic boxes, which are moisture proof, and additional precautions are taken by placing the whole equipment in another case where the apparatus is in special danger.

The person who attends the hoisting machine at the elevator shaft is supplied with both automatic indicators and telephonic apparatus.—Condensed from Electricity.

Mining Statutes for Philippine Islands.

The Senate Committee on the Philippines has accepted the report of the sub-committee, consisting of Senators McComas, Deitrich and Rawlins, appointed to prepare a plan for disposing of the mineral lands in the Philippine islands and prescribing the conditions of mining in those islands, and the plans suggested will be adopted as a substitute for the portion of Senator Lodge's bill dealing with this subject.

The substitute does away with extralateral rights to lode claims. The locator of a lode or vein is allowed to enter a tract of land 1000 feet square, and he is required to plainly mark his claim with posts. Record of claims is to be made with the Secretary of the province in which they may be located. No one person is to be allowed to make more than one location on the same lode, and the surface land and timber are to be used only for the development of the lode. It is required that not less than $100 worth of work shall be done on a claim each year. To secure a patent on a claim $500 worth of work must be done. Placer claims are limited to twenty acres of land for individuals and 160 acres for associations, and authority is given to enter petroleum or building stone land under this provision. Entries of coal lands to the extent of 160 acres are authorized.

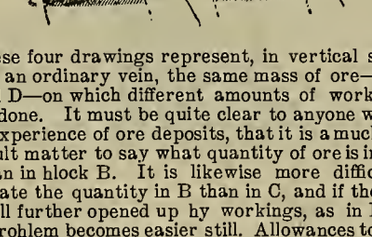
Ore in Sight.*

By J. D. KENDALL.

The estimation of ore in sight is very far from being one of the most difficult matters with which an engineer has to deal. Yet some of the most serious losses in mining have been incurred through errors in such estimates, and engineers have, very properly, been most severely censured for their failures in this connection. It is therefore proposed to bring the matter before the Institution with a view of making some recommendations which, if followed, will in the future greatly reduce, if they do not prevent altogether, the losses which have so frequently arisen in the past from the so-called estimates of ore in sight.

DEFINITION OF TERMS.—Ore in sight is an expression of very common occurrence in reports on mines. The meaning attached to the phrase does not appear, however, to be always the same. In some instances the so-called "ore in sight" is only "ore in imagination." The former expression, it is true, is not a happy one, for the ungotten ore of a mine can never be all in sight even when "blocked out" in the most complete manner possible in the regular working of mines. No matter how small the pillars, or masses of ore, blocked out may be, there must always be a large proportion in the interior of them which can not be seen. But if a person of experience can see the four sides of a rectangular mass of ore, in a vein, for example, he can, in the great majority of cases, form an estimate—not absolutely accurate, it is true, but sufficiently so for commercial purposes—of the quantity of ore contained in that pillar. He may in some cases be able to do so if he can only examine three sides of the ore mass, or again even when only two opposite sides are in view; but in each of these cases he will have to employ a different factor of safety. This factor will also vary with the size of the mass under consideration. These remarks may be extended to ore bodies of other shapes. On the other hand, if only one side of a mass of ore can be seen, it must be perfectly clear that no one can tell what quantity of ore is in that mass. The side visible may show a large area of ore, but quantity of ore involves a third dimension. If this be wanting, we can not possibly know anything about quantity. The third dimension, so often unfortunately assumed, can only be ascertained, with an approach to accuracy, by "blocking out," so that "ore in sight" may be looked upon as synonymous with "ore blocked out."

By blocking out is meant the exposure of ore on two, three or four sides of a rectangular or other shaped mass, as is partially shown in the following diagram:



These four drawings represent, in vertical section along an ordinary vein, the same mass of ore—A, B, C and D—on which different amounts of work have been done. It must be quite clear to anyone who has had experience of ore deposits, that it is a much more difficult matter to say what quantity of ore is in block A than in block B. It is likewise more difficult to estimate the quantity in B than in C, and if the block be still further opened up by workings, as in Fig. 4, the problem becomes easier still. Allowances to cover any possible error from nips, intrusions or inclusions, would have to be greater in the case of A than in that of B, and greater for B than for C. The allowances must, in fact, be inversely proportional to the amount of blocking out. They must also vary as the distances apart of the exposed sides vary. For example, in the case of No. 1, if the tunnel were 200 feet below the surface at block A, the estimation of the probable amount of ore in that block would be much more difficult than if the depth were only 50 feet, and therefore greater allowances for possible variations must be made. The same remarks apply to the other figures. The extent of allowance—that is, the factor of safety—depends largely upon the character of the deposit, and must be determined on the spot for each particular case.

Blocking out does not mean simply the exposure of ore by trenches, tunnels, drifts, winzes and raises, but includes also the exposures that sometimes result from denudation.

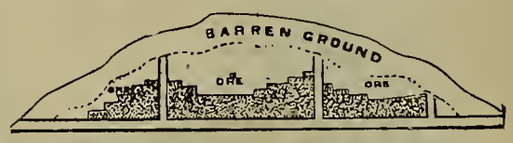
WHY BLOCKING OUT IS NECESSARY.—Owing to the very irregular manner in which ore deposits usually occur, no one can, as a rule, form even an approximate idea of their extent until the boundaries have been determined by actual work. But even if the main or outside boundaries of a deposit be known, there is still much to be learned with regard to the inside boundaries, for most, if not all, deposits contain more or fewer or larger or smaller inclusions of country rock, or other barren ground, about which we can not know anything until the deposit has been more or less blocked out.

Variations also occur in the quality of ore in different parts of a deposit, so that the more we see of it and the more samples we can take, the more likely are we to arrive at the average quality of the workable portion of it.

The man who has not from experience realized the truth of the above statements will be apt to permit his fancy to form his facts, and so reach conclusions which will most probably be altogether unreliable; for he will assume extensions which may not exist, continuity where they may (and probably will) be great interruption and uniformity where there is great variation.

A few of many instances that have come within the writer's experience will now be given of the unreliability of estimates of ore in sight which are made when the ground under consideration has been insufficiently blocked out.

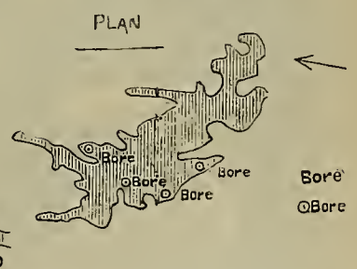
ILLUSTRATIONS OF ERRONEOUS METHODS.—The first illustration relates to a deposit of argentiferous galena, which occurred as a vein. The diagram below gives a section along the vein, and shows the amount of work done at the time the engineer of an intending purchaser made an estimate of the ore in sight.



Had the vein carried ore at the surface, it would have been fairly safe to infer that the ore in the back of the stopes would extend to the surface; but, without satisfying himself of the existence of ore in the vein at the surface, the engineer referred to assumed that the body of ore he had seen in the stopes would extend out to "day." Had he taken the trouble—as he ought to have done—to ascertain what really was on the surface, his estimate would have been very different from what it was, if, indeed, he had thought it possible to make one. The writer followed soon after with the same object; but, failing to find any ore on the surface—that is, lacking the third dimension—did not make an estimate, because the ore above the stopes could not be said to be in sight.

When the stopes were extended upwards, it was found that the ore actually nipped out along the dotted line in the diagram.

Another instance is in connection with a deposit of hematite. The deposit had been discovered by means of boring. Hematite had been found in five holes at the points shown in the following diagram:



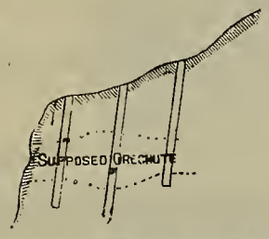
It was assumed that all the bores which passed through ore were in one and the same deposit, that the deposit extended literally much beyond the bores, and that therefore a body of ore containing at least 650,000 tons had been "thoroughly proved"—to adopt an expression made use of in the report prepared for the sale of the property—which expression may be considered as another way of writing "ore in sight." This estimate led to a very serious lawsuit, for when the deposit was practically exhausted only 41,879 tons of ore had been raised, the lateral extent of the deposit being shown in the above diagram. To assume that all the bores which cut hematite were in one deposit was to disregard entirely all experience of such deposits. But, further, the founding of such conclusions so important, financially, on such insufficient data is most reprehensible. If the ore had been more thoroughly bored, or blocked out by workings, before any estimate had been attempted, no such ruinous mistake could have been made.

Let us now consider an estimate of ore in sight relating to some gold-bearing veins. In its disregard of facts and its confident reliance upon assumption, this is, perhaps, the most reprehensible instance that has ever come under the writer's notice. One vein could only be seen for a length of about 50 feet

*From a paper read before the Inst. of Mining and Metallurgy.

in a trench about 4 feet deep. The width of the vein in the trench was about 18 inches. On these data it was assumed—for prospectus purposes, it ought to he said—that the vein contained 1,000,000 tons of ore. There were three other veins in the property which —also for prospectus purposes—were assumed to contain over 4,000,000 tons of ore, although there was not sufficient work done on them to thoroughly prove the existence of 4000 tons. In this case we have not simply the assumption of the third dimension, the whole three are assumed. Can we wonder that severe things are sometimes said of those who make such an unscientific use of the imagination. Whether it be from incompetence or dishonesty is immaterial, the final outcome is alike disastrous commercially. That any competent person ever made such an estimate is incredible, and that anyone should issue such an estimate to the public, after its utter unreliability had been pointed out fully, is, to say the least, most discreditable.

Another instance may he given to show the risks that are sometimes run in estimating quantities on a minimum of information. The vertical projection below was suhmitted to the writer by the owner of the property to which it related, with a view to sale.



An ore chute was represented as existing in the form indicated ahove and a quantity given, corresponding thereto, as ore in sight. When the writer examined the mine he found that no chute existed. The country rock was limestone, in beds 2 to 4 feet thick, standing nearly on end. The overlying rock was igneous. The ore, a highly argentiferous galena, occurred interruptedly along the bed planes of the limestone, as shown helow in plan, on an enlarged scale.

The different lots of ore seen in the uppermost tunnel were not on the same hed planes as those in the level helow, which again differed from those seen in the hottom tunnel. Moreover, ore occurred outside the supposed ore chute altogether. As a matter of fact, there was not a scrap of evidence on hand to show that such an ore chute, as was assumed, existed. Not one of the lenses of ore extended from one level to the other. Had the ground been further blocked out hy a numher of raises, the invalidity of the inferences drawn with regard to the supposed ore chute would have been demonstrated.

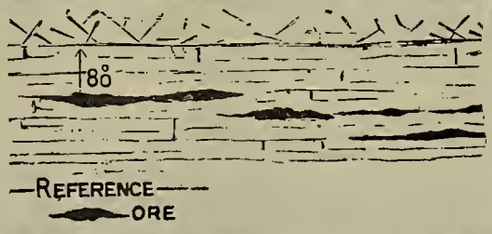
LOSSES RESULTING FROM OVERESTIMATE.—Excessive estimates of ore in sight not only enahle promoters to ohtain exorbitant prices for their properties, but most prohably induce the purchasers to erect expense treatment plants, which soon become useless where they stand, and often altogether valueless on account of the cost of removing them. Both these results cause unnecessary expenditure, which means avoidahle loss, and, therefore, they are highly detrimental to honest mining. To put it on no higher plane, that ought to be quite sufficient to induce engineers to keep their estimates within the hounds of fact.

SUGGESTIONS.—As a rule, statements as to the quantity of ore in sight, like many other statements in reports, are made so that there is no possihle way of checking them without going on to the ground. You have the simple statement that there are so many tons of ore in sight, and you are expected to accept it. That is not as it should be. Every statement of such quantity should he accompanied hy an accurate plan and vertical section, on a working scale, which shall indicate the extent of ore to he estimated, and show clearly the ore which is known to exist, as distinguished from that which is only inferred. The width of the pay chute should be marked on the section at equal distances apart. Samples should also he taken at equal distances. The frequency of hoth will depend upon the character of the deposit. If variable in form, hut fairly uniform in quality, the widths will need to he taken much more frequently than the samples. If the quality is variable the samples must be taken frequently. The width or length, area and weight which each sample represents should in every instance he stated. It is importaut, too, that the lines along which the samples are taken be shown on the plan. Ore deposits are frequently more or less handed, and, often, the values vary in the different hands. It is necessary therefore that, in such deposits, the samples be taken across the banding, and not lengthwise of it. If taken in the latter direction the latter may he wholly from a rich hand, or wholly from a poor one, and therefore, do not represent the average quality at that part of the deposit.

If these suggestions he followed we shall hear much less than in the past of errors in estimating ore in sight, for anyone can then check the calculations, and see at a glance what has heen observed and what assumed. Only hy willful misrepresentation could the facts then be concealed.

Some people, unfortunately, are incapahle of recording facts accurately, either from lack of the necessary training, or hecause their ohservations are more or less vitiated by all sorts of ideas that are not paralleled hy phenomena, so that what is becomes twisted into what, from their point of view, ought to he. Such men would he much more useful in the realms of fiction than in a mine.

Others, again, are more or less capahle of making the ohservations suggested, but from lack of ex-



perience in structural geology, are not, in some cases, capahle of forming a reliahle opinion as to the quantity of ore in sight. The work of such men could be checked if their reports were prepared as recommended.

The careless and reckless who might airily write down a few figures in the usual omnibus sentence as to the quantity of ore in sight—looking upon them prohahly as a mere matter of opinion—would douhtless feel themselves compelled to go into the matter thoroughly when the facts on which their opinion was hased had to he set forth clearly in the manner suggested.

It is also necessary that a statement should he made as to who is responsible for the different data employed, as for example: Who made the geological ohservations, who took the samples, who made the assays, who supplied the plans. The value to be attached to each part and to the whole can then he fixed with some degree of uses data supplied hy one less able or less careful, the conclusions of the former may be of very little value. In conclusion, the writer wishes it to he clearly understood that this communication is not so much intended to set forth all the methods and precautions needed in estimating ore in sight, many of which can only he determined on the spot, as to urge the importance of having all the observations of fact relied on to set out in the report and accompanying plan that anyone competent to do so may check the results. The effect of such a course will prohahly he to induce greater care on the part of those responsible for the estimates, and at the same time increase the confidence of those for whom the estimates are made hy affording a clear indication of what is meant hy "ore in sight" in each particular case.

Iron Smelting by Electricity.

In the valley of Camonica, in northern Italy, electric furnaces have heen erected for the purpose of manufacturing pig iron under the Stassano patent.

There are three furnaces, taking 500 H. P. each, used. In these furnaces electrodes are employed, placed in the lower part. The ore is pulverized hefore heing put in the furnaces and a sample carefully inspected and analyzed with the ohject of ascertaining how much carhon will be necessary to reduce it successfully, likewise the required quantity of fluxes.

After a determination of the lime, carhon and silicate, the proper proportions are added to the pulverized ore and hriquettes are formed, to which are added from 5% to 10% of coal tar. The furnace heat developed around the electric arc decomposes the iron ore, the oxygen with the carhon uniting to form carbon-dioxide. The figures given show that 3000 H. P. hours of the current, costing $3.42, are required to make one metric ton of iron.

Live Mining Exhibit at the St. Louis Exposition.

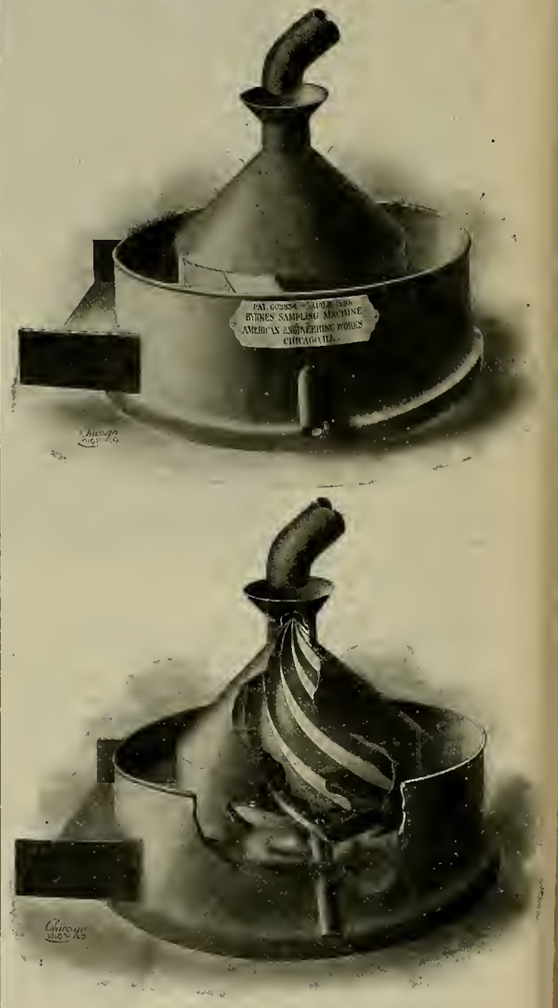
Representatives of the zinc and lead miners of Missouri have made inquiry of the chief officer of the mining and metallurgical department of the St. Louis World's Fair as to whether the erection of a zinc reduction mill would he accepted as an exhibit, the mill to he operated during the fair. The chief officer said, in reply: "That is just what the Louisiana Purchase Exposition wants you to do. There will he plenty of room for your zinc mill in the hig Mining and Metallurgy building. Make your exhibit as 'live' as you can, and don't worry about the space. Preparations are already in progress for the installation of stamp mills and smelters by the gold and silver mining men of Colorado, and the copper miners will have their machinery in operation in the same huilding. The mining exhibit at the World's Fair will be the largest and finest and liveliest ever assembled."

ELECTRICITY was first used for lighting purposes late in 1881 or early in 1882. Electric street lighting in Brooklyn, N. Y., hegan in 1884. The first city lighting hy electricity in the United States was in Cleveland, O., in 1879, the Brush arc lamps heing used.

Automatic Pulp Sampling Machine.

Every practical mill man knows that the practice of sampling hy a cup or dipperful of material is inaccurate. The sampling machine represented by the accompanying cuts is intended to be located in the system of launders or pipes in a mill so as to take the entire flow from the stamps or crushing machinery, or the entire flow of concentrates or tailings from tahles, vanners, etc., so that from the entire flow an absolutely average and definitely known part or sample may he taken.

Material is received in the hopper of the sampler onto the apex of an inside cone, the space between the inner and outer cones being divided into ten equal spiral chambers. When the material flows through these spiral chambers a rotary motion is developed. Nine of the spiral chambers discharge directly into the fixed casing, forming the hase of the sampler and through the free outlet of the casing can be led wherever desired. One of the spiral chambers is entirely closed and extends through the outer cone, terminating in a spout or chute which is open on the hottom. This spout or chute also discharges into the casing forming the base of the sampler, hut at every rotation of the douhle cone the spout passes



Automatic Pulp Sampling Machine.

over and discharges a certain amount of the material, heing sampled into a tuhe provided with a slot opening of known width. The width of this opening hears a known and definite relation to the circumference of the circle described hy the spout, thus a known portion or sample is caught and conducted hy the tuhe through the casing into any convenient receptacle placed outside of the sampler and under the outer end of the tuhe.

The operation of the machine appears simple and automatic. The makers say that one of these samplers has heen in constant and successful operation for the past two years in a well-known plant near Butte, Mont.

Five sizes of this machine are heing manufactured and carried in stock, varying in capacity from 25 to 600 gallons per minute. Other sizes can he made if desired. The standard machine is designed to cut out a sample exactly $\frac{1}{30\,0\,0}$ part of the entire amount of water and material flowing through the sampler. When required for use in cyanide or chemical work every part can he made of the material hest adapted to meet requirements.

This sampler was invented by Owen Byrnes, of Empire, Mont. The American Engineering Works of No. 204 Dearhorn St., Chicago, are the sole licensees, under the Byrnes patent, and will he pleased to furnish full information and quote prices to any one requiring this apparatus.

Mining and Metallurgical Patents.

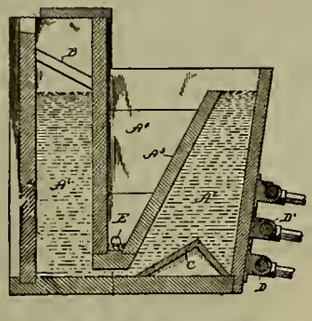
Patents Issued March 18, 1902.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

CHUCK FOR ROCK DRILLS.—No. 695,388; R. H. Hamill, Salmo, Canada.

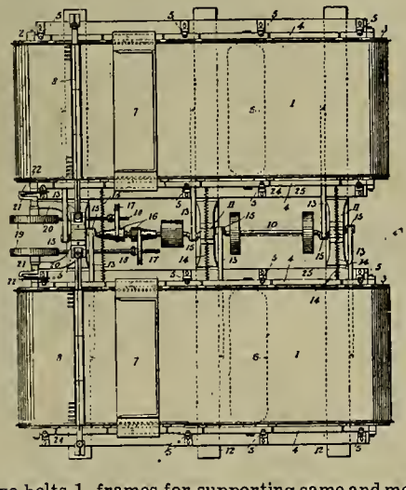
A head bored to receive a drill shank and formed with slot communicating with hore, in comhination with chuck key inserted in slot; hridge crossing slot and formed with dovetail groove in its under side; dovetailed key fitted into groove and wedge adapted to engage dovetailed key and chuck key.

ORE PULP DISTRIBUTER.—No. 695,654; F. W. Sherman, Park City, Utah.



Receptacle provided with pressure chamher having supply opening, sizing chamher connected therewith at or near its lower portion, and overflow chamher arranged to take care of overflow from sizing chamber and provided with discharge passage at or near its lower portion, screen in pressure chamher arranged adjacent to and underneath supply opening, inclined haffle hoard in sizing chamher arranged adjacent to connecting passage to hreak up eddy or current of pulp, and several multiple discharge valves connected with sizing chamher and arranged in different horizontal planes to take care of classified product and distrihute same uniformly through their several discharge openings.

ORE CONCENTRATING MACHINE.—No. 695,695; W. McDermott and F. E. Elmore, London, England.

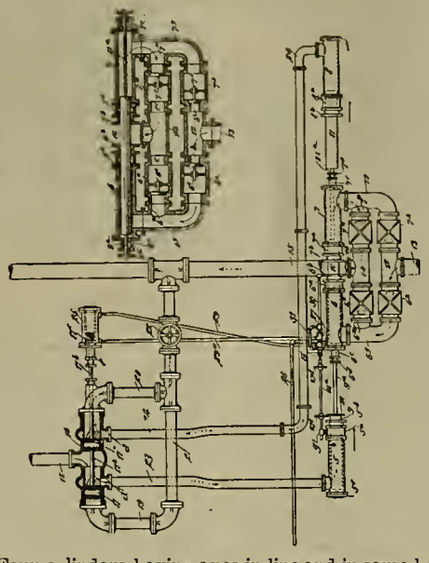


Two helts 1, frames for supporting same and means for causing helts to travel, common operating shaft 10, connecting rods 13 carried by frames, cranks carried hy shaft and acting on connecting rods for moving hoth frames in opposite directions, connecting rods engaging with cranks without caps wherehy thrusting motion only is imparted to them, springs 14 connected to frames for producing reverse movement of same, wherehy even motion without jar is ohtained, two cone pulleys 16 on shaft, driving roller 2 for each helt 1 and means connecting each cone pulley with roller so that two belts while driven from shaft 10 may he independently regulated with reference to speed of latter.

PROCESS OF PURIFYING ALUMINOUS ORES.—No. 695,762; D. A. Peniakoff, Brussels, Belgium.

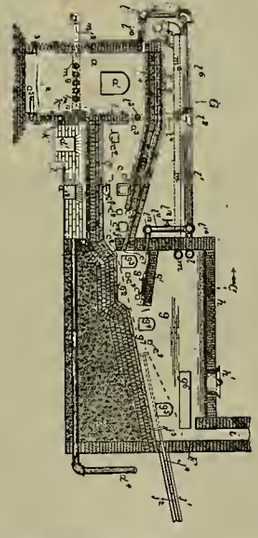
In the treatment of ferro-aluminous ores, such as hauxites, the process which consists in converting iron compounds therein into sulphides and then extracting iron sulphides thus formed with acid capable of attacking iron sulphide.

HYDRAULIC PUMP.—No. 695,815; C. B. Lakenan, Grass Valley, Cal.



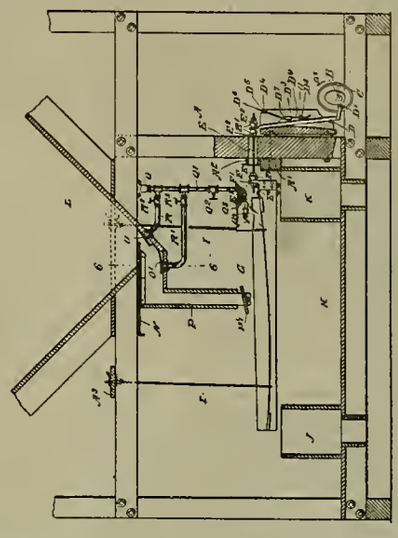
Four cylinders having axes in line and in same horizontal plane, outer cylinders spaced equal distance from adjacent ends of inner cylinders, which distance is less than the length of either cylinder and packing hox, and inner cylinders separated short distance at adjacent ends; packing boxes affixed upon ends of cylinders and exterior to cylinders wherehy interior packing is ohviated; three plungers axially in line, two occupying outermost cylinders and having length ahout equal to combined length of cylinder and exterior packing hox which it occupies, and intermediate plunger operating in two inner cylinders and having such proportionate length as will permit it to fully occupy one cylinder, and also pass through packing boxes on adjacent ends of inner cylinders; branch pipes leading from sides of inner cylinders and turned toward each other and axially coincident; valve hoxes secured upon hranch pipes and provided with valves; water inlet; pipe connection hetween hranch pipes and provided with valve hoxes; and discharge pipe leading from pipe connection.

REVERBERATORY SMELTING FURNACE.—No. 695,868; F. Nevegold, Portland, Or.



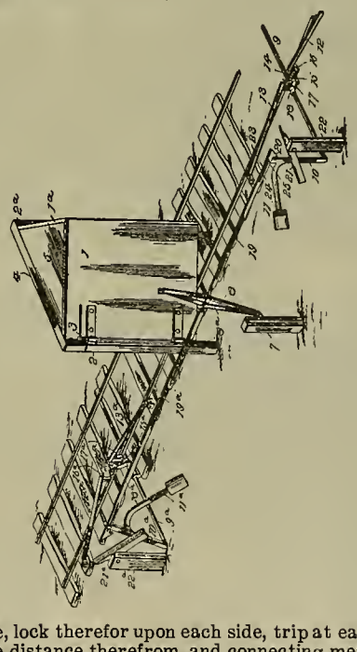
Fire chamher, smelting chamber, and intermediate concentrating chamher, smelting chamber heing on higher plane than concentrating chamher, inclined floor portion or roasting hearth, g^7 in smelting chamher; bridge wall h, separating fire chamher from concentrating chamber, reverberating roof over fire chamher and concentrating chamber, false roof extending over fire chamber, and for greater length of concentrating chamher, providing with reverherating roof intermediate heating chamber, discharging into forward end of concentrating chamber; means for producing hlast through base of fire chamber, and secondary blast through heating chamher; means for regulating hlasts relatively to each other; means for throwing continuous current of air or vapor under false roof, to protect same against heat, dividing wall f, between concentrating and smelting chamhers, having upper passageway, or flue c^7, and lower passageway, c^8, for fluid smelted material, upper passageway heing adapted to direct blast of volatile matter issuing out of concentrating chamber onto smelting hearth, and roof of lower passageway being low so as to skim melted material passing through passageway and hold back insufficiently fused matter, walls of concentrating chamher heing provided with slag taps arranged on level with lower passageway; arch g', projecting from wall f over smelting hearth for purpose of there concentrating heat; suitahly disposed doors in concentrating and smelting chambers for supplying fuel; means for injecting continuous current of air or vapors under arch g' to protect same; an auxiliary fire chamber d; and means for injecting blast therein.

COAL WASHER AND ORE CONCENTRATOR.—No. 695,790; A. C. Campbell, Asheville, N. C.



Pan and means for oscillating and imparting percussive action to it, pan having true bottom and false hottom, chamher heing hetween hottoms and increasing in depth toward discharge end and in direction in which percussion takes place, false hottom consisting of spaced riffles having perforated pockets at forward ends.

MINE GATE.—No. 695,858; N. K. Bowman, North Lawrence, Ohio.



Gate, lock therefor upon each side, trip at each side of gate distance therefrom, and connecting means hetween trips and gate, including bars mounted for longitudinal movement in opposite directions, parts heing combined, wherehy actuation of trip upon one side of gate by approach of a car effects opening of gate and sets lock upon opposite or far side of gate to hold latter open and whereby operation of remote trip effects release of lock and permits gate to close.

ELECTROLYTES are electrical conductors which are distinguished from ordinary conductors in three particulars. With a few exceptions their resistance decreases with increase of temperature, instead of conversely, as in the case with ordinary conductors; most electrolytes are liquid at ordinary temperature; and they are decomposed by the passage of a current. Perfectly pure water is not a conductor of electricity, nor is perfectly pure acid, but a solution of sulphuric acid in water is a conductor; and this is true of many other solutions of salts and acids in water. When an electrolyte is decomposed hy a current the molecules are separated, and some are liherated at one electrode and the others at the other electrode, as, for instance, the oxygen and hydrogen of water, which are liherated each at its own electrode.

MINING SUMMARY.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

KETCHIKAN.

It is understood that a sale of the Westcoatt properties at Niblack Anchorage, Prince of Wales Island, has been made to Eastern people, who will begin the work of development next month.

NOME.

In Boulder creek, in the Kuskokwim district, the pay streak has been located from the mouth to No. 5 above discovery, a distance of about 2 miles. In some places it is over 100 feet wide, and from 3 to 5 feet deep, averaging 15 cents to the pan.

Winter work on the Dexter benches at Nome has been carried on on three or four of the claims, fifty or sixty men being employed in taking out dumps. The benches opposite No. 5 and 7 were worked this winter, as well as Creek Claim No. 2 on the left fork and the fraction between Nos. 1 and 2. J. A. Dufresne, the owner of No. 10, expects to have a $30,000 dump by spring. With the building of the proposed ditches, Mr. Dufresne expects next summer to work the claim hy hydraulicking.

Private letters from Nome state that work during the early winter was progressing steadily on the benches of Anvil, Dexter, Cooper, Glacier and other creeks. The latest news from the Arctic district stated that good pay dirt had been found for 20 miles along Candle creek. The construction during the winter of a large water ditch to carry a strong head of water from the Nome river to the benches of Anvil and Dexter creeks had been started and it was expected to complete it early this summer. R. T. Chestnut writes that the country about Council City will become this year a great gold producing district. From Nos. 15 and 23 on Ophir creek C. D. Lane is said to have taken out over a ton of gold in 1901, and it is understood that Lane's representatives will employ 1000 men in his mining and industrial enterprises during the coming summer.

VALDEZ.

The Alaska Copper Co., H. O. Havemeyer of New York president, it is reported, has bought the McClelland copper mines, in the Chittyna district, at $1,100,000 for ten-elevenths of the forty-five claims, with 320 acres of coal land. W. R. Abercrombie and B. F. Millard own the remaining one-eleventh. Of the price, $2500 has been paid, $5000 is to be paid No. 1, 1903, and the remainder by Nov. 1, 1904. It is the idea in Alaska that the company will build a railroad to the property, so as to get copper and coal to tide water.

ARIZONA.

COCHISE COUNTY.

Under D. E. Heller the preliminary work for the construction of the reduction plant of the Calumet & Arizona Copper M. Co., at Douglas, is being rapidly accomplished. The company has a quarry from which stone for the foundations for the heavy machinery is being procured. A spur from the railroad has been built to the quarry.

GILA COUNTY.

The annual report of the Old Dominion M. Co., at Globe, for the year ended Dec. 31, shows:

Gross value of copper, silver and gold product		$1,276,979
Cost at mines and smelter	$993,800	
Freight, copper chgs., commissions, etc.	169,339	
		1,163,140
Profit from production.		$113,839
Special con. and imp. account		72,197
Surplus		$41,659
Balance on hand Jan. 1, 1901	$401,992	
Difference in price in stocks on hand, 2,300,000 pounds fine copper at 16⅝c (Dec. 31, 1900) and 12c (Dec. 31, 1901) 4⅜ cents	106,375	
		295,547
Balance of assets Dec. 1, 1901		$337,206
Cost per ton ore mined	$5.845	
Cost per ton ore smelted	4.798	
Cost per pound copper, exclud-in cons		.1153
Cost per pound construction		.0072
Total cost per pound		.1225
Average yield fine copper		6.23%

E. Smith and W. W. Swetland, of Los Angeles, have taken a year's bond, at $22,000, on two copper claims owned by N. S. Berray and C. Bartailleur on Middle Pinto creek, near Glope. Work is to be commenced before April 15.

Operations in the Gray shaft of the United Globe mines, at Globe, have been interrupted by an unexpected flood of water encountered at a depth of 780 feet, the water rising rapidly 200 feet deep in the shaft. Two No. 9 pumps have been submerged. The shaft will be unwatered by the use of tanks, using two of 700 gallons capacity.

In the Alice mine of the Troy group, at Troy, the crosscut from the 165-foot level has been driven through the lode, opening fine ore. In the Sisson shaft of the Manhattan sinking was resumed, and the shaft is now in a large body of iron, heavily copper stained. The third level drift from the Sisson shaft is in 12% sulphide ore.

MARICOPA COUNTY.

(Special Correspondence).—The outlook for the mining industry of central Arizona has never been more flattering than at present. The regions of Wickenburg and Congress are receiving a great deal of attention from prospectors. Work on the Leviathan Co.'s property near Octave is showing up well in a widening body of ore of the same character as that of the Congress and Octave mines. Southwest of Wickenburg Senators Dorsey, Pettigrew, Chandler, Teller and J. P. Jones are interested in a group of fifty claims called the Del Monte, on which considerable work is done in the way of development. An 80-stamp mill, concentrator and cyanide plant are being provided for this property and will be erected during the coming summer. The Angel group of copper mines is to have reduction works erected at an early day. At the Oro Grande, where less than a year ago the first strike of rich ore was made at the depth of 34 feet, Upton, Hatfield and Ellis of Wickenburg and G. E. Lamb of Iowa, the owners, have the shaft down 300 feet and about 1700 feet of drifts and crosscuts, all in ore, with only one wall of the ledge found. The workings cover a width of from 120 to 150 feet. It is announced by the owners that a 100-stamp mill is to be erected immediately and reduction of the ore begun. B. Hatfield, one of the original owners, has recently sold his one-sixth interest to his partners for $100,000. A three-compartment shaft will be dug as an upraise and will be ready before the mill can be erected.

Another property that looks most promising is that of the White M. Co., lying 6 miles from the Oro Grande. It is in an entirely different formation. The two ledges, well defined in their outcroppings, are about 10 feet wide, with pay streaks of from 2 to 4 feet. About 600 feet of work is done in short tunnels.

Phœnix, Arlz., March 23.

MOHAVE COUNTY.

Work on the Burro properties, near Kingman, will soon be started up. A mill is to be installed at once and operated by water power from Burro creek. A site for power development has been located, and the transmission line will be less than two miles long.

S. C. Bagg, Supt. of the New Comstock M. Co., near Kingman, is arranging for a supply of coal at the mill on the Colorado river. Large ore bins are under construction, and a tunnel is being driven in to open the ore body at a depth for stoping.

PINAL COUNTY.

The Mineral Hill M. Co. has been incorporated in Phœnix with capital $1,000,000. J. W. Cope, A. S. Arthur, M. T. Russell, C. M. Sturges, B. F. McFall and E. S. Russell are the directors. The company's mines are located in Pinal county, and are said to be rich in silver. Considerable work has been done on the property.

SANTA CRUZ COUNTY.

The Independence is the discovery claim at the new gold find near Patagonia. It is owned by R. R. Richardson, W. Powers and J. B. Seager. About fifty claims have been taken up. J. Parks has the old Gringo mine, which is close up to the side line of the Independence. There are a number of claims which have been located upon which work is being done. On account of the richness of the ore taken from the Independence, the shaft has to be guarded. It is estimated that more than $1000 in value was stolen in one night and carried away. There is a good road into the camp, also abundance of water in the gulch, along which tents are being pitched and camp established.

YAVAPAI COUNTY.

The Gopher mines, near McCabe, have been hought hy the McCabe Extension Co.

The Big Rebel G. M. Co. has been incorporated, with Mrs. M. K. Church as president and J. H. Hise of Prescott vice-president and general manager, to take over and operate the Red Buck and other claims near Kirkland. A stamp mill will be erected.

F. Williams has sold the Storm Cloud group of mines near Prescott to Chicago people, who propose to go right to work sinking. The payments run through a period of fourteen months. The purchase price is said to be $40,000.

S. E. Bretherton, metallurgist at the Val Verde smelter at Val Verde, gives the following as the composition of the charges, 100 of which are fed into the furnace during twenty-four hours:

	Pounds.
Sulphides	960
Copper containing lime	240
Slag containing small per cent values	500
Coke	55
Total charge	1755

Thus it will be seen that the first two items of ore amount to 1200 pounds to the charge, or sixty tons every twenty-four hours, and with the adding of the slag makes eighty-five tons, leaving two and three-quarters tons as the small amount of coke used. This is the work the furnace is now doing, and on the basis above given twelve tons of ore are being concentrated into one ton of matte. The ore which has been run so far carries from 7% to 11% arsenic and a great deal of sulphur. Of the former, all is extracted from the ore and very nearly all of the latter, making a very excellent quality of matte.

Supt. Mansfield of the Empire Co. and Groom Creek G. M. Co., at Groom Creek, has installed a pump in the Alma mine shaft, which is making more water all the time. The vein of ore, 18 inches wide at the surface, is 4 feet wide down 135 feet. The shaft will be put down 200 feet and drifts run each way on the vein.

CALIFORNIA.

AMADOR COUNTY.

The Sargent quartz mine at Middle Bar has been bonded by W. B. Thomas, Supt. of the Central Eureka mine at Sutter Creek, for four years at $30,000, $50 a month to be paid. Operations will be commenced at once.

The Central Hill gravel mine has been bought by Nuner Bros. of San Andreas and the old bedrock tunnel has been cleaned out and retimbered.

In the Bootjack mine at Plymouth a 4-foot ledge is claimed in the 100-foot deep shaft. A crushing of 100 tons of ore is to be made and is expected to go $7 or $8 to the ton.

CALAVERAS COUNTY.

The Junction placer mine at Douglas Flat, near Murphys, is being developed by Williams, Roberts & Co., who are sinking a shaft to reach the bedrock of the channel.

At the Fanny Marie mine at Glencoe, in the 200 and 300-foot levels the ore prospects well. At the Bluejay, near Jesus Maria, another property of the company, a tunnel has been stated to tap the vein 800 feet down. The ledge in the shaft on the surface is about 5 feet in width.

A strike has been made in the Mountain View mine, owned by Woodcock Bros., at Glencoe. A shaft has been sunk 120 feet. The 100-foot level shows a vein 5 feet wide, with free milling ore.

The mine in Hazel Dell gulch, near West Point, being operated by Newsome, Sterling & Congdon, is on a ledge 10 inches wide, but the ore is claimed to be extremely rich.

C. M. Burleson, who has bonded the Petticoat mine at Railroad Flat, has started development and has given a contract for 1000 cords of wood to be cut by the first of May.

A strike is reported made in the Sheep Ranch gold mine at Sheep Ranch. A crosscut run from the 1300-foot level to the ledge is stated to have struck the downward extension of the ore shoot 6 feet wide. J. T. Langford is Supt.

The Werle gravel mine, near Chile gulch and about 2 miles from Mokelumne Hill, is working its 3-stamp mill. Considerable dead work has been done during the winter in sinking, opening pay gravel.

J. J. Meyers of San Francisco has been examining the Black Oak mine, at Angels, which has not been worked for four years on account of water. At the present time there is a 90-foot shaft, which is to be sunk to 600 feet. The owners will put up either an electric or steam hoist. The company is composed of New York and Chicago people. F. McMillen of San Francisco is consulting engineer for the company.

The owners of the Angels quartz mine, at Angels, have bought the 20-stamp mill and air compressor now at the California Ophir mine and will remove it to the Angels mine and erect it in conjunction with forty other stamps.

The Salvator G. M. Co. is building a wagon road to its mine, near Mokelumne Hill, preparatory to hauling in the machinery for a 10-stamp mill. It is also making a ditch from Esperanza creek to its mill site.

Water from the Stanislaus dam was turned into the flume line of the Melones mine at Melones on the 19th, completing work of six years of preparation under the supervision of Wm. C. Ralston, general manager. Ore was started through the mill on the 22d.

DEL NORTE COUNTY.

E. A. Work and J. Bagley, of Crescent City, are interested in the Cant Hook Platinum & G. M. Co. Locations have been made of the bars along the South Fork of Smith river, for a distance of 4 miles. All the bars are claimed to prospect well in platinum and osmium. Preparations are being made to work the ground, which is expected to pay several ounces a day for each man shoveling into sluice boxes.——J. Holloway, who is mining on Smith river, it is said, has about forty pounds of platinum concentrates gathered from his gold mining operations this winter.

INYO COUNTY.

The southern gateway of Death valley has been opened, according to a letter received by Prof. Bailey of the State Mining Bureau. Prof. Bailey lately went through Death valley, especially investigating the salt and niter deposits that are of enormous extent. The letter tells of the opening and acceptance of a stretch of railroad several miles long, reaching from Manvel on the Santa Fe railroad lines over the summit of the mountains, from whence there is a somewhat easy passage into the valley for pack trains and wagons. The new line is the California Eastern. In addition to furnishing an entrance into Death valley this road also is supplying means to reach the Tonopah mines, and also the Searchlight mining district in southern Nevada. The line does not enter Death valley, but reaches a point from which it is comparatively an easy journey into it.

The Soda Works Co., at Keeler, is making preparation for the construction of sixty acres more of vats. The company has about 100 acres in use at present.

MONTEREY COUNTY.

The Ralston G. M. Co. is engaged in the first placer mining to be attempted in Monterey county. The property consists of forty-three claims, covering 860 acres, located near Mansfield, about 2½ miles from the coast. The output for the year ending December 10, 1901, was $8000 in nuggets. The report of the assay of the black sand shows that it goes $102.80 to the ton. Gold runs $17.25 to the ounce.

NEVADA COUNTY.

G. A. Nihell and G. Gray of Grass Valley have taken a contract to erect a building to hold a 5-stamp mill at the Niagara mine, in Willow valley, near Nevada City.

J. Clark has sold part of the Oro Fino mine, near Nevada City, to Capt. Ord of Benicia and associates.

R. Phelan & Co., owning the Gold Ridge mines, lying between Graniteville and Meadow Lake, have sold out to a San Francisco company, represented by M. M. Baruh, formerly of Nevada City. The latter is arranging for extensive operations as soon as the snow melts.

Dr. Fouch of North San Juan has completed arrangements for resuming work at the Ensign mine, between Sweetland and Birchville. A mill was erected on the property last fall and in a few weeks it will commence crushing ore.

The New Mohawk mine near Graniteville is to be operated by C. Schuenert of Sacramento, W. McLean of Graniteville and associates. Mr. McLean will have charge of the work.

The Providence G. M. Co. has sold and turned over the Providence mine and other properties at Nevada City to the Champion G. M. Co., it is reported, for $130,000. The Champion Co. now has the Champion, Merrifield, Wyoming, Nevada City, Spanish, Providence and Ural mines, giving a continuous string of mines for 3 miles on a rich lode. The Champion Co., with E. R. Abadie Supt., will work the Providence mine through drifts from the Champion mine. The Champion mill has seventy stamps and the Providence forty. The Providence mine was located in 1858 and has produced over $6,000,000 to date. The lode has been worked for over a mile and to a depth of nearly 2000 feet.

The Spenceville Mineral Co., C. W. Howard, Jr., manager, will begin operation again by the first of May. The company is to prospect the property by a diamond drill.

H. W. Morris, W. C. Peyton and J. P. Wallace, owners of the Yuba mine at Maybert, state that work will he immediately resumed at the Yuba under Mr. Morris as Supt. Only the pumps have been kept running for several months past.

PLACER COUNTY.

W. Duffy, Supt. of the Sailor gravel mine, near Westville, reports that he has

cut into well-washed blue channel gravel that prospects $4 per car.

PLUMAS COUNTY.

J. Gill and C. Penman have been prospecting a gold-bearing quartz vein near Quincy, and report the ledge to be from 10 to 25 feet wide and traceable for a distance of 3000 feet.

The mill at the Puscheck quartz mine on Bear river, 4 miles northwest of Colfax, has been started up.

SAN BERNARDINO COUNTY.

(Special Correspondence).—The Grand Central group of mines in Monumental mining district, 50 miles below the Needles, 37 miles below Mellen, the nearest railroad station, 12 miles from county wagon road at West Wells, and near the old Rincon steamboat landing on the Colorado river. The formation of the district is chiefly granite and porphyry. The six claims carry a small per cent of copper and one of them sulphide of iron. Considerable development work has been done by shaft, tunnel and open cut. Two years ago ore was shipped from three of the claims to Pueblo, Colo., towed up the river by Indians in small boats to Mellen. The returns are not at hand and cannot now be accurately stated, but at the time were considered extremely good. The mill site is on the river bank adjoining the mines.

South of this range, 9 miles from the Colorado river, is Copper basin, where E. D. Bannister of San Francisco and Mr. Leiter of Chicago were interested. It is said to be a very rich and extensive copper district. A mile above Rincon landing Los Angeles men have taken up all the gravel ground available for dredging purposes, and are said to be making preparations to start in on a large scale.

Yuma, March 16.

A letter from the Dale mining district states that developments indicate that the richer rock is at some depth below the surface. All the good rock milled from the O. K. mine, it is stated, came from below the 150-foot level. At 250 feet they have a large body of ore that mills over $40 per ton, while nearer the surface it milled less than $15. The Eaton mine ore on top assayed $3 and at a depth of about 100 feet some ore assayed up into the hundreds of dollars. Not enough development work has been done on any one mine to tell just what there is in the camp, but there are good prospects.

SHASTA COUNTY.

The Northern Light mine, near Shasta, is reported bonded by F. E. Ware of the Mount Shasta Mines Co.

The new mill of the Mount Shasta mine on Clear creek, near Shasta, has been completed and started crushing.

J. R. DeLamar of the Bully Hill copper mine and smelter is reported to be considering the doubling of his smelter to keep up with the new copper discoveries of the mine.

The Shasta G. & C. M, Co. has been incorporated in Salt Lake City, Utah, capital $300,000, with W. F. Mitchell president and G. C. Snyder secretary and treasurer. The company owns the De Dallas, Gossin King, Gossin Queen, Nut Pine, Sulphide, New York, High Ore and Queen Draga mining claims in the Pittsburg mining district.

In the Evening Star mine of Old Diggings, near Whitehouse, a crosscut tunnel has struck a ledge 800 feet in which prospects well. This ledge is paralleling the Evening Star vein, distant from it about 200 feet, and shows a width of about 8 inches.

SIERRA COUNTY.

At the Feather Fork Co.'s property, commonly described as the Thistle Shaft, the Bellevue tunnel is now in nearly 2000 feet, and in softer rock. It is going ahead at the rate of about 70 feet a week. There are about thirty men now employed.

The Wide Awake G. M. Co., of which F. H. Wheelan of San Francisco is president, J. L. Field of Alameda secretary, and W. H. Rouse of Oakland Supt., bought some years since an extensive placer claim near Downieville. The superintendent reports after seventeen months work that from tunnel No. 3, in an upraise of 45 feet, the old channel of auriferous gravel has been struck.

After prospecting for three years and a half the owners of the White Bear group of mines at Port Wine, A. S. Macdonald of Oakland, A. N. Lewis of San Francisco and associates have struck the old Port Wine channel formerly worked in the Monte Cristo mine adjoining.

SISKIYOU COUNTY.

The Clark hydraulic mine on the upper Greenhorn creek, owned by Martin, Hawkins & Co. of Yreka, has been bonded at $7000 to Colorado people, who intend reopening it. It has been shut down for over twenty years on account of litigation.

Extensive repairs and alterations have been made at the Dewey mine, near Gazelle. New concentrators and a canvas plant are included in the improvements. In addition a sawmill is to be erected at the mine in order to enable the company to cut its own timber and lumber.

TRINITY COUNTY.

A payment of $14,000 has been made on account for the Fairview mine, at Minersville, and the balance of the bonding price ($60,000) is to be made on June 1. C. Allenberg is one of the new owners and J. Porter is Supt. Two tunnels have been driven. No. 1 is in over 200 feet and 240 feet below the apex; No. 2 has been driven in 540 feet. The ledge is in slate and shows in a width of from 6 to 10 feet $8 to $10 a ton free-milling ore. A 10-stamp mill will be erected during the early summer.

C. Swoeny and wife of Spokane, Wash., have deeded to the Trinity County G. M. Co. the Chloride-Bailey group of mines on Canyon creek, at Dedrick.

TUOLUMNE COUNTY.

It is reported that a large and rich strike has been made in the Jumper mine, near Stent, a pocket of almost pure gold. It is claimed that almost $1,000,000 has been taken out or is in sight. The Jumper has a vein of free-milling ore in which, as work progresses every few months a pocket is uncovered. Two or three of the large ones have been taken out before, but this one just found, it is claimed, exceeds anything of the kind ever reported. The Jumper is owned by an English and Scotch syndicate.

L. M. Cody and C. A. Bigelow are reported to have struck a good pocket claim on the Hebbing ranch, near Tuolumne.

Ten stamps are to be added to the Republican mill at Jacksonville.

The Wild Cat and Joe Hooker mines at Sonora have started up. E. A. DeHaven is Supt.

A. Colby and H. M. Pease have struck a rich pocket in their claim on the Fleming vein, near Algerine.

The Golden West mine near Sonora is now running with full force, and the mill has been started up. On the 300-foot level there is said to be 20 feet of solid pay ore. There is a strong flow of water.

Single-handed machine drills are in use in the Soulsby mine at Soulsbyville. About 30 men are employed. The ore stoped is keeping the 10-stamp mill running one-half time.

Arrangements are being made by the Gold Ridge M. & M. Co. for the erection of a 10-stamp mill on the Gold Ridge group of six claims near Quartz. Developments made indicate a large deposit of fine milling ore. W. Jones is president, and A. Jones secretary of the company.

The Wheal Perrin mine, a parallel vein on the west of the Soulsby, at Soulsbyville, is being unwatered, and a steam plant is being installed.

At the Badger mine, near Jamestown, the shaft is down 250 feet, showing a 4-foot vein of good ore in the bottom. G. E. Stayton is Supt.

A 40 H. P. engine has been installed at the Potato Ranch mine, near Phœnix Lake, near Carter's. The shaft will be cleared of water and mining resumed.

The McAlpine quartz mine and mill site, near Big Oak Flat, have been bonded to S. E. Rigg. An incorporation is to be made and S. E. Rigg is to be Supt. Work is expected to commence before May 1st.

The Mohican M. & M. Co. has been incorporated, with office at San Francisco, to operate the Mohican mine. H. C. Chesebrough, G. W. Fisher, H. Fisher of Oakland, S. Holmes, W. Classen, C. E. Holmes, and E. Holmes of San Francisco are the directors.

M. C. Duchow has leased a portion of the Empire gravel mine and her half interest in the Bed Rock blue gravel mine, on Table mountain, near Sonora, to L. Lang, R. Lang and Duchow Bros. for five years. The lessees have commenced operations.

A rich pay shoot has been uncovered in the Dead Horse mine, at Carters. The Dead Horse was formerly owned by Hobart & Hayward and has been a gold producer for many years. It is the deepest worked mine on the east belt.

VENTURA COUNTY.

(Special Correspondence).—A group of mica claims in Piru mining district, Ventura county, promises well. The mica is of the muscovite or white variety, the formation granite foot wall, with hanging wall mica schist, the mica coming up between the granite and the mica schist and forming in the feldspar. A company has been formed and men are now at work under the direction of H. Mead. A camp has been established and a wagon road constructed, enabling transport of material from the highest claim, 6000 feet above sea level, to the lower camp, where a mill is being erected. Of the eleven claims now owned by the company three have been stripped—the Alamo for 150 feet, the Slopa 100 feet and the Gertrude runs for half a mile, extending into the Alta—all in varying widths, from 4 feet to 400 feet. Where the claims have been opened the mica shows in mass, with quantities of book mica.

Bakersfield, March 26.

COLORADO.

BOULDER COUNTY.

About 18 inches of high-grade gold ore has been opened up in the 70-foot level of the Gold Crystal mine at Ward.

A company is being formed to prospect the Red Jacket vein or ledge near Ward. This ledge of mineralized material is from 100 to 300 feet in width, and bears low-grade payable values at different points on the surface.

The New Morning Star M. Co. has been incorporated in Wyoming to operate at Ward, with capital $100,000. C. J. Pratt is president, D. W. Dwight secretary and treasurer, both of Boston, Mass. J. E. Lee of Boulder is Supt. at Ward.

The B. & M. mine, near Ward, is shipping a fine grade of smelting ore and accumulating mill ore on the dump. The mine is to have a mill to save an expensive haul.

CHAFFEE COUNTY.

The Silvertip G. M. & M. Co. has ten claims near Salida, which it will develop during the summer. A shaft is now being sunk and machinery will be put on at once to sink 500 feet. S. Hopkins is president, G. P. Nix secretary, and E. Beeler manager, respectively, of the company.

CLEAR CREEK COUNTY.

(Special Correspondence).—The plant of the Idaho Springs M. & R. Co., of which A. H. Roller is manager, is built in two sections. The first has 30 stamps, with an amalgamating plant following each battery, the material passing from the plates to Bartlett and Standard tables. The middlings from the Bartletts are returned to the Bartlett belt-slimer. At present about 60 tons per day are being run. The saving on the plates is an important item in treating the ores handled. The other section, the equipment for which is not yet in place, will have three crushers, six sets rolls, Colorado Iron Works shaking screens, and several Bartlett and Standard tables. This section will be strictly for concentrating work. The mill will do custom work, having now some good contracts with large producing mines.

The Seaton Mountain M. Co., F. S. Goldsmith, manager, is producing 500 tons of ore a month, the bulk of which is milled. Their work is mainly through the Foxhall tunnel, belonging to the Alma Co. From the highest surface workings to the bottom of shaft, that sinks from the tunnel level, is 900 feet. The underground work aggregates about a mile.

The Mixsell mill, sold to R. Reed, of Seattle, Wash., is being operated by the new management.

The Alma G. M. Co., owners of a group adjoining that of the Seaton Mountain Co., is in charge of manager J. J. May. The Foxhall tunnel, 1350 feet long, runs through Alma ground. A small tonnage of ore is being shipped, which is high grade. A gasoline hoister will be put in to sink from a point in the tunnel.

The Newhouse tunnel, now in 13,000 feet, is being driven ahead at the usual rate of speed. The haulage over the double track of this tunnel is now done by an electric locomotive, which is capable of hauling 70 tons. About 1000 tons of ore per month are being shipped out of this tunnel by mine owners who have mine connections made with it. Manager Hanchett states that thus far about 3000 feet per year have been driven, and that at this rate it will require two years and four months more to complete the tunnel.

The Little Mattie M. & M. Co., managed by W. S. Leebreck, has a group formed formed from the consolidation of the Mattie, Republican, Silver Glance and Newton. The property includes a mill which is being overhauled preparatory to operate. It will include crushers, rolls, screens, jigs, stamps, hydraulic classifiers and settlers, and concentrating tables.

The Consolidated Alpine G. & S. M. Co., one mile southeast of the Lamartine, was formerly a producer, and is now being put in condition to operate by the new manager, T. B. Crow.

As an indication of the activity and interest in Clear Creek county, it may be stated that for the year 1901 there were 380 patent surveys ordered by the Surveyor-General.

Idaho Springs, March 19.

The owners of the Cumberland and Independence group, at Yankee, have given an option to the Yankee Con. M. & T. Co. The mine is developed by the Cumberland shaft, 115 feet deep, in which there is over 4 feet of eight-ounce ore. A small 5-stamp mill at the shaft has made the mine pay its own way with a profit from milling from three to four tons per day of ore.

The Golden Hecla M. & M. Co. has been incorporated, capital $250,000, by J. W. Boyd, R. C. Quick and W. A. Haggott, to operate the Silver Horn tunnel, near Idaho Springs.

The Elgin M. & R. Co., of Chicago, Ill., has been incorporated to operate in Clear Creek county, by M. Green, J. Van Liew, and J. Stoddard, all of Chicago.

A party of Eastern people have been inspecting the Vulcan mine at Silver Plume, and it is reported that a new company will take over this property and resume work at once. It is believed that a large body of ore exists in the junction of some of the lodes of this group, but 200 feet of a tunnel will have to be driven to cut them.

E. H. Worrell, Jr., of the New Era M. Co., at Freoland, has made arrangements to start up extensive operations in a few weeks.

The Star tunnel, near Idaho Springs, is to be started up and driven to the Little Mattie mine to open it below the shaft. Air drills will be used in the work. The tunnel is now in about 1400 feet.

The Double Header mine, owned by H. L. Roberts, with H. H. Noyes manager, has been bought by G. Albertson of Denver, representing an Eastern company, for $5000. The group consists of several claims on McClennan mountain at Silver Plume. The new company will commence operations at once.

GILPIN COUNTY.

The Ivanhoe mine, near Nevadaville, has been started up with W. Grenfell as foreman. The retimbering of the shaft is being done. This property is owned by St. Louis, Mo., people. The mine yields smelting ores carrying a heavy percentage of lead and zinc, the average values being between $40 and $50 per ton.

Denver people have taken a lease and bond on the Little Jemima property at Gregory, owned by W. Benallack, Jr. and associates of Central City. The mine is developed by a shaft now 80 feet deep and a tunnel. The lessees are figuring on putting up a gasoline plant.

LAKE COUNTY.

About 2000 tons daily is the heavy oxidized iron output of Leadville. The Resurrection, Ibex, New Monarch, A. M. W., Evelyn, White Cap and others are still unable to dispose of sulphide ores.

The work at Lake Park by the Hap Hazzard Co. is developing large bodies of low-grade free milling ore. It will be necessary to have mills at the mines for their treatment. The ore is a honeycombed quartz material carrying free gold.

LARIMER COUNTY.

The tunnel of the Empire copper mine, near Fort Collins, is reported to be in shipping ore. The stockholders' meeting has decided to erect reduction works. S. Stark is manager.

OURAY COUNTY.

Plans are now perfected for the building of a large mill for the Camp Bird Extension mine at Ouray, the work to be commenced in June.

O. C. Van Houten and J. Z. Prosser have sold to L. B. Jackson and associates of Chicago the Tempest group of three claims, situated in Imogene basin, near Ouray and adjoining the Camp Bird. The price was $42,000. Mr. Jackson and associates now own seven claims and it is said will begin the erection of a mill soon and equip the mine with electric drills and other machinery.

The Gennessee-Vanderbilt group at Red Mountain, consisting of five claims, has been sold to a New York company for $25,000. The property was a big producer of silver prior to 1893, when it was closed down. It is developed by two shafts and two tunnels. The new company contemplates doing considerable development work.

ROUTT COUNTY.

The Hahn's Peak & Elk River Canal & Placer M. Co., owning the placers at Hahn's Peak, near Steamboat Springs, is installing several thousand feet of piping for hydraulic works. Later in the season a dredger will be installed for operation next year.

T. Emerson and J. Labr are driving a tunnel on the Iron Springs divide, near Craig, in search of a vein or the source of the placer gold which is very abundant in that locality. The tunnel is in rich gravel and follows the bedrock.

SAGUACHE COUNTY.

The new machinery on the Independent mine, near Crestone, has drained the mine and the shaft is being pushed down with power drills. Some ore is being shipped direct to the smelter and the low-grade ore is put through the mill.

At the San Isabel mine at Crestone a steam hoist is being installed and the shaft will be sunk to a depth of 500 feet. L. N. Fitts is manager.

The 5-stamp mill installed at Liberty by the Blanca Mutual M. & M. Co. has been started up. E. S. Ainutt is Supt.

SAN JUAN COUNTY.

The Hidden Treasure group of five

claims, located in Mastodon gulch, near Silverton, has been sold to Colorado Springs people for $400,000, part cash down. The property formerly belonged to R. Hanson.

SAN MIGUEL COUNTY.

The Nevada vein at Ophir has been cut by the Deadwood tunnel at a depth of 940 feet from the surface. Assays where the vein has been intersected show values at from $15 to $20 a ton in gold and silver, principally the former. The tunnel will be extended to cut other veins owned by the company, and drifting and blocking out the ore will commence April 1. Should the character of the ore be the same as at the point of intersection a mill will be built. G. R. Dolf, formerly Supt. of the Suffolk-Globe M. Co. at Ophir, is manager of the company.

SUMMIT COUNTY.

In the Etigrade mine on Little mountain, near Breckinridge, owned by R. W. Foote and J. Conrad, a paying body of silver-lead ore carrying gold has been struck. The strike has been made in a 50-foot drift from the bottom of a 130-foot shaft in the Etigrade vein here ranging from 2 to 6 feet in width, with a pay streak averaging a foot in thickness, which will mill about $70 per ton.

The Puzzle M. & Red. Co. is renovating and overhauling the Engle mill in Georgetown, which it recently bought. A contract has been let for transporting several thousand tons of ore from the Puzzle Extension mine to the mill. H. B. Achter, president of the company, is personally superintending the work.

TELLER COUNTY.

(Special Correspondence).—In many respects Cripple Creek district is not so lively in a business way as it was, for instance, two and three years ago, although there is now fully as large a tonnage of ore being produced in the district as at any time in the camp's history. This is easily explained by saying that much of the former activity and business resulted from the employment of many men and much money in building the numerous towns, building railways, both steam and electric, all over the district, developing the mines and equipping them with power plants and other operating facilities. This work was in a large measure a preparation for the actual mining operations and ore transportation now carried on systematically and on a large scale. But the towns—consisting of Cripple Creek, Victor, Anaconda, Goldfield, Independence, Elkton, Altman and Cameron—have been built and their growth in the future will be by the slower processes that characterize a settled community. The railroad lines, which enter the district from the north, south and east, cover the camp with a network of trackage and afford facilities for passenger and ore transportation which are certainly unequaled in any other mining district in the world. But this work is virtually complete. The force necessary to construct these lines is no longer required.

Through the system of consolidation constantly in progress the tendency has been to reduce the holdings of the district to a number of large groups, each one operating as nearly as possible through one or two main shafts, equipped with modern facilities for hoisting and for power drill work. Many such shafts have been sunk and equipped. While some of these are being sunk deeper, some new ones are being started, and considerable new machinery has been and will be ordered for the future, it may well be observed that the mines of the district are well developed and well equipped. While development and exploitation will continue to go on, such work will be coincident to the principal business of actual mineral production. In the earlier operations of the camp the production was deemed incidental to the extensive development which demonstrated the extent and character of the ore bodies. The mines are now sufficiently opened to partially reverse this order. Hence, the force now required in Cripple Creek district is confined largely to operating the well proved mines or their extensions. The principal business is that of breaking down the ore, hoisting and sampling, and shipping to reduction plants. Power drills are more generally used now than formerly and the consolidations have reduced the number of hoisting plants. Other advantages have been taken which effect economy of operating.

The camp has not developed into a milling center. A number of mills have been erected in the district, of which only one—the Economic—is operating. With excellent ore hauling facilities to valley points, the great reduction plants for district ores have been built at Colorado City and Florence, where coal and fuel oil are both close at hand. Besides the cyanide and chlorination plants at the two points named there is the Rocky Mountain smelter at Florence, which is equipped for general work. The plant of the U. S. Smelting Co. at Canyon City, which has been confined to zinc-lead ores, will doubtless soon have facilities also for smelting such ores as are produced at Cripple Creek.

At present there are a larger number of leases in force than there has been for two years, and it is believed the number will increase. The Woods Investment Co., who control large holdings through various sub-companies, have given numerous leases.

The Independence Con. mine, at southwest foot of Bull hill, is under lease to R. P. Russell, who struck good ore on the lower levels in sinking the shaft to the 1000-foot level. Russell is shipping a considerable tonnage from this and other leases.

The Mary McKinney has given three leases on its upper levels and is sinking the main shaft 100 feet deeper.

The Vindicator keeps up a steady shipment of about 2000 tons of ore per month.

Lessee Kirk, on the Lexington, ships thirty to forty tons ore per day and is said to have recently struck 16 feet of two-ounce ore in a new shoot. This is on Gold hill.

The Economic mill, which handles most of the ore from the mines in control of the Woods people, is said to have made a profit of $25,000 for the past year.

About 150 tons a day are being shipped from Stratton's group through his Logan, Deerhorn, Orpha May and Abe Lincoln shafts. His Longfellow shaft on Bull hill is being sunk deeper.

The El Paso, on Beacon hill, for the year ending Feb. 10, 1902, sold 5847 tons of ore, the average value of which was $52.57 per ton, making $307,443. The operating expenses were $115,976; ore treatment and transportation charges, $60,006; paid lessees, $69,973; improvements, tools and implements, $10,211; dividends, $24,250; other expenditures, $10,873; cash on hand, $27,116. Supt. W. M. Bainbridge's report shows 5250 feet of development done on the El Paso for the year. WASCOTT.

Cripple Creek, March 15.

Manager G. Keener of the Mary McKinney mine at Cripple Creek states that an entirely new vein has been cut in sinking the main shaft below the fifth level. The mine is making about 400 gallons of water a minute, which is being easily taken care of by the pumps.

IDAHO.

ADA COUNTY.

T. Antisell of Salt Lake City, Utah, has sold to D. H. Moseley of Boise, for $1000, the Summit mine, near Shaw.

BOISE COUNTY.

The Lucky Boy shaft, at Idaho City, is down 160 feet and 30 feet below the level of the lower tunnel, in ledge matter carrying gold. Whether this is the Lucky Boy ledge or a parallel vein is not known. The mill is running on ore from the tunnel.

The Gold Hill mine, near Quartzburg, has been pumped out and sinking the shaft toward a depth of 1000 feet commenced.

CUSTER COUNTY.

A strike has been made in the Riverview mine, at Bayhorse, owned by O. J. Salisbury of Salt Lake City, Utah. A body of lead-silver ore 20 feet across has been opened up.

IDAHO COUNTY.

The Fanburg group of fifteen claims, at Thunder Mountain, has been bonded to a company represented by W. B. Moore of Walla Walla, Wash. The figure of the bond is said to be $100,000, and it is understood that $5000 has been paid down. The sellers of the property are three Payette men and W. L. Root of Warren.

The Poorman group of four claims, at Thunder Mountain, has been sold to L. P. Grunbaum of Boise City for $4000.

The Hunch M. & M. Co. has been incorporated at Moscow by R. M. Walker of Kendrick, G. A. Ruhedew of Collins, G. G. Pickett of Moscow, M. A. Ellis and J. A. Morrow of Pierce City. The company owns a group of claims at Pierce City and is preparing to work ore in a custom mill.

Spokane, Wash., people have organized a company to operate the Rice mining claim, near the Dewey mine, in the Thunder Mountain district. It is incorporated as the Thunder Mountain G. F. M. Co. The directors are D. Shoudy, W. Huntley, G. Ambs, C. T. Newcomb and J. R. Stone. Arrangements are being made to develop the claim as soon as supplies can be taken into the camp.

The Golden Rule M. Co., Ltd., has been incorporated by W. D. Rowland, E. Rowland, W. C. Lauder, G. N. Larrabee and A. C. Larrabee; capital, $100,000. The company owns the Rowland Bros. group of claims on Moscow mountain. A ledge of gold-bearing quartz has been exposed in a number of places.

J. H. Morris of the Big Creek M. & D. Co. at Dixie says that in and about Dixie there has been considerable activity during the winter. The Gold Bug and Columbia have just had the contract for 100 feet of sinking and 150 feet of drifting completed. The mill on the Dixie Queen, a property controlled by W. H. Plummer of Spokane and the Hye Bros., is to start up as soon as the spring thaw comes. A 4-stamp mill is being put on the North Star. On Crooked river a 10-stamp mill is being erected on the Hogan property.

The Sunnyside property at Thunder mountain is reported sold by the Caswell Bros. to the Belle of Thunder Mountain Co. of Pittsburg, Pa., for $125,000. The terms of the sale are said to be $50,000 down and the remainder upon examination and approval of the title.

KOOTENAI COUNTY.

At the Buckhorn group, near Bonners Ferry, a stamp mill will be built under the direction of E. Doust. The Hoosier Boy G. M. Co. of Granite, Or., owns the mine.

OWYHEE COUNTY.

The Bluebird group of mines in Pixley basin, near Silver City, has been incorporated as the Tibo-Bluebird M. Co., capital $500,000, by J. McMillan, R. Aikman, M. B. Gwinn, F. Irwin, G. Clithero and J. G. Watts—the last named being the secretary.

SHOSHONE COUNTY.

It is stated that the sale of the Golden Chest mine, at Murray, has been concluded in New York at the price agreed upon in the bond—$800,000. The property consists of ten or twelve mining claims between Murray and Littlefield, together with water rights and water power plant. It has two mills of twenty stamps each, only one of which is now in operation, together with air compressor, pumps, hoists, concentrates, electric lighting plant, etc. The larger part of its value is in the form of free gold. It has been in operation about sixteen years. In its earlier days the methods were crude, but the tailings were impounded and there are thousands of tons ready for a cyanide plant.

The Manhattan M. Co., operating near Harrison, has struck a 5-foot vein of ore which is said to show an average of $34 per ton in silver and lead.

WASHINGTON COUNTY.

W. C. Meeker of New York has organized in New York the Azurite M. Co. to operate a group of claims near Cuprum, in the Seven Devils district. S. M. French is president and W. C. Meeker manager.

The placer mines on Goose creek, near Meadows, are to be operated this season by J. W. Butler & Co., who expect to take out $10,000. With one giant last year they took out about $7000. This year they will run two giants. The ground is river wash, is on a hill side and is covered by a ditch 1 mile long.

MICHIGAN.

HOUGHTON COUNTY.

The annual report of Supt. Parnell of the Osceola Con. M. Co., at Houghton, for the year ended Dec. 31, 1901, says: "In the old mill—which we have evidence to know compares favorably with any of the old mills treating amygdaloid rock—we have never been able to reduce the losses in the tailings below from .25 to .27 of 1%, an average of about .26. In the new mill the average for the year was .094. Twenty-six hundredths mean 5.2 pounds of mineral, which, at 72% fine, means 3.74 pounds of ingot per ton of rock. Ninety-four thousandths losses mean 1.35 pounds mineral per ton of rock; at 72% fine this means 1.35 pounds ingot per ton of rock, or a difference of 2.39 pounds of ingot per ton of rock. The two Osceola mills the past year stamped 687,094 tons of rock. A difference of 2.39 pounds per ton means 1,642,154 pounds of ingot copper, which at, say, 10 cents per pound, figures a value of $164,215 in round numbers. Add to this a difference of cost in stamping of, say, 5 cents per ton—it will certainly amount to that much—which is $34,354, and we have:

Savings in tailings	$164,215
Savings in stampings	34,354
Total	$198,569

MONTANA.

BEAVERHEAD COUNTY.

The Indian Queen mine, near Dillon, owned by J. Annear, J. Broughton, B. Annear and the estate of R. Dawe of Butte, is being developed through an 800-foot tunnel that taps the vein at a depth of 450 feet and a winze 150 feet deep sunk at a point 100 feet from the face of the tunnel. The ore is high grade and is being shipped to Butte for reduction.

FERGUS COUNTY.

J. Fahl has sold the Cora and Minnie Healy claims at North Moccasin to F. Elliott for $1225.

J. F. Robinson, for the Colorado & Montana Mines Co., of which he is vice-president and manager, has bonded from W. G. Norman the Paymaster, Gray Horse and Monday claims at North Moccasin. The price is $55,000. Assays of surface ore are considered so satisfactory that a development of the property will at once be commenced.

J. Leslie reports a shaft sunk 70 feet on the Blue Dick copper mine, near Lewiston, exposing a body of copper ore, 6 feet of which is high-grade carbonate.

FLATHEAD COUNTY.

The Libby G. M. Co., of Kalispell, A. L. Jaqueth, manager, operating on Fourth of July creek, has bought a 10-stamp mill, which it expects to get in operation this summer.

JEFFERSON COUNTY.

The Mollie McGregor mine on the Boulder river, owned by J. H. Curtis of Butte and the estate of A. G. Clark of Helena, has been leased to A. Doehler and M. Matson for eighteen months. The mine is developed by a 150-foot shaft and a 90-foot tunnel. The lessees intend to begin work at once.

MADISON COUNTY.

In the Boss Tweed Extension mine, at Pony, owned by T. C. McGrath, the vein has been crosscut 30 feet and the opposite wall has not been reached. The ore is gold bearing. In the Jeanette, which adjoins the Boss Tweed Extension, the vein is a continuation of the one in the Extension and is said to be fully as rich. The mine is being opened by a shaft and tunnel.

C. Austin, manager for the Red Bluff G. M. Co., Ltd., at Red Bluff, says the company will build a 100-ton concentrating plant.

MISSOULA COUNTY.

The St. Patrick M. Co. has been incorporated at Missoula to operate mines and mills and electric power plants. The directors are T. H. Elliott, A. O. Elliott, W. G. Ranft, J. B. Porter and T. C. Marshall, all of Missoula.

SILVER BOW COUNTY.

The Denier mine, at Butte, owned by T. M. Hodgens and Mrs. L. Largey, is reported sold to the Anaconda Co. for $75,000.

The annual meeting of the stockholders of the Montana Standard M. Co. was held at their office, No. 106 West Granite street, Butte, Montana, March 10th. The following members were elected trustees for the ensuing year: P. T. Davis, F. T. Britton, D. C. Smith and A. N. Yoder of Butte; L. Wottrich, Marysville, Mont.; N. L. Lennan, St. Paul, Minn. P. T. Davis was elected president; L. Wottrich, vice-president; F. Britton, treasurer, and W. H. Lindsay, secretary. At the meeting the stockholders bought treasury stock to the extent of $5000. A contract was let for a 400-foot extension of the La Blanche tunnel.

Suit has been brought in the District Court at Butte by J. A. Boyer to recover from the Washoe Copper M. Co. $150,000 which, it is claimed, is the value of ore alleged to have been illegally extracted by the Washoe Co. from beneath a lot belonging to Boyer. An injunction is also asked.

NEVADA.

LINCOLN COUNTY.

The work on the late discovery of cinnabar, called the Red Cloud, near Goodsprings, is being pushed ahead by Armstrong & Loop, the discoverers. The shaft is down 50 feet and the ore streak is from 8 to 15 inches in width. The average, it is claimed, assays $34 gold and 15% quicksilver.

The Keystone group, near Sandy, has been bonded to the Doke Bros. of California, and they are working twenty men on a newly discovered shoot of ore, which is soft and clayey in character, but rich. A mill has been erected at Sandy, 8 miles distant from the mine. C. Anderson is metallurgist for the company.

The E. & F. M. Co. has been incorporated in Salt Lake City, Utah, capital $100,000, with A. C. Ellis president and F. Higginbotham secretary and treasurer. The company owns the Ida May, Lone Star, Silver King, Bully Boy, Sentinel, Copper Chief and the Iron Mine claims, with an option to purchase the Highland Mary claim, all at Bristol. In the developments is exposed copper and gold bearing ores. E. Freudenthal is Supt.

The wet process and the Chilian mill that has replaced the old mill at De Lamar has handled the ores of the De Lamar mines so satisfactorily, states H. A. Cohen, the general manager, that two more machines are to be added immediately. With this added equipment the plant will treat at least 150 tons of gold-bearing ore daily.

LYON COUNTY.

J. N. Beck of Wellington reports work on the Yankee Girl claim, which he is operating at that place, as making a satisfactory showing. One of the ledges is

about 10 inches wide and the ore goes about $100 to the ton. It is his intention, as soon as a little more development work is done, to put a small 2-stamp mill on the property.

NYE COUNTY.

The Tybo M. & R. Co., operating the 2 G and other mines at Tybo, are projecting the construction of a concentrating plant.

The New York G. M. Co. has been incorporated in Salt Lake City, Utah, capital $37,500, with G. A. Land president and E. L. Hall secretary and treasurer. The company owns three mining claims at Tonopah.

The new working shaft of the Tonopah M. Co. is being rushed by contract work and is making good headway. The Brougher shaft is down close to 270 feet, showing a ledge 12 feet wide in the bottom. The drifts on the 250-foot level from this shaft and the Cutting shaft are beginning to show up fine ore.

NEW MEXICO.

COLFAX COUNTY.

At the Denver mine at Elizabethtown the pumps are in operation taking water out of the shaft. It is the intention of the company to work in the old incline shaft and also to drive a tunnel 700 feet lower down the hill to intersect with present workings, providing drainage of the upper works and a direct way to the mill. M. Walsh is manager.

SIERRA COUNTY.

Manager Kasser of the Hillsboro G. M. & M. Co. claims a showing of $100 ore on his mine near Hillsboro.

The Galles Bros. & Hartney are retimbering the workings of the American mine near Hillsboro. There is in sight 6 to 18 inches of good ore.

J. Kassar, manager of the Hillsboro M. & M. Co., has decided upon the erection of a 10-stamp mill for the treatment of the ores from the Ready Pay group of mines at Hillsboro.

Galles Bros. & Hartney, who are operating the American mine at Hillsboro, have opened up a 12-inch streak of ore which, they claim, averages about $100 per ton in gold.

O. E. Conner of Cincinnati, Ohio, has taken an option on a group of seven claims near Animas Peak, near Hillsboro.

The Las Animas G. & C. M. Co. at Hillsboro has opened up a body of high-grade ore on their 200-foot level.

SAN MIGUEL COUNTY.

Three reduction plants at Las Vegas within the next six months are a possibility. A dozen companies have been organized for development work on copper propositions in the country tributary to Las Vegas. The ore deposits found are great bodies of sandstone carrying, it is stated, from 2% to 10% copper in carbonates, and so situated that the ore can be mined and hauled 12 miles to a reduction plant for $1.25 per ton. It is claimed that the mill cost for treating it will not exceed $2.75 to $3 per ton.

OREGON.

BAKER COUNTY.

The ore shoot at the Gem mine, near Sparta, has been encountered on a level 100 feet below the present workings. The mine is owned by Geiser Bros., of Baker City.

GRANT COUNTY.

The Red Boy Extension Co. has been incorporated at Portland by B. I. Cohen, W. E. Hurd and E. J. Hurd. The capital is $1,500,000.

JACKSON COUNTY.

W. B. Dennis, of the Black Butte quicksilver mine in Lane county, has bonded the Golden Fleece mine, at Ashland, at $20,000, of E. K. Anderson. In the sandstone bedrock where a portion of the soft conglomerate has been hydraulicked off are seams of calcite, associated with cinnabar ore, which it is proposed to develop to depth.

JOSEPHINE COUNTY.

A rich strike is reported made at the Granite Hill quartz mine of the Louse Creek district, near Grants Pass, owned by Booth & Mangum. In the tunnel a 3-foot ledge has been uncovered showing free gold. A 5-stamp mill is kept in operation at the mine.

SOUTH DAKOTA.

CUSTER COUNTY.

The North Star M. Co. is preparing to build a 20-stamp mill on its ground, 9 miles from Custer, and has the excavations and foundation completed. It is intended to have a cyanide plant in connection. The mine is developed by a shaft 340 feet deep. The ore, it is claimed, will average $20 a ton, about one-fourth of it amalgamable.

LAWRENCE COUNTY.

The new cyanide plant at Spearfish, which has been in course of construction for some time for the Spearfish G. M. & Red. Co., has been started up. It replaces the plant destroyed by fire last fall. The old plant had a capacity of 125 tons. The new plant, of 300-ton capacity, has been built in a very short time at a cost of $41,000. The mill has ten leaching vats, 7x26 feet each, with a capacity of 160 tons of ore to each vat. The system of operation will be to empty and refill one vat every ten hours, allowing seventy-two hours for leaching. The ore bins are placed immediately over the crushers in the mill and have a capacity of 250 tons. The ore is mined from open pits and delivered to the mill by a steam locomotive tramway.

UTAH.

GRAND COUNTY.

A company has been organized in Colorado Springs, Colo., for the purpose of operating placer mines on the old bars along the Grand river. Two placer machines are being built. M. Kinney, E. H. Holbrook and M. S. Beach of Colorado Springs are interested; the machines are to be placed in operation along the river from Dewey, at the mouth of the Dolores, to Moab, a distance of 30 miles.

IRON COUNTY.

T. Ferguson, Supt. of the Iron Mountain C. M. Co.'s properties at Iron Mountain, says that at a depth of 200 feet in the main shaft, in a crosscut 110 feet in, copper sulphide ores are showing. Nearer the surface 14 feet of ore that averages 9% copper has been opened up.

JUAB COUNTY.

It is understood that Manager G. C. Moore of the Sunshine, at Tintic, is to be retained in making the tests of the leaching ores of the Mammoth, the company to act on his recommendations in the erection of a plant.

WYOMING.

CARBON COUNTY.

E. P. Jennings of Salt Lake City says that the control of the Carisa M. Co.'s properties at South Pass has been passed to P. L. Kimberly and H. M. Ryan of Salt Lake City and associates. The operation of the property is to be continued upon the most energetic scale. A 50-stamp mill is to be installed.

FOREIGN.

BRITISH COLUMBIA.

Work on the Imperial mine, on Munro mountain, near Atlin, by Pearse & Co., consists in stripping the ledge above the old workings and prospecting. They expect to put in a crusher and stamp mill.

The sample mill of the smelter near Greenwood, recently bought by the Montreal & Boston C. Co., is being dismantled, preparatory to putting in a larger plant. A rock crusher, sampler and a large engine are being installed. Much of the sampling plant at first put in will be used, but it will be supplemented by the heavier machinery.

At a meeting at Greenwood of the Royal Victoria G. M. Co., Ltd., owning the Golden Eagle near the Volcanic claims, on the North Fork of Kettle river, authority was given to the management to make a sale of the mine.

The manager of the Ymir mine, at Ymir, reports that during February eighty stamps ran 656 hours (twenty-seven days, eight hours); estimated profit on operating is $9472. The grade of ore shows considerable improvement during the present month, drawn from the same stopes.

YUKON TERRITORY.

A smelter test of $126 per ton is reported from quartz taken from a group of claims near the Dome, at the head of El Dorado creek, in the Klondike district.

The Ladue mill, at Dawson, is running its 850-pound stamps crushing on rock from Hunker creek. The rock carries, besides free gold, considerable gold-bearing galena which is concentrated from the tailings. The results from the different runs of rock are declared to be satisfactory.

The contract of the Treadgold concession and the Canadian Government provides that he shall have 25,000 miners' inches of water, one-half of which he is to use himself and the other half sell to the present Klondike miners at 25 cents a miners' inch per hour. This would amount to $150 a day for each claim using a sluice head. There is no claim in the whole country that would be able to pay that sum. During the richest condition of the claims the highest rate ever charged was $7 or $8 an hour, and very few claims were ever able to pay that.

Personal.

J. T. McCALL, of San Francisco, is in Tonopah, Nev.

T. A. RICKARD of Denver, Colo., is in San Francisco.

W. BROADBRIDGE has returned to London from Pahang.

I. E. ROSE has opened an assaying office in Baker City, Or.

J. DUFFIN AND J. GILES, of De Lamar, Cal., are in Tonopah, Nev.

H. L. WASHBURN of Cripple Creek, Colo., is in Tombstone, Ariz.

R. W. HUNT of R. W. Hunt & Co., Chicago, is at Monterey, Cal.

J. H. SHOCKLEY has returned to Telluride, Colo., from Pasadena, Cal.

J. A. PANTING has returned from Boise, Idaho, to Baker City, Or.

S. E. PAUL has returned to Salt Lake City, Utah, from Los Angeles, Cal.

C. A. SNYDER will in future be ore buyer for the Val Verde, Ariz., smelter.

EDMUND JUESSEN, mining engineer of Spokane, Wash., is in Chicago for a time.

J. A. YERRINGTON of Hawthorne, Nev., is in New York on mining business.

K. FARNSWORTH has resigned as Supt. of the Bullion Beck mine at Tintic, Utah.

R. CHAUVENET has resigned the presidency of the Colorado State School of Mines.

R. D. FEATHERSTONHAUGH has returned to Atlin, B. C., from a trip to London.

F. H. DAVIS, of the Davis Calyx drill, has returned to Virginia, Nevada, from Arizona.

E. BARTON has been appointed manager of the Black Hawk mine at Randsburg, Cal.

FRANK W. GRIFFIN of Griffin & Cameron, has returned from Oroville, Cal., to San Francisco.

HENRY KEHOE, a mining engineer of Spokane, Wash., has returned there from San Francisco.

A. H. ELFTMAN, managing director of the Miller M. Co. of Brownsville, Cal., is at Silverton, Colo.

E. L. UREN, C. E., formerly of Grass Valley, Cal., and now of Wardner, Idaho, is at Iowa City, Cal.

EDW. BRAYTON of the Pelton Water Wheel Co. of San Francisco returns from the East next week.

L. W. SHIRLEY is now in charge of publicity department of Link Belt Machinery Co., Chicago.

B. N. SHOECRAFT, secretary Champion M. Co., has returned from Nevada county, Cal., to San Francisco.

JNO. H. MARKS, of the Gold Pan M. Co., Breckenridge, Colo., has returned there from San Francisco.

THOMAS JONES, Supt. of the Wood & Bamberger mine at Battle Mountain, Nev., is in Salt Lake City, Utah.

GEO. L. WALKER of the American Steel & Wire Co. has returned from Portland, Or., to San Francisco.

THOS. J. STEELE succeeds Geo. M. Nix as general manager Hidden Fortune M. Co., Deadwood, South Dakota.

A. J. McCONE of Harron, Rickard & McCone has returned from Nevada county, Cal., to San Francisco.

S. V. TRENT of the Trent Engineering & Machinery Co. has returned from Redding, Cal., to Salt Lake City, Utah.

C. A. STRITE, late of Plumas county, Cal., is foreman at the Bloss & McClary hydraulic mine at Trinity Center, Cal.

E. C. ENGLEHART, who has been sojourning for several months in Los Angeles, Cal., has returned to Denver, Colo.

C. A. CUMMER of Cummer, Son & Co., Cleveland, Ohio, is in Mexico in the interest of ore drying machines of their manufacture.

W. J. CHALMERS, treasurer and director in the Allis-Chalmers Co., has gone to Europe in connection with business of his company.

T. J. HARTMAN, M. E., formerly of Leadville, Colo., but now located at Coolgardie, West Australia, was in Denver, Colo., last week.

F. R. CULBERTSON of Spokane, Wash., manager of the Chloride-Bailey gold mine at Dedrick, Cal., will locate his office at San Francisco, Cal.

H. Z. OSBORNE, a prominent California miner, has been reappointed by President Roosevelt United States Marshal for the southern district of California.

O. W. GRIFFITH of Colfax, Cal., has been put in charge of the gravel washing department at the Bob Lewis No. 2 gravel mine, near Westville, Cal.

F. PEEBLES, late of the Val Verde smelter at Val Verde, Ariz., has taken position as one of the foremen at the Shannon smelter at Clifton, Ariz.

HARRY BRETHERTON, late assayer reduction works, Silver City, N. M., has been appointed chemist for the A. S. & R. Co., Aguas Calientes, Mexico.

J. L. PARKER, former Supt. Dominion Copper Co.'s Phœnix, B. C., property, is now back to his former position as Supt. North Star M. Co., Kimberly, B. C.

JULIAN SONNTAG, part owner and secretary Providence mine, and general manager Giant Powder Co., has returned from Nevada county, Cal., to San Francisco.

WESLEY MERRITT, industrial commissioner Atchison, Topeka & Santa Fe Railway, has been in Indian Territory and New Mexico looking over mineral properties.

JOHN K. MACKENZIE, mining engineer, of Dickman, Mackenzie & Potter, has left Chicago for Guadalajara, Jalisco, Mexico, near which place he will make a mine examination for Chicago people.

R. T. WHITE has resigned as Supt. of the Highland Boy smelting plant at Bingham, Utah. W. C. Thomas, late of the Butte & Boston smelter at Butte, Mont., succeeds to the position vacated.

J. L. McVICAR, electrician at War Eagle mine at Rossland, B. C., for several years, has gone to West Africa to take charge of the electrically operated diamond mine drill plant of an English syndicate.

E. G. EWART has resigned his position with the Link Belt Machinery Co. of Chicago and accepted a similar position with the H. W. Caldwell Son Co., Chicago. Mr. Ewart is in charge of the publicity department.

Commercial Paragraphs.

THE Standard Diamond Rock Drill Co. will soon begin operations, with Chicago as headquarters.

THE Oakland Iron Works, Oakland, Cal., has the contract for manufacturing the auxiliary machinery for a dredger for Portland, Or., for $54,154.

THE Trenton Iron Co., of Trenton, N. J., has the contract for the aerial tramway, 15,600 feet, fifty tons per hour, for the U. S. M. Co., Bingham, Utah.

THE Mine and Smelter Supply Co., of Denver, Colo., is sending via San Francisco eight carloads mining machinery to the Inca M. Co., Tirapata, Peru, an 8500-mile trip.

D. KEITH, T. KEARNS, and others of Salt Lake City, Utah, are reported to have organized a company to operate a large machinery supply house in Salt Lake City, J. E. Galigher to be the manager.

FRANK L. SIZER, who has been engaged on the winning side of the Plymouth-Silver King suit just completed at Butte, Mont., has gone to Mexico, where he is operating the Rosario mine, south Chihuahua, for C. W. Clark.

THE Ingersoll-Sergeant Drill Co. have an order from the Gold Creek Consolidated M. Co., of Jersey City, for a complete outfit consisting of air compressors, receiver, drills, etc., for the Mascot group of mines, Oro Fino, Idaho.

THE Allis-Chalmers Co., because of immense amount of business on hand, has had to open up a part of the old Fraser-Chalmers plant on West Lake St., Chicago, where they will manufacture perforated metals, this part of the company's business having grown to large proportions.

THE Jeanesville Iron Works Co., Denver branch, A. Middlebrook, manager, reports, among recent sales and shipments, one to the Vindicator mine, Cripple Creek, Colo., of one compound condensing pump, capacity 500 gallons, 1200-foot lift; to the Golden Cycle mine, Cripple Creek, Colo., one mine pump, 1200 gallons, 1000-foot lift; to the Iron-Silver M. Co., Leadville, Colo., one pump, 500 gallons, 900-foot lift; to the Nisi Prius mine, Leadville, Colo., 500 gallons, 900-foot lift pump; to the Gold King mine, Cripple Creek, 500-gallon pump, 800-foot lift; six electric station pumps for Old Mexico.

THE Westinghouse Machine Co., East Pittsburg, Pa., has recently entered the field as builders of blast furnace blowing engines, and has contracted within the last few weeks for six large vertical blowing engines—three for the Toledo Furnace Co., Toledo, Ohio, and three for the South Chicago Furnace Co., South Chicago. These engines are to be arranged so as to run as compounds, or each engine can be run separately as a simple engine. Each of the stations will have two high-pressure engines and one low pressure, as relates to the steam end. The low-pressure engine is to be used as an auxiliary; when it is in use the high-pressure engine will receive steam at boiler pressure and exhaust into receiver, from which the low-pressure en-

gine will be supplied. When the low-pressure engine is in use as a simple engine, it will receive steam from the boiler through a reducing valve. The high-pressure engines will have steam cylinders, 50-inch bore, fitted with modern design of Corliss valve gear. The low-pressure engines will have steam cylinder, 96-inch diameter, also equipped with Corliss valve gear. The air cylinders will be 96-inch diameter in all the engines, and the stroke of all will be 66 inches. The engines are expected to run safely and quietly at a speed of sixty revolutions per minute. The air cylinders will be equipped with patent piston valves for induction and eduction. The engines are of the type having the air cylinder below, the steam cylinder above, the two being connected by a long type crosshead carrying a connecting rod to a flywheel on either side of the engine. These engines are to be extra heavy, and are specified to embody the highest type of material, workmanship and design.

C. O. BARTLETT & Co. have incorporated their business under the laws of the State of Ohio to the following: The C. O. Bartlett & Snow Co., and have purchased a tract of land with buildings and power plant consisting of 150 H. P. boiler and engine. The property comprises sixteen lots or one entire block, situated in the central part of Cleveland, with fine railroad facilities. It is bounded by Winter, Leonard, Summer and French Sts. Other buildings will be added and they expect to have a first-class plant in every particular. C. O. Bartlett will be president, and K. F. Snow vice-president and general manager.

Latest Market Reports.

SAN FRANCISCO, March 28, 1902.

METALS.

SILVER.—Per oz., Troy: London, 24⅞d (standard ounce, 925 fine); New York, bar silver, 53⅞c, refined (1000 fine); San Francisco, 53¾c; Mexican dollars, 44½c San Francisco, 43⅛c New York.

On the 26th, in London, at a meeting of the stockholders of the Bank of Africa, the chairman said that it was calculated that, owing to the closing of the South African mines during the last two and a half years, the world's gold supply was short to the extent of forty millions.

COPPER.—New York: Lake, 1 to 3 casks, $12.50; carload lots, $12.25; Electrolytic, 1 to 3 casks, $12.25; carload lots, $12.50; Casting, 1 to 3 casks, $12.00; carload lots, $12.25. San Francisco: $14.00. Mill copper plates, $17.00; bars, 18@24c. London: £52 10s per ton.

LEAD.—New York, $4.12½; Salt Lake City, $3.60; St. Louis, $4.00; San Francisco $4.50, carload lots; 4⅛o 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, $4.75. London, £11 7s 6d per ton.

SPELTER. — New York, $4.35; St. Louis, $4.00; London, £17 10s per ton; San Francisco, ton lots, 5¼c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN. — New York, pig, $26.25; San Francisco, ton lots, 27c; 1000 lbs., 27½c; 500 lbs., 27¾c; 200 lbs., 27½c; less, 28c; bar tin, ℔ lb, 30c.

PLATINUM.—San Francisco, crude, $17 ℔ oz.; New York, $18 per Troy oz

QUICKSILVER. — New York, $51.00 large lots; London, £8 15s; San Francisco, local, $47.50 ℔ flask of 76½ lbs.; Denver, $51.00. Export, $45.00.

BABBITT METAL.— San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER. — Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 14.20c.

NICKEL.—New York, 50@60c ℔ lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $17 00; gray forge, $17.75; San Francisco, bar, 2 75 ℔ lb .,3c in small quantities.

Good authorities say that from now on the pig iron output will show a material increase, and that the demands of consumers will be more readily satisfied.

STEEL.—Bessemer billets, Pittsburg, $32.00; open hearth billets, $32.50; San Francisco, bar, 7c to 12c per lb.

CEMENT.—Germania, $2.65; K. B. & S., $2 65; Hewmoor, $2.50; Trowell, $2.50 per bbl.

LIME.—Santa Cruz, $1.60; Roche Harbor, $1.60 per bbl.

GENERAL SUPPLIES.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.50; Cut, $3.50; 10d to 16d, Wire, $3.55; Cut, $3.55; 8d, Wire, $3.60; Cut, $3.60; 6d and 7d, Wire, $3.70; Cut, $3.70; 4d and 5d, Wire, $3.80; Cut, $3.80; 3d, Wire, $3.95; Cut, $3.95; 2d, Wire, $4.20; Cut, $4.20. Special rates for carload lots.

POWDER.—F. o. b. San Francisco: No 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one toss 15½c. No. 1** 50%, carload lots, 11½c; led, than one ton, 13½c. No. 2, 40%, carloan lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ℔ set; 14 oz., 40s., 9c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $6.50; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $9.56, long ton; Colorado Anthracite, $14.00. Coke, $15 per ton in bulk, $17 in sacks; Sunnyside, $11 75, long ton.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 29@30c ℔ lb.; carloads, 27@28c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c ℔ lb.; soda ash, $1.90 ℔ 100 lbs.; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5¾@6¼c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 5c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.25 @1.50 ℔ 100 lbs.; sks, $1.05; chloride of lime, spot, $2.50@2.60; nitrate of potash, in bbls, 8c; caustic potash, 10c in 40-lb. tins.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6¾c; 1 ton and less than 5 tons, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7¼c; less than 500 lbs., per lb., 7½c; in 25 lb. tin pails, ¼c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6¾c; do. in kegs, 7½c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7¼c; less than 500 lbs., 7½c

ASSAY LITHARGE.—Per lb, 9c.

BISMUTH.—Subnitrate, por lb., $1.60.

BONE ASH.—3c ℔ lb.

BORAX.—Crystal, 7c: calcined, 20c.

CHROMIUM.—(90% and over) per lb., $1.25.

COPPER.—Carbonate, 20c; Red oxide, ℔ lb., 60c.

MAGNESIUM.—Per lb., $3.00.

MANGANESE.—(90% and over) ℔ lb., $1.25.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—25c. ℔ gramme; 1000 grammes=2¼ lbs.

PHOSPHORUS. — (American) ℔ lb., 80c.

SILVER.—Chloride, ℔ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ℔ lb., $1.00

URANIUM.—Oxide, ℔ lb., $3.50.

ZINC.—Metallic, chemically pure, ℔ lb., 50c.

ZINC.—Dust, ℔ lb., 10c.

ZINC.—Sulphate, ℔ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Recently Declared Mining Dividends.

	Payable.
Con. Mercur G. M. Co., Utah, 5 cents per share, $30,000	April 7
Ontario S. M. Co., Utah, 30 cents per share, $45,000	March 20
Rambler-Cariboo M. Co., British Columbia, monthly, 1 cent per share	March 30

WANTED.

CAPITAL WANTED.—I am in a position to secure a valuable quartz proposition (gold). Can get a good working bond on same. Will give best of reference as to character and ability. W. B. GRANT, Tuttletown, Tuolumne Co., Cal.

STAMP MILL WANTED, either ten or twenty stamps, second hand, as near Amador County, California, as possible. Must be in good condition, and low as to price—advertiser has himself built mills and then tried to sell, so don't quote fancy figures. Water-power mill preferred; steam no objection, however. Give full details, price, location, condition. Concentrators acceptable if with plant. Will also buy small hoist and any good second hand mine equipment. Address E. N. DARLING, 9 Pine St., New York.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDINO MARCH 18, 1902.

695,871.—PUMP—Ames & Fulton, Galt, Cal.
695,781.—GRADER—J. Bagley, Tacoma, Wash.
695,432.—DRAWER OPENER—C. H. Bakeman, Snohomish, Wash
695,801.—CONFECTIONERY MACHINE—W. S. Dillon, S. F.
695,545.—SKIRT ELEVATOR—G V. Egan, S. F.
695,453.—HINGE—Rose Frank, S. F.
695,807.—THRUST BEARING—Fulton & Ames, Galt, Cal.
695,718.—BUILDINO CONSTRUCTION—A. Goodman, S. F.
695,608.—STAMP CANCELER—J. Guidinger, Los Angeles, Cal.
695 6 0 — RAIL BRACE—J. Jensen, Black Diamond, Wash.
695,461.—AX HANDLE CLAMP—L. Johnson, Seattle, Wash.
695,815.—HYDRAULIC PUMP—C. Lakenan, Grass Valley, Cal.
695,61 —BOILER—C. F. Lake, San Bernardino, Cal.
695,818 —SOFA COUCH—L. C. Le Count, Los Angeles, Cal.
695,462.—CAN BODY BLANK—J. Lee, S. F.
695,745.—DRILL—J. W. Livermore, Berkeley, Cal.
695,574.—FIREARM—J. B. Mahana, Kelso, Wash.
695,748.—PIPE MACHINE—Martin & Ormand, Riverside, Cal.
695,749.—PIPE MACHINE—Martin & Ormand, Riverside, Cal.
695,868.—FURNACE—F. Nevegold, Portland, Or.
695,830.—BOISTING GEAR—F. V. Nielsen, S. F.
695,836.—CAMERA—W. L. Root, Spokane, Wash.
695,588.—VALVE—O. O. Storie, Tacoma, Wash.
695,589.—VALVE O. O. Storie, Tacoma, Wash.
695,514.—CAN HEADINO MACHINE—G. Wilcox, Los Angeles, Cal.
695,515.—CAN FUSING MACHINE—G. Wilcox, Los Angeles, Cal.
695,516.—CAN DIPPING MACHINE—G. Wilcox, Los Angeles, Cal
695,517.—CAN SEAMINO MACHINE—G. Wilcox, Los Angeles, Cal.
695,518.—CAN SOLDERINO MACHINE.—G. Wilcox, Los Angeles, Cal.
695,519.—CAN BODY MACHINE—G. Wilcox, Los Angeles, Cal.
695,520.—CAN SOLDERING MACHINE—G. Wilcox, Los Angeles, Cal
695 521.—CAN SIDE SEAMINO MACHINE—G. Wilcox, Los Angeles, Cal.

SITUATIONS WANTED.

MINING ENGINEER, with many years experience as manager and superintendent, is open for an engagement. Also posted in mining and metallurgy. Is at present engaged as superintendent of a large copper mine. Address Engineer, care Mining and Scientific Press.

WANTED.—Position as Assayer and Millman by a practical man. Am a practical miner. Understands cyanide work and mine accounting. Competent to act as assistant superintendent. Can handle men. No objection to Mexico or British Columbia. Address O. T , care of this office.

WANTED.—Position by an experienced and reliable assayer of all metals, and Bookkeeper. Has also had five years' experience in general merchandise business. Will give references from one of the best gold-producing quartz mines in California. Wire or write E. C. M. W , care of Mining and Scientific Press.

A YOUNG MINING ENGINEER desires position with reliable mining or milling company as assayer, chemist, or surveyor and engineer. Technical graduate; practical miner before graduation, mill and emelter work since; cyanide preferred. Can handle men. Prepared to develop small properties. Good references. Address "A," Lock Box 772, Florence, Colorado

WANTED.—Position as Superintendent or Foreman of an amalgamation and concentration mill. Have had eighteen years' experience. At present time engaged as foreman with one of the largest companies in Colorado. Best of references furnished. Address "Millman," care of this office.

AN ALL-ROUND PRACTICAL MINER, TIMberman and Tool Sharpener wants position as Foreman; also good Surveyor. Twenty-two years' experience. Successful in handling men. Regular habits. Can earn my pay. Address L. A. P., this office.

MINING ENGINEER, practical miner and mill man, assayer, etc., desires position of superintendent or assistant manager of a big property. Eleven years' experience. Best references. Now working in southern California. Address A. M. P , care of Mining and Scientific Press.

WANTED. — Position as superintendent of quartz mine. Worked as miner, engineer, mill man and superintendent. Superintendent at present. Would engage for foreign service. References given. Address Economy, this office.

WANTED.—POSITION AS MILL SUPERINtendent or Foreman. Understand concentration, amalgamation, cyaniding and assaying. Seventeen years' experience. Address "Mill Foreman," care of Mining and Scientific Press.

OPEN FOR ENGAGEMENT, A MINING AND Metallurgical Engineer. Eleven years' experience as Consulting Engineer and Manager. Graduated from the best technical schools in Europe. Specialty: examination and management of gold and silver properties. Location must be in California, Arizona or Nevada. Salary $5000 per year. Address C. A., care Mining and Scientific Press.

WANTED.—SITUATION AFTER MARCH 15, 1902, as Manager or Superintendent of mine. Have had five years' experience in manufacturing and constructing mining machinery and plants. Three years' experience in underground work. Four years' experience as manager and superintendent. Treatment of low grade ores a specialty. Practical in every detail. State location of mine and salary. Best of references. Address X. Y. Z., this office.

DELINQUENT SALE NOTICE.

SILVER KING MINING COMPANY.—Location of principal place of business, San Francieco, California; location of works, Pioneer Mining District, Pinal County, Arizona Territory.

Notice.—There are delinquent upon the following described stock on account of assessment (No. 23) levied on the 31st day of January, 1902, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
F. Avery, Trustee	7393	1000	$250 00
F. Avery, Trustee	7415	400	100 00
F. Avery, Trustee	7416	300	75 00
Michael Levy	7353	100	25 00
Nat. Stein, Trustee	7243	50	12 50
Nat. Stein, Trustee	7247	50	12 50
John Turnbull, Trustee	6754	100	25 00
New York Issue.			
Wm. Hyndman	89	100	25 00
R. H. Merrick	188	100	25 00
Michael Levy	1015	100	25 00

And in accordance with law, and an order of the Board of Directors, made on the 31st day of January, 1902, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, No. 310 Pine street, Room 36, San Francisco, California, on TUESDAY, the 8th day of April, 1902, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. W. PEW, Secretary.

Office—310 Pine street, Room 36, San Francisco, California.

DELINQUENT SALE NOTICE.

WILLIETTA MINING AND MILLING COMpany.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the 20th day of January, 1902, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Nolden, William	104	1 000	$10 00
Nolden, William	107	1,000	10 00
Nolden, William	108	1,000	10 00
Nolden, William	110	500	5 00
Nolden, William	112	500	5 00
Stayton, George E.	118	2,000	20 00
Stayton, George E.	172	500	5 00
Von Bonin, Carl	7	1,000	10 00
Von der Planitz, Emma	24	2,000	20 00
Von der Planitz, Emma	55	500	5 00
Von der Planitz, Emma	64	500	5 00

MINING AND SCIENTIFIC PRESS.

Whole No. 2176.—VOLUME LXXXIV. Number 14. SAN FRANCISCO, CAL., SATURDAY, APRIL 5, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Copper Refinery at San Francisco, Cal.

A few weeks since this journal noted the existence of an industrial movement which, it was declared, would ultimately result in the establishment on the bay shores around San Francisco of the Pacific coast center of the metallurgical arts. The economic reasons for the anticipation of this were explained in some detail. Briefly recapitulated, they were the commercial supremacy of San Francisco as the seaport of the Pacific coast, the possession of the terminals of both established inland and sea transportation lines, the great extent of deep water frontage, cheap fuel and electrical power and a perfect climate.

These conditions will inevitably produce the suggested result, and it is, indeed, a question if the progress towards it will not be exceedingly rapid. The first addition to the already existing plants that is projected is a copper refinery, for which a tract of land has been bought near Rodeo, a few miles across the bay from San Francisco. On the bay shore there are already four smelters producing copper matte and in the interior of California twenty or so in operation or construction. In addition, on Puget Sound there are two operating and two more building. If the inland region west of the Rocky mountains be considered now, the aggregate natural supply of crude copper bullion that will become the raw material for the refinery will build it up into one of the great plants of this kind in the world.

From another point of view—that of the consuming market for manufactured copper—the enterprise is also timely. The success of long-distance electrical transmission in California has become the stimulus to additional projects of a similar character. There is at the time these words are being written not a possible water power in a California stream that is not the basis of a long-distance electric power transmission for early construction. These will very shortly require enormous quantities of manufactured copper, which the refinery will enable Pacific coast copper mines to supply without paying double and treble transportation charges across the continent from the mines to New York refineries, and back again past the mines to the installations in California.

Economically considering the cost of refining, the projected establishment, as a consequence of the comparative cheapness at San Francisco bay of the electric power from water, over electric power produced from steam plants at New York, should produce refined copper at a much lower cost than similar establishments at New York.

Insuring a commercial success to the projected refinery, there may then be summarized: the ability of the institution to pay the miner more for the raw material and to still have it cost less than to refineries at New York; the lower cost of refining on any scale of production, and the protection to it of a large consuming market by the transportation charge from New York to San Francisco.

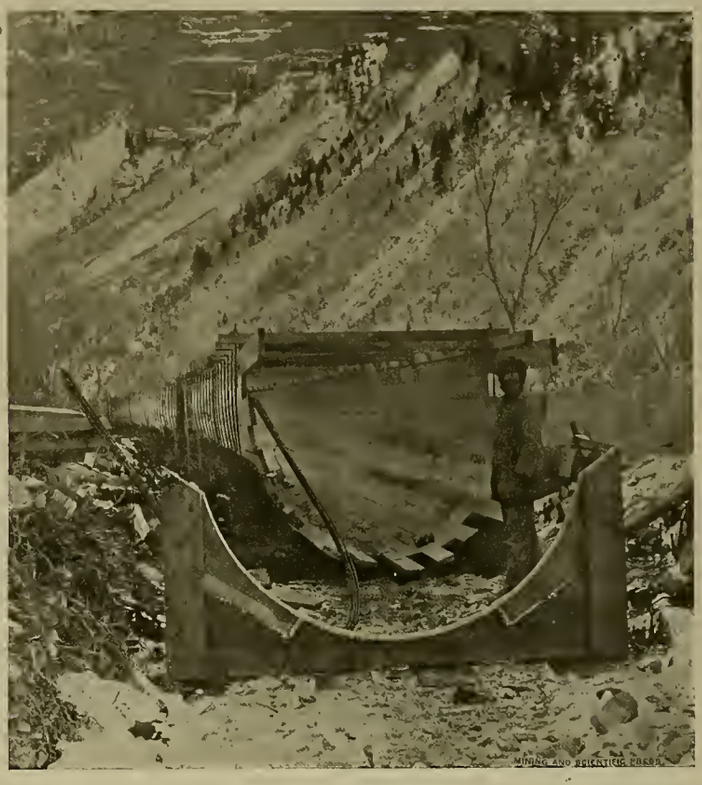

FIG. 1.

FIG. 2.

The copper mining industry of the Pacific coast should be benefited by the establishment of this institution. Copper produced here that now has to be shipped to New York for refining is worth from 1 to 2 cents a pound less at the matte smelter than it will be with the refinery and factory here. It is not to be assumed that all of the difference will go to the miner; but some of it will, and to the extent that it does it is the same to the miner as now is an increase in the market price of copper in New York.

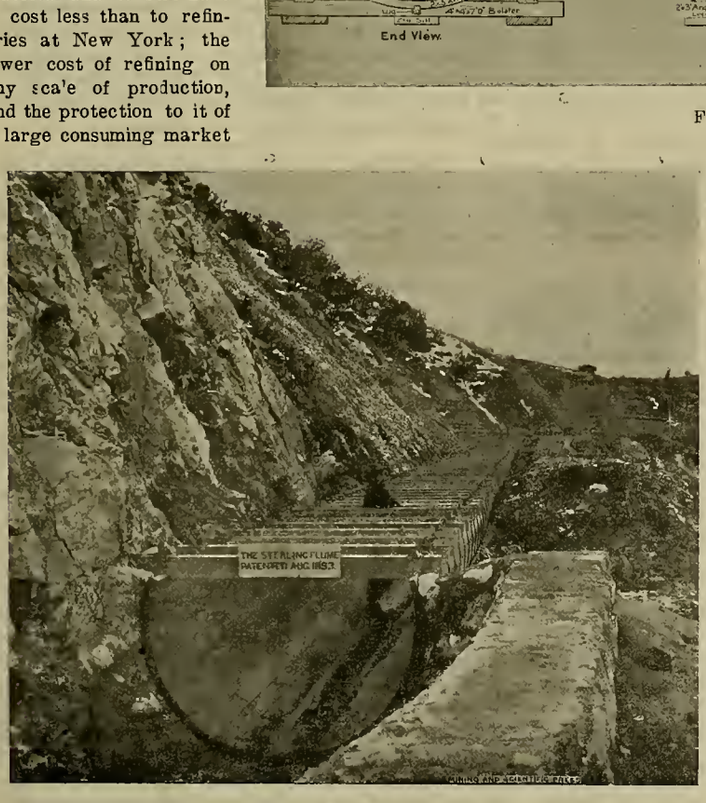

FIG 3.
The Stave and Binder Flume. (See page 189.)

THERE are a number of little things that may happen to a gas engine which the attendant must look out for. An oil cup may run dry or get stopped up. A lock nut may work loose on a valve stem, and, if not looked after, may wear off the cotter pin above it and allow the valve to drop into the cylinder. An ignitor wire may work out of the terminal nut and become grounded, thereby shutting down the engine. This last would not happen if the set screw in the terminal nut had been clamped down on the wire. A trip stem nut may work loose, so as to prevent contact taking place between the points of that ignitor, thus causing the cylinder to miss fire, or it may move in the opposite direction till it allows the points to remain permanently in contact, thus short-circuiting the other ignitors and causing a shut-down. An advantage of a two or three-cylinder engine is that a failure of one cylinder does not cause the engine to stop, and many small derangements may be cured while running. An exhaust valve may leak and need grinding. An ignitor may become grounded by moisture or carbon. A battery may become exhausted and need renewal. A bearing may need keying up. Backfiring is the ignition of the explosive mixture before it has entered the cylinder. A sharp explosion and a jet of flame from the air inlet usually accompanies it. That may be caused by a bad mixture of gas and air, burning so slowly that flame hangs in the cylinder during the whole of the expansion and exhaust stroke, thus igniting the incoming gases when the valve opens. Or, more rarely, a leaky inlet valve may allow the explosion flame to shoot into the mixture outside and ignite it. Backfiring should be cured, for it checks the speed of the engine and sooner or later necessitates new inlet valve springs. By driving the inlet valve down till the spring comes solid it often wedges one coil sideways over another, thus crushing them together, and decreasing the lifting power of the spring.

Personal; Commercial Paragraphs; New Patents; Notices of Recent Patents; Recently Declared Mining Dividends; Catalogues Received, 198.

THE Colorado mining property taxation hill as it finally got through the Legislature is a wohhly hit of law. Mines are to be assessed as at present—25% of the gross production, and "prospects" are to he assessed according to the smallest producer in the locality. That last word will stand considerahle different interpretation. The Colorado mining men feel that they are not as hadly cinched as they might have heen, as there is no increase on "mines," and as to "prospects," the courts have yet to determine what "prospects" and "locality" mean.

IN mine timhering it is calculated that square columns are ahout one-quarter stronger than round ones of the same diameter. The safe load on a timher column is calculated at 600 pounds per square inch for heights under 20 feet. Cedar and aspen are weak, showing an ultimate strength endwise of 4400 pounds per square inch; red pine gives 6300 pounds; white pine, 5400 pounds; hlack spruce, 5700 pounds. The strength of the stick is proportional to the area of cross-section over which the load is distributed. If a post has an area of 12x12 inches, and the bearing on its head is confined to a space of 6x6 inches, the timher will carry no greater load than if its full cross-section were only 6x6 inches. The strength of freshly cut timhers is from 25% to 40% less than that of seasoned timhers, and their life underground is likely to he from 40% to 60% shorter, heing subject to rapid decay and susceptible to fungus growth. The longevity of timher is increased hy maintenance of uniform conditions of dryness or moisture.

ON the 2nd inst. Robt. Mein of San Francisco, Cal., who has mining interests in South Africa, received a London cahlegram saying: "Peace negotiations about concluded." If pending overtures for settlement of the war prove successful, there will he immediate revival of deep gold mining in the vicinity of Johanneshurg. When resumption of gold mining in the Rand, S. A., takes place, the principal prohlem presented there in deep mining will be economical handling of the material. As the reefs that carry the gold dip into the earth at an angle of, approximately, 35°, it will hecome necessary in the progress of the work to sink vertical shafts to intersect the reef at a depth of from 7000 to 10,000 feet. Some time before the hreaking out of the Boer war this paper presented a plan in connection with such projected deep mining that comprised the installation of a hoist at the surface that would hoist from a depth of 2700 feet; at that depth another hoist of equal capacity, and at the 5400-foot level a third, to hoist from the 8000-foot. This involves, among other things, the question of what kind of power. To this it would appear that electricity only can be relied upon in such a case, though compressed air has claims to feasihility that justify attention. The matter presents a favorahle field for American enterprise and skill, with the customary attendant profit.

The Colorado Mine Owners' Association.

The preliminary meeting for the permanent organization of the Colorado mine owners into an association to accomplish several useful purposes was held in Denver last week. While the meeting was private, the conditions which have created the necessity for such an organization, and the ends which it proposes to accomplish, are well known and have heen frequently referred to by this journal in anticipation of the action just hegun.

The facts are that the interests which huy ores as raw material have hy consolidation become a virtual monopoly, and naturally use the power of their monopoly to huy ores cheaper, the transportation agencies have made a similar consolidation of interests, making a monopoly which naturally proceeds to use its power of monopoly to get more for the service than it hires out; and the lahor employed in the mines hy making its service a monopoly would get more for its service. The mine operators alone have made no consolidation of interests and naturally have become the hird to be plucked.

It is full time that they should, for protection, avail themselves of the same weapon of organization that is used so effectively against them. The lahor organization could, it would seem, well ally itself with the mine owners and operators against the real monopolies. This has been done successfully in California, where mining has had the power of monopoly applied to injure and destroy it. It is suggested to the mine owners and operators of Colorado that it would he well to make their organization on lines hroad enough to take in the working miners. The hurden to mine owners of increased wages, which increased costs of living inevitahly necessitate, would cease to be a hurden if the real burdens imposed by the monopolies were unloaded.

For the miners it would he well to consider now what the end of the present condition means, if the monopoly of ore buying—the smelter trust—and the monopoly of transportation become the real mine owners and operators. The anthracite coal mining of Pennsylvania is an illustration, the iron mining industry in Alahama and in Minnesota is another, and a third, closer at hand and more directly in point, is the lead-silver mining in British Columhia and in Mexico. Do the miners of Colorado wish to have their opportunity to earn a living to be at the will of the same smelter trust which is now closing down mines in Mexico? Unless the mine owners and operators of Colorado save their mines from the monopolies now threatening them, the Colorado miners will become as dependent as these Mexican miners are now.

For the present time the two monopolies that the mining industry in Colorado must suhordinate, if it would continue to he supreme in Colorado, are the smelter and mill monopoly, and the transportation monopoly of the railroads. These two monopolies are working together in an alliance, more effective, possihly, than if the two were one single monopoly.

There is only one method that will he permanently successful in defeating the smelter and mill monopoly, the ore huying trust. That method consists in not selling the ore to it. The position of the smelters and millers is that there is only one profit in metal production, and that they must have. There is no husiness reason why the mine owners should not take the position that if there is only one profit, that the mine owner should have it, and not the smelters and millmen. The mine owners must, then, own and operate their own mills and smelters. It is not necessary for each mine to own its own plant. The present system is the more efficient to save waste. It only requires a different ownership and a different policy. It is quite practicable for the Colorado mine owners' association to provide the hasis for organization which will accomplish this without affecting the complete independence of each individual mine operation. It cannot, however, he done hastily or without method, and it will cost money, which must he invested and risked.

The transportation difficulty is different. Mine owners and operators cannot expect to own and operate common carriers such as railroads. There is no question hut that the service the railroads give should be paid for so as to provide a profit for the service. The real question is entirely with the existing inequalities of payments for exactly equal services. There is ahsolutely no reason why low-grade ore should pay a less rate than high-grade ore. There is no reason in husiness or morals why the mine operator producing high-grade ore should pay part of the transportation cost of the mine operator producing low-grade ore. Transportation is a service that all should have on ahsolutely equal terms. Mine owners must first accept this principle for themselves, if they would have the right to have the metal produced by the smelter trust transported to market on precisely the same rates as the metal their own reduction works produce. Deny it and continue the present system and the smelting trust will have the precedent to sustain its present advantage hy which independent mine owners pay a large part of its transportation costs.

A Regretable Tendency.

This journal notes with regret the hindering tendency of some Californians who seem to consider any mining or metallurgical enterprise as an opportunity for hlackmail or suppression. There is scarcely any mining movement of note in California that has not had to fight a horde of mosshack nondescripts who seem to consider any enterprise in that line as a source of questionahle income to them by ways and means known to the shifty and the criminal in every clime.

Emboldened hy the success of the onslaught upon the California hydraulic miner, these knights of the road seek to hold up and despoil every measure looking to the advance of California mining and metallurgy. Whether it he the Mountain Copper Co., in Shasta county; the Copper King, in Fresno county; the Selby Smelting & Lead Co., in Contra Costa county, anywhere and everywhere that hrains, capital and opportunity comhine to develop California's mineral wealth comes a crew of cormorants clamorous for trihute. Their favorite weapon is an injunction, their favorite tool a hiased judge, and their favorite game an appeal to manufactured local opinion.

California is big enough and naturally rich enough to provide opportunities for all comers to create new clean wealth. It is a mistake to assume that the easiest way to get it is to take it away from some one else who creates it. It is a mistake to assume that the acceptance of an opportunity provided hy nature destroys other opportunity. The reverse is true. There is no excuse for the blackmail and legal hrigandage with which new enterprises sometimes meet. The toleration which has been given such action should be withdrawn. Try the other way a while. Remove ohstacles from the way of new enterprises instead of putting them in the way.

THE Chinese Government mining concession regulations are as they read prohibitive of mining hy foreign capital. Practically they are nothing of the kind. There has heen considerahle mining hy foreign and partly foreign companies in Manchuria for several years. The government taxes have heen ahout the same as now promulgated. The companies were not expected to pay them hy the officials whose business it was to make the collection for the Government. The operating companies simply made special contracts with the officials and compromised on much smaller payments. This mining was confined to gold, however. The Chinese have had no experience with any other kind of mining and the promulgated code is hut an expression of their ignorance. The tax collecting officials can he depended on to construe its provisions liberally to favor mining. The fixing of mining regulations with the knowledge that they are not to he enforced is an idea that Americans naturally find difficulty in comprehending. It is quite the Oriental way, however. Mining by foreign capital will get along under it and be profitahle. It would he a mistake to assume, though, that the mines in China are specially rich, or that the low wages will afford a larger profit margin and more opportunities than exist in the mines of our own country. Indirectly, however, the opening of mines in China will he an advantage in providing a market for mining machinery and other manufactures.

Concentrates.

AT the boiling point of any liquid its vapor pressure is equal to the atmospheric pressure.

CYANIDE OF POTASSIUM in ton lots is delivered at Riverside, Cal., for 25½ cents per pound.

THE Nevada statutes relating to the location of placer claims provide for the marking of the boundaries the same as on lode claims.

A COURT of competent jurisdiction decided last July that royalty need not be paid for the use of zinc dust in cyanide solution precipitation.

THE Act of Congress of March 3, 1891, makes it mandatory on a mine owner to keep the mine clear of standing gas and provide adequate ventilation.

THE consent of an owner of an undivided interest in mining ground to the establishing of a certain line as a boundary cannot bind his co-owner, not consenting.

THIRTY-NINE INCHES in fifteen minutes through granite with eight-pound hammers was the best record for double-handed drilling at Leadville, Colo., July 4, 1900.

A TEST TRIAL of chilled iron stamp shoes and dies indicates a consumption of iron per ton of ore crushed of about one pound in the shoes and about one-half pound in the dies.

THE present duty on blasting caps is $2.36 per 1000, or 24 cents per box of 100. In Europe a similar article can be obtained for less than the amount of duty. The duty on percussion caps, used for sporting purposes, is 30%.

IN case of the substance being a gas the heat necessary to change its form from a liquid to a gas must be in the substance, and whenever all this heat is removed the substance will return to its liquid form.

PORTLAND CEMENT is manufactured in California at Colton, San Bernardino county. A large Portland cement works has been projected at Suisun, Cal., and a large plant is under construction at Whatcom, Wash.

STRUCTURAL steel and iron are coming into more general and deserved use in and around mines and mining plants, lessening the liability of destruction by fire, reducing cost of insurance and adding to the life of the plant.

THE life of a steel wire rope is about two years of active work. This time can be greatly diminished by careless use. It can be increased much by having large sheaves and perfect lubrication of the internal wires of the rope.

THE resistance to traction per ton for a 1% grade due to gravity is 20 pounds, to which should be added 8 pounds per ton for rolling friction, making a total of 28 pounds per ton tractial resistance, as applied to pulling a carload up a 1% grade.

P. & B. PAINT, made by the Paraffine Paint Co., 116 Battery street, San Francisco, is good for either wood or metal. A marine paint for metals is made as follows: Red lead, 44; mercury, 24; thick turpentine, 5⅜ parts. Mix with linseed oil to the desired consistency.

SMOKE can be burned if the proper conditions exist. Most smoke consumers are, however, devices for insuring the complete combustion of fuel without the production of smoke, which is a much better plan than to attempt to burn the smoke after it has been formed.

THERE is considerable gold mining in Brazil, S. A., one mine—the Ouro Preto, in the State of Minas Geraes—employing 4500 men; but the inducements to American miners are very slight. English capital controls the mines and native labor is abundant and cheap.

THE notice of application for patent to a mining claim must be published in the newspaper nearest the location of the claim. It is strictly construed and the measurement is always of an air-line distance. It sometimes happens that publication in a newspaper that has absolutely no circulation in the locality of the claim.

THE hardness of aluminum varies according to its purity, the purest metal being the softest. Ordinary 98% aluminum is about as hard as copper. Aluminum becomes harder the more it is worked by rolling, drawing, stamping or hammering. The metal must be annealed in a close muffle, and must not come in contact with the open fire.

SKETCHES AND LINE DRAWINGS intended for reproduction by the zincotype process should be made using photographic black drawing ink. It is better to make them fairly large and let the photographing bring them down to a convenient size. Letters and figures should be made so that reduction by the photographing leaves them clear and distinct.

ASSESSMENT WORK on a mining claim, to validly hold it, must be performed by the claimant or in his interest. Work performed on the claim by another by mistake cannot count as assessment work, unless, indeed, the owner of the claim make it his work by paying for it. The owner of a mining claim is not compelled to pay for work done on his claim by the mistake of another.

IN deciding the case Sutter Co. vs. Johnson et al, brought in the Yuba Co., Cal., Superior Court to enjoin the operation of the Polar Star hydraulic mine, and to test the Caminetti law, the court holds that the law is not absolute and that the permits granted to hydraulic miners by the Debris Commission appointed under that law are no bar to injunction suits when the debris from the mines is injuring the rivers and valley lands, even though the miners have constructed dams in accordance with the plans and under the supervision of the Commission.

IT is as easy to transform all other forms of energy into heat and to lose that heat as to lose water out of a leaky barrel, and as hard to make the reverse transformation as it would be to fill the leaky barrel with a leaky dipper. Every time one kind of energy is changed into another some considerable part of it insists on appearing as heat.

IN the case of Duncan vs. Fulton, Pac. Rep. 61, 244, the Colorado Supreme Court decided that a description in a certificate of the location of a mining claim which locates the mine a certain distance from a patented mine is sufficient, since such patented mine will be presumed to be a natural object or permanent monument, until the contrary appears.

THE bromo-cyanide process is in successful commercial use at the Atlas G. & A. Co. mine at Hastings, Ontario, Canada. The ore is quartz, carrying gold associated with a large percentage of mispickel or arsenical pyrites. The ore is first amalgamated and some of the gold recovered. The concentrates are treated by the bromo-cyanide process and afterwards roasted for the arsenic.

AS to acetylene the light is relatively costly; it is practically impossible to utilize this gas in heating apparatus or in motors, for the cost of the material necessary to produce a cubic meter of acetylene gas is six times greater than the cost of a similar volume of coal gas, while the calorific power of acetylene is only three times that of coal gas. But acetylene gas may be advisable for isolated buildings with no central lighting plant within reach.

A METHOD of fireproofing wood is as follows: Subject the wood from six to eight hours to the boiling heat of a solution of 33 grammes of manganese chloride, 20 grammes of orthophosphoric acid, 12 grammes of magnesium carbonate, 10 grammes of boracic acid and 25 grammes of ammonium chloride, in 1 litre of water. The wood thus treated is incombustible even at great heat, and is protected by this method against decay, injury by insects, or putrefaction.

THE formula for a cement for cast iron has been published before, but in response to two inquiries is herein republished: Two ounces sal-ammoniac, one ounce sulphur, sixteen ounces boringe or filings of cast iron, are mixed well in a mortar and kept dry. When required for use one part of this powder is taken to twenty parts clean iron boringe or filings, and thoroughly mixed in a mortar; the mixture is made into a stiff paste with a little water, when it is ready for use. A little fine grindstone sand will improve the cement.

IN the case of the Cosmopolitan M. Co. vs. Foote, 101 Fed. Rep., U. S. 518, the U. S. Supreme Court decided that where, by mistake, a mining claim is located across instead of along, the vein passing through the location point, the rights of the locator are governed by the facts as they exist with regard to such vein. His side lines, as located, become end lines, and he is not entitled to any extralateral rights thereunder, although another vein, extending transversely to the one intended to be located, may have its apex inside of such surface lines.

IT is customary in the process of copper refining to leave a small quantity of oxide in the metal, in order to oxidize any trace of bismuth, arsenic or antimony which have not been entirely removed. As a result, these metals exist in the commercial product as oxides, and not as metals, which would form an alloy with the copper and so injure its quality. In making copper bars for the manufacture of wire of high electrical conductivity, and cakes to be rolled into sheet, this practice is, without doubt, beneficial; but it does not improve the copper for the manufacture of brass or other alloys. Zinc is a strong reducing agent, and a study of its thermo-chemical reactions has shown that it will reduce not only the oxide of copper, but the oxide of bismuth, antimony and arsenic also.

GOLD found casually by any person, working for another, in grading a millsite on the public domain, is not acquired by the employer in California. The California civil code, Section 1985, provides that "everything acquired by an employe by virtue of his employment, except his compensation, shall belong to the employer;" but gold found casually on the public domain by an employe belongs to him and not to the employer, and the former can maintain an action against the latter for a wrongful conversion of gold so found. A decision to this effect was due to the fact that a number of graders found a pocket of gold worth $600 while leveling off for a quartz mill on public land. The employer took possession of the gold under the idea that it was his "by virtue of his employment." The court held that gold so found is an adventitious find, and, being found on the public domain, rightfully belongs to the finder. The case was fully reported at the time in the Mining Law Journal, Denver, Colo.

A FALL of 450 feet will provide by gravity more than the power required to operate a suspended cable tram for ore carriage for 1400 feet of distance down hill. It will provide just about the power required for the gravity operation of a three-rail car tram for the noted distance. The track rails could be made of scantlings, or even poles with the sides and tops faced off. A steel cable should be used, but a hemp cable could be. A single-track jig could be used, constructed as described in the MINING AND SCIENTIFIC PRESS of Feb. 8th of this year. If these tram constructions can not be considered, a wagon road can be built of any practicable grade up to 18 feet in 100. The lighter the grade the better, but with 18 feet to 100 a team can haul up the empty wagon. If the side hill cutting is rock and costly, the road can be made for a special narrow-track wagon, 3-foot gauge even. A sled can be used on a still steeper road. It is preferable, if a road has to be built, not to economize on it at the expense of the grade. A fall of 450 feet in 1400 is not sufficient to keep rock moving in a slide way. The amount of shovel assistance required would make it very costly of operation. Probably the cheapest and readiest solution of the problem would be the wagon road, which would in this case save a rehandling of the ore at the top of the slope to the mill.

ALL modern gas engines belong either to the 4-cycle or 2-cycle class. In 4-cycle engines the sequence of operations takes four strokes, or two complete revolutions, before it repeats itself. First, the piston moves out, drawing in a charge of mixed gas and air at atmospheric pressure. On its return stroke it compresses this charge into the clearance space. Then the ignition takes place, and the pressure and temperature suddenly rise, and the piston moves rapidly forward, expanding the burning gases. At the end of this stroke the exhaust valve opens, and then the piston returns, driving out the burned gases and making ready for a repetition of the cycle. This necessity of taking two complete revolutions per cylinder per charge has led to the devising of the 2-cycle engine. In it the mixture is partially compressed by means of an auxiliary blower, or cylinder, and is made to drive out the burned gases while the piston is at its out dead center. Then the valves close and the piston compresses the charge into the clearance space. Explosion and expansion ensue, as before, and the new charge again drives out the exhaust gases. This cycle has the advantage of more frequent explosions, but it is sometimes more difficult of successful operation on account of the possibility of turning in too much mixture and losing part unburned in the exhaust, and also the difficulty in cooling sufficiently to prevent the new charge from becoming ignited by the preceding one.

TO DETERMINE the percentage of copper in the ore one way would be as follows: Five grams of the finely powdered sample are roasted to eliminate the sulphur, adding and mixing in a little carbonate of ammonia towards the close. Dissolve the roasted product in a casserole (covered with a watch glass) by adding 5 c. c. of hydrochloric acid, 10 of nitric acid, and 10 of sulphuric. Boil slowly, nearly to dryness, until nothing but dense white H_2SO_4 fumes arise, then cool, dilute with a little water and digest. Filter, and wash thoroughly the residue which is then rejected, the copper being now present as a sulphate in the solution, which is transferred to a porcelain dish. A small piece of pure metallic zinc, resting on an accurately weighed platinum foil, is introduced into the solution. Zinc has a stronger attraction for the sulphuric acid radical (SO_4), than copper does, and so the former displaces the latter from its salt and it collects on and around the platinum foil as metallic copper. The action should be made to take place fairly rapidly by the addition of dilute H_2SO_4, until all the zinc is dissolved, at which time all copper should be deposited, and the solution should be clear and show no dark color with H_2S water. It is then poured off, the metallic copper and platinum foil are both washed with water and alcohol, dried and weighed, which, less the former weight of the foil, would indicate the amount of copper per 5 grams of ore. Suppose it to be 1.06 grams, then the percentage of copper would equal $1.06 \div 5 = .212 = 21.2\%$, and the ore would yield $2000 \times .212 = 424$ pounds of metallic copper per ton of 2000 pounds.

SECTION 4886, Chapter 126, U. S. Revised Statutes, provides that any person who has invented or discovered any new and useful art, machine, manufacture or composition of matter, or any new and useful improvement thereon, not known or used by others in this country, and not patented or described in any printed publication in this or any foreign country from his invention and description thereof (and not in public use or on sale for more than two years prior to his application, unless the same is proved to have been patented) may, upon payment of the fees required by law and other due proceedings had, obtain a patent therefor. Under this section of the Revised Statutes it has been held that, in order that a prior publication may defeat a subsequent application, the publication must be, first, a work of public character intended for general use; second, within the reach of the public; third, published before the date of the latter invention; fourth, a description of the same complete and operative art or instrument; fifth, so precise and particular that any person skilled in the art to which the invention belongs can construct and operate it without experiments and without further exercise of inventive skill. It has also been held that a written but unprinted description is not a publication; that a drawing or tinting without printed text is not a publication; that business circulars that are sent only to persons engaged or supposed to be engaged in the trade are not such publication as are contemplated by the section referred to. It was held, however, in another case that a journal devoted to a special science, printed in German and deposited in the library of the patent office and in the library of the Institute of Civil Engineers—a society of 3000 members and there accessible to them—and catalogued under the head of "Journals" only, though proved to have been read but by one person, is a sufficient publication.

Water Purification for Domestic Use.

Written for the MINING AND SCIENTIFIC PRESS by
F. RIGAUD, C. E.

The requirements as to quality are widely different between water desired for industrial purposes and water for domestic use. To know if a given water satisfies technical requirements for industrial purposes a chemical analysis is made. Difficulties of use arise from the presence of calcium carbonate and sulphate, rarely from other saline substances, such as sodium chloride or sulphur. All of these minerals are easily detected by the chemical analysis, which is also more or less suggestive of the means to be taken to obviate the difficulty.

Sodium chloride—common salt—cannot be got rid of, but is not of much consequence when in small quantity, for either domestic or most industrial uses. It, however, makes water unsuitable for brewery and some chemical fabrication uses. Sulphate of sodium can be changed to sodium chloride by adding to the water a proper quantity of calcium chloride, provided it is desirable to avoid the presence of the calcium sulphate.

Carbonate of calcium is easily removed, good aeration effecting it, the water after aerating by a convenient fall in the open air being allowed to settle still in a reservoir. The calcium carbonate, having been deprived of its carbonic acid, sinks with suspended clay, sand and other mechanical impurities. Some calcium sulphate, if present, will also be deposited, but not all there may be in the water.

When necessary, it is possible to take out the calcium of calcium sulphate by adding a proper amount of sodium carbonate, and the free sulphuric acid by the addition of barium chloride. This process may be useful when water is intended for use in steam engines, because calcium salts give hard deposits in boilers and are the cause of dangerous explosions. In this process some sodium chloride remains in the water and for several purposes the inconvenience is not much diminished. Perhaps a better result may be obtained by using, with proper care, barium soluble aluminate, which is claimed to precipitate together lime and sulphuric acid; but the reaction is costly and the process requires too long a time.

Sulphur, or sulphuretted hydrogen, or calcium and sodium sulphides, disappear easily by aeration, being transformed into sulphates. From the above it results that the first and most useful process to render water proper for industrial purposes is aeration by fall, with settlement in large ponds or reservoirs for a sufficient time.

In some places the water supply for domestic service is divided into two distinct parts, on one side water for bathing, washing, cleansing and irrigation, no special condition of purity being required for such purposes, and the water, if necessary, can have added to it antiseptics, phenols or its fellows (except for garden watering). But for the second part, or the whole supply, when there is no separate service distribution from which the people can take their drinking water and water used for ice making, other examinations and conditions are to be met and provided for.

The aim of these examinations is double. In the first line the chemical analysis may exclude absolutely the proposed water. Such is the case if it contains the maximum dissolved sulphate of calcium—two parts in one thousand—or a similar amount of magnesium sulphate, or a notable amount of sodium sulphate, or an excess of sodium or calcium chloride. In each of these cases the presence of these substances in small quantities—about one-half part in one thousand—is not sufficient reason to reject the water. But the several minerals noted above must be considered as cumulative in their noxious effects. Sodium chloride, when not above one to one thousand, is more advantageous than noxious to taste and for health.

In case other substances are present, such as, perhaps, arsenic, sulphur, etc., the analytical chemist may indicate if it is possible to remove them by a simple process without danger to the public health. Otherwise the proposed water is to be rejected. Naturally, in all cases water cannot be clear, and, except when coming from perfect springs, it must be aerated and settled in ponds or reservoirs. Here in the second line of examination begins the work of the hygienist and microbiologist. Water is to be examined with the aid of the microscope for microbian culture by a very competent specialist; and this examination must take place not at springs or reservoirs, but after arriving at the place of use, because the rest in passage in pipes, ponds, reservoirs and basins is an opportunity to raise high the number of microbes in a given quantity of water, and the question is to have pure water, not 10 miles from the city, but at hand for the drinker or ice maker.

In current circumstances the microscope reveals the presence of numerous microbes or colonies, but the specialist is able to distinguish between noxious and non-noxious bacilli, and if he does not find anything other than common and inoffensive ones he may declare the water to be acceptable without danger to the public health.

This conclusion generally is a dangerous fallacy. The chemist has no right to declare a water supply not dangerous except when the microbes are very scarce. If microbes are numerous in water, although not dangerous when observed, they prepare by their presence a fertile field, a true bouillon of culture, for dangerous microbes in the atmosphere, so that, however ordinarily without dangerous microbes, a microbous water, in time of epidemic, is a sure vehicle for the extension of the epidemic.

The condition is especially dangerous when the point of consumption is a seaport, into which from all parts of the world the microbes of epidemics come.

We must add to this that other considerations than material purity of water are to be taken into account. Water must be agreeable to the taste, and the public are interested in securing the delivery of such water, and not of an insipid and nauseous kind. With disagreeable water, there is an inducement to use alcoholic beverages, separately or mixed with water.

This question of taste is the principal reason for aerating water supplies; but aerating water is quite insufficient when water is microbous, and aeration does not kill the microbes, or, if they are partially killed, they are not destroyed, and the water remains insipid.

From these premises it appears a duty of public or local authorities to control the quality of water by insuring that water is clear and without microbes at entrance into the delivery pipes, in which it will be free from contact with the open air till tapped by the consumer.

If connection cannot be made with pure springs, it is necessary to make water absolutely clear and to deprive it of microbes at its entrance to local delivery. Sterilization of water may be accomplished by boiling it a few minutes, but it is not possible to insure the killing of all the microbes if the temperature does not greatly exceed 100° C., or 212° F. Several microbes resist a temperature up to 110° C. However, the boiling of water before drinking is a good precaution in time of epidemic, at least in a low country. On mountains the boiling temperature is not high enough, being 1° C. lower for each 27 millimeters of atmospheric pressure. Epidemics are, however, rare in mountainous countries, excepting dysentery. If there is something to fear, it is best on plains and mountains alike to boil water with antiseptic matter, and especially with tannic and perfumed ones, tea or coffee. To the habit of drinking tea must be attributed the scarcity of epidemics in China.

This sterilization of water is an individual question, and not to be attempted by the general public. The same is the case with the use of alcohol. Thus whiskey is a good antiseptic, and by mixing it with pure water, in the proportion of one to four, there remains no great chance of taking an epidemic disease from drinking water.

Another plan has been to sterilize water by adding to water in a vessel a small quantity of calcium permanganate, just enough to see a light red tint. In a few minutes all microbes are killed and burned by the excess of oxygen in the permanganate, and excess of permanganate, if very small, disappears quickly by natural destruction. But such a process for purifying water for drinking is too dangerous for general use.

Chlorine as a gas or in solution may be used and is a perfect destroyer of microbes, but makes water very disagreeable if there remains the least speck of free chlorine, or of its combination with sodium and calcium. Probably the use of chlorine would not be quite as dangerous as the permanganate, but neither is to be recommended.

As a general conclusion we must say that, except by boiling, by mixing with alcohol, or by infusion with tea, coffee or other aromatic and tannic leaves, we do not know of any way to realize perfect sterilization of water in small quantities except by ozone.

We arrive now at the ozone process. Ozone is nothing more than oxygen, the ordinary agent of animal life, but enjoying very active oxidizing faculties, because of certain molecular or electrical modifications.

As soon as ozone is put in contact with organic substances, such as microbes, it burns them completely up, giving in their place a very slight amount of carbonic acid. And if an excess of ozone is used, it disappears very readily by itself, ozone being unstable.

In the last ten years numerous experiments have been made by physicians, chemists and biologists on this question of ozonization of impure water, as well on a small scale in laboratories as by large quantities for water supply in considerable cities. The results obtained are perfectly verified and may not be contested; and because I took part in several of the most important of these experiments I am able to explain the method and the results.

One interesting feature of ozonization is the economy of its use on any scale, not, however, in the same way. When applied in small quantities the process is to use ozone-gasified water. This liquid, for our purpose, may be considered a solution of ozone in ordinary water. It is commercially furnished with about 3% of pure oxygenated water, in weight; but it is necessary to compare it to ozonized air in order to examine its effect, and a gallon of commercial ozonized water is equivalent to 2500 gallons of air ozonized at the rate of ½%—one gallon of ozonized air being sufficient to sterilize about ten gallons of impure water in an ordinary cooling chamber, and one gallon of commercial oxygenated water to treat 25,000 gallons of impure water.

The sole precaution to take in the use of this process of sterilization is to have a good mixture of the sterilizing liquor with the flow of water, and that is easy to obtain.

We take a Mariotte (or sypoide) vessel as regulator for dropping the oxygenated water, and we put the tube of this vessel in the flow of water arriving from a pipe in the last reservoir before distribution. The discharge of water being known, we regulate the pressure in the Mariotte apparatus in order to produce the required proportion of 1 to 25,000 and thereafter there is nothing more to do except to exactly supply the Mariotte. When this operation is begun it is necessary to verify by bacteriologic examination that we have adopted the proper proportion. This at the beginning is probably too short, and leaves part of the bacteria. It will be increased according to observation until the water going out from the reservoir presents only a small number, say 400 or 500 to the cubic inch, and all of the harmless kind, known by bacteriologists by the name Henbacillus. This number seems high, but the ordinary number of bacilli colonies is 30,000 or 40,000 per cubic inch. The sterilization down to 1% is comparable to the best practical industries of any kind. The difficulty may be to be supplied with clean oxygenated water, free of barium and containing a regular quantity of ozone.

When the question of sterilization arises for a city the use of dissolved ozone cannot be considered. It is much cheaper and better to make ozone in place and to utilize it immediately. The tests I made were on a large scale, treating daily 2,500,000 gallons. If there is a much larger quantity of water to sterilize daily, the same ensemble of apparatus can be reproduced as many times as there are 2,500,000 gallons to be treated daily, except, of course, the steam and power plant. A reduced disposition may be adopted for 1,000,000 gallons daily, but the expenses increase notably. Therefore I take for basis of treatment 2,500,000 gallons daily.

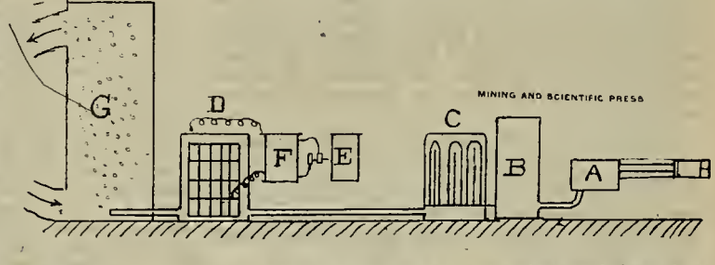
Since I made the experiments referred to, the ozone process has been put into use in several cities. Certain differences exist between the apparatus established in these different places, and certain improvements resulted from these operations. But the main points are well established and the results of practice have been perfect in every case, the difference being only in the cost of treatment.

The following is a description of the operation and scheme of its organization: It is necessary to use fresh cold air. In case it should be impossible to obtain air below 60° F., it is necessary to cool the flow of air before its ozonization by passing it through pipes inclosed in ice or by refrigeration by some process.

The water must be under about one-half atmospheric pressure and the purification must take place under this pressure. The air is deprived of moisture by caustic alkali. In the accompanying diagram A is the air compressor, B the drier, C the cooling chamber.

The quantity of air to pass into the ozonator D is about one gallon to ten gallons of water to be treated, or 33,000 cubic feet daily, in our type—385 cubic feet per second, under pressure of 20 inches of mercury.

The ozonator may be constructed on several plans, the principle alone being fixed. It contains a large number of small cells, each of which is formed by two



surfaces of glass. The exterior sides of their surfaces (plates or cylindrical) are covered with metal—tin or copper—or are in contact with pieces of iron, and the surfaces respectively are connected by wires with the two poles of an electrical alternator E and transformer F, giving at least 40,000 volts pressure. The electrical engine furnishing electric current for our type is a 30 H. P., producing daily about fourteen pounds of pure ozone.

Between the surfaces of glass runs slowly the air sent by the compressor, and it acquires about ½% of pure ozone as a result of this indirect electrization. Then the air goes directly to a tower G, or, more exactly, three or four towers (about 15 feet high), whose diameter is calculated to provide fifteen seconds

for the water to pass through. The aim of this disposition is to assure perfect mixture of ozonized air at ½% ozone with water during fifteen seconds.

The variables in the operation are the amount of air furnished and the number of turns at the electric engine. Regulation is made by accurate bacteriologic examination of water flowing from the tower. The indications we have given above appear like a maximum, except in extraordinarily impure and dangerous water.

The result is absolutely perfect and marvelous. Examination of water arriving at the aerator, in the experiment to which I refer, gave about 60,000 bacilli colonies to the cubic inch. After fifteen seconds mixture it was not always easy to find any microbes, but the estimation was twenty or thirty, all non-noxious.

On the other hand, when taking water in a pipe 6 feet long, terminated by two glass plates, it was difficult to see light through the water arriving. After treatment the transparence was complete; and, tasting the two kinds of water, I found a big difference. The first one was insipid, the second very agreeable to drink. And this experiment is not the least one, because the taste is a better analyzer than some chemists and scales.

From the experiments I made, and confirmed by other observations, the plant for this operation will cost about $20,000 for the type treating 2,500,000 gallons of water daily.

The necessary current expenses are the cost of running an engine of 25 to 30 H. P. and the maintenance of all apparatus in perfect shape. From our experiments the direct expense was 1 cent for 5000 gallons, or $5 daily for the 2,500,000 gallons. The cost of maintenance for the $20,000 plant may be not far from the same figure; but for general expenses it is difficult to foresee everything without knowing the special indications. If the purification is connected with pumping, the general expenses will be low, the salary of an engineer only; but if the operation is separate the cost may be very high. I think as a provisional figure, under various circumstances, the price may be between 2 and 5 cents to 5000 gallons; but the above figure, applied with care, allows any one to make an exact estimate in given circumstances.

The important point is constantly made that air at ½% ozone, in contact during fifteen seconds with impure water, transforms this liquid into a perfect beverage.

Quality of Stone Used for Concrete.

The use of concrete is increasing so rapidly at the present day as to render a consideration of the quality of stone best adapted for the purpose of more than passing interest. In discussing the influence upon the strength of concrete of different varieties of stone, the Quarry says:

It appears from experiments which have been carried out in the testing shops of the Royal Technical High School in Stockholm that all kinds of broken stone are by no means of equal value for making concrete. These experiments did not include the examination of the different results obtained from crushed stone and from shingle, which is very largely used for concrete in the neighborhood of shingle beaches, but rather of the different results obtainable from various kinds of crushed stone which might reasonably have been supposed likely to be of uniform value for this purpose. All the stone upon which experiments were made was crushed in an ordinary stone breaker to a uniform gauge, and a number of 10-inch cubes, made of cement, sand and broken stone, in the proportion of 1, 3, 5, were molded and rammed, with the addition of 5½% of water. Both the sand and broken stone were carefully dried and washed before mixing. The ramming was done by forty-four blows of a monkey, weighing 130 pounds, with a fall of 3.28 feet, this being about one-quarter of the work put on standard test pieces of cement. The blocks were kept for a fortnight covered with soaked mats in a damp cellar, and afterward in a dry, cool room until the completion of a month from the time of mixing. The mean results of five separate tests of blocks made from five kinds of stone gave the following figures:

Kind of Stone.	Weight of Concrete per Cubic Yard. Tons.	Crushing Strength per Sq. In. Tons.	Relative Crushing Strength.
Hornblendic granite	1.79	1.125	100
Diorite (greenstone)	1.79	0.965	86
Hornblendic granite from Rindo redoubt	1.74	0.958	85
Pegmatite, from Edholmen	1.72	0.894	79
Pegmatite, from Ytterby	1.70	0.685	61

Individually the five specimens of greenstone concrete showed the greatest variation both in weight and crushing strength. The strongest was more than half as strong again as the weakest, although the weight per cubic yard did not differ by more than 4.4%. This important result points to the great necessity of ramming in order to secure the greatest possible density. The relative strengths given by the different kinds of stone in the above table also show great differences. Between the two kinds of hornblendic granite, for example, there is a difference of 15%, the only difference observable in the stone being that the weaker specimen was of coarser grain. The pegmatites, which gave the poorest results, were also coarser in grain than the other varieties.

The structure of the stone employed for concrete appears, therefore, to play a most important part in determining its strength, and coarseness of grain is not a desirable quality. To this fact we call the attention of all engineers and concrete manufacturers, for it is obvious that not all kinds of crushed stone are capable of giving the best results.

The Stave and Binder Flume.*

Written for the MINING AND SCIENTIFIC PRESS by GUY STERLING, C. E. and M. E.

Successive years of water scarcity throughout the West have induced engineers and others, who are interested in the handling and conservation of water, to give careful consideration to the improvement of some of the older methods of hydraulic construction. In proportion as the more easily available sources of water are appropriated, will the future development of water supply tax the ingenuity of the engineer to design safe, permanent and economical works for the diversion of water and its conveyance over difficult routes and through long distances to the place of use.

In spite of its makeshift character, its many faults and inherent weaknesses, no design for any form of open-topped conduit has been made for conveying water on a grade line along steep mountain sides, so cheap in first cost, so easily and quickly built and so readily adaptable to a wide range of conditions and services, as the all-wood box flume. Any form of structure which retains the chief advantages of the box flume and is at the same time free from many of its objectionable features will be of interest to engineers and users of water in general.

In the round-sided stave and binder flume (patented) the writer believes that a type of flume has been designed which is entirely free from the faults objectionable in the box flume. In the round-sided flume the materials—wood and iron or steel—are combined in an economical and self-contained manner for the purpose in view. This flume may be described as a round-sided, or semi-circular or partially round-sided, open-topped conduit, composed of staves and tie beams, the latter spanning the top of the conduit, and binding rods or bands which pass around the staves and through the ends of the tie beams and are adapted to bind the whole firmly and tightly together. In Fig. 1 is shown a view of the flume, which clearly illustrates the mode of construction, which is more like that of a wooden stave pipe than a box flume. Under comparable conditions, whatever advantages or disadvantages pertain to the wooden stave pipe would seem to pertain with equal force to the semi-circular flume.

Of this round-sided flume about 6 miles have been built, all of which is in successful operation. Two miles were built in 1892, 1½ miles in 1895 and the remainder in 1896 and 1897. The two first mentioned were built of redwood staves and for irrigation purposes; the other flumes of this type were built of Oregon fir staves.

With one exception, these flumes were allowed to stand for long periods of time in a perfectly dry condition, with no care or attention of any kind; nevertheless, the work of clinching up the bands and rounding out the staves, which work put the flumes in first-class condition, cost only 4 cents per lineal foot of flume. Whenever this type of flume has been used in a normal manner, the total cost of maintenance, operation and repairs for flumes of from 15 to 30 square feet area has been less than 2 cents per lineal foot per annum.

In the use of a new type of flume, as might be expected, some defects of design have developed; but these were entirely defects of particular designs, and not of the type. Taken as a whole, the nine years of experience with this flume, under extremely unfavorable and under some favorable conditions, have shown that it meets every requirement of durability, cheapness of maintenance, ease and convenience of repair, water tightness and low first cost.

In the shell or lining of this flume no nails are used; its parts are held in place by the binding action of the tie beams and bands. The flume may be supported by wooden chairs, as illustrated in Fig. 1, or preferably, by iron chairs, as shown in Fig. 2. Where the circumstances will permit, no better support can be devised than earth tamped firmly around the sides, as shown in Fig. 3.

The setting up of the flume is simply made. Two chairs, or outside forms, are set up, and in these the flume staves are laid, with their adjacent ends falling 2 or 3 feet forward or back of each other, thus forming a "stagger" joint. When all the staves required to fill a section are in place, the bands, tie bands and washers are put in place and the nuts on the ends of the bands are turned down, thus binding the staves together. As the bands are drawn tighter and tighter, the staves are rounded out with leather-faced mallets, until the inside of the shell is smooth and the longitudinal seams between the staves are closed. Iron tongues, 1½ inch wide, ⅛ inch thick and a little longer than the stave is wide, are next driven into the grooves cut into the ends of the staves for that purpose. Then another outside form, or chair, is set up and the staves of the next section are put in place, the staves being so held that the tongues already inserted in the ends of the staves of the completed section can enter the grooves, or slots, in the ends of the next section. The joints at the abutting ends of the staves are then closed by by driving up the staves with a wooden driving bar and heavy hammer, by which operation their joints are made water and air tight.

*See illustrations on front page.

Under fair conditions, a well trained crew of two or three men and a foreman will build from 75 feet to 150 feet of flume per day, depending upon the size of the flume and the character of the alignment.

On curved alignment the flume is built straight out on the tangent to the curve and is then bent, as a whole, by special power appliances, to fit the curve. In this manner flumes of 6 feet inside diameter have been bent to curves of 80 feet radius. For such large flumes, however, the radius of curvature should not be less than 200 feet. When curves of shorter radius are unavoidable, the flume can be mitered to fit them.

The best material for staves is California redwood or Washington cedar; when these can not be obtained, Oregon fir or Texas pine can be depended upon for good results. Wood which is free from knots will give the best service, although the so-called "common" grade of Oregon fir has been used for this type of flume and is giving satisfaction.

Owing to the variable conditions controlling the cost of all flumes, it is difficult to make a statement of comparative costs for the box flume and the round-sided flume which will have anything like a general application. The quantities of material required for a flume of each type, the areas being equal, will convey an idea of the comparative costs.

Flumes of 13 square feet area and 16 feet long require, if made in the half-round design just described, for a 16-foot length, 444.5 feet of lumber and 96.91 pounds of metal. The same cross-section of water flow area made in the form of the ordinary box flume will require 646.5 feet of lumber and 10 pounds of metal.

For flumes of about 13 square feet area, the box flume has about 10% less carrying capacity than the round-sided flume by reason of the difference between their respective hydraulic radii. The box flume requires 45% more wood—a perishable material—than the half-round flume. The first cost of the box flume will be about 10% more than that of the round-sided flume. As no nails or screws are used in the lining of the round-sided flume, the flume will be likely to have a long life.

In flumes of greater area than 13 square feet, the difference in the hydraulic radii and the relative quantities of lumber required are more in favor of the round-sided flume than shown above, while for smaller flumes these differences tend to disappear.

The respective fields occupied by flume and pipe conduits seldom overlap, for when it is practicable to carry the water in an open-topped conduit, the flume, on account of its lower first cost, will be preferred; but where water has to be conveyed across deep canyons or around steep cliffs, requiring high and expensive trestles if flumed, the pipe will have the lower costs and some constructive advantages.

Volumetric Determination of Antimony.

The finely crushed sample, ½ to 1 gm., is treated in a beaker with 50 c. c. hot water and 50 c. c. strong HCl, the water being added first. Heat on sand bath at 70° C. for one-half to one hour. Filter in large beaker or flask, washing with dil. HCl and water. Add tartaric acid to filtrate, dilute to about 750 c. c., heat to 70° C., and precipitate with H_2S. Filter, wash with H_2S water, then precipitate back into precipitation vessel with the aid of hot water. The sulphide is warmed with 50 c. c. strong HCl (avoid boiling) until no more H_2S is evolved. The presence of H_2S is at once detected, if a little cold water be added to the solution, by the reappearance of a precipitate of red Sb_2S_3, the addition in the absence of H_2S causing only a slight milkiness, due to basic chloride. When all H_2S is expelled, the liquid is diluted, the turbidity is removed by just sufficient HCl added drop by drop, and the solution titrated with permanganate. $5Sb\,Cl_3 + 16H\,Cl + 2KMnO_4 = 5Sb\,Cl_5 + 2KCl + 2MnCl_2 + 8H_2O$. If 5.27 gms. of $KMnO_4$ be dissolved per liter of solution, 1 c. c. will equal 1% Sb with 1 gm. sample. The end point of reaction is sharply defined.

AN appropriation of $60,000 has been made by Congress for the investigation of the mineral resources of Alaska by the Geological Survey. One of the parties has for its objective point the base of Mount McKinley, the highest mountain in North America, and which, so far as any record shows, has never been viewed except from a distance. The party will explore the northern slope of the Alaskan range, making such expeditions into the mountainous regions as is possible, and so mapping the country that future expeditions will find a broken trail. It will be under the direct supervision of A. H. Brooks, and will leave Seattle, Wash., about May 15, going by steamer to Tyonok, on Cook Inlet. D. L. Raeburn will be topographer, and five camp hands, with a pack train of twenty horses to carry the outfit, will make up the party.

Placer Mining Kinks.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by CHAS. P. RICHARDSON.

UNDERCURRENTS. — For saving fine, rusty and "black" gold and floured amalgam I screen my material through a grizzly made of twenty to twenty-four bars ¾x2x30-inch tire steel, set on edge across the 30-inch flume with ½-inch interstices between the bars, the top of the bars set ½ inch below the level of the riffle blocks when new. The screened material passing through the grizzly falls through a 24x18-inch hole cut in the bottom of the grizzly box into the head box, 20 inches wide, 24 inches deep, set below and at right angles to the main flume. This box, set on 6 inches grade to 12 inches, leads the material to the head of the undercurrent tables, and it is there distributed to the tables by gates hung at right angles across the head box, from a slotted frame resting on the top of the box. (See Figs. 5, 6 and 7.) I cut the gates with a narrow top so that by reversing them in the slots they can be adjusted to cover the whole width of the head box. There is no side board to the head box on the side toward the tables, after the head box joins the top of the tables. The tendency of the impetus is to drive all the material to the far end of the head box and consequently onto the last table. (See cut.) To counteract this tendency the distributors are set to divert the material, and they need to be stoutly made, too, it being well to set the slot frame guides A and B (Figs. 5, 6 and 7) below and above the supporting frame C, as shown, to better resist the impact of the water and prevent its prying guide A off the frame.

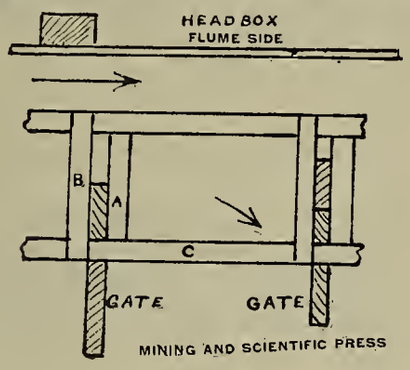


FIG. 5.

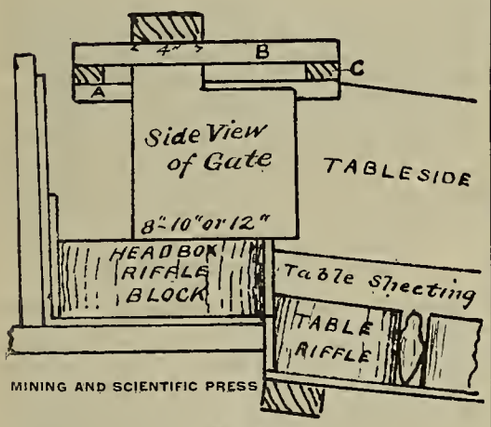

FIG. 6.

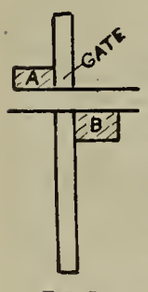

FIG. 7.

The undercurrent tables, set parallel to main flume, are 10 feet wide, 24 feet long, on my upper flume, and 7½ feet wide, 36 feet long on my lower flume, are each divided into three compartments longitudinally and are set on a grade of 15 inches to 12 feet. I use two or three distributors to each compartment to flow the material evenly over the whole riffle surface. I use a block riffle spaced up and down the tables about 2 inches apart and chinked with boulders. I formerly used round blocks, but now square and split them to form a better cross riffle.

I give the grizzly box a 10-inch grade and the tail boxes below the grizzly 15 inches grade to 12 feet as against 6½ inches above the grizzly box. Below the grizzly I square the blocks carefully on four sides and set the sides tight against each other and the flume sides with no interstices. This forms a perfectly smooth surfaced pavement which with the increased grade effects a proper delivery of the coarse material through the tail boxes to the dump, without any stoppage arising from the reduction of the water flow at the grizzly.

The material from the grizzly dropping 2 feet into the head box tended to form dead water and a boil, resulting in the blocking of the head box with the sand and gravel sent down. The 6-inch grade on the head box is ample, even a trifle heavier than necessary to handle my class of fines after they are in motion. To prevent the boil and start the fines down the head box I cut the two blocks under the grizzly with a sloping surface, as shown in Fig. 4, which gave them 5 inches grade in 30 inches. This ended the boil and the inertia difficulty.

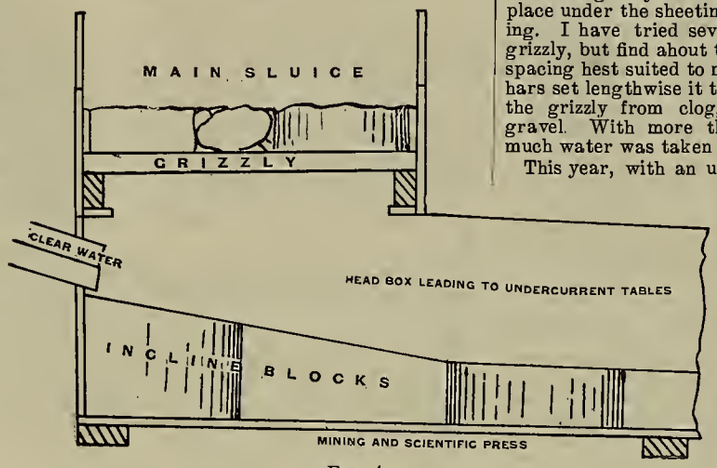

FIG. 4.

In running very sandy ground which resulted in a great quantity of fines, and also in the "sand padding" of the riffles and consequent inclination of fine gold to travel excessively, I found it necessary to supply additional clear water to keep the riffles clear on the tables. I tapped my ditch and brought clear water down in an old string of 6-inch hydraulic pipe and delivered it in the head box, as shown in Fig. 4.

I have used, up to this season, a 10x24-foot undercurrent table modeled in a general way after the North Bloomfield table as described by Bowie, divided into three longitudinal compartments. This year I installed a second table on my lower flume.

Undercurrent on Hydraulic Sluice.

This I made up of three independent lines of 30-inch sluice boxes set side by side, with the head box and distributors as described above. I like the idea much better than the one broad table, as it permits the lengthening or changing in any way desirable of one of the tables without the necessity for shutting down the whole undercurrent, and makes it easy to experiment as to grades, etc., on a portion of the tables. My grizzly bars are of tire steel because it is easy to obtain at general stores in my vicinity. I presume a chilled cast bar or hardened steel would wear longer and would be improved with a wedge-shaped cross section, giving freer passage of gravel through the grizzly. I formerly used ¾x3½-inch bar, but found that one season's wear on each edge and side cut them down so in the middle that their usefulness is past, so the ¾x2-inch serves just as well. I rest the bar ends on two pieces of scantling 3x4½ inches set on edge lengthwise on each side of the flume, and space the bars with wooden blocks 2x3x½ inches set on edge on the scantlings.

In setting the grizzly I first lay the pavement to the upper side of the grizzly, and wedge it up so that the carefully squared riffle blocks on the upper side of the first bar are tight and true against the bar and each other, wherefore there is no chance for sand to wash down between and cut out a hole to let coarse material through. Then I lay the bars and spacing blocks. Finally, the pavement below the grizzly being laid, the last two riffle blocks—likewise carefully squared—are placed against the grizzly from below and then wedged up tight against it by driving wedges between those blocks and the pavement below. Don't drive your wedges between the last two blocks and the grizzly. This wedging up holds the grizzly bars and spacing blocks firmly in place under the sheeting with no additional fastening. I have tried several ways of setting up the grizzly, but find about twenty cross bars and ½-inch spacing best suited to my material and water. With bars set lengthwise it took one man's time to keep the grizzly from clogging with roots, grass and gravel. With more than about twenty bars too much water was taken from the tail flume.

This year, with an upper flume 120 feet long—on 6½ inches grade to 12 feet—above the undercurrent grizzly, discharging into 400 feet of bedrock race which discharged at 100 feet lower into a lower flume 120 feet long—on 7 inches grade to 12 feet—above the undercurrent grizzly, as my flume equipment, I saved 13% of my values on the undercurrents. So large a percentage of savings on the undercurrents is due to my opening a new pit, now 120 feet deep, which had to be attacked at this point from on top, and my working consequently a large proportion of top and sandy ground containing light and somewhat flaky gold, which of course travels long distances in the sluices. On another deposit on this property, with 840 feet of sluices in ahead of the undercurrent, my saving on the latter was about 2% of the values recovered.

RETORTING WITH A POT RETORT ON A BLACKSMITH'S FORGE.—My understanding of a proper retorting fire is one diffusing a moderate heat over a distributed area, one under easy control of the operator and, preferably, one heating the retort first at the top. A blacksmith's forge fire gives an intense heat over a restricted area, and that restricted area at the bottom of any body so large as a retort placed upon it.

With a little adaptation the forge can be transformed into a very satisfactory retorting agency for use on small or poorly equipped properties, or those in the development stage, for use with retorts up to five or six-pint capacity. Bend a piece of sheet iron, 12 to 15 inches wide, around three sides of a box large enough so that with the retort hung within there will be 3 or 4 inches of space between it and the sides of the sheet iron jacket which this is to form. (See Figs. 8 and 9.) Stand this jacket on the forge hearth over the tuyeres so that the forge back will form the fourth side of the square which—to mix geometry and Irish—has neither top nor bottom. In this hollow square swing the retort by hooks attached to chains or strong wires depending from overhead, the hooks engaging the retort hale, keeping the retort bottom 6 inches or so above the "duck's nest."

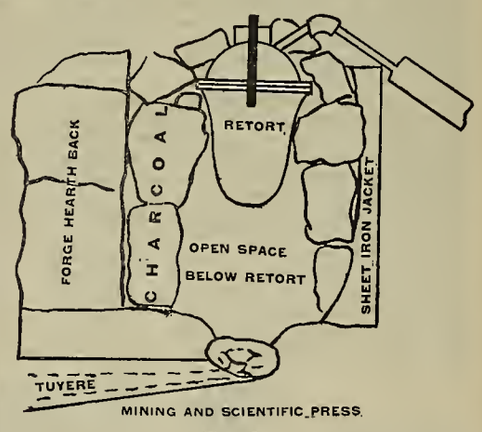

FIG. 8.

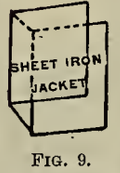

FIG. 9.

In the absence of sheet iron build up your hollow square of rocks or clay, or even thoroughly soaked boards.

Then, after building a small fire in the duck's nest, build up a wall of pieces of charcoal 5 or 6 inches in diameter around the retort in the hollow square, putting no charcoal under the retort bottom, and

piling the fuel up until the top of the retort is covered with smaller pieces. (See Fig. 8.) By using the large chunks of charcoal to build with at the bottom it is possible to maintain the hollow under the retort bottom until the retorting is nearly completed. After the fuel is arranged, using the bellows briskly, the fire is communicated to the whole of the charcoal. Then with a jet of water, handily formed from a tin can with a nail hole in the bottom, wet down and extinquish, or nearly so, all of the fire below the lower part of the retort. You then have a gentle heat distributed over the upper half of the retort, and capable of being maintained or increased by moderate use of the bellows, and diminished by the water jet.

Heating the retort very gradually, and taking care to keep the fire at the bottom of the retort under control by the water jet, the quicksilver commences to distill over with no perceptible "boiling," no rushes and no spurts to carry amalgam over into the condenser.

After the distillation is under way allow the fire to work down into the bottom fuel, which gradually collapses and collects under the bottom of the retort. Keeping fresh fuel piled around the retort the distillation is completed with the whole retort at a low red heat. By building the fire with the hollow under the retort bottom, and with proper use of bellows and water can, the tendency of the forge to get a high heat on the bottom of the retort is avoided, and a very satisfactory retorting furnace obtained.

I never place the end of the iron condenser tube under the surface of the water in the quicksilver receptacle. Instead I wind two or three thicknesses of cloth around the end of the tube, forming a cloth tube, which I allow to hang in the water. The cloth tube being collapsible and somewhat pervious to the passage of air, forms a sort of safety and air valve as it were, so that in case of puffs or "snorts" in the retorting of foul amalgam or a sudden and violent boiling over of quicksilver followed by a subsidence, causing a partial vacuum in the retort, there will be no danger of water being sucked back up the condenser tube into the redhot retort to create explosions.

My three-pint retort two-thirds full of my amalgam contains about $1500. I put it in as loosely as convenient, after luting the retort interior with a paste of ground chalk and water, and remove it by dumping the retort in a gold pan as soon as possible after distillation is complete, before the sponge has a chance to cool.

PANNING AMALGAM.—In panning the foreign substances out of my amalgam for retorting after a clean-up, I find the sooner the amalgam is panned the easier the process is. Finishing a clean-up at 5 o'clock in the afternoon, I have panned clean of black sand, tacks, nails, etc., in two hours, $2900 in amalgam.

Left to stand over a couple of nights in the clean-up bucket, $1600 of similar amalgam has kept me busy for half a day. Lying in still water and quicksilver and in a large mass the amalgam loses much of its coherence, and is much harder to pour dry than the freshly picked up amalgam. Under agitation in the pan it breaks into small independent masses erratically, forming a rough and creviced surface to the "pat" in the pan, which allows the black sand, etc., to settle in the cracks and irregularities of the surface. Consequently the sluicing action of water fails to reach and carry them out without tedious effort and skillful manipulation.

The fine gold in my diggings—mostly from the upper portions of the banks, presumably—that runs down into the sluices for the first of the season's clean-ups, runs better than $19 per ounce; that from the bedrock cleanings a little over $18. The space occupied by $100 of the fine gold amalgam would contain $145 to $170 of the bedrock cleaning's gold.

(TO BE CONTINUED.)

Ancient Workings of Kougarok, Alaska.

Evidence has been found which seems to establish the fact that the mines in the Kougarok district were worked many years ago. A cofferdam built of rock has been found on No. 3, Gold Run, similar to the one on No. 8, and a bedrock drain 500 feet long has been uncovered on No. 14. Within the confines of the cofferdams the bedrock yielded no gold, while on claim No. 14 on the bedrock of the drain little or no gold has been taken out.

These discoveries were made at a considerable depth from the surface. The walls of the drain can be traced distinctly for a distance of 500 feet, and show every indication that the stones of the wall were placed one upon the other by human hands. Those who have given the matter close study say the mines were probably worked by the Russians while Alaska was under lease to the Russian Fur Company. During that lease the fur company made it a crime to mine within the limits of Alaska, and even when hunters brought in gold-bearing quartz they were given from fifty to one hundred lashes. The Kougarok district was out of the range of the officials, and the mines were undoubtedly worked clandestinely.

Friction.

As pointed out by Engineering, one is sometimes inclined to look upon friction as a needless retarding element in nearly all machines, and this is not far from right in so far as the opposition to motion is concerned in the bearings of an engine, the piston, crosshead, valves, shaft and stuffing boxes. It is friction that causes hot boxes and cutting at the bearings and requires the production of from 25% to 40% more power in driving a factory or mill than is actually utilized in the finished products. It is friction that resists the efforts of the locomotive to start a train and tends to stop the movement of vessels passing through the water. But with all its disadvantages and wastefulness we could not possibly get along without friction. While it retards motion with considerable loss, its retarding influence is accompanied by a substantial gain—in fact, we could not run machinery without it. It is only by the aid of friction that a belt is made to turn the pulley, or the pulley to drive the belt. It is by friction that a locomotive is enabled to start a train. This may be proved by placing a small quantity of oil on the rails. As soon as the driving wheels reach the lubricant, which reduces the friction, the drivers will fly around at a very rapid rate and until the wheel reaches the clean rail or the steam is shut off. The friction clutch, one of the most convenient appliances used in the transmission of power, would not accomplish what it does without this wasteful, yet necessary, element. It would be a very difficult matter to stop a train of cars, or even a single car, if there were no friction between the tread of the wheel and the brake shoe, and between the wheel and the rail.

There are three important facts or laws to be remembered concerning friction and which everyone having anything to do with the operation of machinery ought to understand:

First, that friction is independent of the extent of the surfaces in contact.

Second, that it is practically independent of the velocity where there is sliding motion.

Third, that it varies with the pressure when the materials of the surfaces remain the same.

From what has been said concerning the necessity of friction it will be apparent that friction is the resistance which a body meets with from the surfaces with which it comes in contact. Friction is usually designated as a certain percentage of the weight of the body, or the pressure it exerts, and this percentage is called a coefficient and is merely a number which, when multiplied by the pressure, gives the amount of friction.

Suppose the coefficient of friction between two bodies is .02, or $\frac{2}{100}$; this means that it will require a pull of .02 of a pound for each pound weight, or the pressure produced on the supporting body, so that by multiplying the pressure, or weight—which is practically the same thing—by .02 we obtain the resistance due to friction.

These numbers or coefficients are obtained by experiment by placing two bodies of given materials in

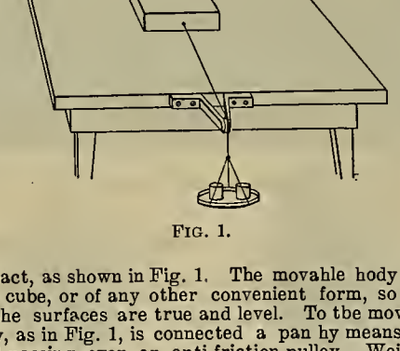

FIG. 1.

contact, as shown in Fig. 1. The movable body may be a cube, or of any other convenient form, so long as the surfaces are true and level. To the movable body, as in Fig. 1, is connected a pan by means of a cord passing over an anti-friction pulley. Weights are then placed in the pan until the body begins to move, which shows that the friction between the surfaces has been overcome. The weight in the pan is then divided by the weight of the block or cube—that is, the body which has been moved. Rolling friction is obtained in the same manner. Suppose in Fig. 1 that the block is of metal, say of cast iron, placed on a table of oak, and that the coefficient of friction between cast iron and oak is to be determined. We place weights in the pan until the block just begins to move and find it to be 16 pounds 3.2 ounces, or 16.2 pounds. Now, if this force was sufficient to move a block weighing say 90 pounds, then, according to our rule for finding the coefficient, it would be 16.2÷90=.18. Now, this coefficient means that if the weight of a body of cast iron sliding on oak wood be multiplied by .18 the product will be the force necessary to start it. In this case 90 pounds multiplied by the coefficient .18 will give us the weight in the pan that was required to move it. Suppose you have a casting weighing 1600 pounds and you wish to draw it or slide it along on an oak floor. How much force will be required to move it? The coefficient of friction is say .18 in the case of cast iron on oak. Then the force required is 1600×.18=288 pounds. We are also enabled to estimate the weight of a body when we know the materials of the surfaces, or the coefficient of friction, and the force required to move the body. Suppose the materials are the same as those we have just considered and the force required to move a body was 288 pounds. What did the body weigh? By consulting a table of coefficients of friction we find that between cast iron and oak wood it is .18. Then the weight of the body may be found by dividing the force required to move it by .18. In this case it would be 288÷.18=1600 pounds. This would represent the coefficient of friction between cast iron and oak only. Different materials have different coefficients, and the same materials have different coefficients, depending upon whether the surfaces are smooth or rough, dry or wet, and if wet, what they are moistened with. Different kinds of lubricants will produce different coefficients, depending upon the efficiency of the lubricant. This may be understood by referring to the accompanying tables.

TABLE I.—FRICTION OF REST.

Pressure lbs. per sq. in.	Wrought Iron on Wrought Iron.	Wrought Iron on Cast Iron.	Steel on Cast Iron.	Brass on Cast Iron.
187	.25	.28	.30	.23
224	.27	.29	.33	.22
336	.31	.33	.35	.21
448	.38	.37	.35	.21
560	.41	.37	.36	.23

Friction of rest is measured by the force required to start a body when standing, while the friction of motion is measured by the force required to keep it in motion after having started it.

The first of the laws previously given states that friction is independent of the extent of the surfaces in contact. As an illustration of this fact take a block of cast iron and place it first flatwise and then on edge, as shown in Figs. 1 and 2. Suppose this

hlock is the size of a common hrick, or 8x4x2 inches, and weighs 18 pounds. In Fig. 1 the pressure per square inch will he 18÷(8x4)=.562 of a pound. The coefficient of friction is .18, or 18%. Then the pull per square inch of surface will be .18 of .562 of a pound, or .562×.18=.101 of a pound, and the pull required to move the hlock will be .101 multiplied by the number of square inches in the hlock (Fig. 1), which is 8×4×.101=3.23 pounds.

Now, in Fig. 2 the pressure per square inch will he

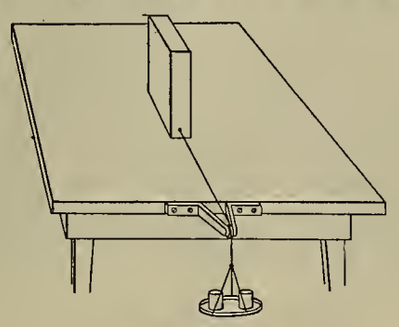

FIG. 2.

18 pounds divided hy 2×8=16 square inches, or 18÷16=1.125, or 1⅛ pounds. The force per square inch of surface necessary to move the hlock will he .18 of 1.125 pounds, or 1.125×.18=.202 of a pound, and the force necessary to move the whole hlock will he equal to .202 multiplied hy the number of square inches in the side or edge of the block in contact (Fig. 2), which is .202×(2x8)=3.23 pounds. From this we see that the extent of surface in any given case has little or no influence upon the amount of friction, and, therefore, upon the force necessary to move a hody. Increasing the number of hearings upon a shaft has no tendency to increase the friction, provided they are in line, for there is a certain weight of shaft to support, and if it is held in two hearings the area in sliding contact will he less, hut the pressure per square inch of surface will be proportionately more than if more bearing surface were used, the same as in the case of the hlock of cast iron. If, however, the pressure is increased to the point where the lubricant can not enter hetween the shaft and the hearing, thus interfering with the proper luhrication of the shaft, the coefficient of friction will he very greatly increased and will then approach that of unluhricated surfaces of the same materials. The pressure per square inch in hearings should not exceed 460 pounds, the surface in round hearings heing taken as the product of diameter and length. As the friction is not increased by adding hearings, and thus increasing the hearing surface, it is advisahle to use a sufficient number to prevent any deflection of the shaft, or sagging due to its own weight, together with that of the pulleys, and the pull of the helts. Sagging will cause the shafts to bind at the ends of the bearings and will require more power to run them. Increasing the length of the hearing or the numher of bearings will have no effect in tending to increase the frictional resistances, hut increasing the distance through which the frictional resistances are to be overcome will increase the work proportionately, for by increasing the hearing surface hy enlarging the diameter we move the point of application farther from the center and increase the leverages of these resistances.

The second law states that friction is independent of velocity. This means that it takes no more power to turn a shaft 10 revolutions when running 250 revolutions per minute than it does to turn it 10 revolutions when running 75 revolutions per minute. In other words, the frictional resistance per revolution does not increase with the number of revolutions per minute; but that due to the atmosphere will, of course, be greater. The amount of pull or force which must be exerted upon a hody—a shaft, for instance—will he found to be the same whether the shaft revolves at a speed of 200 revolutions per minute or at 100 revolutions per minute. But while we are increasing the speed from 100 revolutions to 200 revolutions per minute the amount of force required to turn the shaft will be increased, the amount required per unit of time increasing in proportion to the increase in the speed in the same length of time.

Smelting at Grand Encampment, Wyoming.

The copper matte smelter at Grand Encampment, Wyoming, will he enlarged to a capacity of 600 tons per day, six times its present capacity. The management announces that a converter and refiner will also he added, so that the plant will turn out the pure copper product.

The smelter is owned hy the Boston-Wyoming Smelter, Power & Light Co., and was huilt at a cost of many thousand dollars. The company has made a contract with the Ferris-Haggarty Copper Mining Co. for the entire output of the Rudefeha mine for a period of ten years, commencing with Octoher 1, 1902, and an aerial tramway 16 miles in length is heing constructed by Leschen & Sons of St. Louis to transport the ore from the mine to the smelter. The contract calls for a minimum output of 200 tons of ore daily.

Copper Matte Smelter at Grand Encampment, Wyoming.

The smelter has heen in operation a sufficient length of time to prove its efficiency in handling the ore. Dr. L. D. Godshall is superintendent of the plant, and under his supervision the work has heen carried on with success.

The Grand Encampment copper district is experiencing a hoom this spring, and it is expected that other properties will he worked during the present year.

Grand Encampment, March 22.

The Schilz Cyanide Process at Johannesburg, Transvaal.

This process is carried out hy means of potassium cyanide, harium peroxide, and—Time. In the ordinary cyanide process it is necessary that oxygen be present in some form or other to enable the gold to be dissolved. Various oxidizing media have heen suggested and used, hut Herr Eugene Schilz has introduced a method of supplying this oxygen hy the employment of the higher oxide of harium, which under certain conditions parts with one-half of its oxygen. The process has heen successfully worked at the City and Suhurhan mine since its restarting last summer.

The process consists of carefully sprinkling or mixing the fine dusty harium peroxide with the tailings or concentrates, etc., previous to running on the cyanide solution, and allowing an extra day or two for the dissolving action to take place. The peroxide is gradually decomposed by contact with the gold and pyrites in the wet tailings, etc., with the result that the free gold is dissolved, the pyrites oxidized to sulphate of iron, and the float gold thus set at liherty from the pyrites likewise dissolved. The gold extraction is, therefore, increased, and it has heen found possible to reduce the residual gold in the tailings from the usual 1.1 dwt. to 0.55 dwt., and in the concentrates from 3 dwts. after the old treatment to 1.4 dwt. The normal oxide of harium, which is left after the treatment, performs further functions—inasmuch as it decomposes the sulphate of iron in the solution, forming a sulphate of harium and oxide of iron, hoth insoluble; it removes sulphocyanides, and it dispenses with the use of lime and answers the purpose of the same, with other minor advantages in addition.

A few details have to he ohserved for the successful decomposition of the peroxide, which is performed entirely in the cold, and the process is as follows: The peroxide powder is well sprinkled with the tailings whilst the vat is being filled, so that a good mixture is ohtained; a rather stronger cyanide solution than usual is run in, and the whole allowed to stand undisturbed for at least three days. The longer the time the better is the extraction, and in the case of concentrates it should he at least a week. After running off the gold solution the residue is washed with four weak cyanide solutions, the first of which should remain six hours. Then, again, a strong solution should be applied, followed hy weak solutions. The quantity of peroxide depends less on the percentage of gold than on the length of time during which the solution remains in contact with the charge; and, further, the more pyrites present the greater the consumption of peroxide. The vat should not he filled to the brim with the tailings as the mass swells up hy the evolution of gas, sometimes as much as a foot. Thus the liberated oxygen should remain undisturhed as long as possihle in contact with the charge, the greatest solvent action of the cyanide heing after a few days. The quantity of peroxide required varies with the material under treatment. For simply the free gold one pound would he sufficient for several hundred tons of ore, hut in actual practice the quantity varies from about one-third to one pound per ton. The cost of barium peroxide delivered in Johanneshurg is put down at £50 per ton.

The actual results obtained at the cyanide works of the City and Suhurhan mine, according to T. J. M. Macfarlane, the manager, show a gain of ahout 13% in extraction, due to the use of harium peroxide at a small cost. The average of twenty charges of fine sands showed an extraction of 89.1% with peroxide and of seventeen charges only 76% without. The twenty charges yielded an aggregate of 4836.6 ounces fine gold, which with the lower rate of extraction would come out at 4125.5 ounces, thus showing a gain of 711.1 ounces, or £3022, at a cost of £130 for the harium peroxide. In the treatment of concentrates an average of three charges using varying quantities of peroxide gave an extraction of 91.3%, whilst one charge without yielded only 78%. The aggregate yield for the three charges was 1216 ounces fine gold, which at 78% extraction instead of 91% would show only 1033.85 ounces, a gain in favor of the peroxide of 182.15 ounces, equal to £774, at a cost of £38 6s. for barium peroxide and £9 for the extra lahor of mixing. The consumption of peroxide with the fine sands, containing about 8 or 10 dwts., was approximately one-half pound to the ton, and with the concentrates, with ahout 28 dwts., it was ahout one and one-quarter pound for the average of the three ex-

Grand Encampment, Wyoming.

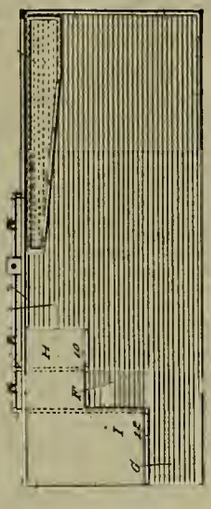
perimental trials. The residues in the former case are worked down to about 1½ dwt., instead of nearly 2 dwts. with the ordinary process of extraction, whilst in the latter case they contain under 2 dwts., instead of 6 dwts. hy the usual method.—Mining Journal, London.

Mining and Metallurgical Patents.

Patents Issued March 25, 1902.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

CONCENTRATOR.—No. 695,969; B. W. Traylor, Denver, Colo.

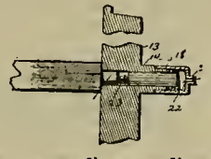


Transversely inclined concentrating tahle mounted to reciprocate and composed of sections extending rearwardly different distances, giving rear edge of tahle stepped appearance in plane of concentrating surface or bed, uppermost section on transversely inclined surface, extending shortest distance toward rear, the other sections in order of location, lowermost section extending farthest distance toward rear, washwater feed located at upper edge of uppermost section, and separate washwater feed for each section, the washwater feed of any lower section extending rearwardly from rear extremity of section next above, along upper edge or step of lower section.

CONCENTRATOR.—No. 696,058; J. A. Lehrritter, Denver, Colo.

Two laterally inclined tahle sections, lower of which adapted to receive tailings discharge from lower edge of upper tahle, slime trough arranged across head of upper tahle, riffles extending longitudinally on upper tahles and terminating at slime trough, return conveyor for carrying tailings from lower edge of upper tahle to head of lower tahle, and compartment separated from return conveyor and adapted to receive slimes from slime trough of upper tahle, compartment heing provided with an outlet allowing slimes to pass lower table in rear of discharge from return conveyor.

MINING CAR.—No. 696,070; J. McAlister, Birwinsdale, Pa.



Wheel having outwardly extending sleeve; journal extending through it and having means to hold it in place thereon, in combination with cap 18 fitting over extended end of sleeve and journal and provided with spirally disposed rih upon internal surface to direct oil normally inward.

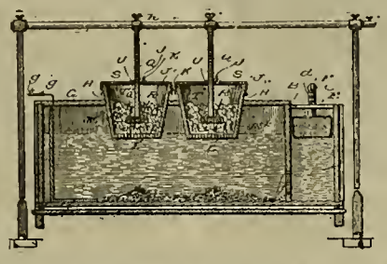
METHOD OF PRODUCING METALS.—No. 696,092; G. H. Clamer, Philadelphia, Pa.

The art of reducing metals from ores by hringing ore into contact with flux and alloy composed of same kind of metal as metal of ore and element more electropositive than that metal, heating all suhstances and effecting combination of electropositive element with suhstance with which metal was combined in ore, fluxing compound of electropositive element, recovering metal set free from alloy and from ore.

PROCESS OF HARDENING COPPER.—No. 696,271; C. Renstrom, Seattle, Wash.

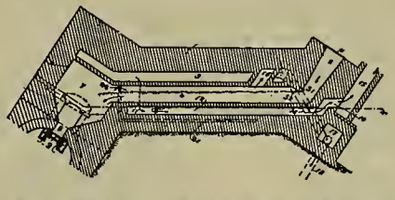
The process of hardening copper or alloys of copper which consists in subjecting same to heat at proper temperature and for proper length of time, and while in heated condition sprinkling sulphur on same, and then suhjecting thus treated copper or alloys of copper, while in heated condition, to blue vitriol bath.

ELECTRIC METAL WORKING APPARATUS.—No. 696,004; G. D. Burton, Boston, Mass.



Receptacle for containing substance to be treated, having perforations in hottom thereof adapted to admit electrolyte, and to permit treated substance to pass out therethrough, a cover for receptacle provided with slot therein, electrode adapted to extend through slot into receptacle, and means for hringing electrolyte into contact with suhstance heing treated.

QUICKSILVER SEPARATING AND CONTINUOUS ORE FURNAOE.—No. 696,323; C. Fitzgerald, San Francisco, Cal.



Inclined muffle and furnace, firebox whereof is directly removed from ore chamher, muffle having parallel floor and roof wherehy surrounding heat is equidistant from all parts of surface of ore, roof having short horizontal projection at its highest end for regulating depth of ore in muffle, ore inlet at upper end of muffle, a chamher in open communication with lower end of muffle, and removed from direct roasting heat, means hy which heated air may he delivered to muffle, vapor outlet for muffle, and means for condensing mercurial vapors.

An Oil Saver.

The injudicious use of ordinary oil cans, as well as some special forms, of which the "squirt-gun" type

is common for a variety of applications, provide opportunities for wastefulness of luhricating oils. The device herewith illustrated in two different forms for economically applying oil to working parts, is reputed to have had its origin in an operating department of pronounced wastefulness, and originally provided for the oiling of mine car wheels, hut its henefits adapted it to various classes of mining and other machinery and general manufacturing institutions wherever luhricants are required. A saving of 50% in lahor and oil is alleged to have followed its adoption in some of the larger coal mining properties. The illustrations of the Ironsides improved Tormay patent oiler herewith are said to he the product of all past experience and from which former weaknesses have heen eliminated and improvements incorporated. It is described hy the manufacturers as an article of superior design, workmanship and great durability. The oiler consists of a central working harrel, containing a plunger and surrounded by an oil reservoir. Openings in the working harrel, sealed or unsealed, according to position of plunger, communicate with the oil reservoir. The adjustahility of the stroke of plunger governs quantity of oil forced each operation. When not in use its contents are not only preserved from leakage, hut also protected from dust and other impurities. The Ironsides Co., Columbus, Ohio, manufacture this oiler.

Utilizing Earth's Interior Heat.

To use the earth's internal heat for industrial power is an old idea presented in a new way hy W. Hallock, who plans to get steam from the interior of the glohe.

He has measured the temperature of some of the earth's deep holes, from which he determines a theoretical rate of increase of 1° for every 60 feet, exceptions to the rule proving that the earth's crust is hotter in some places. He lowered thermometers into the wells near Pittsburg and Wheeling, and found an increase of 1° for every 50 feet. The temperature of the Pittshurg well at the hottom is 129°. Agassiz, of Camhridge, Massachusetts, found the temperature at the 4900-foot level in the Calumet & Hecla mine, at Houghton, Michigan, to he not more than 100°. The heat of the 2500-foot level in the Comstock lode is 145°. The Schladehach well shows a temperature of 135° at the hottom, the Sperenherg well 118°. The Cornwall mines show a temperature of 100°; at Ronchamp, France, the temperature of the coal mines at 3609 feet is 117°. Although it varies in different localities, the heat of the earth's crust grows gradually greater from the surface inward.

Mr. Hallock thinks there would be no difficulty in ohtaining heat from the earth's interior, hecause that involves merely a little extra lahor in horing down into the very hot area, and it is as easy comparatively to hore 10,000 feet as it is to hore 6000; hut to give the steam commercial value, a method must he provided for dropping the water to the hot area, allowing it time to heat, and yet having it returned to the surface as steam without for a moment interrupting the flow.

He argues this way: "Suppose two holes were hored directly into the earth 12,000 feet deep and, say, 50 feet apart. According to the measurements I made in the Pittshurg well, at the hottom there would he a temperature of more than 240° — far ahove the hoiling point of water. Now, if very heavy charges of dynamite or some other powerful explosive were to he lowered to the hottom of each hole and exploded simultaneously, and the process repeated many times, I helieve the two holes might have a sufficient connection estahlished. The rock would he cracked and fissured in all directions as in deep oil wells when they are shot; and if only one avenue were opened hetween the holes it would he enough. The shattering of the rock around the hase of the holes would turn the surrounding area into an immense water heater. The water poured down one hole in the earth would circulate through all the cracks and fissures, the temperature of which would he over 240°, and in its passage it would he heated and turned to steam, which would pass through the second hole to the earth's surface. The prohlem is a mechanical one, and the chief difficulty would he the connecting of the holes at the hottom. This accomplished, the water heater would operate itself and a source of power he estahlished that would surpass anything now in use. Such a system might change the commercial aspect of the world, since the greatest manufacturing communities might gather in those regions which yielded up heat the most readily."

It is the intention of the owners of the Pittshurg deep well to continue the hole down into the earth until some demonstration of the pent-up heat is experienced. This was originally an oil well, hut helow the oil sand a natural gas fissure was struck and each product was used in turn to furnish power for horing.

THE suh-committee of the Senate having the currency question for the Philippines in charge will report in favor of permitting the present silver standard in the Philippines to remain undisturhed, and will report a hill providing for a silver dollar to replace the Mexican dollar, to weigh 416 grains and he 900 fine, the supply to he limited to the needs of the islands and the silver to he purchased hy the Government.

THE Government of China has decided upon mining regulations, under the terms of which concessions may he granted to foreigners in any part of China. These regulations provide that the Government shall receive 25% of the profits; 25% of the output of diamonds and other gems; 15% of the output of gold, silver and mercury; 10% of the output of copper, lead and zinc; 5% of the output of coal and iron, hesides export and likin duties.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

JUNEAU.

The Juneau-Douglas Electric Co. has been incorporated in Seattle, Wash., to construct and operate an electric light and power plant at Juneau. The capital is $1,000,000 and its organizers are A. B. Iles and W. J. Sutherland of Juneau, and W. E. Guerin of Seattle. It is estimated that the plant which the company proposes to construct will cost in the neighborhood of $750,000.

Placer diggings are reported found in Rodman Bay. The pay streak is said to be only a foot below the surface. Rodman Bay is between Killisnoo, a cannery station, and Sitka.

The Treadwell M. Co. are preparing to start up the 300-stamp mill, which has no steam power and is idle during the winter months.

NOME.

Reports from the Arctic district, 300 miles north of Nome, indicate that the district promises to be as good a producer of gold as Nome. A letter dated January 10th says the writer in one day's rocking on Tuttle creek cleaned up $187. On No. 17 on Tuttle creek J. Hanson took out $475 from a hole 18 feet deep without drifting on bedrock. Gold is plentiful on other creeks, but only the Tuttle is being worked at present.

PORCUPINE.

J. Dalton reports the completion of arrangements for the extensive development, during the coming summer, of the Porcupine properties, owned by himself and J. F. Maloney of Juneau. He says Porcupine will be more generally worked this season than before.

VALDEZ.

In the Gladhough mine, near Valdez, the triple-compartment shaft is now down 240 feet. The foundation is ready for the hoisting plant and machinery, which will be sufficient for sinking to the 600-foot level.

The Heidron copper property at Landlock bay, near Valdez, has been bonded to Nelson & Comble, and a development tunnel is being made.

ARIZONA.

E. F. Kelsey, of the Eagle group at Bowie, says that its ledge runs the full length of the tunnel and is rich. Ore is being shipped to the smelters.

COCHISE COUNTY.

It is reported that Manager Brockman of the Commonwealth Co., at Pearce, is arranging for the building of a railroad from Pearce to Cochise, to provide an outlet for the product of the mines. It is also understood that the company proposes to double the capacity of the mill.

T. F. Bostwick and associates have incorporated the Bunker Hill M. Co. to work five claims near Tombstone. There is a 585-foot shaft on the property. Two thousand feet of development work has been done.

GILA COUNTY.

At the Black Warrior works at Black Warrior all of the thirteen leaching tanks are in use, treating 125 tons of ore from the Montgomery mine daily. Tanks are filled and emptied every twenty-four hours, but the time required to complete the leaching process is being gradually reduced, and has been brought down to nineteen hours. Copper precipitates are being accumulated rapidly and smelting is to start. The acid works have made a total output of over 800 tons. Oil is used for fuel exclusively at the leacher and the storage capacity is being enlarged. At the Gold Gulch property a contract has been let to build 1000 feet of road, and the shaft is being enlarged preparatory to installing a hoist.

GRAHAM COUNTY.

The Packer group of five copper claims at Ash Peak has been bonded to an Ohio company for $10,000 for six months. The claims show native copper.

The Detroit C. M. Co. expects to increase the capacity of the concentrating plant in Morenci from 500 tons to 800 tons.

MARICOPA COUNTY.

F. Baxter of Agua Caliente reports a strike in the Eagle Tail mountains, about 25 miles from that place, in a mine owned by M. Cohen and R. Debbs. In a 50-foot shaft the ledge is 6 feet wide of free milling high-grade gold ore. The region is difficult of access. All the water has to be hauled a distance of 25 miles.

Near Wickenburg since New Years the Angel has developed from a prospect into a copper-gold mine of considerable proportions. Crosscuts show the dike 200 feet in width and throughout occur bodies of copper ore. An electric drill will be put in.

MOHAVE COUNTY.

A strike is reported in the third tunnel of the Leland mine, near Boundary Cone, of an ore body 4 feet wide that is claimed to average $100 per ton gold. In tunnel No. 2 there is a larger ore body, but the grade is lower.

The main shaft on the Gold Road mine is 230 feet and will be put down to the 400-foot level. A plant for the reduction of ores will not be installed until the mine has been opened to a depth of 400 feet.

The Minnesota & Arizona M. Co. has increased its capital from $1,000,000 to $5,000,000 to buy a group of mines in the Gold Basin country, near Kingman, upon which they are at work at present. Extensive work is planned and the installation of machinery will soon be made.

Near Chloride the Minnesota-Connor mill is connected with the water supply of the Payroll.

S. C. Bagg, Supt. of the New Comstock M. Co., is putting in ore bins at the mine and driving a tunnel to tap the ore body at greater depth.

A large force of men will be put on the Lucky Boy mine when the new hoist is in running order.

The new gasoline hoist is working well on the Treadwell mine. On the Pioneer, of the same group, a shaft is being sunk.

A company has been formed to take over the old Santa Maria del Bac grant, over on the eastern boundary of Mohave county.

The new management of the Gold Road mines will put on more men and talk of a mill.

YAVAPAI COUNTY.

T. Peters and W. T. Hall have shipped a carload of ore from their Meadow Valley and Rainbow claims, in the Black Hills district, 10 miles northeast from Congress Junction. The ore carries copper, silver and gold.

W. Lester of the concentrating plant on the Agua Fria says some extensive improvements in the plant are soon to be made, which will include an addition of ten stamps to the rolls, Wilfley tables, an extra engine room and an additional engine.

Supt. Kiley of the Oro M. Co., Minnehaba Flat, will have a 60-stamp mill in operation next month.

CALIFORNIA.

AMADOR COUNTY.

W. R. Thomas has bonded the Sargent quartz mine at Middle Bar for four years at $30,000.

A strike has been made of a fine body of ore on the 900-foot level of the Wildman mine, at Sutter Creek.

F. A. Orr has started sinking a 100-foot vertical shaft on his ledge on Indian creek north of Plymouth.

The New Western M. Co. of Plymouth has changed ownership, F. Moffit selling out to W. E. Dargie of Oakland. The latter will start the plant in operation and make some additions to its capacity.

The new 20-stamp mill of the Keystone mine, at Amador City, has been started up and sixty stamps are now dropping. It was at the Keystone that quartz mining in this county was started in the early '50s. After fifty years of continuous working, the mine has now a larger equipment than at any previous period of its history.

The Fremont and Gover consolidated claims, near Amador City, are to be operated on a large scale. Heavy hoisting machinery is to be erected over both shafts, with gallows-frames nearly 100 feet high. A 60-stamp mill is projected and a site has been selected about midway between the two shafts. Rock is now being crushed at the Pocahontas mill, near Dry creek.

The chlorination plant in Sutter Creek, owned by E. C. Voorheis, has been started up, using oil for the sulphuret-roasting fuel at a considerable reduction in cost.

The drifts at the 2400 and 2500 foot levels in the Kennedy East shaft, at Sutter Creek, are being driven ahead rapidly toward the ledge.

CALAVERAS COUNTY.

F. Jantza and H. Bauer are reported to have taken out over $1000 in two weeks from their mine about 5 miles north of Valley Springs. They crushed their ore in a band mortar.

At the San Joaquin mine, near San Andreas, H. F. Stewart Supt., the shaft is down 100 feet. The mill is running five stamps on ore from the upper tunnel. The hoist and mill will be run by water power.

A rich strike has been made in the Mountain View mine, owned by Woodcock Bros., at Glencoe. A shaft is down 120 feet and the 100-foot level shows a vein 5 feet wide of free milling ore.

At the Gwin mine recent development made in the 1750-foot level shows a body of good grade ore of such an extent and character that twenty more stamps are to be added to the mill, which will make 100 stamps. The company will also erect a new hoisting plant, together with a steel gallows frame 100 feet high. F. F. Thomas is the president and general manager of the company and D. McClure, Jr., the superintendent.

It is reported that the Carson Creek mine, near Angels, will be started up on May 1. A new shaft is to be sunk nearer the Stanislaus river.

At the Fanny Marie mine, at Glencoe, another shoot of rich ore has been struck in the 200-foot level. The vein is about 4 feet in width. The 300-foot level is still in ore.

Manager Cortmarsh reports that the shaft at the Bluejay is down 50 feet, and the tunnel is in 55 feet, with ore in the shaft.

Work has been begun on the Greek mine, near West Point, owned by the Greek Mine Co., in which Mrs. H. A. Waldron of Santa Cruz and C. F. Humphrey of San Francisco are interested.

The Duchess mine, near Vallecito, is being developed steadily under Supt. W. E. Emery.

Shepherd & Richmond have bought the water wheel owned by Thomas & Bisbee at Central Hill and will move it to the Tenderfoot mine, near Murphys, to operate the mill.

In crosscutting in the Iowa Con. mine, at Rich gulch, a 6-foot wide blind lead has been struck, showing free gold and sulphurets.

EL DORADO COUNTY.

At the Josephine mine at Volcanoville the tunnel is being retimbered and preparations are being made to install power drills.

Porter & Parker have bought a portion of the Wilton claim at Georgetown and are preparing to work it.

Operations are to be resumed on the Little Gem mine, near Josephine, and on the Sligo, near Spanish Dry Diggings.

It is reported that work will be resumed at the St. Lawrence mine, near Kelsey, by T. Alderson and A. Mierson, the owners.

INYO COUNTY.

At the Reward mine, near Independence, the tunnel on the new vein is now in 300 feet and ore is showing. This tunnel, when connection is made, will be below the present deepest workings in the mine and will be made the main outlet for handling the ore, which is now hoisted to a tunnel at the second level. A new flume, to carry 3000 inches of water, and a power plant of 150 H. P. are being installed. It is proposed to erect a 20-stamp mill near the mine, car the ore through the new tunnel direct to it, and abandon the 5000 feet of wire tram. The present mill building will be utilized as the power house. Air compressors and power drills are to replace the present hand drilling.

In the Panamint valley, about 12 miles south of Modoc, S. R. Phail, L. R. Porter, J. P. Chambers, J. J. Gunn and Eva L. Gunn have sold six claims to E. L. Percy of Los Angeles, who represents Spokane, Wash., people, for $12,000. There is 700 feet of shafts, tunnels and drifts on the claims, and the buyers will do development work, build roads, tramways and put up a stamp mill with concentrators and cyanide plant.

The Mineral Hill Ranch G. M. & M. Co. are working in Panamint valley east of Johannesburg, operating a 5-stamp mill. The property is bonded to a Boston company and two payments have already been made. They contemplate adding five more stamps to the mill besides a smelting and cyanide plant.

KERN COUNTY.

The Mojave C. M. Co. has been incorporated at Bakersfield, capital $200,000, with directors E. W. Craven of Seattle, Wash., C. T. Tryon, C. A. Barlow, J. E. Austin, G. P. McMillan, R. H. Handy, F. P. Roy and A. W. McCray of Bakersfield, J. W. Scott of Omaha, Neb., F. Carmen of San Francisco and S. N. Palmer of Oakland.

The Frazier Mountain M. Co. has developed a ledge of borax ore (colemanite) 12 feet in thickness and of a high grade. The company now has a market for 500 tons a month, which is hauled to Bakersfield and shipped.

The action brought by Kelly & Clemans at Bakersfield affecting the title to certain sections of oil lands are now on hearing and indirectly involve the titles to all of the oil lands taken up under the mineral land law. The point made is that the mineral locations are illegal because they were made before the minerals were discovered on the land instead of afterwards.

MARIPOSA COUNTY.

The Buckeye mine, near Mariposa, has been sold to McRae & Heman by the Krogh Mfg. Co. of San Francisco. The new owners will develop the mine.

MONO COUNTY.

Near Bodie the Blue Vein mine is reported bonded for $100,000.

NEVADA COUNTY.

Supt. Abadie of the Champion M. Co. at Nevada City has started work in the Champion mine to run connecting drifts to the Providence mine. Two will be made—one from the 2100-foot level and another from the 2400-foot level. The Merrifield mine, also the property of the Champion Co., will be connected with the Champion by drifts. The object is to secure better facilities for air in the lower levels.

I. Haas and I. Stein of Grass Valley have bought from C. Mellish his third interest in the Alta California placer mine on Randall Flat, at Rough and Ready. The property covers 140 acres of placer ground, which the owners have proved with shafts and now propose to exploit through a tunnel.

W. L. Bell and A. J. McCone, of Los Angeles, and the manager of the Allison Ranch mine, near Grass Valley, are planning the installation of new machinery, including a large stamp mill and a new hoisting plant.

Fire has destroyed the hoisting works and building at the Eclipse mine at Gold Flat, near Nevada City. During the fire giant powder stored in the building exploded. The loss is total. Supt. B. Hoskins believes that the owners will erect a new plant and resume work soon.

A register issued by the State Mining Bureau shows that this county has 234 quartz mines, 26 placer mines, 5 hydraulic mines, 77 mills and arrastras. Under the heading of miscellaneous mines are included copper claims, barites and calcite, kaolin and granite and marble. Grass Valley and Nevada City are the center of 192 mining enterprises and the 77 mills and arrastras in the county. There are four electrical plants—the Brunswick mill, Gold Hill, Pennsylvania and W. Y. O. D.—all near Grass Valley. Water and steam are used in the majority of the mills operating. Gasoline as a motive power is employed at the Rose Hill mine only. There are several mines at an elevation, approximately, of 1 mile above the sea level.

A 4-stamp mill goes on the Kitts Bros. mine near You Bet.

The National mine, near Granlteville, is putting on more men.

PLACER COUNTY.

The sale is reported to A. C. Burrage of Boston, Mass., of the properties of the Big Channel Con. G. M. Co., on the Forest Hill divide, for a large sum. The property consists of 3500 acres of deep channel placer ground, comprising the Gray Eagle, North Star, Mountain, Spring, Garden, Natches, Wolverine, Owl Creek, Union and Rough & Ready claims. The property is to be opened by tunnels driven from Gas canyon and Owl creek.

The Tadpole Con. M. Co. of Sacramento has elected W. H. Cass president and secretary; J. L. Sparhawk of Iowa Hill has been appointed superintendent. The tunnel at the mine above Westville was advanced in very hard rock 32 feet during February.

PLUMAS COUNTY.

The McGill and Standard mines and one-half interest in the Round Valley Water Co.'s water right have been sold to the Plumas M. Co. of San Francisco. The company will during this summer build a 60-stamp mill and cyanide plant.

Hydraulic mining is to be resumed at the Plumas Imperial mine, near Quincy, early in April.

Work has been resumed by the Quincy M. & W. Co. in its hydraulic mine above Spanish Ranch.

SHASTA COUNTY.

It is stated that the Winthrop group of mines at Copper City, 3 miles from Bully Hill, owned by the Bully Hill M. & S. Co., have been started up. It is said that Capt. J. R De Lamar intends to double the capacity of his Bully Hill smelting plant.

J. C. Frick is in 50 feet on a tunnel on his claim on Middle creek, near Shasta, and has cut a strong vein of galena.

W. A. Pryor has bought a quarter interest of H. A. Whiteman in the Sunlight mine at Shasta, and with T. Greene of Redding he has begun reopening the mine.

The smelting plant of the Mountain C. Co., at Keswick, is now operated wholly by electricity furnished by the Northern California Electric Power Co. The slag railroad, traveling cranes and smelting furnaces—in fact, every piece of machinery about the smelter and works—is operated by power generated at the Shingletown power station, 80 miles distant. It is stated that the cost per H. P. hour with electricity will be about ¼ of a cent.

SISKIYOU COUNTY.

The Portuguese Co. is working a hydraulic claim on upper Greenhorn, near

Yreka. The Portuguese hydraulic claims at Hawkinsville are being worked day and night.

The Leall De Costa hydraulic claim at the lower end of Cherry creek is now being worked day and night with an abundance of water. The claim has paid about $20,000 a season.

T. Quigley has bonded at $20,000 his mining property below the mouth of Beaver creek, near Yreka, to Newkirk & Co. of Detroit, Mich.

At the Minetti B mine, at Nolton, White & Martin, the lessees, are hydraulicking some very rich ground.

Work has been commenced on the Commodore Dewey mine, located in Plowman's Valley district, near Etna, with H. Tissot as manager.

The Pitz Bros.' mine at Oro Fino has been bonded for a company by J. W. Pickard. The mine will be started up immediately.

TRINITY COUNTY.

The Sweepstake Co. has discontinued work on the tunnel to pass the slide on its ditch line, and will temporarily connect the ends of the break by a 1500-foot pipe, which will require but a few days to put in place. A tunnel farther back in the mountain will be run later.

In the Hero drift mine, at Lewiston, an old channel has been discovered at a depth of 26 feet. The blue cement gravel found is 6 feet in depth by 18 feet wide and values of $5 and $6 to the pan of gravel have been found.

F. R. Culbertson, manager for the Trinity County G. M. Co., owning the Chloride-Bailey group at Dedrick, says: "So far the development work aggregates over 5000 feet. The ore is entirely free milling and runs from $12 to $15 to the ton. The ore body is 8 feet in width. It is thought we can mine and mill it for less than $1 a ton. It is our intention to add twenty more stamps to the 10-stamp mill and construct buildings, ore bins, etc."

TUOLUMNE COUNTY.

W. J. Graham, Supt. of the Duleek mine, near Sonora, is arranging to add new machinery to the plant and will run a tunnel 4000 feet in length to tap the ledge at a depth of 800 feet.

Supt. R. Restano of the Golden West mine, near Columbia, says the mill is running day and night now. The ledge, he says, is between 20 and 25 feet wide of ore which goes from $12 to $14 in free gold, and four men can keep the stamps going.

At the Draper mine, near Tuolumne, preparations are being made to sink the shaft from the 500-foot level down another 100 feet.

E. A. Wiltsee of San Francisco has bonded to A. H. Ward of Alameda the Two Brothers and the Little Sister quartz mines, situated near Groveland, also a millsite of five acres at the head of Deer creek, on the Sheehan ranch.

J. E. Doolittle, A. Brown and associates have bonded 1400 acres of land along the Tuolumne river, near La Grange, for gold dredging. They are at present negotiating for 600 acres more, and are projecting the construction of an electric plant at La Grange to furnish power to the mines of Calaveras, Tuolumne and Mariposa counties. The LaGrange ditch and water rights to 2000 inches of water have been bonded by them, and it is expected to commence the construction of the plant the coming summer.

YUBA COUNTY.

On the O'Brien farm Keystone drills are boring holes to bedrock, a distance of 200 feet apart on the 2000 acres. The soil and gravel in places is 40 feet in depth. The earth and gravel taken from these borings are washed to determine the amount of gold to a cubic yard. The calculation is made by determining the number of cubic yards a dredger will handle and properly wash in a day to secure the gold. The three machines will finish the work in May. As soon as the dredgers can be made the work of extracting gold will begin.

A compromise in the case of Relley vs. Campbell results in Weissbein Bros. of Grass Valley assuming the debts and taking over the control of Blue Point gravel mine and ditches at Smartsville.

COLORADO.

Forty of the leading owners and operators of Colorado mines met on the 27th ult. in Denver and held the preliminary caucus looking to a State organization. A. Winslow, manager of the Liberty Bell mine at Telluride, presided. The draft of the constitution stated that the organization is: First, to be known as the Colorado Mine Operators' Association; secondly, that the object of the Association shall be to develop, foster and protect the metal mining industry of the State in all its branches; third, that the membership shall consist of individuals or companies actively operating metalliferous mines in the State, and fourth, that the governing body shall be a council composed of delegates from the different mining camps, such representatives to be appointed or elected by the operators of the respective camps, for such terms as such camps may see fit. The Association's first work is to deal with the smelter trust which is discriminating against certain localities of the State in refusing to take ores, also to secure a reduction of rates now being charged by the smelter; to secure lower freight rates and the abolition of the discrimination being carried on now by the railroads, and to fortify the mine owners against undue aggression on the part of the labor unions. The next step to be taken will be the formation of a permanent body and a second meeting has been arranged for some future date. In the meantime the State is to be thoroughly organized, the plan being to form a Mine Owners' Association in every district of the State. Two organizers have been appointed to act in each district. The representatives of the districts will immediately organize local associations, and where this cannot be done will get the mine owners to select representatives to attend the forthcoming meeting, when the State federation is to be completed. Each district having 100 or more miners in it is to be entitled to one representative up to 500 miners, and one additional representative for each succeeding 500 or fraction thereof. This will make forty representatives who will effect a permanent organization and elect the governing body or board, which will be styled the council. The manner of operation proposed is simple, yet effective. Each district association is left to attend to its own affairs and settle its own troubles, and the State Association will only be called in when the trouble gets beyond the local Association. It has been announced that the Mine Owners' Association would build its own smelters if satisfaction could not be obtained at the hands of the smelter trust.

BOULDER COUNTY.

The Boulder County Co. have completed the erection of their 20-stamp mill near Eldora, and will soon contract for 2000 feet of tunnel work.

The Olympic claim of the Fourth of July group, near Eldora, is now being opened up by a shaft down 65 feet in 3 feet of good shipping ore carrying gold, silver and copper.

CHAFFEE COUNTY.

N. A. Loggin of London, Eng., manager of the Cache Creek placer, near Granite, is starting work on the property. It is expected that a force of 100 men will be employed this summer.

CLEAR CREEK COUNTY.

The Gold Cord M. & S. Co. has bought the Lexington group of mines on Soda creek, near Idaho Springs, and have men cleaning up old workings and extracting ore. There are five patented claims—Golden Link, Preacher, Hamilton, Comet and Lexington.

The Frisco group, four claims on Woods mountain, near Empire, has been bonded to Eastern people, who have commenced operations.

The Golden Hecla M. & M. Co., organized to operate the Silver Horn mine and group on Ute creek, will push the tunnel ahead, which has been driven about 500 feet, and will resume sinking.

Manager Roller of the Reduction Co. expects to be able to handle 150 tons crude ore per day.

At Idaho Springs the Mason Con. M. & M. Co., capital $1,000,000, has been incorporated to work properties in the Lamartine section.

Idaho Springs reports that the Newhouse tunnel closed down on the 31st, the mining companies refusing to make contracts for the working of their properties through the bore. The tunnel had been driven 13,220 feet, and was costing $21.81 per foot to drive it 12x12 feet in size through granite. In the distance driven more than 100 veins were cut. Three companies are working their properties in the tunnel.

At Idaho Springs a recent test was made by the Sun and Moon Co. of 200 tons of their low-grade ore. One hundred tons were shipped to the smelter and 100 tons treated at a concentrating mill. The ore was taken from the same place in the mine and each alternate lode was given to the smelter. The concentrating process is reported to have saved the Sun and Moon Co. $450.

CUSTER COUNTY.

The Bull Domingo property at Westcliffe has been sold and the new owners will equip it for working.

EL PASO COUNTY.

The Rocky Mountain smelter at Florence has been bought by the smelter trust for $1,500,000.

The Telluride Reduction Co. has about completed a plant near Colorado Springs, which comprises crushing, roasting and bromine treatment. It is soon expected to start up.

FREMONT COUNTY.

That the American S. & R. Co. has bought or is negotiating for the Rocky Mountain smelter at Florence is denied by J. B. Grant, who says: "We have all the smelters that we want now and are not preparing to buy any more."

GILPIN COUNTY.

The Helen G. M. & T. Co. has been incorporated by R. A. Gutsch, E. B. Webb and A. Bruderlin, capital $200,000, with offices in Denver. The company will operate a tunnel project in the Pine Creek district, near Central City.

Simonds, Pulham & Co. have sold their interest in a lease on the Continental mine, in Illinois-Central district, near Central City, to B. M. Myers and associates, who have bought the mine from the owner, L. Fake of Chicago, Ill.

Articles of incorporation have been filed to consolidate the sampling works in Clear Creek, Gilpin, Boulder and Summit counties, as ordered by the smelter trust. Some of the plants will be operated by the Chamberlain-Dillingham Ore Co. The capitalization is $1 000,000.

Shipments of smelting and crude ores, concentrates and mill tailings from the Black Hawk depot to the smelters and outside points for treatments during the first three weeks in March totaled 5749 tons.

The Stewart mine, near Wide Awake, is making shipments to the mills from the 140-foot level. An adit has been started from the west side of the mountain to connect with the east 140-foot level, to provide better ventilation. J. A. Gilmour is manager.

The shaft on the Dictator mine, at Eureka, is being put down to 150 feet. Arkansas and Iowa people are interested in a lease and bond, with R. Hastie, Supt. The lessees propose to erect a new shaft building and install a plant of machinery immediately.

At the stockholders' meeting of the Lillian G. M. Co. of Central City, held in Denver last week, W. B. Lewis was elected president and J. C. Lewis secretary.

HINSDALE COUNTY.

Manager O. Pierce of the Tobasco M. Co., near Lake City, is building a tramway, to be between 8000 and 9000 feet in length, to run from the mine to a 100-ton concentrating mill and cyanide plant soon to be built. The mine is owned by Indianapolis people and producing gold ore.

W. Mendenhall has leased the Ocean Wave mill at Lake City and expects to start April 15.

LAKE COUNTY.

A. J. Davis, Jr., who is looking after zinc shipments from Leadville, says of the transportation of this ore from the A. M. W. mill as concentrates, or the mine as crude ore, to Belgium, that the system has been brought to such a perfection that the sampling and weighing are done at the mill with a saving estimated at $1 per ton. Shipments are more than 100 tons daily, including both concentrates and crude ore. Steamers are loaded with 4000 to 5000 tons. Sacking is resorted to in putting the concentrates on the vessels, and by this precaution the only leakage is that on the cars from Leadville to the coast. In discussing the treatment of zinc ores, Mr. Davis was of the opinion that he is certain that the Leadville zinc product will be treated at a profit in this country as it is now in Belgium. Concentration and re-concentration are the gist of the Belgian method. A day's wages of $3 here would represent about what would be paid for seven shifts of twelve hours each in Europe. But balanced against this is the cost of transportation, $10.50, which can be deducted when the ore is treated at Pueblo.

The recent reported find of copper in East Tennessee gulch is stated to be bona fide. The country rock is diorite, locally called Mount Zion porphyry.

OURAY COUNTY.

The Blue Bell M. Co., which owns the Guston, Hudson and National Bell groups of claims near Red Mountain, have the shaft of the Hudson cleared of water and are pushing work with twenty men. The ore is a high-grade silver, copper and lead. Work on the National Bell has also continued during the winter, and a large amount of carbonate of lead ore is ready for shipment. Supt. W. J. Hammond is working two shifts and driving 8 feet of tunnel per shift. The mouth of the tunnel is near Red Mountain. It is now in 3000 feet and is being steadily pushed on to eventually cut the Tom Boy and Smuggler-Union veins at Telluride.

A large 50,000-pound boiler is being installed in the new power house of the Caroline M. Co. at Ouray.

ROUTT COUNTY.

The Coldwater C. M. Co. has made the final payment for their Wolverine property at Pearl. The installation of a plant of heavy machinery is projected, and it is expected that a shaft will be sunk to a great depth on the main lead. Electric drills are to be used and negotiations for water power are being made.

SAN JUAN COUNTY.

The Zuni mine on Anvil mountain, at Silverton, is showing an ore shoot already proven to be over 200 feet long and 40 feet wide. The ore is low grade, but is claimed to be suitable for concentration.

The Hidden Treasure group, with water rights, located near the head of the Animas river, has been sold by R. Hanson of Eureka to a company of Colorado Springs men, who have ample capital to fully develop and operate the property and erect a mill for concentrating the ore. W. B. Wilson of Colorado Springs is concerned in the deal.

It is believed that ten new mills will be erected in San Juan county during the coming season. These include plants for the Silver Ledge, Grand Mogul, Green Mountain Henrietta, Highland Mary, Neigolds, Royal and Hidden Treasure. The Ledge M & M. Co. will erect a $40,000 concentrator of a 200-ton daily capacity at Chattanooga and will connect with the mine. It is stated that work will be commenced in April.

TELLER COUNTY.

Regarding the conditions of the famous Stratton's Independence mine on Battle mountain the following official report was cabled to London by John Hays Hammond: "Recent developments have confirmed the last report. Regret to report the lowest developments unfavorable." From the previous reports referred to it would appear that the life of the mine is limited and depends entirely on the working of low-grade ore.

About one-half the Portland force is laid off. President J. F. Burns favors closing down the mine May 1st and allowing it to remain unproductive until the new Portland mill at Colorado City is ready for operation. He says he is paying heavy treatment charges to the smelter trust. The mill will be ready by June 1st, and it would mean a big saving to the company as soon as it begins to treat Portland ores.

The Cripple Creek March gold production was $2,074,100, treating 53,300 tons of ore.

IDAHO.

BOISE COUNTY.

N. Gratz, Supt. Basic Dredge Co. at Centerville, says the dredger is nearly completed and will be started into operation at once.

J. H. Burton of Salt Lake City, Utah, is said to have bought the Gold Eagle mine at Neal for himself and associates.

BLAINE COUNTY.

The Liberal mine, in the Hailey gold belt, has been taken over by the company and will shortly be equipped for extensive developments. F. R. Reed is manager.

J. Gorman of Hailey has bonded a half interest in the General Gomez, Young America and Gundaker claims, in Little Smoky district, to C. W. Orton of Ortonville, Minn., for $10,000.

CUSTER COUNTY.

A. S. Livingston and Mrs. J. B. Hunter of Denver are working a group of silver-lead mines, near Clayton, about 75 miles from Thunder mountain. Owing to the very heavy snows in winter, the mines are closed about the middle of October each year and reopen in April. The ores are shipped to the smelters.

IDAHO COUNTY.

In Salmon river, east of Grangeville, is reported the renewal of placer operations. In the old channel coarse gold is found under banks of gravel and considerable work is in progress with machinery.

Near Lucille two quartz properties—the McKinley and Black Jack—are being developed.

Six miles east of Grangeville are the Dewey and Evergreen properties. The Evergreen has been a steady shipper to the smelter for twelve months. A. A. Kincaid, manager of the mine, says over 4000 feet of work has been done. The Dewey has a gasoline hoist. A working shaft is being sunk 400 feet. It is said this mine has shipped ore which went $100 to the ton.

Florence, formerly a big placer camp, lies 30 miles south of Grangeville. The Banner mine, the best known quartz property there, is in almost steady operation.

Forty miles southeast of Florence is Warren's camp, at present the end of the State wagon road toward Thunder mountain from Grangeville. The Iola, owned by Chicago men, has a 10-stamp mill, operated by water power.

Daily newspapers are publishing glowing accounts of the riches of Thunder Mountain district. The facts have appeared herein, and readers need no caution regarding the glittering boom stories

now so common. Douhtless good properties will he developed as elsewhere in equally deserving districts, but to entertain any present notion of starting "right away" for Thunder mountain is not good judgment. Two months from now will be time enough to think of starting.

KOOTENAI COUNTY.

At the Richmond mine at Tyson the tunnel is expected to reach the main ledge in April. The owners say a stamp mill will then he installed.

OWYHEE COUNTY.

Samples of ore from a strike in the Sinker tunnel, on War Eagle mountain at Silver City, are very rich, running more than $500 a ton in gold. The ore is found in small hunches as yet.

J. Scales is having the transfer made of the De Lamar M. Co.'s cyanide tailing plant at Wagontown to himself and S. T. N. Smith of Boise. This plant has a capacity of 150 tons per day. Scales & Smith will operate their amalgamating mill also, and employ thirty men this season.

WASHINGTON COUNTY.

The Hero M. Co. has heen incorporated in Philadelphia to operate the Dewey, Hohson and Sampson groups of mines at Heath. The capital is $1,000,000. M. C. Parker is president, A. Donart of Heath vice-president and Supt., and J. H. Bailey, Jr., is secretary and treasurer.

MONTANA.

BEAVERHEAD COUNTY.

Stolle & Taylor, lessees Silver Rule mine, near Argenta, owned by W. A. Clark and B. F. White, shipped two carloads of ore to the East Helena smelter—one carload first-class ore sacked, the second-class loose. The second-class ore will yield ahout sixty ounces silver to the ton and a small per cent in copper and lead.

CHOTEAU COUNTY.

The Big Blackfoot Dev. Co. has been incorporated to work a copper and silver property at the head of the Big Blackfoot river. The property is already developed by a tunnel and shaft on a 7-foot ledge. A. W. Mahon of Valley county, G. H. Stanton of Cascade county, S. McPherson, F. Fryberg, and J. Ulrich of Havre, are the incorporators.

Mrs. Zemich of Marysville, A. J. Craven and Prof. Vollert of Helena have sold to an English syndicate their interest in the property of the Snowshoe P. M. Co. in Keep Cool gulch, near Lincoln, in the Big Blackfoot country between Butte and the Canadian boundary. The consideration is said to have been $20,000. The syndicate has also bought several claims in the immediate vicinity of the Snowshoe ground.

FERGUS COUNTY.

The Paymaster M. Co. at North Moccasin has been merged into the Abhey Cyanide G. M. & M. Co. J. R. Cook is Pres. and Treas., J. Wilmot of Spokane, Wash., Vice-Pres., J. L. Lovell Sec.

Strontium sulphate, the mineral celestite, is reported found in the Little Rocky mountains by E. Massing. The discovery is said to be in a hlanket formation from 30 to 40 feet thick.

The plant of the Kendall G. M. Co. at Kendall is completed and started in full operation. R. K. Neill has had charge of the work of construction for Finch & Campbell of Spokane, Wash. The plant consists of a water power and electric transmission from the Horseshoe Bar ranch, on Warm Spring creek, a 6-mile pipe line carrying water to the mill at Kendall and a cyanide mill of 350 tons capacity with refinery and assay office.

FLATHEAD COUNTY.

The Snowshoe mine, near Lihhy, is developed by 6000 feet of tunnels and a shaft now sinking for the 500-foot level. D. P. Bowers is manager of the property, having taken it over from the Pacific Northwest M. Co. of London. The mill has a capacity for concentrating about 150 tons of ore daily, putting about ten into one. The values are largely in lead, with gold and silver as hy-products, and the concentrates run ahout $55 to the ton. It costs $4 a ton to get the concentrates to the railroad, 18 miles distant.

JEFFERSON COUNTY.

The Mayflower Con. M. Co., operating the Mayflower property, near Whitehall, has heen incorporated in Butte with capital $120,000 hy A. J. Johnston, A. H. Wethey, T. M. Hodgens, C. W. Clark and J. W. Cotter.

The Montana Verde Copper Co. is organized under the laws of South Dakota to work a group of sixteen claims 4 miles from Bernice; capital stock, $2,500,000.

MADISON COUNTY.

Rich high-grade ore has been struck in the Olympia mine at Pony, owned hy Gilhert & Parker. Average samples are claimed to show $150 in gold, 30% lead and seventy ounces silver. The vein is 12 to 18 inches wide.

In the Pan-American mine at Pony, operated under lease and hond hy Macfadden, Drackert & Ervin, a streak of ore 8 to 12 inches wide has been opened, which assay shows to carry $156 in gold, 25% lead and sixteen ounces in silver.

SILVER BOW COUNTY.

Ore from the Alice mine at Walkerville has been shipped to Salt Lake City for testing for a method of treatment.

At Butte twenty-eight hoisting engineers have struck. They have heen receiving $4 a day and demand an increase of $1 a day. They act upon their own initiative in walking out.

Bassett Bros. of Butte, who leased a 10-stamp mill in Homestake district, near Butte, have added a cyanide plant to it. The plant has been started up on ore from the Blue Ridge mine, owned by J. P. Reins of Butte. The ore, it is claimed, will go ahout $15 per ton gold, and the vein is from 3 to 4 feet wide and has been opened 400 feet down. It is claimed that by the douhle process of milling and cyaniding 91% of the gold value of the ore—all of which is gold-bearing—can be saved. If the test proves successful several other prospects in the district will be started up.

NEVADA.

According to the county assessors' returns, the gold and silver production of Nevada for 1901 was as follows: Lincoln county, $1,096,000; Storey, $514,000; Eureka, $250,286; Elko, $168,260; Nye, $262,000; Washoe, $57,000; White Pine, $80,000; Lyon, $67,000; Ormshy, $45,000; Esmeralda, $6280. Tonopah reports were incomplete, but will greatly increase Nye's figures.

CHURCHILL COUNTY.

O. W. Schweitzer states that the Bell Mare group of claims owned hy him and the claims belonging to the Nevada Copper Co. at Cottonwood, near Lovelocks, have been consolidated and the control given to W. W. Gihhs of the latter company. The new company is to hegin the erection of a 100-ton smelter on the Bell Mare property hefore May 1st.

ESMERALDA COUNTY.

The Humphrey Bros. of Crow Spring have two claims on the turquoise deposit. The vein can he traced for 200 feet. Specimens half an inch in thickness and 3 inches square have been taken out. The property has been bonded to Eastern people.

EUREKA COUNTY.

A. Laird and J. H. Hoegh have leased for three years the Alexandria mine on Prospect mountain, near Eureka, from the Alexandria M. Co. of Detroit, Mich. H. C. McTerney of Eureka is Supt.

LINCOLN COUNTY.

The suit of the Utah-Nevada Co. vs. J. R. De Lamar has been transferred from the Superior Court of San Francisco to the U. S. Circuit Court. The complaint recites that I. E. Blake on April 10, 1894, was the owner of a contract to buy the Monitor, Jim Crow and De Lamar claims in Lincoln county, and that De Lamar and he formed a copartnership and hought them, Blake subsequently selling his interest to the Utah-Nevada Co. By the terms of the partnership contract Blake was to receive 49% of the proceeds of the mines. It is alleged that De Lamar has turned over only $7363.44 out of $7,000,000 taken out of the mines. The complainant asks for an accounting and $3,422,636, that amount being 49% of the alleged proceeds.

LYON COUNTY.

R. Logan states that the Hulby-Logan mine at Como has heen started up and work is heing done on the tunnel to make connection with the North Rapidan main shaft. It is estimated a year will be required to complete it.

At Dayton the Davis & Gignoux cyanide plant is to he enlarged to seventy-five tons daily capacity.

NYE COUNTY.

The property of the South Tonopah Con. G. M. Co. of Nevada consists of seven claims, 4 miles south of Tonopah. The company propose to sink the shaft to the 200-foot level and to erect buildings and machinery. A. J. Froehlich is president and E. C. Simpson is seoretary, hoth of Tonopah.

The Tonopah M. Co., in development work in the east drift at the 250 level in the Brougher shaft, have opened up a 7-foot ledge of horn silver ore that, it is claimed, will average $800 per ton in silver, besides carrying its usual per cent of gold.

J. Healey, Supt. of the Tonopah & Salt Lake M. Co.'s mines at Tonopah, reports that in the Stone Cabin claim the vein has heen encountered in the crosscut off the 100-foot level, and that an average of $31 in gold and silver had been obtained from a hreast of ore 6 feet wide.

A specimen of turquoise, found in the Tonopah district of Nevada, has been returned from the East, where it was cut and pollshed. A letter with it states that the specimen is of the finest grade and could be readily disposed of in any quantity. The mine is ahout 12 miles from Crow's springs, near Tonopah. Mr. Humphries, the owner, expects to commence work at once.

The following directors have heen elected in the Tonopah Tunnel & M. Co.: A. L. Hudgens, R. C. Gordon, P. Manning, C. Brougher and T. L. Oddie. The officers elected are: T. L. Oddie president and A. L. Hudgens secretary.

ORMSBY COUNTY.

A strike of copper is reported in the Quill mine 2 miles west of Carson City. The vein is 12 feet wide. It is stated to he concentrating ore and, if so, can be worked without a smelter.

STOREY COUNTY.

The Incorporated Tunnel Extension Co. is organized in New York City to extend the Sutro tunnel and its lateral branches. This is interpreted as intention that the south lateral branch drift of the Sutro tunnel, which now connects with the main shaft of the Alta mine, will be extended to Silver City, a hranch tunnel tapping and draining the American Flat region, and that the main Sutro tunnel will he pushed westward from the Savage mine. It is locally stated that $500,000 has heen provided for the work. The new company is understood to be separate from the Comstock Tunnel Co., which owns and operates the Sutro tunnel.

WASHOE COUNTY.

Another strike is reported in the Wedekind-Reno Star mine, the lead heing reached hy a shallow surface cut. Four feet of ore was exposed, claimed to be practically solid silver sulphide, which assays from $1 to $4 a pound, besides several ounces of gold.

W. H. Elwood of Idaho Springs, Colo., is Supt. for the Willow Creek M. Co., which recently bought the old Galena mine near Washoe. Two shifts are cleaning out and retimbering the old workings preparatory to stoping from a 22-foot vein. A spur track will be put in by the V. & T. and ore will be loaded on the train from ore cars direct from the stopes.

An Ogden, Utah, company has bought the Shannon mine, near Reno. It is an old mine on which considerable development work has heen done.

A strlke has been made of a body of ore in the Harris mine, near Washoe City, which, it is claimed, goes $200 to the ton.

WHITE PINE COUNTY.

(Special Correspondence).—The Morris & Pilot Knoh mine, located near Ely, belongs to J. A. Snedaker and associates of Denver, Colo. The group comprises about 1000 acres. Recently a six-drill air compressor, two pumps, three hoists and two cages have been shipped to the property. Four shafts have been sunk, the deepest being 300 feet. The ore is much leached out and carries gold and copper.

The New York & Nevada group, in the same locality, is having a compressor put in.

The Chainman Co. has a body of lime ore, carrying oxidized iron and gold, at the contact of lime and porphyry. The ore belt is about 200 feet wide, the average value heing about $10 per ton. This company's 800-ton cyanide plant, in charge of Louis Janin Jr., has started up, running about 150 tons per day. It is considered they have a large tonnage in sight.

The McKinley mine has a 200-foot shaft, disclosing a fair grade of copper ore.

On the copper belt of the Ely district the ores from the surface down to 160 feet are leached out and oxidized. Below this general level they become more of a copper and iron pyrite.

Ely is lighted hy electricity generated hy water power on Murray creek.

There is a large timber belt west of Ely, in which there is plenty of yellow and nut pine and mountain mahogany.

There is considerable talk of the Palisade-Eureka Railroad being huilt from Eureka to Ely, a distance of about 80 miles. At present stages run to Ely from Eureka, Pioche and Wells, Nev., and from Frisco, Utah.

Ely, March 18.

NEW MEXICO.

BERNALILLO COUNTY.

The Home M. & M. Co., of Bland, will buy the 10-stamp mill of McKinney in Hell canyon. The custom ore hrought to the mill is to he treated at a cost to the owners of a little over $4 a ton, leaving $1 profit to the mill on each ton of ore treated. The mill will treat ahout 500 tons of ore a month.

The Woodbury mill at Allerton has begun to treat ore from the Iron King mine and also custom ore. It is managed by V. V. Clark.

DONA ANA COUNTY.

A 75-ton concentrating plant has been erected at Organ for the Torpedo and Modoc mines. A 4000-foot tramway has also been completed. On the Torpedo mine the double-compartment shaft is to be sunk 350 feet.

GRANT COUNTY.

The Wilson M. & M. Co. of the Volcano district has completed a 5-mile pipe line for water supply from the Animas valley to the mine, and has a 10-stamp mill started.

The Silver City M. & D. Co. has been incorporated, capital $100,000, with office at Silver City. The directors are E. Harms, E. A. Layne and L. A. Snyder.

A company of Grand Rapids, Mich., and Canadian people has bought a group of twenty-two claims near Stein Pass for $300,000. Two smelting plants are to be built on the group.

LINCOLN COUNTY.

The American G. M. Co. has bought the American mine at Nogal. The mine is equipped with a 10-stamp mill. The company has also bought the Rockford group at Nogal from A. Schinzing.

The Old Ahe mine at White Oaks is reported to be yielding some very rich ore on the 1250 and 1300-foot levels.

LUNA COUNTY.

The General Concentrates Co. has bought the lead property in the Cook's Peak district, formerly owned by J. Onstot. A $30,000 concentrating plant will be erected.

SOCORRO COUNTY.

The Socorro G. M. Co. of Hartford, Conn., are working the Socorro mine in the Wickenburg district. The development consists of a 300-foot shaft and 400 feet of levels, and the company is about to put in a 20-stamp mill, a hoist and a pump of 18,000 gallons capacity. It has 3 miles of pipe line. The tailings are to he worked by the cyanide process.

OREGON.

GRANT COUNTY.

The Golconda mine, in the Cracker creek district, 7 miles west of Sumpter, has been sold for $250,000 by English Bros. of Danville, Ill., to Pendleton people.

JACKSON COUNTY.

In the Roaring Gimlet mine, near Gold Hill, has been developed a new pay lead, from which, with one man panning, $400 a day is being taken out.

At the Mayhelle mine a large two-story boarding and bunk house has been built and grading is being done for a 30-ton capacity mill.

W. P. Chisholm has started the driving of a tunnel to tap the Prosperity lode in the Meadows district, near Jacksonville, to a depth of 250 feet. This vein carries nickel, cohalt, copper and gold.

JOSEPHINE COUNTY.

In the Granite Hill quartz mine in the Louse creek district, near Grants Pass, a vein of high-grade ore lately struck carries values running as high as $500 to the ton. The property is equipped with a 5-stamp mill.

The Oak Flat hydraulic mines, in the Illinois district, have heen bought from Cope, Horn & Cornell by Pool Bros. & Reynolds of Denver, Colo. The mines comprise 1200 acres of hydraulic placer ground lying in the fork of the Illinois river and Briggs creek, with a hydraulic plant and 20-mile ditch from Soldier creek. The new owners will add to the equipment and build a new and large ditch to Briggs creek.

H. W. Ogilbe, C. E., of San Francisco, and B. S. Taylor have heen surveying several weeks in Applegate valley, near Grants Pass, looking for a suitable location for a power plant. Their object is to furnish electrical power for a radius of 30 miles, the power to come from the Applegate river.

UMATILLA COUNTY.

The Big Four M. & M. Co. has been incorporated at Pendleton by J. T. Hinkle, M. Wyrick and J. F. McCarthy, capital $150,000.

UTAH.

Utah mine dividends for the first quarter of the year totaled $1,163,500. For the corresponding period in 1901 the dividends amounted to $585,500.

BEAVER COUNTY.

President L. G. Young of the Hub M. Co. says that work is to he started up at once on the mine near Shauntie in a vein from 1 to 6 feet in width that carries values in gold, copper, silver and lead. It is the intention to sink a shaft on the vein.

S. Newhouse says of the Cactus mine, owned hy him, that the shaft is now down 600 feet and is to go down to the 2000-foot level before mining is started. In the meantime exhaustive experimental tests will be made on the ores, and to that end the machinery for a complete concentrating mill will he installed. Prof. J. M. Callow will build this plant and continue making experiments, hoth as respects the equipment that will be required and the

results attained, till a process and mill perfectly adapted to the ores have been worked out, then a large working plant of any capacity that will require no changes after it is constructed can be installed.

BOX ELDER COUNTY.

F. D. Higginbotham, Sr., Supt. of the West Century mine of Park valley, states that the tunnel, which is now in 350 feet, is advanced from 40 to 50 feet a month, and 200 feet farther will reach the main ledge. The mill is kept running.

EMERY COUNTY.

The Toltec M. Co. has been incorporated at Salt Lake City, capital $30,000, with W. H. Clark president and E. W. Clarke secretary. The company owns the Toltec group of five claims in Stove can yon.

IRON COUNTY.

The Ophir mine at Stateline resumed operations on the 1st inst.

JUAB COUNTY.

The Great Northern G. M. Co. has been incorporated in Salt Lake City; capital, $5000. J. A. Headlund is president and C. C. Anderson secretary. The company owns the Great Northern and other claims in Dowit district.

PIUTE COUNTY.

The I. X. L. M. Co. of Manti has been incorporated, capital $50,000, with J. Snow president and W. C. Snow secretary and treasurer. The company owns the I. X. L. and seven other claims in the Mount Baldy district.

SALT LAKE COUNTY.

The Oquirrh-Bingham C. Co., G. R. Adams Supt, has shipped a fifteen-ton carload of ore from the tunnel on the Amanda vein, at Bingham, the control sample showing 11% copper and $3.42 gold. The total cost of mining and delivering to smelter is estimated as not exceeding $2 50 per ton.

The Laura May G., S. & C. M. Co. has been incorporated in Salt Lake City; capital, $30,000. The officers are R. P. Morris president and W. D. Mathis secretary and treasurer. The company owns the North Star group in the Big Cottonwood district.

SEVIER COUNTY.

Manager C. I. Rader of the Annie Laurie mine, at Gold Mountain, announces that the company has decided to double the capacity of the plant, which will enable it to handle from 500 to 600 tons a day.

SUMMIT COUNTY.

Litigation involving approximately $3,000,000, it is reported, has been avoided by an agreement for the consolidation of the Daly West M. Co. and the Quincy M. Co., both of Park City. The Daly West Co. is to increase its capitalization and take over the Quincy Co. The former company is paying dividends at the rate of $60,000 a month, the latter company at the rate of $125,000 a month. It was estimated that at least $250,000 would be spent in legal expenses, besides the loss involved in closing the mines.

The Elise M. & M. Co. has been incorporated at Salt Lake City, capital $10,000, with J. E. Chisholm president and W. G. Tolhurst secretary. The company owns the Elise and twelve other claims in the Uintah district.

The Anaconda M. Co. has been incorporated in Salt Lake City, capital $15,000, with J. O'Donovan president and A. McKellar secretary. The company owns the Garey group of six claims in the Uintah mining district.

TOOELE COUNTY.

The plans for the new mill for the Sacramento M. Co. at Mercur are approved and Supt. G. W. Cockler will have charge of the work.

A trial of the filter presses lately installed in the Sunshine mill at Mercur, it is stated, has resulted in satisfactory demonstration of efficiency. In the trial the presses took up the silt which has hitherto carried off much of the metal values and the solution which came from the presses was clear and free from slimes. The device was improvised by Mr. Moore, the manager, to perfect the operations of the cyanide plant.

The Mercur M. Co. mill is gradually increasing its output and it is expected that it will soon be averaging 1200 tons per day. It has lately made 1148 tons in twenty-four hours.

The Regent M. & M. Co. has been incorporated at Salt Lake City, Utah, capital $60,000, with T. B. O'Reilly president and F. L. Wilson secretary and treasurer. The company owns the Mistake and Mistake No. 2 lode mining claims in Clifton mining district.

Plans for the new mill of the Sacramento M. Co., at Mercur, have been prepared and active construction is expected to begin at once. Some of the original structure, injured by fire several months since, will be utilized in the reconstruction. The mill will have twenty-six leaching tanks, with a capacity for treating about 150 tons of ore daily, the same as the original mill. G. R. Bothwell is manager.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Horseshoe Co. have bought the chlorinating works at Pluma and the mines of the company in the Bald Mountain district. The new company will put in a 100-ton cyanide plant at the chlorinating works.

The Columbus group of mines, north of the Homestake Co., is bought by H. J. Mayham of Denver. There is ore blocked out and ready to mine as soon as the mill is built.

A property adjoining the Homestake on the southwest is bought by G. M. Mix, formerly general manager of the Hidden Fortune M. Co., and O. P. Th. Grantz, for New York men, who will organize and build a mill.

In the Ragged Top district California men have 150 men on surface work. The Spearfish and Deadwood-Standard have bonded 1000 acres to Denver people, and there is talk of a 100-ton cyanide plant on Spearfish creek.

The Hidden Fortune Co., which has been developing north of the Homestake, is preparing for a 100-ton stamp mill with cyanide annex.

WASHINGTON.

CHELAN COUNTY.

W. J. Bowen has organized the Holden Extension M. Co. to operate the Emma, an extension of the Holden mine, at Chelan.

The company which has bonded the Holden group proposes to build a smelter on the lake shore and operate a short railroad from the mine to the smelter. The contract for the burning of 600,000 bricks and for the making of the railway ties has been let. The Holden ledge is said to be over 100 feet wide, carrying values in copper.

S. H. Dahl of Westby, Wis., a stockholder in the Badger Girl M. Co., operating the Lone Pine group, near Chesaw, says the company will build a mill on the property.

FERRY COUNTY.

At Republic the diamond drill on the Gold Ledge is averaging 15 feet per day. The drill is operated by hand power, an innovation on the usual method of prospecting in that section.

OKANOGAN COUNTY.

The Mineral Hill M. Co., at Conconully, is to have the buildings and machinery lately destroyed by fire replaced. G. Wheeler is manager of the property. It is stated that an electrical plant will be erected.

LINCOLN COUNTY.

A rich strike is reported made by J. Thornbreau near Cedarville. The ledge is said to carry 8 inches of ore which assay 700 ounces of silver to the ton.

FOREIGN.

BRITISH COLUMBIA.

Foreman P. Dwyer of the Hewitt mine at Silverton reports that he has struck 10 inches of 200-ounce ore 120 feet in the long tunnel. Thirty men are employed, all on development work. In the last eighteen months the mine has shipped 2500 tons of ore. It is owned by R. Insinger and F. J. Holman of Spokane and Bennington, Vt., people.

J. Cronin, manager of the St. Eugene mine at Moyie, S. O. Buchanan of Kaslo and W. H. Aldridge, manager of the C. P. R. smelter at Trail, are in Ottawa to ask the Dominion Government for an adjustment of the tariff on lead products in order to encourage the marketing of Canadian lead in Canada. The Government is being asked to put a beavier import duty on manufactured lead products, raising it from about $2 per ton to about $40 a ton, the import duty into the United States. The idea is to manufacture Canadian lead at home, thereby cutting out freight abroad and back. It is estimated that about 40%—about 12,000 tons—of the lead mined in Canada is used there.

At 2150 feet in on the lower tunnel on the Ymir mine at Ymir the main ledge has been struck at a depth of 1000 feet. The values and character of the ore are the same as those of the higher levels.

The Young Australia group of copper-gold mines on Phillips Arm, west coast of Vancouver Island, has been bonded at $35,000, and it is the intention of the bonders to push development work.

The Arlington-Burns group in Deadwood and the Riverside group near Greenwood have been bought at about $50,000 by S. H. Jones and H. S. Ely of Duluth, Minn., for themselves and associates.

The Montana G. M. Co., operating six claims near Deer Park, on Lower Arrow lake, are to have a 50-ton concentrating plant. It is the intention to build a series of settling tanks for the recovery of the silver values in the slimes.

The War Eagle M. Co. of Rossland proposes to erect a milling and concentrating plant to handle the $5 a ton ore in the mine, which has been too low a grade to be shipped.

J. P. Graves, general manager of the Granby Co., says he is getting estimates of the cost of installing a large compressor plant to be operated either by electricity or by steam, when they will increase the output to 2000 tons daily. The new equipment will have sufficient capacity to operate the drills and hoist.

A placer gold discovery is reported on Cooper creek, 20 miles from Kaslo. The creek has been staked for several miles. A company has been formed to build a flume dam. Men are rushing into the camp from all quarters. Gravel taken from the creek bed is said to yield 25 cents in coarse gold to the pan. Gold has been known to exist in that locality for years.

It is reported that the St. Eugene mine at Moyie will recommence shipments about May 1. The mine has for some months suspended shipments on the ground that, at the rates of treatment and transportation, coupled with the low price for lead on the London market, it could not afford to produce ore. With its present plant the St. Eugene can produce from 3100 to 3200 tons of concentrates monthly, carrying approximately 70% lead and forty ounces of silver.

CANADA.

The erection is projected this season of a 200-ton smelter for the treatment of ores and rock from the lake district in Ontario near Sault Ste. Marie. The plant will consist of a converter, reverberatory furnace and a blast furnace. There will be no electrolytic department, the experience of the Lake Superior S. Co. at Dollar Bay, Mich., showing that there is not enough gold to pay for extracting it. J. J. Case, Supt. of the Lake Superior S. Co, is interested. The charter will probably be secured from the Canadian Government.

KOREA.

The Oriental M. Co. at San Francisco want good millwrights to go to Korea to erect an 80-stamp mill. The wages offered are $4 50 per day and board, the company agreeing to pay the fare of men both ways if they remain the full time of the contract.

MEXICO.

G. C. Kaufman, general manager of the mining department of the American S. & R. Co., is reported to have given notice that all the mines of the company in the Sierra Mojada district, Chihuahua, will shut down and remain inactive for at least one year.

At the silver mining camp of Las Planhas, Sonora, there is a 10-stamp mill treating free milling silver ore, to which, it is expected, will be added ten more stamps and a lixiviation plant.

S. Penrose and C. M. MacNeall of Colorado Springs, Colo., have bought for $800,000 the Pinos Altos group of mining claims embracing 31,000 acres in Chihuahua.

W. M. Kiddie of Clifton, Ariz, has bonded from C. C. Rountree of La Colorada, Sonora, Mexico, the Cerro Verde group of mines, near San Javier, and is doing development work on them.

YUKON TERRITORY.

Advices from Dawson state a Gold Commissioner's decision, involving the question of what shall be the base line in creeks where there are many twists and turns, or where the banks are anything but even and in one general direction. The gist of the decision is that a point should be taken and designated the center of the stream, and the center of the creek claim then be made a line drawn perpendicular to the cross line of the creek through the given point. The decision establishes a precedent in this respect, and will enable all to determine how to form the base line of adjoining hill or bench claims, as well as of the creek claims. The decision will affect a large number of claims in the Territory.

Personal.

K. C. PARRISH of Denver, Colo., is in Los Angeles, Cal.

J. H. LIVINGSTON, of San Francisco, is in Placerville, Cal.

THOS. HYE is superintendent North Star mine, Dixie, Idaho.

THOS. I. SLATER is manager Gold Anchor mine, Yankee, Colo.

W. E. GOLDEN, M. E., of San Francisco, is in Tonopah, Nev.

H. W. OGILBE, C. E., of San Francisco, is at Grants Pass, Oregon.

J. B. HARRELL is Supt. Bob Tail 80-stamp mill, Black Hawk, Colo.

JNO. A. LESCHEN has returned from Encampment, Wyoming, to St. Louis, Mo.

V. M. CLEMENT has returned to Salt Lake City, Utah, from Mexico.

DR. CABELL WHITEHEAD, chief assayer of the mint, has resigned.

F. C. DOBLER is now manager Cornucopia mines, Cornucopia, Oregon.

R. S. GRIER is now general manager Woodbury Mining Co, Empire, Colo.

W. H. LINNEY is superintendent De Lamar mill and mine, De Lamar, Nevada.

L. R POUNDSTONE has returned to Gaston Ridge, Cal., from San Francisco.

VICTOR MCCUNE, manager of the Victor mine at Bingham, Utah, is in New York.

CHARLES P. RICHARDSON has returned from Oakland, Cal., to Moose Creek, Idaho.

HENRY COLBATH succeeds H. W. Fox as superintendent Golden Gato mill, Mercur, Utah.

T. R. HEINTZ of Salt Lake, Utah, is visiting his mining property in Shasta county, Cal.

THOS. MOFFETT is the new superintendent Oregon Monarch G. M. Co., Sumpter, Oregon.

G. W. SMALL, M. E., has returned to Salt Lake City, Utah, from a five months' absence in Mexico.

O. O. SAXHANG has been appointed assistant general manager Sonora M. & M. Co., Tuhutania, Mexico.

D. E. SUTHERLAND, of London, is in California examining petroleum deposits and methods of working.

ALBERT BUCKMAN, general manager Con. Alaska M., D. & D Co., Council City, Alaska, is in San Francisco, Cal.

T. H. JENKS goes from Cuba to Senorita, New Mexico, as Supt. at the latter place of the Jura-Trias Copper Co.

R. J. CORY, the Denver representative of the Allis-Chalmers Co., has returned there from a trip through Montana.

THOMAS D. HARRIS, superintendent American Dredging Co., has returned from Leadville to Breckenridge, Colo.

HENRY WOODBURN, general manager War Eagle mine, has returned from Salt Lake City, Utah, to Silver City, Idaho.

J. H. BROWN, Supt. of the Leesburg G. M. & M. Co. at Leeshurg, Idaho, has returned to the mine from San Francisco.

W. HUNTER has returned to Hailey, Idaho, from Arizona, to take charge of some Thunder Mountain mining projects.

L. A. SNYDER, late ore buyer for the Silver City, N. M., smelter, is now with the Val Verde smelter at Val Verde, Ariz.

H. F. STEWART has been appointed Supt. of the San Joaquin mine, near San Andreas, succeeding J. McClay, resigned.

L. A. DUNHAM, manager Clifton Con. Copper Co., Clifton, Ariz., returned to the latter place from Denver, Colo., on the 31st ult.

N. A. LOGGIN, manager of the Cache Creek placer mines near Granite, Colo., has come from London to start up the season's work.

J. F. MEIKLE, former superintendent Red Boy, will have charge of the Golconda, Baker City, Oregon, under the new ownership.

W. C. RALSTON, T. B. BISHOP, W. S. KEYES, F. G. DRUM AND F. H. HARVEY are the present trustees of the California State Mining Bureau.

W. P. SWARTS, late of Chicago, is now connected with the mining machinery firm of Harron, Rickard & McCone, 21-23 Fremont St., San Francisco.

GARDNER WILLIAMS, manager of the De Beers, South Africa, diamond mines, who recently left San Francisco for London, has gone from there to Kimberly, S. A.

E. B. SAWYER is remodeling the chlorination mill at Pluma, South Dakota, for the Horseshoe M. & M. Co., and will start a 100-ton experimental cyanide plant there.

W. A. HUNGERFORD, manager of the Atlas Gold & Arsenic Co. of Hastings, Ontario, Canada, was in Colorado last week, examining a mine development near Ouray.

M. M. O'SHAUGHNESSY of San Francisco leaves San Francisco this month for Honolulu, Hawaii, having been appointed consulting engineer for a large irrigation and water supply company on the island of Kauai.

G. E. BAILEY, under the auspices of the California State Mining Bureau, is about to visit San Bernardino, Los Angeles and Riverside counties, Cal., making special inquiry into the turquoise, tourmaline and lepidolite deposits of those counties, respectively. From San Diego county lepidolite is shipped to Germany, lithia extracted therefrom and thence shipped back to the United States.

Books Received.

"Sewage, and the Bacterial Purification of Sewage," hy Samuel Rideal, D. Sc. of London, England; second edition, 8vo., 316 pages. It follows the first edition just a year later, and is revised and Inclusive of new data obtained in the interval. It is a valuable text book for the use of sanitary and municipal engineers. Published by John Wiley & Sons, 43 East 19th St., New York. Price $3.50.

"The Asphalt and Bituminous Rock Deposits of the United States," hy George H. Eldridge, is an extract from the twenty-second annual report of the U. S. Geological Survey, 1900-01. The subject is very fully discussed and maps, descriptions and illustrations are so complete that those interested should have the book. Published hy the U. S. Geological Survey, Charles D. Walcott director, Washington, D. C.

"The Copper Handhook," 1902 edition, by Horace J. Stevens of Houghton, Mich., 8vo., 416 pages. The hook is an excellent compendium of information relative to copper production. Copper mining and metallurgy are described. The chemistry of copper and the mineralogy of copper receive attention. Descriptions of copper mines ard the statistics of the industry are comprehensive. Published hy the author; price $2.

"Plane Surveying," a text and reference hook for the use of students in engineering and for engineors generally, hy Paul C. Nugent, A. M., C. E., associate professor of civil engineering, Syracuse, N. Y., University; 8vo., 577 pages, 320 figures. This volume will be found just what the author claims for it. The subject is presented intelligently and practically, without an overhurden elther of mathematical theory or practical application. Puhlished hy John Wiley & Sons, 43 East 19th St., New York. Price $3 50.

"A Practical Treatise on Mine Surveying," by Arnold Lupton, M. E. and C. E., of London, England, 8vo, 414 pages, illustrated. The hook is a very complete treatise on the subject as well as heing practical. Dealing entirely with English practice ln mine surveying, very different from the rough-and-ready American practice, it is more for American surveyors a work of reference rather than a text book for the American student of surveying. Mine surveying is particularly a profession in which one becomes practical from commercial practice rather than from the study of text books. Books that are suggestive to the worker thus are more important than text books for the student. Published hy Longmans, Green & Co., 39 Paternoster Row, London, and 91 Fifth avenue, New York. Price, $5.

Catalogues Received.

"Leyner Air Compressors, Catalogue B, 1902," is the title of a neatly illustrated treatise sent out from the office of J. Geo. Leyner, Denver, Colo., illustrating the air compressors manufactured at the Leyner shops, together with sectional detail views that show the mechanism of the different features. The suhject matter goes into an explanation of these machines, with much instructive material on air compression generally. The catalogue also illustrates the Leyner air receiver, rock drills, air reheaters and anti-freezers. The manufacturers will he pleased to mail it on request.

Recently Declared Mining Dividends.

	Payahle.
Bunker Hill & Sullivan M. & C. Co., Idaho,	$21,000..... April 4

Commercial Paragraphs.

AT a log-sawing contest at Marshfield, Or., on the 8th ult., the Simonds saw won first prize.

EXTENSIVE improvements are heing made hy the Greene Consolidated Copper Co., Naco, Ariz., and orders have been placed for 1000 H. P. Stirling water-tube safety hoilers.

THE Mariposa Electrical Power Co., Room 33, 508 California St., San Francisco, want hids for huilding a concrete and masonry dam, statlon, pipe lines and 6¾ miles ditch.

ON April 1, 1902, the Holthoff Machinery Co. began occupation of their new offices at Cudahy, Wis., and all communications should he addressed to them at that place. Their shops are approaching completlon and they expect to have them ready for operation about May 1.

THE Garlock Packing Co. has within the last few months placed on the market a perforated metal insertion sheet packing, patented, designed especially for high pressures and uneven surfaces. The perforations in the metal allow of a complete union of the rubber composition, thus making an extremely firm packing. The company reports a large demand for the goods.

THE month of March has brought to the Crocker-Wheeler Co. orders for eleven more motors to be added to its already large equipment in the new Philadelphia mint. This brings the total number furnished to 120, hesides four generators aggregating 625 K. W. Nearly the entire installation is of Crocker-Wheeler manufacture and the plant is most interesting in the completeness of the distribution of power by electricity. In fact, the metal is electrically treated from the time it enters the building until it leaves it. The electric current refines it, the rough ingot is topped, rolled out and weighed all in motor driven machines, an acid hath then leaves it ready for the coining machines, which are a unique application of a small motor driving a large fly wheel of sufficient momentum to insure a heavy pressure at the instant of stamping. The whole plant demonstrates the extent to which electric operations may he successfully carried.

U. S. CONSUL HOLLIS of Lourenco Marquez writes that he has received from Wilcken & Ackermann of that city (branch house in Johannesburg), a request for American products. The house wishes to secure the agency for steel hars, locomotives and other rolling stock, mining and electrical machinery, pitch pine, Oregon pine, etc., from the United States. Mr. Ackermann, one of the partners, is on his way to the United States to arrange for these agencies. Mr. Hollis helieves that a large trade in these lines can he created in southeast Africa, the Transvaal, Mozamhique and adjoining States. The Consul also remarks that United States firms sometimes make the mistake of giving the agency for Portuguese East Africa to a Natal house. He wishes to remind exporters that Lourenco Marquez is not in South Africa; it is in Southeast Africa, and is the capital and chief port of Mozamhique. There is nothing in common hetween Lourenco Marquez and the British colonies; on the contrary, they are trade rivals. Mr. Hollis advises that local agents be appointed for all articles that it is desired to introduce into Mozambique, and that no reliance he placed upon sub-agents located in ports which are politically and economically widely separated from that province.

Latest Market Reports.

SAN FRANCISCO, April 4, 1902.

METALS.

SILVER.—Per oz., Troy: London, 24⅛d (standard ounce, 925 fine); New York, har silver, 53⅝c, refined (1000 fine); San Francisco, 54c; Mexican dollars, 44½c San Francisco, 43½c New York.

The value of a Mexican dollar has been appraised at $0.437 for the month of April by the Washington authorities.

The new Philippines hill authorizes the Government to establish a mint at Manila and to coin a silver dollar which shall contain 416 grains of standard silver. The silver dollar is made a legal tender in the Philippines. Authority is given for the coinage at San Francisco, at the request of the Philippine Government, of silver dollars authorized by the Act. Silver certificates of not less than $10 in denomination are authorized. Authority is also given for the coinage of a subsidiary and minor Philippine coinage. The U. S. Philippine Commission has fixed the Government rate of exchange for silver, for the second quarter of this year, at $2.27 Mexican silver for one gold dollar. The scarcity of American gold in Manila is attrihuted partly to the banks and largely to Chinese speculators, who always huy American gold at a quotation two points higher than the bank rate.

COPPER.—New York: Lake, 1 to 3 casks, $12.25; carload lots, $12.00; Electrolytic, 1 to 3 casks, $12.00; carload lots, $12.25; Casting, 1 to 3 casks, $12.00; carload lots, $12.25. San Francisco: $14.00. Mill copper plates, $17.00; hars, 18@24c. London: £53 5s per ton.

The new copper rules go into effect at the New York Metal Exchange on the 15th inst. Under these rules all American copper is traded under the new standard contract, which is hased on the contract under which husiness in copper is done in London.

LEAD.—New York, $4.12½; Salt Lake City, $3.60; St. Louis, $4.00; San Francisco $4.50, carload lots; 4⅜o 1000 to 4000 lhs.; pipe 5½, sheet 6, har 5½c; pig, $4.75. London, £11 7s 6d per ton.

SPELTER. — New York, $4.35; St. Louis, $4.00; London, £17 10s per ton; San Francisco, ton lots, 5¼c; 100-lh lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lhs., 11c; 100-lh. lots, 13@15c.

TIN. — New York, pig, $26.50; San Francisco, ton lots, 27c; 1000 lbs., 27½c; 500 lbs., 27¼c; 200 lbs., 27½c; less, 28c; bar tin, ℔ lb, 30c.

PLATINUM.—San Francisco, crude, $17 ℔ oz.; New York, $18 per Troy oz

QUICKSILVER. — New York, $51.00 large lots; London, £8 15s; San Francisco, local, $47.50 ℔ flask of 76½ lbs.; Denver, $51.00. Export, $45.00.

BABBITT METAL.— San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER. — Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 14.20c.

NICKEL.—New York, 50@60c ℔ lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $17.25; gray forge, $17.75; San Francisco, har, 2.75 ℔ lb ,3c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $31.75; open hearth billets, $32.25; San Francisco, har, 7c to 12c per lb.

CEMENT.—Germania, $2.65; K. B. & S., $2 65; Hewmoor, $2.50; Trowell, $2.50 per hbl.

LIME.—Santa Cruz, $1.60; Roche Harbor, $1.60 per hhl.

LUMBER.—(Retail): Pine, ordinary sizes, $18.00@19 50; extra sizes higher; redwood, $19.00@20.00; lath, 4 feet, $3.90 @4.00; pickets, $19 00; shingles, $2.00 for No. 1 and $1.75 for No. 2; shakes, $13 00 for split and $14.00 for sawed; rustic, $25.00 @31.00.

GENERAL SUPPLIES.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.50; Cut, $3.50; 10d to 16d, Wire, $3.55; Cut, $3.55; 8d, Wire, $3.60; Cut, $3.60; 6d and 7d, Wire, $3.70; Cut, $3.70; 4d and 5d, Wire, $3.80; Cut, $3.80; 3d, Wire, $3.95; Cut, $3.95; 2d, Wire, $4.20; Cut, $4.20. Special rates for carload lots.

POWDER.—F. o. h. San Francisco: No 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one toss 15½c. No. 1** 50%, carload lots, 11½c; led, than one ton, 13½c. No. 2, 40%, carloan lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ℔ set; 14 oz., 40s., 9c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $6.50; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $9.56, long ton; Colorado Anthracite, $14.00. Coke, $15 per ton in bulk, $17 in sacks; Sunnyside, $11 75, long ton.

Receipts of coal at San Francisco in March (exclusive of California and Utah) totaled 120,849 tons, including 67,005 tons from Puget sound and 37,368 tons from British Columhia. For the same month last year the receipts were 149,823 tons. Oil is supplanting coal as fuel.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 29@30c ℔ lb.; carloads, 27@28c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c ℔ lb.; soda ash, $1.90 ℔ 100 lbs.; hyposulphite of soda, 2¾@3c ℔ lb.; hlue vitriol, 5¾@6¼c ℔ lb.; horax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 5c; alum, $1.90@2.00; flour sulphur, French, 2¼@ 2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bhls., $1.25 @1.50 ℔ 100 lbs.; sks, $1.05; chloride of lime, spot, $2.50@2.60; nitrate of potash, in hbls. 8c: caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, hoiled, bhl., 76c; cs., 81c; raw, hhl., 74c; cs., 79c; lots of 5 hhls., 1c less; Lucol oil, hoiled, hbl., 66c; cs, 71c; raw, hhl., 64c; cs, 69c. Kerosene —Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in hulk, 13½c; Mineral Seal, iron hhls , 19c; wooden bbls., 22½c; cs, 25c; Mineral Sperm, cs, 26½c; Deodorized Stove Gasoline, hulk, 15½c; do., cs., 21½c; 86° Gasoline, hulk, 20c; do., cs., 26½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14c; do., in cs., 20½c; Lard Oil, No. 1 hhl., 60c; cs., 65c; Neatsfoot Oil, hhl., 70c; cs., 72½c; No. 1 hhl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6¾c; 1 ton and less than 5 tons, per lb., 7c; 500 lbs. and less than 1 ton, per lb , 7¼c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, ¼c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6¾c; do. in kegs, 7¼c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb , 7c; 500 lbs. and less than 1 ton, per lb., 7¼c; less than 500 lbs., 7½c.

ASSAY LITHARGE.—Per lb , 9c.

BISMUTH.—Suhnitrate, per lb., $1.60.

BONE ASH.—3c ℔ lb.

BORAX.—Crystal, 7c: calcined, 20c.

CHROMIUM.—(90% and over) per lb , $1.25.

COPPER.—Carbonate, 20c; Red oxide, ℔ lb., 60c.

MAGNESIUM.—Per lb., $3.00.

MANGANESE.—(90% and over) ℔ lb., $1.25.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—25c. ℔ gramme; 1000 grammes—2⅛ lbs.

PHOSPHORUS. — (American) ℔ lb., 80c.

SILVER.—Chloride, ℔ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ℔ lb., $1.00

URANIUM.—Oxide, ℔ lb , $3.50.

ZINC.—Metallic, chemically pure, ℔ lb., 50c.

ZINC.—Dust, ℔ lb., 10c.

ZINC.—Sulphate, ℔ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING MARCH 25, 1902.

696,320.—EASEMENT—C. O. Anderson, Los Angeles, Cal.

696,128.—CLOTHES DRIER—T M. Anderson, New Whatcom, Wash.

695,905.—ANIMAL TRAP—G. Brown, Santism, Or.

696,389.—GANG PLOW—H. Bryan, Modesto, Cal.

696,319 —CIRCUIT CLOSER—D. L. Demorest, Tacoma, Wash.

696,136 —SHACKLE—E. F. Diamond, Oakland, Cal.

696,323 —ORE FURNACE—C Fitzgerald, S. F.

696,031.—CANNING DEVICE — W. H. Fredericks, Portland, Or.

696,172.—CIRCUIT BREAKER—A. J. Higgs, Colton, Cal.

696,141.—ANNING MACHINE—A. Hoob, Alameda, Cal.

696,123.—ADDING MACHINE—A Hoch, Alameda, Cal.

696,239.—BED BOTTOM—J. Hoey. S F.

696,341.—DISPLAY CAHINET—A. L. Johnson, San Luis Obispo, Cal.

696,345.—MASSAGE MACHINE—H. E. Law, S. F.

696,348.—LIFE SAVING DEVICE—W. H. Martin, S. F.

696,251.—EXPLOSIVE ENOINE—J. D. McFarland, Jr., S. F.

696,065.—RHEOSTAT—M L. Miller, Pasadena, Cal.

696,066.—TROWELL—P. S. Miller, Seattle, Wash.

696,078.—DREDGER CUTTER—R. H. Postlethwaite, S. F.

696,271.—HARDENING COPPER—Carrie Renstrom, Seattle, Wash.

696,276 —PAPER ROLL—J. Sinclair, S. F.

696,113.—JAR COVER—H. H. Stevens, Los Angeles, Cal.

696,370.—JOINTER FOR PLOWS—H. Traeger, Auhurn, Wash

695,976.—TELEPHONE—W. D Watkins, San Jose, Cal.

695,985.—LAMP—W. R. Wilson, Baker City, Or.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CEMENT GRAVEL CRUSHER AND SEPARATOR.—No. 695,076. March 11, 1902. C. H. Ohm, Shellville, Cal. The object of this invention is to provide an apparatus for pulverizing gold-hearing cement which is found adhering to gravel and cobblestones, and to separate it from such stones without crushing the stones themselves. It consists of an inclined trough or mortar hed, and a series of stamps, with mechanism hy which they are alternately raised and dropped in the line of said hed. Means are provided hy which they are prevented from striking the hottom. The lower ends of the stamps are so formed as to facilitate the pulverizing and separation of the cement without striking with such force as to crush the worthless stones. Separating screens are constructed to carry off the gravel and worthless material and a means located below the screens for collecting the valuable cement.

CONFECTIONERY MACHINE.—No. 695,801. March 18, 1902. W. S. Dillon, San Francisco, Cal. This invention is designed for the production of that class of confectionery known as "sugar creams." It consists of an exterior casing, a series of centrally journaled revoluhle hlades, and a series of fixed hlades to operate in unison therewith; one set of hlades having a right spiral and the other having a left. The casing has an opening for the admission of air so that when the revoluhle shaft is turned, and the prepared material is fed into one end of the machine, it is continually worked and air intermixed with it as it passes through the casing, so that it is delivered in the proper cream-like consistency at the discharge end.

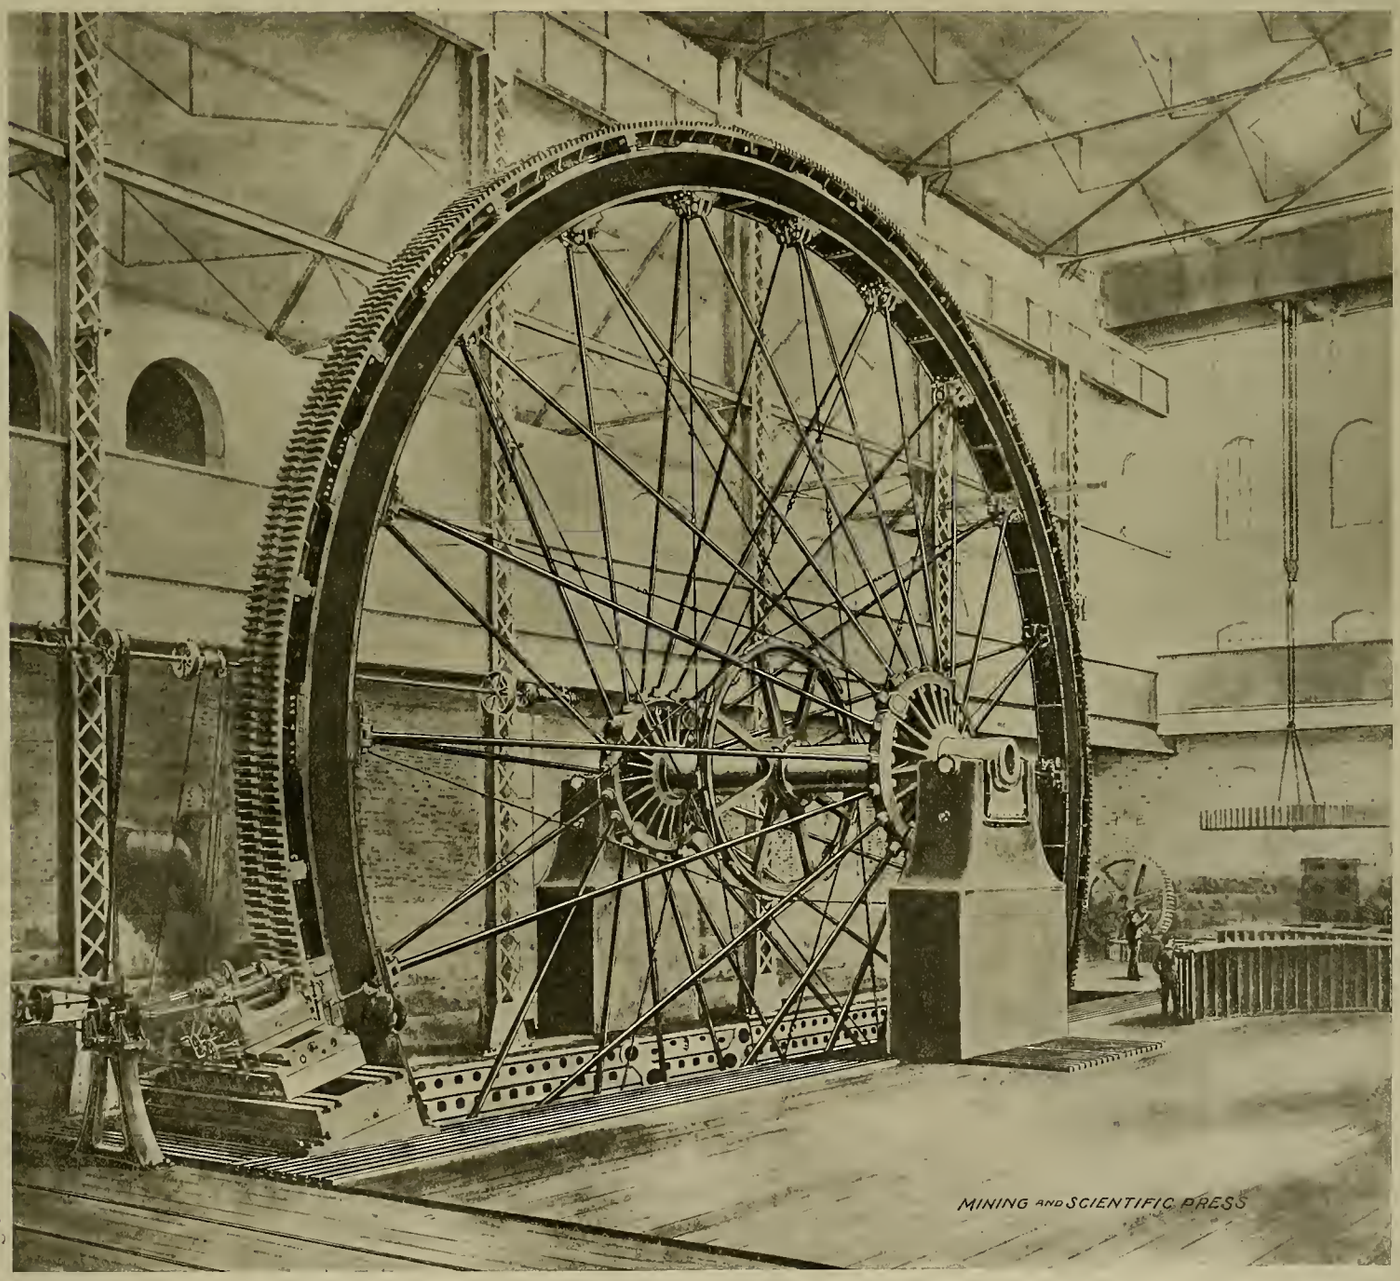
HYDRAULIC PUMP.—No. 695,815. March 18, 1902. C. B. Lakenan, Grass Valley, Cal. This invention refers to pumps used for the removal of water from mines, or the elevation of water, or other liquid from a low level to a higher one The pump is so constructed that water under pressure entering through a supply pipe and conduit will act to force one of the plungers in the operating cylinder into another cylinder which is in line therewith. The single plunger moving in these two cylinders alternately aomits water to the end of one cylinder and the other, and correspondingly discharges it on the return movement. The operating cylinders have likewise plungers within them, are located in line with the pumping cylinders, and the employment of the supplementary hydraulic motor device allows the pump proper to he located at a low level in the well or mine.

MINING AND SCIENTIFIC PRESS.

Whole No. 2177.—VOLUME LXXXIV. Number 15. SAN FRANCISCO, CAL., SATURDAY, APRIL 12, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

A Large Wheel for a Michigan Copper Mine.

The Robert Poole & Son Co., iron founders and machinists at Woodberry, Baltimore, Maryland, is finishing one of the largest wheels of its kind in the world. The wheel is known as a sand wheel, and was ordered hy the Calumet & Hecla Mining Co. for one of their copper mines at Lake Linden, northern Michigan, near Lake Superior. It is being huilt from the plans of the company's engineer, E. D. Leavitt, of Cambridgeport, Mass., and is 65 feet in diameter, weighing, with its hase plates and supporting columns, over 1,000,000 pounds. The shaft, or axle, is made of Krupp's crucible cast steel, 32 inches diameter, 27 feet long, with a 16-inch hole bored through the center, and weighs 42,000 pounds. The journals are 25 inches diameter, 42 inches long. Two gun iron huhs are fitted to either end of the shaft, each weighing 20,000 pounds, and from these hubs radiate forty 4-inch steel arms or spokes, which support the rim sections on the same principle as a hicycle wheel, each spoke arranged with special nuts and threads for fine adjustment when erected in place. The rim is huilt up in twenty segments. It consists of two concentric rings, one on the inside for strengthening the entire structure attached to the radial spokes, and another on the outside, consisting of a toothed gear rim fastened to the inside rim with holts and keys. On the periphery of the outside rim are cast staggered or stepped gear teeth, and these teeth are milled with special tools to an accuracy of one-thousandth of an inch variation. The pitch of the teeth is 4.7 inches. Each row of teeth is 12 inches wide, making an effective working face of 24 inches. There are twenty-six teeth in each segment, or a total of 520 in the entire wheel.



Large Sand Wheel for the Calumet & Hecla Co., Lake Linden, Mich.

To each side of the sectional rim is riveted a rectangular plate iron box, carrying on its inner side 275 buckets—550 buckets in all—each hucket measuring 3½ inches hy 3 feet by 4 inches. The buckets are set at an angle which, together with the periphery velocity, prevents discharge until a horizontal position is reached near the top of the wheel, the distance across the face of the wheel when the huckets are fitted being about 12 feet. The lower part of the wheel dips in a shallow pit, into which the refuse from the stamp mill flows, and as it turns each hucket is filled with water, gravel or sand, and carried up to he discharged at an elevation of ahout 50 feet into a trough, where it is carried away hy the water in sluiceways, the discharge heing close on to 75,000,000 gallons in twenty-four hours. The pinion, or small wheel hy which motion is given to the large wheel, has twenty-three teeth in each row, and is 37 inches in diameter, accurately milled to match the large wheel, and is fitted to a shaft carrying on its outer end a mortise, or wood-tooth wheel, engaging with an iron pinion fitted on the motor shaft.

The electric motor for driving is of 750 H. P., speed 150 revolutions per minute.

The large wheel makes ahout four revolutions per minute, and the periphery speed at the inner edge of the buckets will he ahout 12 feet per second.

It is expected that the wheel will be ready for delivery in about four months, when thirty or forty gondola cars will he required for its transportation from the Maryland works nearly half way across the continent to the mine.

The Court's Construction of the California Caminetti Law.

It has been supposed that by the operation of the California Caminetti law hydraulic mining was firmly re-established, free of the harassing injunctions of the courts and the incubus of blackmailing payments which during nearly twenty years previous had cumulated until the industry was paralyzed. The recent decision of Judge Davis in the Superior Court at Marysville, Cal., in the case entitled Sutter Co. vs. the Polar Star Mine et al., is that court's notice to the miners that it does not consider the Caminetti law as having any practical validity at all, and that the old conditions are to be restored. The decision issued an injunction against the mine, compelling it to cease operating, even though it held a license to operate from the debris commissioners, who are charged with the enforcement of the Caminetti law and the regulation of hydraulic mining.

The miners, accepting in good faith the provision of the Caminetti law, have expended vast sums in the construction of dams and the reopening of their mines and have submitted to the restriction and limitation of mining that it imposed. Not all of the mining that was destroyed by the injunctions and direct blackmailing prior to the enactment of the Caminetti law had been re-established, but progress toward that condition was being made. It would have been but a comparatively short time before hydraulic mining would have been yielding upwards of $12,000,000 annually, as in the years before mining by injunction became an institution for rewarding one kind of thrift.

The decision of Judge Davis, if sustained by the Supreme Court on appeal, will not only stop the normal growth of the industry to its old standing, but will make waste of the great sums of money expended by the miners now operating. If the license of the debris commissioners has no standing in the courts, if the latter refuse to recognize hydraulic mining, done in compliance with the provisions of the Caminetti law, as being any different from hydraulic mining carried on without it, the old condition so disastrous to mining and to California will again be in effect. It is not a pleasant prospect that Judge Davis' decision opens up. With hydraulic mining at the license of debris commissioners acting under the law, miners can know what to anticipate. With hydraulic mining at the blackmailing license of informers and spies, the miners can not know what to anticipate.

There is certainly at this time the necessity of prompt, effective action to hold what it took years to gain for the industry. The Miners' Association should fight this decision by appeal clear to the Supreme Court of the United States. It is the old attempt to destroy the mining industry of California revived. It is unfortunate to the State that it should come at the present time, when the general tendency of its industries is toward increase and expansion.

A Fallacy Exposed.

Every little while some one rises in print to make a comparison between the way they mine in Michigan and South Africa and the way it is generally done in California and Colorado. The comparison is always expressed in conclusions uncomplimentary to the latter two. That there can be no valid reason for the difference, and that there is no room for argument is implied in the form the statements are made. Because rarely questioned by authority it is apt to be assumed by the careless reader that the conclusions are unquestionable. This is not so. The conclusions of the kind of comparison referred to are questionable and are not true conclusions from the differences which are compared.

The usual form these comparisons take is a eulogistic description of the large and deep shafts, great hoisting works, and enormous milling plants that are characteristic of the Lake Superior copper mining and the Transvaal gold mining, and of how the operators of these great works plan them on their great constructive scale and invest millions of money in advance of any actual mining or return from it. Then the writer goes on to draw down the other end of the comparison by describing the very much smaller shafts, hoisting works and milling plants of California, and of how no money or comparatively little money is risked in small sums in advance of actual mining and return from it. The conclusion is then stated, as if no other was possible, that the mining capital of California and Colorado is small in amount and ridiculously timid, and that it should imitate to its certain advantage the policy of capital in the Michigan and Transvaal mines. The idea is very frankly advanced that opportunities for mining profits are missed in California and Colorado mines because of the neglect of capital and timidity of its management.

The comparison and conclusion are simply evidence of how the untrained, careless intelligence is influenced and fixed by the surface of what it thinks it sees through. The difference of the surfaces created by the application of capital to plant and dead work construction is the creation of the wide difference in the mines which are beneath the surfaces. The difference in the mines beneath the surfaces is not the creation of the difference in the surfaces made by differences in application of capital, as the careless writers assume. Capital and its methods adjust themselves to the mine, not the reverse.

The beginnings of copper mining in the Lake Michigan country are so many years past that the beginning is largely forgotten now. But if mistakes were made then, or, better, if we did not know of it in the beginning what we know now, we do know now that the lodes or copper-bearing rocks have a remarkable uniformity of metal content, form of occurrence and persistence in extent beneath the surface. The rules of the mines are known, and are almost as certainly exact as are mathematical laws. The exploitation of a Lake Michigan copper mine may be defined as comparable to the solution of a problem involving geometry and simple arithmetic. Experience has made it sure that capital can do its part first in the certainty that the mine will then do its part.

What has just been stated of Lake Superior copper mining can also be said of Transvaal gold mining. The gold-bearing deposit in the mine can be measured and estimated unseen. The mining of it is simply the adaptation of a sum of money—capital—to buy a known quantity of gold. Here, too, as at Lake Superior, the large capital advances in plant are the proper use of it, as determined by the mine that is known.

Gold mining in California and Colorado is quite a different thing. Experience with it has resulted in establishing the fact that ore bodies and the gold they contain cannot be known in advance of exploitation. The great mother lode of California is probably the closest of any to being an exception to the general rule. But the mother lode is not uniformly gold-bearing in quantity or in the form of the rock masses carrying gold, and while the lode is persistent the values in it are regrettably not. All the attempts at making mines on the mother lode have not been successful, and where successful the life period has been indeterminate in advance. As a conclusion from experience with gold mines in California and Colorado, we know that the limits of measurement of commercial metal in advance of exploitation are restricted. Capital adjusts itself to the conclusion of this experience precisely as it does to the conclusion of experience in Michigan and in Transvaal.

There is no true comparison that can be instituted between the two kinds of mining practice. The real comparison is between the kinds of mines. Here California and Colorado have nothing to concede to Michigan or Transvaal. It will probably appear that in proportion to energy expended, of which capital is one form, the two former have somewhat the advantage of the two latter. That is, California and Colorado mining will give more return for less money. And, in conclusion, where the policy of mining capital is being questioned, the question should be as to the correctness of the judgment applied, and not as to the mere element of quantity of capital applied.

Salt Mines and the Salt Trust.

The monopoly of salt production by a trust has increased beyond all reason the price of that necessary commodity. While no longer as universally important in metallurgical operations where roasting is part of the treatment scheme, the aggregate of its use in western metallurgical plants is still so considerable that the raise of the price is a heavy burden on the overworked industry. There is no economic reason why the imposition should continue any very long period of time. Salt mines, in which the mining would be of the simplest description, are quite common in the arid regions of the western United States. They have been little utilized heretofore because the seawater provided the supply so cheaply convenient to transportation facilities that there was not profit enough to justify the cost of establishing a business. The trust raising prices is providing the usual incentive to establish a permanent competition from the salt mines. At present price some team freighting can easily be paid to get the salt to the railroad. In Utah some salt mines are beginning to be worked commercially. Nevada has many deposits, including some alongside of the railroads. In Death valley, Inyo Co., Cal., there is a dry bed of salt on the surface which is 5 miles across at its narrowest width and of undetermined depth. It can be mined crude at the cost of shoveling it into the wagons, and transportation to the railroads would not materially affect the present margin of profit. The desert prospectors, with salt a possible profit-earning mineral, can easily show up many more possible salt mines, some of which could probably be cheaper exploited than those suggested. For metallurgical and chemical use a refined grade of salt is not essential; the crude article as mined is pure enough. There is an opportunity now for the establishment of a large salt mining industry. The existing high prices will carry the extra cost of establishment, which latter, once effected, will be able to successfully maintain itself in competition with low prices. It is notable in this connection that there is no law under which title to salt deposits can pass from the United States and thus make a monopoly of those lands. They are open to the public to take the salt away without tribute to any one. They cannot be located as mines or filed on as agricultural land. Given absolutely even transportation rates by the railroads, these free salt mines that cannot be monopolized will make a salt trust an impossibility.

THE next step in the progress of the International Nickel Company toward becoming a temporary monopoly has been taken. It has authorized a capital stock of $24,000,000, of which $9,000,000 is common and $9,000,000 is 6% non-cumulative preferred issued and $10,000,000 of 5% bonds are issued. It has made a trade arrangement with the Nickel Company of Paris, France, to harmoniously divide profits and prevent the competition of new mines. For a time users of nickel will have to pay more for the metal, but the lime light of publicity which a monopoly always ignites will produce its inevitable result of new discoveries of mines and new discoveries of cheaper processes of reduction and of substitute metals for the uses. For a time the finders of new mines and the inventors of processes will have the monopoly for a good buyer. In the end the monopoly will fail, as other metal mining monopolies have, and consumers will get permanently lower prices and have new uses for an enlarged consumption.

Concentrates.

THE preeeure of the atmoephere at 11,500 feet altitude ie 9 34 pounde, equivalent to about 19 inches of mercury.

WITH the barometer at 30 inches, 1 cubic inch water will make 1.646 oubio inch eteam; at 29 inches, 1.703 cubic inch; at 28½ inches, 1.721 cubic inch.

THE eaving of a cent a ton in the cost of producing iron ore at the Lake Superior mines amounts to about $200,000 annually on the entire production of the district.

THE most economical point of exhaust in a non-condensing engine is that point which will allow the preeeure to fall to the back pressure by the time the piston begins the return stroke.

THE red hairs in the clear quartz crystal are tourmaline. The green haire are also tourmaline. The occurrence of tourmaline in thie form in clear quartz cryetal ie not uncommon in granite rocks.

CALIFORNIA has no hituminous coal suitable for coking. In Washington there are some fields which produce coking coals. For use in hlast furnace they are not wholly eatisfactory, lacking hardness.

GAS METERS and electric current metere are by no means exact measuring machines. The tendency is noted to run slower and register under rather than the reverse. In the majority of the caees the consumer has the beet of the meter.

IN sidehill ditches of large capacity any grade between 5 and 13 feet to the mile can be considered safe and practicable. The nature of the ground the cut is in limits it. The flow should not be made eo rapid as to ecour and wear the eides of the cut.

CONSIDERABLE deep-channel placer mining is heing done in Australia. It is all shaft mining, however, as there has been no such cutting down of etream channele as in California. Proepecting is done by core drilling, drifting hy tunnele being impracticable.

PROBABLY the lowest cost charges for mining and milling at depth on the mother lode in California are now being made in the operation of the Keystone mine at Amador, where the coste are about $1.50 a ton. Water power and electric power are both ueed.

A USE FOR MAGNETITE ORES has been suggested in the making of concrete blocks, and the use of the magnetic and titanic sand in place of common eand. The advantage ie in the additional weight, which, where the blocks are under water, is twice that of the ordinary concrete.

ELECTRIC motore can be conveniently used in connection with large excavation workinge to furnish power to operate power drills, car loading and discharging plants and lighting for working through the night. For excavation work in railroad conetruction it has the advantage of ability to cover considerable linear distances at small costs for installation.

IRON RAILS are preferable to steel rails in mines. The eteel ralle require much more time and labor to bend and straighten, and the use of them involvee more cost in the long run than the iron ralle do, even though the latter may cost more in the beginning. The iron rails will also outilve the steel rails, being lese rapidly corroded by ordinary mine water.

WHILE there ie no mining statute specifically requiring the maintenance of boundary monuments on mining claim locations, decisions of the courts, where the question of the sufficiency of the original marking to enahle the boundarles to be readily traced was at issue, have indicated that the boundary monumente should be maintained to make the location valid.

ECONOMIC geology ie more practically useful to mining engineers than what may be defined as general geology. The former ie more limited in scope of ground covered, but it covere it more inteneively. While a knowledge of general geology is broadening to the mind of the engineer, it is not essential to the underetanding of economic geology, which he must have.

AN ordinary incandescent electric lamp, 16 candle power, will throw off enough heat to ignite paper, cloth or wood in cloee proximity to it. It is a cause of fire that is the more dangerous hecause unsuspected. The flexible cord connection with the lamp, short-circuiting through a defect in the ineulation, can also be ignited hy the arc formed before the safety fuse burns out.

STEEL hae almoet euperseded iron in the manufacture of pipe and tubing. It is now estimated that 75% of the entire product of the country is made of eteel. Up to a few yeare ago wrought iron was used almost exclusively. The lapweld joint proved a serious objection and the change to steel has heen rapid. Steel pipe is stronger, hae longer life, and ie less liahle to corrosion.

CHARCOAL that yields "$35 gold to the pan" ie the latest from Thunder mountain, Idaho. Thie discounte the "white gold" worth $27.80 per ounce" ordinarily reported from the vicinity of Yuma, Ariz., and is coneiderahly ahead of the "tracee of gold in the ashes of a hemlock tree" at Olympia, Wash., and the $4.75 "found in a chicken's crop" at Josephine, Or., the two last annual etatements heing now overdue.

SAWDUST can he ueed for firing hoilers and is regularly in many sawmills. Compreesed into hriquettee hy preseure alone, without any hinder, it has been found an excellent fuel, much superior to wood. Being a costless waste product of lumhering to the extent of 25% to 35% of the commercial lumber product, it would seem to offer some opportunitiee for commercial utilization as a by-product fuel in competition with wood, and even coal.

NORTHERN CALIFORNIA has many mining advantages that justify the attention of the prospector and inveetor, both in hydraulic and quartz gold mining, as well as in copper and other metals. The chief drawback is the inacceesibility of eome parts of that region, but that is being overcome. It has produced a great quantity of gold, platinum and copper, its production being but an index to the possibilitiee of its future output when developed.

LOSSES in gold quartz milling have been very largely reduced by improved practice combining several processes. The ultimate loss as now made ie not fairly statable in terme of percentage when comparisons are being made. The number of cents disappearing in final tailinge should not vary much with different gradee of ore. That ie, good milling practice should lose little if any more cente per ton in tailings with $50 a ton ore than with $5 a ton ore.

THE best results which have been obtained in multiple expansion steam engines are repreeented by the consumption of 11 pounde of eteam per I. H. P. hour. With highly euperheated eteam 10 pounds per I. H. P. hour has been accomplished, and, with a binary type engine, using sulphurous acid in the eecond engine, the steam consumption in a 170 H. P. engine has been brought down to 8½ pounds per I. H. P. hour.

THE treatment of ore at the Bingham, Utah, mine is as followe: The ore is quartz, iron oxide and lead carbonate; the capacity of the plant ie forty tons per day; size of ore leached, mesh ¼ inch; the preliminary treatment ie eodium dioxide; the etrength of the cyanide eolution is 0.025 to 0.125; number of hours leached, 120; one pound of cyanide is consumed to each ton of ore treated; .30 of one pound of zinc is so consumed; the ore assaye one-quarter ounce per ton gold and two ounces silver; the per cent of gold extraction ie 80, at a cost of $1.85 per ton.

THE one kind of talent hardest to obtain, and for which accordingly the highest market price is paid, is that of planning and direction—executive ability. There will be found 500 men ahle to do things under direction to one who is able to plan what to do and set himself or others to doing it. To be ahle to wind one's self up and eet one's self going is a talent in itself, and in the market conception of the case is worth more than any other phaee of individual talent. To be able to not only keep one's eelf advantageouely employed, but to euccessfully direct the lahor of othere, is still more valuable. With this ability temperament and habit have much to do.

A DEPOSIT of natural coke was reported found in Archuleta county, Colorado, about three years ago. It wae of small extent and had evidently been formed by forest firee or other external application of heat to coal measures protected by superimpoeed earth. At Las Prietas, Sonora, Mexico, there is a larger hody of such coke which has been used by the mining company owning the ground for eome time. This depoeit is said to he 10 feet thick and has been taken out 160 feet along the drift. It is eupposed hy some to have been caused by a volcanic vent in the vicinity, others maintain that it is due to surface conflagratione.

THE cost of mucking and tramming the epoil from a tunnel face to the waste dump by hand labor varies largely with differences in conditions, eome of which can be made uniform. The dietance of the tram is the principal variable element, but this ie affected by the kind of rail used, size of cars and grade of track. It pays to make a saving hy providing heavy wide-top T rail track, fi-et-clae steel cars of large capacity, and an absolutely uniform grade to the track, not less than 4 inches or more than 7 inches to the 100 feet. The car ehould run down hy gravity, and be of a weight and design euch that it can be easily puehed hack empty by hand at the ordinary speed of walking.

MEXICAN MINTS receive for coinage whatever quantities may he presented by individuals, whether of gold or silver. The coinage charge on silver is 4.41% and on gold 4.61% of their respective values. In the payment of Government dues or taxes no fixed amount in gold or silver is exacted, and payment is admitted in any of the coins in legal circulation. There are eleven mints in the country. Refined silver is now heing ehipped in considerable quantities from the United States to Mexico, whose silver production is large. Excessive exportations of silver coln from Mexlco to the Orient has caused a stringency in the money market. For a time a scarcity of eilver in Mexico caused a rise in the price of coined silver, hut now the demand is hetter supplied, and the money condition has heen relieved. Mexico has the right of way in eupplying China, Japan, the Philippines and India and all the East with silver coinage.

THE successful placing in midchannel of the San Joaquin river, 2 miles west of Stockton, Cal., of a column of solid concrete 25 feet in diameter and 20 feet high was the work of W. B. Storey Jr. The pier was placed as the main support on which a railroad drawbridge turns to permit vessels to pass up and down the river. Ordinarily such a pier is erected hy sinking a caisson and pumping out the water, so that the workmen really operate dryshod inside the water-tight walls. This maes of concrete was huilt and lowered into place while the water was there. Many piles were first driven deep into the bed of the river and their tops sawed off even with the earth bottom. The projecting piles were used as a sort of scaffolding in the work of lowering the concrete pillar. The big circular mass of cement was formed layer on layer just above the surface of the water and lowered a little at a time, the buoyancy of the water relieving the strain on the supporting piles. Finally the bottom of the mass eettled upon the tope of the submerged eawed-off piles after nearly ten days of lowering and building.

THE determination of the average trend or pitch of a pay shoot—calculated hy explorations or levels driven upon the vein and from end to end of the shoot—the determination of the angle and course of the trend is a matter of importance in devising a system of underground development. On the numerous levels of a mine, well opened, the length of the shoots almost alwaye varies, and even when there is considerable regularity and persistency, the tonnage of the ore fluctuates perceptibly when extracted from the blocks between equidistant levels. To any one making an estimate of the value of a mine or mining property a correct determination of these features is a difficult problem. The pay shoot being short the expense of dead work increases very much, as the cost of sinking shafts, driving levels, making raises and sinkIng winzee, and the coet of crosscuts, through barren ground, may be so considerable in proportion to the amount of stopeable pay ground disclosed, as to render the whole thing unprofitable. When the deposition of the ore has taken place in the form of pockets, the coet of exploration is often In excess of the value of the total amount of pay ore exploited. Of course a small shoot may be tenacious to a coneiderable aepth and carry an unusual high-grade ore, or a pocket, when the mine is of a pocket character, may be of suoh magnitude and value as to give large returne; but these are exceptional cases.

THE combustion of liquid fuel ie complete, that of coal is not; consequently in the former case there is no lost heat in emoke or eoot. There are no ashee or clinkers, and consequently no fires to clean, with the accompanying loss of heat and drop in eteam preseure—the steam pressure and revolutions of the enginee being maintained at one point throughout. The boiler tubes are always free from soot and are clean, alwaye in the best condition for transmitting the heat from the gases paseing through them to the water from the boiler. With liquid fuel the temperature of the escaping gases may be considerably lower than ie required to create the necessary draught for coal firing. With coal the air has to be drawn through the bare, and its fire in the furnaces. By natural draught this requires a temperature of the escaping gasee of from 600° to 700° F. In the case of liquid fuel there are no bars or thick fire for the air to force its way through, and the required amount of air can be drawn through furnaces by a much lower uptake temperature—ahout 400° to 450° F. being in most caees sufficient. The admission of air to the furnace being under complete control, and the fuel heing hurnt in fine particlee in cloee contact with the oxygen of the air, only a small excess of air above that actually neceeary for the complete combuetion of the fuel is required. With coal, in order to ensure as complete combustion as possible, a large excese of air is required.

MANY prospects have been pronounced valueless by mistaken men, which have later developed into rich mines, the judgment of the examiner having been hased mainly on the absence of pay ores, or on inferior valuee of the eame, along the outcrop. The value of the outcrop and the absence of pay values are in no inconeiderahle degree dependent upon the character of the country rocke and the topographical featuree along the etrike of the vein. It would naturally eeem that if the outcrop is exposed for a coneiderable distance—for hundrede of feet in extent—that at some polnt, if the vein contained value at all, there would be pay ore on the outcrop, that one or more of the pay shoots would appear on the surface. It would naturally appear so, coneidering the form of deposition of ore In veine, but, neverthelees, it does not necessarily so follow, and this is owing to attendant features and to meteoric influences. The procese of leaching and degradation of surface ores is not in evidence ae acting upon the ores helow the point of meteoric influences. At the point when the veins were formed the present horizon, or outcrops, were in all prohability a thousand, If not thousands of feet below the surface outcroppings at that time, and the present exieting outcrops heing so far helow the former horizons is attributable to denudation or erosion of the upper euperficial portions. Nature'e changing process goes on through practically incalculable periods of time, and it is apparent that the quality of ores in depth has no important, if any, hearing upon the depth of a vein. A vein may be regarded as a mineralized plane, where the deposition of the ore has taken place in irregular form, to a greater or less extent, and variable in quality—and it has thus taken place both longitudinally and vertically. The source of the ore, as regards character, ie more or less dependent upon the conetituent properties, the nature of the country rocks in which the vein occurs, and through which it passes on its strike and in its depth, as, from these rocks the minerals are in all prohahility moetly derived and depoeited within these veins. And within the mineral and its matrix, especially quartz, being thus formed, coming from combinations of chemical solutions and deposited at euch points in the vein as afford the most favorahle conditions—there are necessarily stretches of barren, nonproductive ground between the areas of pay ore.

Coal on the Pacific Coast.

Of the three Pacific Coast States, Washington ranks first as a coal producer, California second, Oregon third. In the San Francisco market the coals of the world compete. Foreign coal enters that port chiefly as hallast in tramp steamers seeking grain cargoes, so that the condition of the wheat export trade has a direct bearing upon the coal imports. The coal supply of California comes from England, Wales, Scotland, Australia and Japan, in addition to British Columbia, always a principal source for imported coal. The imports of coal at the California ports have for many years amounted to ahout three-fourths of the coal tonnage imported into the United States. Eastern coals reach the Pacific coast only in small quantities, and the Rocky mountain field is not a steady source of supply. The contribution from the three Pacific States to the San Francisco market is growing greatly. In 1861 it was less than 20,000 tons; in 1900 it was ahout 830,000 tons out of a total of over 1,800,000 tons.

The coal fields of Washington are confined to the western and central parts of the State—the northern and the southern Puget sound coal fields, the Roslyn basin, and the southwestern field in Lewis and Cowlitz counties. The northern Puget sound coal field includes the coal mines of Skagit and Whatcom counties, in the northern part of the State. The southern Puget sound coal field lies in King and Pierce counties, in that portion of the Puget sound hasin directly east of the cities of Seattle and Tacoma. In production this is the most important field of the State, and it includes the Wilkeson–Carhonado district in Pierce county, and the Green river, Renton–Cedar river and Newcastle–Issaquah districts of King county. The other field of western Washington lies about 40 miles southwest, in Lewis and Cowlitz counties. The Roslyn field is in Kittitas county, near the center of the State, and on the eastern slope of the Cascade mountains.

The number of coal heds in the Puget sound formation is remarkable, and the workahle heds in a single district may vary from five to ten in numher. At Wilkeson four seams of coal are mined; at Carhonado several seams have heen mined. In the Green river district there are three seams, from 3 to 6 feet thick; in the eastern extension of this field eight workable seams are reported. At Renton three seams are known, two ahout 8 feet thick; at Cedar mountain two seams—3½ and 13 feet thick—have been worked. In the Newcastle district four seams from 4 to 12 feet thick, and at Issaquah six heds from 4 to 15 feet thick, have heen worked. In the northern field the old Bellingham hay seam was 14 feet thick; the present Cokedale seam is 20 feet thick in places, and the Blue canyon seam averages 7 feet in thickness. In the Roslyn hasin there are three workahle heds varying from 4 to 19 feet in thickness. The coals of Washington range from lignite to hituminous coking coal. In the Newcastle–Issaquah and Renton–Cedar river districts the coal is a hard lignite, well suited for domestic use; in the Green river district it is a friable bituminous coal, excellent for steam fuel; in the Wilkeson–Carhonado district it is a very soft hituminous coal, good for coke making, for gas, and for locomotive use. In the Roslyn field the coal is coking bituminous, but in good lumps and well adapted for steam and gas making. The northern field produces bituminous coking coal containing much slack. Both lignite and hituminous coal are reported from the southwest field, whose product is little known.

The mines at Roslyn and Cle-Elum constitute the largest colliery in the State. Various methods of mining are in use, according to the nature of the mines. The miners are hoth white and colored. No machine mining is done in the State. Since 1894 the output of the State has shown a steady increase, and in 1900 King county alone reached the 1,000,000-ton mark. The prospect is for a steady development. The largest market for Washington coal is San Francisco, and the railroads of the Northwest furnish the next largest market. The third important demand is in the local markets of Washington and the adjoining States for fuel for manufactories and gas works. For example, in Spokane fully 80% of the coal supply comes from the Roslyn mines; the remainder comes from Montana and Wyoming, with a few carloads from British Columbia and eight or ten carloads of Pennsylvania anthracite, shipped via the Great Lakes and Duluth. Coal used in Washington is consumed hy smelters at Tacoma, Everett and Northport and in California. The Great Northern, the Northern Pacific and the Columhia & Puget Sound Railroads afford transportation for the coal, and are interested in the present development of the coal industry.

The coal product of California comes from four counties—Alameda, Contra Costa, Amador and Riverside—and there are now four productive fields. The Mount Diablo field, the oldest, is 35 miles east of San Francisco, on the northern slope of Mount Diahlo, of the Coast Range. Somersville is the principal town. Corral Hollow (Tesla), 50 miles southeast of San Francisco, on the southeast slope of Mount Diahlo, lies on hoth sides of the divide petween Livermore valley and San Joaquin valley, and is for the most part in Alameda county. The third, the Ione coal field, is in the foothills of the Sierra Nevada, 90 miles northeast of San Francisco. The fourth field lies in the southern part of the State, in Riverside county, near Elsinore, at the eastern foot of the Sierra de Santa Ana. The Ione field probahly has an extension to the south to Lancha Plana, where coal has been mined. Coal veins have heen prospected elsewhere, and Butte, Del Norte, Orange, Fresno, Monterey, San Diego and other counties have been coal producers. Coal prospects more or less promising are reported from Fresno, Trinity, Mendocino, Siskiyou and Orange counties.

The Mount Diablo field has three workahle heds from 2 to 4 feet thick, the Clark, the Little and the Black Diamond. The Corral Hollow field has two productive seams, the Eureka and the Summit, from 7 to 12 feet thick. The Ione coal comes from a seam from 6 to 24 feet thick, extending under the whole valley hetween Ione and Carhondale. The Elsinore coal seam is from 3 to 10 feet thick. The coals of California are lignites, soft and friahle. The Ione coal shows woody texture, and in the Mount Diahlo mines carbonized wood, pyrite and gypsum are sometimes found with the coal. The Mount Diablo coal fields were early discovered, and had hegun to ship coal in 1861. In 1874, 206,000 tons of coal were mined. The product for the year is reported as 6000 tons, mined hy the Pittsburg Co. The Corral Hollow field was discovered in 1862. After various experiences the present development hegan in 1897, since which time the output has steadily increased. The Ione field, known in 1866, was little worked until 1883, and has since greatly increased the output. Mining operations in the Elsinore field have been on a small scale for local consumption. No coal mining machines are used, and there are no miners' unions in the State. The consumption of California coal is chiefly local. The railroads consume about 20%, steamboats about as much; manufactories take ahout 35%, and the remainder is consumed at the mines and for domestic purposes in the colliery towns. The Southern Pacific, the Santa Fe, the Alameda & San Joaquin and the Pittshurg Co.'s railroad deliver the coal to the consumers or to tidewater transportation at low rates for the larger mines.

Oregon has but one productive coal field, the Coos hay, in Coos county, on the coast, ahout 200 miles south of the mouth of the Columbia, and hetween the Coast Range and the Pacific. It is ahout 30 miles long north and south, with a maximum hreadth of 11 miles, and the total area is ahout 250 square miles. Other fields showing coal of good quality are the Upper Nehalem field, in Columbia county; the Lower Nehalem, in Clatsop county and Tillamook county; the Yaquina field, in Lincoln county, and the Eckley and Shasta fields, in Curry county, all west of the Cascade range. East of the Cascade coal has heen found in the hasin of the John Day river, which includes parts of Grant, Crook, Gilliam and Wasco counties; but little is known of this field. The Coos bay coal field is divisible into the Newton, the Beaver Slough, the Coquille and the South Slough basins. The Newport hasin contains about 3 square miles of coal lands, but the Newport is the only hed that has heen worked. Beaver Slough hasin, over 20 miles long from near Riverton to the northern limit of Coos bay, and ahout 5 miles wide, has seen many mines start and only die. The Beaver Hill mine survives, though no shipments are now made. The prospects for enlargement, however, are good. The South Slough basin lies immediately to the west of the two basins just mentioned. The Coquille basin is ahout 8 miles long and nearly 1 mile wide. Coal has been prospected at the Seven Mile or Big Coal bed in the South Slough basin, and at Harlocker Hill, along the river south of Coquille, but no mines have been opened. The Coos hay coal is lignite and is preferred to other coals for domestic fuel, hut does not generally coke, and is not a good steam coal. In 1880 the Pacific coast field produced about 425,000 tons; in 1890, over 1,435,000 tons; in 1900, over 2,704,000 tons.

Japanese Mineral Products.

Consul-General Bellows, of Yokohama, writes that Japan has furnished a considerable proportion of the world's supply of the precious metals. The following table shows the output of the mines of the country for 1900 (the latest data obtainable), as reported by the mining inspection boards to the Department of Agriculture and Commerce. The values given are computed by the average quotations in the Osaka market:

Description.	Quantities.	Values.
Gold, tons	2.3369	$1,410,390
Silver, tons	6.4686	1,163,606
Antimony, tons	477.6513	60,680
Manganese, tons	17,589.684	81,189
Coal, tons	7,429,457	12,242,353
Kerosene, hhds	571,906	966,872
Copper, tons	28,121.568	8,108,629
Lead, tons	208.72	162,113
Tin, tons	13.67	5,882
Iron, tons	27,602	475,732
Totals	8,075,385.0988	$24,677,446

New Reduction Works, Anaconda, Montana.

Through the courtesy of C. H. Repath, chief engineer of the new reduction works, Anaconda Copper M. Co., Anaconda, Mont., is received a copy of a paper descriptive of that plant, recently presented hy him hefore the Society of Engineers of Montana. Some of the salient points of general interest are given, the admirable article in its entirety heing greatly condensed:

In 1900 Frank Klepetko was made manager of the reduction works, and he, in conjunction with the president of the company, determined to outline plans for a reduction works that would eventually have capacity to daily treat 5000 tons of ore. Preliminary plans were made, the probahle cost estimated, and in April of that year was authorized the huilding of the new reduction works.

The conception of the idea was worked out by Mr. Klepetko, as manager, and the men whom he employed.

The site of the works is on an imposing hillside near East Anaconda, and together with the necessay tracks, storage bins, etc., occupy over 300 acres. Starting from a point near East Anaconda the railroad goes east and south for 4 miles, and then making a loop, still climhing, trails hack upon itself, traveling northward and westward for 3 miles more until it reaches the highest point in the works, which is the top of the concentrator bins. It was necessary to make this long detour in order to reach the height hy easy grades. The maximum grade of the railroad is 1.1 feet in 100 feet, or something like 55 feet per mile. The top of the ore bins at the concentrator is something like 350 feet ahove the level of the valley. From a point ahout 3 miles up Mill Creek valley there is another railway spur of 1½ miles going into the works at a lower level. There is also another spur from the Mill Creek line going into the converter plant, which will take out the finished product of the works. This line is ahout ¾ of a mile long, from where it hranches off from the main line, going up the Mill Creek valley. Work hegan June 18, 1900, and from that time till finished several hundred men were constantly employed.

In giving a description of the works it is hest to take for a starting point the building in which the ore is first received—the concentrator huilding. The ore, as it is brought in from the mines, is delivered in steel cars on top of steel ore bins that are ahout 70 feet high, and the ore is dumped automatically into these hins. These bins are practically two stories in height; the upper part of the bins are used as receiving bins for the ore as it comes from the mines, and the lower part of the hins are used for storing coarse concentrates and the ore that has passed through the sampling mill, which is situated just hack of the concentrator. Custom ore, and other ores necessary to he sampled, are also dumped into the upper bins. These hins are partitioned off into sections, part of them heing used for concentrating hins and the others for sampled ores. Custom ore and other ores that are necessary to sample are taken from the hottom of these upper hins and conveyed to the sampling mill hy an electric tram car. The ore that is suitable for smelting is taken from the sampling mill after it has heen sampled and delivered to the lower bins in this structure. All of the work is made as automatic as possible.

The sampling mill is 42 feet wide and 60 feet long and is five stories in height. It is equipped with crushing machinery and sampling machines sufficient to treat 1000 tons of ore per day of twenty-four hours.

The concentrator building proper is in two parts of four sections to each part. Each part is 250 feet wide by 350 feet deep. Its estimated total capacity is 5000 tons in twenty-four hours. It is divided into several departments. The crushing department is about five stories in height and equipped with heavy machinery for doing the first crushing of the ore. Eight large crushers receive a piece of ore that is 10 inches wide, 20 inches long and 12 or more inches in height, and crush it into cubes not larger than 2 inches in size. From these the ore passes to sixteen smaller crushers, which crushes it still finer, and then again large rolls take the ore and crush it finer still. Between each of these operations a separation takes place and the ore is separated from the gangue by automatic machinery. Next is the jig department, equipped with 432 jigs, which take the ore, separate it from the gangue automatically, and then the ore is automatically conveyed to storage bins, the gangue taken to another crushing department, where it is crushed still finer, and again put through a separating process in jigs.

Next is the regrinding department, where the ore is reground in Huntington mills of special design, and the ore is ground as fine as the finest sand. This department is fitted with sixteen 5-foot mills and twelve 6-foot mills. Another separation takes place in this department, the ore being automatically conveyed to storage hins. There are 144 jigs in this department.

The next two are table departments, which treat all the fine material which the mills make. These are fitted with 230 Wilfley and twenty-eight Overstrom concentrating tables. The concentrates from the

whole mill are conveyed into large wooden storage hins at the lower end of the concentrator. These hins are 650 feet long and 70 feet wide, and will hold several thousand tons of concentrates.

Power for the concentrator and other purposes is supplied from a power house locatcd hetween the two halves of the concentrator. The concentrator boiler house is 28 feet wide, 190 feet long, and contains ten Stirling hoilers in five hatteries, aggregating over 3000 boiler H. P.

The power house, in which is the machinery for furnishing power to the works, is between the two halves of the concentrator, and is 136 feet wide, 148 feet long. It contains two four-cylinder triple-expansion engines, capahle of developing at a maximum load 3600 H. P. each. In this power house is also located one four-cylinder triple-expansion Fraser & Chalmers Corliss engine, that was originally used to furnish power at the World's Fair. This engine will develop, at maximum, 1150 H. P.

Power is transmitted from the engine through a main line shaft hy means of thirty-six 2-inch manila ropes. Power is transmitted from the Fraser-Chalmers engine hy means of a $\frac{5}{8}$-inch leather helt 5 feet 6 inches wide, 175 feet long.

This power house is also equipped with 2700 kilowatt Westinghouse two-phase alternatlng generators, and one 500 kilowatt general electric direct current generator, hesides smaller arc light and power electric machinery.

All of the electric power for furnishing light to the city of Anaconda, and power for operating the street railway, will be furnished from this power house, and ample provision has been made for any increase of service that will be required in the future. The electric power that is to be used in the new reduction works will also be generated at this power house.

The total horse power of all the machinery in this building will aggregate 10,000 H. P.

There was used in the construction of the power house building, ore hins, concentrator huilding proper, and in the steel railroad approaches to the building, over 6000 tons of steel and over 10,000,000 feet of lumber. The huilding itself occupies a space of nearly seven acres, and is one of the largest plants of this kind in the world. It is fully equipped with modern machinery for the treatment of Butte ores. The total cost of the power plants and the concentrator huilding will approximate $2,000,000.

The ore, after heing treated in the concentrator, is stored in storage hins as previously mentioned, and is then conveyed in cars hauled hy compressed air locomotives to the upper floor of the roaster building. The concentrator and roaster buildings are connected hy tracks ahout 1300 feet long. To reach the upper floor of the roaster huilding it was necessary to construct a trestle work that at one end was over 50 feet high. This building is 98 feet wide and 330 feet long, and is equipped with forty-eight roasters capable of handling from thirty-five to fifty tons of concentrates each twenty-four hours. The ore is delivered in hoppers that feed into the roasters automatically, and comes out at the hottom of the roasters ready to be taken to the reverberatory building. All of the operations are entirely automatic. This huilding is provided with a dust chamher 40 feet wide, 300 feet long. The power is furnished by alternating Westinghouse induction motors. This huilding is also provided with a smokestack 23 feet 6 inches outside diameter, 200 feet high, exclusive of the foundations. Nearly 1500 tons of steel and iron entered into the construction of this building, dust chamher and stack, besides large quantities of hrick and stone. Over 2000 tons of steel and iron entered into the construction of the furnaces.

The roaster and reverberatory buildings are connected by a series of tracks, the calcines are conveyed from the storage hoppers underneath the roasters to the hoppers above the reverberatory furnaces by means of compressed air locomotives and cars.

The reverberatory plant consists of two buildings; one 182 feet wide, 174 feet long; the other, 182 feet wide, 225 feet long. These buildings contain fourteen reverheratory furnaces. In the center, between the two huildings, is a large stack of the same size as that of the roaster building. Four large flues from these two buildings enter the base of this stack. This building is absolutely fire proof. Over 2500 tons of steel and iron were used in constructing this building and the furnaces. The building is so arranged that the silica from the furnaces is granulated by means of water and carried in launders over the B. A. & P. railway tracks, and deposited on the flat in front of the works. In order to carry the granulated silica it has been necessary to construct several trestles. They are constructed of cedar poles averaging from 60 to 80 feet in height. These launders are lined with cast iron liners for the full length, and are over 1000 feet long.

The blast furnace huilding is the next one to be described, taking the method of treating the ore as a guide. Storage bins for receiving ore to be treated at the blast furnaces have been provided. Part of them only have been completed, but the structure is so designed that it can be filled at any time and the framework made into storage bins. These bins occupy a space over 850 feet long and 110 feet wide. They will have a large storage capacity for materials that are to be smelted in the blast furnaces, consisting of first-class ore, lime rock for fluxing, converter slag, coarse concentrates, coke, etc., and all materials that are smelted in blast furnaces. Part of these bins are used for the storage of coal for the reverheratory furnaces and coal for the hoilers located in the smelter power house. Over 7,000,000 feet of lumher have entered into the construction of these hins. The materials are delivered into these hins from the railroad cars on top of the hins, and the cars dump automatically into the hins.

The blast furnace huilding is 82 feet wide, 195 feet long. It is equipped with five large hlast furnaces, capable of treating over 1500 tons of material per day of twenty-four hours. This huilding is equipped with a dust chamher 40 feet wide and 182 feet long, and a smokestack of the same size as the reverberatory and the roaster stacks. There has entered into the construction of this huilding, smokestack and dust chamher over 500 tons of steel and iron, and into the construction of the furnaces themselves over 300 tons more of steel and iron, hesides large quantities of hrick and stone.

In connection with the hlast furnace plant and storage hins there has heen a hriquetting plant designed that is 64 feet wide and 175 feet long, with an annex for covering drying machines, 47x150 feet, for pressing fine material into hricks 3½ inches diameter, 2½ inches thick. This material will he smelted in the blast furnaces, and is put into this shape to prevent losses hy means of fine stuff heing carried up and out into the atmosphere hy the strong draft in the stacks and the hlast in the furnaces.

The next plant to he described is the converter plant, a huilding 177 feet wide, 416 feet long; part of this building is used for a converter repairing plant. This building is equipped with eight stalls for converters and twenty-four converter howls, there heing three converters to each stall. These converters are the largest that have ever been huilt; they are 8 feet in diameter and 12 feet 6 inches long. The estimated capacity of the plant is 500 tons of matte per day of twenty-four hours. This huilding also contains two reverheratory furnaces that receive the molten matter from the reverberatory and blast furnace plant. The matte is conveyed hy means of large ladle cars holding twenty tons of matte in each car, the motor power heing compressed air locomotives. The matte can also he charged directly into the converters without passing through the receiving matte furnaces. This building has also three copper casting reverheratory furnaces fully equipped with machinery for casting anodes and bars of copper. Slag from the converters is made into small hricks by means of slag casting machines; the slag is poured into molds which are carried forward hy means of chain helting outside the huilding into receiving hins for the slag.

In this huilding there are also two electric traveling cranes, having a span of 60 feet each. They are capable of lifting ninety tons each; also there is an auxiliary crane to he used for repairing these large cranes just overhead. This crane will lift a load of forty tons.

In connection with this building there is a large dust chamber, 264 feet long and 40 feet wide, and a stack, having the same dimensions as the stacks at the other buildings in the plant.

There has entered into the construction of the converter building, dust chamher and stack nearly 2000 tons of steel, besides large quantities of brick and stone. In connection with the converter plant there is a converter repairing plant, fitted with the necessary crushing machinery for grinding clay and slag for lining the converters. The power in this building is all electric power.

For furnishing power to the last two named buildings there is a power house known as the smelter power house, that is 84 feet wide and 525 feet long. In this building there is located twelve Stirling hoilers, aggregating 3150 H. P.; also four large direct connected Corliss engines and blowers capable of furnishing 120,000 cubic feet air per minute for the blast furnaces; also another large triple-expansion hlowing engine for furnishing air for the converters. This engine will have a capacity of 20,000 cubic feet air per minute. In this building there will also be located two large blowing engines that are to be taken from the old works; changes will be made on these engines that will make them more economical. They will furnish additional supply of air for the converters; also two air compressors for furnishing air at 1000 pounds pressure for operating air locomotives, and one for furnishing air at 100 pounds for ordinary purposes.

The water supply for the works is brought in a flume over 7 miles in length, capable of carrying, under ordinary seasons, the whole flow of Warm Springs creek, for several months in the year, except in flood time. This flume will carry over 50,000 gallons of water per minute, and is built so that its capacity can be increased at least 25%. The flume terminates in a large screening tank, provided with screens to catch any floating material that may be in the water. From this screening tank it is taken to large redwood tanks, which have about 100,000 gallons capacity. From these tanks pipes 40 inches diameter convey the water to the concentrator, and from another large tank the water is conveyed to the power house and other plants hy means of 24-inch and 30-inch redwood water pipe lines.

The whole works is provided with a system of standard gauge railway tracks for the purpose of carrying on the work between the different plants. These are all inter-connected, and one can travel from the upper side of the concentrator clear to the converter plant on railway lines. The motive power used is compressed air, compressed to 850 pounds per square inch. Air at this pressure is conveyed in pipes all over the works, and charging stations are provided at intervals for charging these air locomotives. Each locomotive has two large tanks which contain air at 850 pounds pressure, and sufficient air will be stored in these tanks to enable the locomotive to travel a distance of half a mile under full load. Each of these locomotives weighs twelve and one-half tons, and as the tracks are level where most of the work is to he done they will he capahle of hauling over seventy tons of material at a trip if necessary.

The construction of the works necessitated the using of 50,000 yards of masonry and the removal of over 250,000 yards of excavatiou. There has been used over 1000 cars of red brick and fire brick. There has heen used in the works over 20,000,000 feet of lumber, exclusive of about 5,000,000 feet more, used in the construction of the flume.

There has heen nearly 40,000,000 pounds of structural steel and cast iron in the shape of material, etc., used in the construction of the works. There has been delivered to the works over 10,000 cars of all kinds of material that entered into the construction of the plant.

Frank Klepetko has heen the manager of the works, and the plant as it stands to-day is the fruition of his idea as to what a reduction works should be. For assistance in the work he has had C. H. Repath as chief engineer, as the one directly responsihle to him for carrying out all the details in connection with the work.

Assaying of Low-Grade Silver Ore.

To the Editor:—If your correspondent who has trouhle with assaying a low-grade silver ore containing "a great deal of sulphur" will try scorification, I think he will have no further trouhle and can do his work with more rapidity and less likelihood of error than hy preliminary roasting. If he takes 0.1 assay ton for a charge he can weigh his head down to 0.1 ounce per ton if his balance is sensitive to 0.01 milligram, which is close enough for commercial work. If the ore contains little or no arsenic or antimony, he can make a crucihle fusion of one-half assay ton without roasting hy using a flux of soda, borax, potassium carhonate and just enough litharge to furnish a lead hutton of proper size for cupellation, adding four or five ten-penny nails. If there is little or no lead in the ore, 18 grams of litharge is ahout right. In this fusion the sulphur, as it is released from its comhinations in the ore, first attacks the litharge, abstracting its oxygen and reducing it all to lead. Then the excess of sulphur attacks the iron and the iron sulphide goes into the slag. A fusion of this kind takes from thirty to forty minutes at a good heat, seldom hoils up, and yields a soft lead button, about 15 grams, with no matte. If the ore is galena a simpler and very satisfactory method is to use soda, borax and litharge for a flux, with a few grams of niter to take care of the excess of sulphur. I know of no objection to the use of niter. I should use it very often, but for the fact that it is hard to determine the amount necessary to use, without a preliminary assay, and that is out of the question in a busy office, while the nail fusion always brings a button of proper size.

If your correspondent will mail me a sample of his ore I will be glad to give him a formula that will handle it satisfactorily. C. M. Fassett.

Spokane, Wash., March 27.

The World's Production of Spelter.

H. R. Merton & Co., London, have compiled figures on the world's output of spelter in 1901. In the following table are compared the 1901 figures, as per Messrs. Merton, with the production for 1900, figures in long tons, 2240 pounds:

	1900.	1901.
Rhine, Belgium and Holland	186,320	199,285
Silesia	100,705	106,385
Great Britain	29,830	29,190
France and Spain	30,620	27,265
Austria and Italy	6,975	7.700
Poland	5,875	5,935
Totals Europe	360,325	395,760
United States	110,028	122,830
Totals	470,353	498,590

Thus the total production of spelter or metallic zinc increased 6%. The gain in Europe was 4.3%, while in the United States it was 11 6%. The United States produced 24 6% of the world's total in 1901, as against 23.4% in 1900.

Dr. Le Neve Foster reports that the quantity of minerals produced throughout the world in 1900 was: Coal, 767.636.204 tons; iron, 40,427.435 tons; petroleum, 18,553,950 tons; salt, 12.572,076 tons; fine silver, 5,874,284 kilos; lead, 787,841 tons; copper, 534,735 tons; zinc, 446,373 tons; fine gold, 393,196 kilos; tin, 80,643 tons.

Placer Mining Kinks.

NUMBER III.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by CHAS. P. RICHARDSON.

DELIVERY OF GROUND SLUICE HEAD IN PIT.—If your giant and pipe line are small it is often necessary to bave a "ground sluice" flow of water delivered in tbe pit in addition to tbe water supplied by the giant stream. Witb banks of 30 feet depth or more of soft gravel tbat cuts very easily under a flow of water, it is sometimes quite a problem to get the additional water into the pit witbout having one's sluices continually loaded witb material brougbt down by tbe ground sluice flow, and likewise a problem to deliver tbe flow at tbe point wbere it is most desired. I bave accomplisbed tbe delivery of clear water at tbe desired point in tbe pit by dropping the water from tbe ditcb tbrougb a line of pipe witb tbe end of the line at tbe top of the bank. If pipe is scarce flume boxes can be used to witbin a short distance of tbe face of tbe bank. This delivers the clear

Flume and Pipe Bringing Clear Water Into Hydraulic Pit.

water at tbe foot of the bank without difficulty. Tbe last section of pipe is secured witb ropes. In the course of mining as tbe bank is caved back under the end of the pipe the latter is removed, a section at a time, by aid of ropes, turning tbe water out of tbe pipe, of course, for tbe operation. The pipe back of tbe face of tbe bank sbould be well staked. (See Fig. 10.)

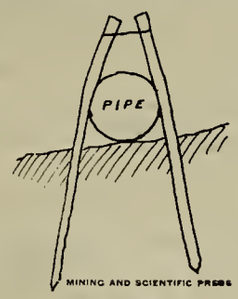

FIG. 10.

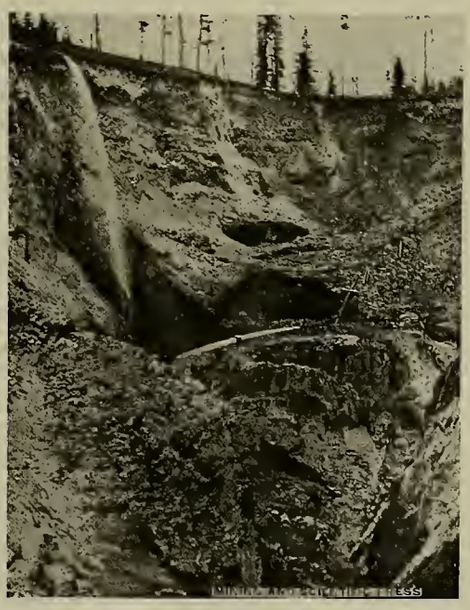
In ground where it is possible to drive wooden stakes to secure pipe and it is desirable to do so, the better metbod is to drive tbe stakes, inclined sligbtly toward each otber, against tbe sides of tbe pipe. Then tbrowing a loop of baling wire over the stakes, twist it up, tbus drawing tbe ends of tbe stakes in so tbat tbey bind tbe pipe firmly. The advantage of tbis over simply crossing the stakes saw-buck fasbion over the pipe is, tbat any strain thrown on one stake by the pipe is taken up by botb, wbetber it be a lifting or a side thrust. And of course it bolds mucb better wbere tbere is an end tbrust on tbe pipe sougbt to be beld by staking.

DRIVING BANKS VERSUS BACKING UP AGAINST THEM. — In bydraulicking compact and cemented gravels where sluice lengths, grades and drops are insufficient to properly disintegrate the material for gold saving, it is probably advisable to back up against one's bank in order to beat up and break up tbe material by driving it against tbe foot of tbe bank witb tbe giant stream. I bave no other case in mind wbere it is desirable, unless tbe topograpby of tbe bedrock is sucb as to make driving unfeasible. Yet backing up is often, and in the case of deep banks, usually done.

Regarded as a mecbanical principle it is faulty. You drive your material witb your impact stream exactly in the opposite direction from wbere you desire it to go, trusting to your dead water or mass stream flowing from tbe foot of tbe bank to pack your material to tbe sluices against all your endeavors witb tbe giant. I bave in fact on good sized properties actually seen the giant set alongside of and below tbe bead of the bedrock flume, where in consequence every pound of material bad to figbt ratber than be assisted by tbe giant stream every foot of the way after tbe material left tbe foot of tbe bank until it reached tbe flume bead. Furtbermore, wbere your bank is more or less difficult to cut and cave fast enougb for your water to be kept busy washing, you constantly tend to bave tbe foot of tbe bank wbere you wish to do your piping covered witb a pile of boulders and coarse material. All material tbat is worked away from tbe foot of tbe bank is tediously "whipped" or "winged" out at rigbt angles, or worse than rigbt angles, to tbe desired course or "rusbed" or "flooded" out by tbrowing tbe pipe stream over tbe top of a cave, tbus forming a reservoir back of it. Tbis winging or flooding is conducted over the more or less flat bedrock where the water, unconfined by cbannels, spreads out and, for sucb grade as it may have to work on, does little execution. As a matter of fact it almost figures out tbat tbe material reaching tbe sluices does so because it can't be belped.

On tbe other hand, where your work is so planned tbat you can pipe toward your sluices and drive your material, as soon as your cave is down every ounce of pressure in your pipe stream is available to drive your gravel toward tbe flume or into tbe races sbot up through tbe bedrock, where the water being confined is able, effectively, to carry tbe material to tbe flume. Tbe greater effectiveness of tbe pipe stream used in tbis way allows one a greater proportion of time to be used in undercutting tbe bank and likewise allows one to keep tbe foot of the bank driven free of boulders. Furtbermore, it enables you to bandily drive out large boulders, stumps and logs to sucb distance from tbe foot of tbe bank that tbey may be safely attacked and worked up by tbe rock rustlers, instead of being constantly beld back against tbe foot, wbere it is unsafe for a man to approacb them. Still again, it enables you to cave your ground abead of and away from your giant, provided you keep tbe point of the breast worked off diagonally abead of you, instead of squared out.



Hydraulic Mine Pit.

In sballow ground workings in creeks and gulcbes, driving your ground always toward your flume is tbe common process, accomplisbed by taking a race up tbrough the middle of a block of ground, setting your giant on tbe surface of tbe ground in bebind tbe block, inclining down to bedrock, and taking down one side of tbe gulcb to the flume head at a time. In ground of any deptb tbis process is not feasible owing to inability to incline down safely and to handle a race between deep banks of gravel.

In an endeavor to be able to break and drive my ground toward my sluices I bave used several plans. One tbing tbat binders tbe easy accomplisbment of tbis in deep ground is tbe fact tbat re-entrant angles in the banks are extremely dangerous points to place tbe giants or men, and tbey are bard to avoid. Of course local conditions, sucb as grades, cbaracter of bedrock and sbape of cbannel cross-section, govern tbe plan to some extent.

In Fig. 11, witb bedrock flume brougbt up as close to the foot of tbe bank as practicable, witb bank or breast line in sbape B L 1 and tbe side race S R 1 shot up as sbown, the giant is set at G 1, and piping tbe face A B into S R 1 commenced. While the face B C is being formed tbe main race M R is sbot up to

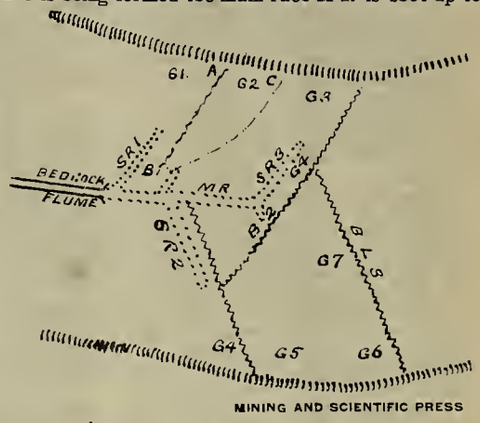


FIG. 11.

as near B L 1 as is safe and S R 2 sbot up. Tbe giant being reset at G 2, G 3 and G 4 if necessary, the gravel is driven into S R 1, M R and S R 2, and tbe pit is left in tbe sbape sbown by B L 2. As soon as main race line is passed tbe main race is sbot up and S R 3 is shot up before tbe line of tbe same is exposed to tbe giant stream. Tbe giant being tben

Gulch Hydraulic Mine Ready for Piping.

set on the otber rim of tbe cbannel at G 4, G 5, G 6 and G 7 if necessary and tbe gravel driven ahead into S R 2, main race and S R 3, tbe pit is left in the shape as sbown by B L 3, whicb is identical witb B L 1. Of course some little backing up against the bank is necessary in getting an opening at each setting of the giant, but you will note tbat the backing up is done on tbe rim wbere grade is usually ample, and tbe amount of backing up necessary is inconsequent.

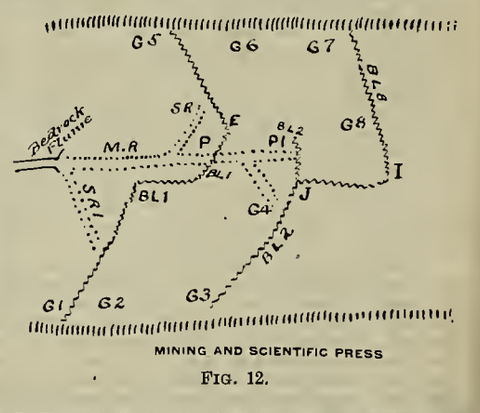

FIG. 12.

In Fig. 12 the breast line is sbaped as sbown by B L 1, witb M R sbot up to point P, witb S R 1 shot

up. As soon as the giant is set at G 1 and begins to drive ground to S R 1 and M R, men are put to work to shoot up S R 2. The giant is set successively at G 1, G 2, G 3 and G 4, leaving breast line as shown hy B L 2 and B L 1 from E to F. Giant is then reset at G 5 and M R shot up from P to P¹ and S R 3 shot up, while pit is shaped as shown hy B L 3 hy giant settings at G 6, G 7 and G 8, driving ground into S R 2, M R and S R 3. You will notice that each breast is driven across the line of the main race, so that hoth it and the side races, when the giant is moved to the opposite rim, can he shot up while protected from the pipe stream by the intervening portion of the hank, necessitating no stoppage for race blasting. The objectionahle feature to this plan possibly is the re-entrant angle in each hreast, as shown hy H I J, hut this can he so arched as to be safe in most ground.

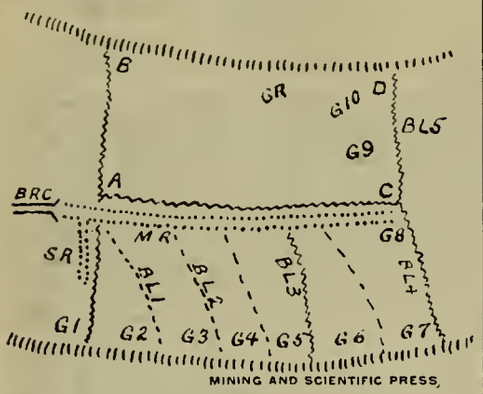

FIG. 13.

In Fig. 13 the giant set successively at G 1 et seq. to G 7 works out the hreasts to B L 4, M R and any necessary side races heing blasted up as much as possihle while giant is being reset. With the setting G 8 a turn is made and the hreast included in C A B D is driven down ahead to the flume. The objection to this plan of working is that race hlasting can not he done while piping is in progress.

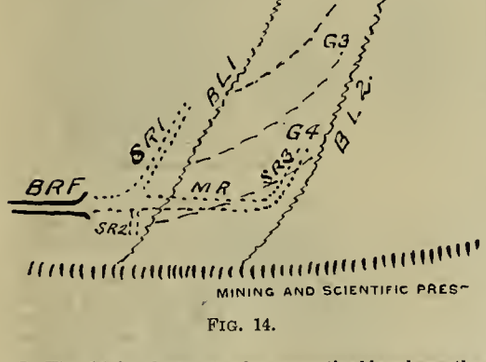

FIG. 14.

In Fig. 14 is shown a plan practicahle where the contour of the hedrock is such that the flume may be set at one side of the channel. The idea is to work constantly from one side of the channel and to keep that side worked well ahead of the other side. This idea is a modification of Fig. 11—Fig. 11 presupposing the lowest hedrock to follow the middle of the channel, and its consequently being advisahle to drive toward the middle of the channel to take advantage of the grade from side to middle. By shooting up side races to the rim and working the ground in narrow hreasts into the side races the plan shown in Fig. 14 could be used in connection with conditions mentioned in Fig. 11.

RAOE SHOOTING.—I do not attempt to square up my races when hlasting them for handling gravel. I place down holes alternately along the proposed cut as far apart as they will hreak into each other, which distance of course depends on the character of the rock. (See Fig. 15.) In decomposed schists and

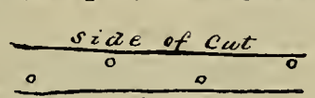

FIG. 15.

granites I drill say 4-foot holes 3 to 4 feet apart along the line and perhaps 12 to 18 inches apart across the line of the proposed cut. After blasting, we pipe out the cut, and the high places disclosed are lowered by a few pop shots. With a little assistance at critical points the gravel running through them will rapidly wear down the races into good shape. In medium or soft rock with two or three hammers at work a lot of race can he drilled and shot up in half a day, as the men can he distrihuted along the line of the cut—since no facing up is required—and all holes blasted at once, timing the shots so that they explode successively up the cut, and consequently hreak free to the hottom as much as possihle. Plan your work so that your race hlasting does not interfere with your piping and cause a consequent loss of water. If the hydraulicking interferes with the hlasting, plan to accomplish as much of the latter as possible in the intervals in piping caused by shut downs to shift giants or to clean up. The main races, worn down more or less to flume grade by the gravel washed through them, are hottomed up and squared out and the flume laid in them up to the hreast at the end of one season for the next year's run.

Effectual utilization of every available inch of water for every available moment is the keynote to the hest hydraulic mining, and all work should he planned to consummate that idea as near as possihle, hy having properly constructed ditches, well kept and vigilantly tended, properly constructed sluices, well located, the pipe line so located as to command the most ground with the fewest moves of pipe or giants, and the actual working of the pits planned far enough in advance to necessitate the minimum of shut downs for dead work in the season of good water flow.

The Electro-Chemical Industries.*

BY SAMUEL SHELDON.

The methods of electro-plating employed in estahlishments in the vicinity of New York do not differ to any extent from the methods well known in the art. The average practice may be described as follows:

GOLD.—There are three solutions in common use to give the three colors of deposit known as "California gold," "green gold" and "red gold." The salts to form the solutions are prepared by dissolving in nitro-hydrochloric acid the following alloys: For California gold an alloy of 22 parts of gold and 2 parts silver, for green gold an alloy of 16 parts gold and 8 parts silver, and for red gold an alloy of 16 parts gold and 8 parts copper. Upon evaporation the chlorides of these metals remain. They are dissolved in a solution of potassium cyanide to form the plating solution. Double cyanides are thus formed. A freshly prepared solution contains a pennyweight of gold to the gallon. The anodes are of pure gold. The articles to be gilded form the cathodes. The rate of solution of the anodes is not as great as the rate of deposition on the cathode. Therefore, the solution has to he enriched by frequent addition of the salts. The current density is adjusted hy varying the depth of suhmergence of the anode, the baths heing supplied with five volts at constant potential. The correctness of the current density which is being employed is determined by the eye and the experience of the attendant. There is no circulation of the electrolyte.

SILVER.—The solution consists of a double cyanide of potassium and silver, the concentration heing two ounces of silver per gallon of solution. The anodes are of pure silver. Owing to the tendency of silver to deposit in arhorescent crystals, the articles which are heing plated are moved backwards and forwards in the bath in a plane parallel with the anode surface. The path of movement is about 2 inches and the time required to traverse it ahout three seconds. The proper current density rests with the judgment of the attendant. Too great a density or an impoverished solution is indicated hy a violet tinge imparted to the deposit. Silver-plated articles to have a polished finish require burnishing with steel or blood stone hurnishers moistened with a solution of soap and distilled water.

NICKEL.—The solution universally employed is one of nickel-ammonium sulphate. The proper concentration results from dissolving eight pounds of the salt in a gallon of water. The solution should he kept neutral by the addition of either ammonia or sulphuric acid. The proper current density is from 0.5 to 1.5 amperes per square decimeter of cathode surface. Nitric acid should not he present in any form in the solution.

BRASS.—Much house or huilders' hardware consists of hrass-plated steel or iron. Many solutions are used. The hest, perhaps, contains equal quantities of zinc and copper cyanides or carbonates dissolved in ammonium carhonate. The color of the deposit can he varied hy varying the relative amounts of the copper and zinc salts.

CRITIOAL CURRENT DENSITY.—In the electro-deposition of metals from a salt solution, the rate of deposition which may he used is limited. If a proper current density at the cathode be employed, an adherent reguline deposit will result. If the current density he increased, the character of the deposit will change, hecoming pulverulent and non-adherent. This limit is termed the critical current density. As an increase of the permissihle current density allows of a smaller plant for the same output and shortens the time that the metal in the solution is idle, a consideration of the factors which determine the value of the critical current density is pertinent. Consider a cuhic centimeter of metal salt solution at rest and directly in front of a cathode. It contains a certain weight of the metal. The weight is dependent upon the concentration of the solution and can be calculated from its specific gravity. A certain percentage of this metal, dependent on the temperature and concentration of the solution, is dissociated and takes part in the electrolytic conduction. If an attempt he made to so adjust the current flowing through this cubic centimeter that by Faraday's laws the rate of deposition is such that all the dissociated metal ions must be deposited in one second; then it is evident the velocity of movement or migration of the ions would he one centimeter per second. Such a rate of deposition of ordinary metals from a stationary solution is impossihle. The maximum velocity of migration is rather to he reckoned in thousandths of a centimeter per second. If the deposit is to remain reguline, the ions must not he expected to migrate faster. It is possihle, however, to adjust the circuit for any current density. As soon as the rate of deposit exceeds the ability of the metal ions to supply it, hydrogen of the solvent appears to take part in the conduction and a pulverulent deposit results which contains some hydrogen and is said hy some to he a hydride of the metal. The critical current density can he increased hy increasing the concentration of the solution hy raising its temperature or by circulating the electrolyte towards the cathode.

CIROULATION.—Circulation of the electrolyte has three functions. It permits of a higher rate of deposition, as mentioned ahove; it replenishes the part of the electrolyte next to the cathode which has heen deprived of its metal; and it prevents, to a certain extent, the deposit from assuming a nodular or arhorescent form. When deposition is taking place at moderately large current densities, accidental differences of concentration occur in the vicinity of the cathode. Places on the cathode, which can he reached hy current flowing through the more concentrated portions of the electrolyte, will receive a heavier deposit than other places. As a result, they will protrude slightly from the cathode. These unevennesses are multiplied and magnified as the deposition continues.

DISSOCIANTS.—The water of an ordinary electrolyte performs two duties: First, it acts as a solvent, whereby it allows and facilitates the uniform distribution of the dissolved substance throughout the solution, suhdivision of the suhstance heing carried to a condition of a molecular fineness. Secondly, it acts as a dissociant whereby some of the molecules of the dissolved suhstance are split up and dissociated into their component ions. Without dissociation there can be no electrolytic conduction of the current. Besides water, the following suhstances are common solvents and dissociants: Liquid ammonia, ethyl alcohol, methyl alcohol, glacial acetic acid and pyridin. The last-named contains no oxygen, and it has heen recently shown hy Dr. Kahlenherg that from a solution of lithium chloride in it, pure metallic lithium may be electrolytically deposited.

COPPER REFINING.—Refined copper constitutes the most valuahle product of all the electro-chemical industries. The processes of producing the refined copper from its alloys have heen well described hy Badt, in the ninth volume of the Institute's puhlished "Transactions." The copper alloy or blister copper is cast into slabs, which are used as anodes in a hath containing a slightly acidulated solution of copper sulphate. This electrolyte is kept in continuous circulation. Pure copper is deposited from the solution upon pure copper cathodes at a current density of from 15 to 25 amperes per square yard. Copper is simultaneously dissolved at the anode and the alloyed gold, silver and other metals drop, as slime, to the hottom of the cell, to he parted and recovered later. After deposition, the cathodes are melted up, poled and cast into wire hars or other suitahle forms. The "poling" of copper consists in stirring the molten metal with a pine stick. The stick carbonizes, and, as a result, reduces cuprous oxide whioh is present in the molten copper. Upon cooling, the cuprous oxide gives up its oxygen to metallic impurities which may he present in the copper. As the mechanical and electrical properties of copper are hetter when impurities exist in the form of oxides, rather than as metals, the proper amount of poling is when just sufficient cuprous oxide is left to oxidize the impurities. Overpoled or underpoled copper is hrittle and of inferior conductivity.

PARTING OF GOLD AND SILVER.—This is accomplished hy means of electrolysis very satisfactorily in the following manner: The alloy of the two metals constitutes the anode and is placed in a linen hag. The cathode is a thin sheet of pure silver. The electrolyte is at first a $\frac{1}{10}\%$ solution of nitric acid, which ultimately becomes a dilute solution of silver nitrate. With a current density of 33 amperes per square foot silver 999.5 per mil fine is deposited on the cathode in the form of beautiful crystals. These are mechanically scraped off and allowed to drop to the hottom of the cell. Gold, in the form of mud containing some silver, colleots in the anode bags. The silver is re-

*Condensed from paper read at the 162nd meeting of the American Institute of Electrical Engineers, New York, Feb. 28, 1902.

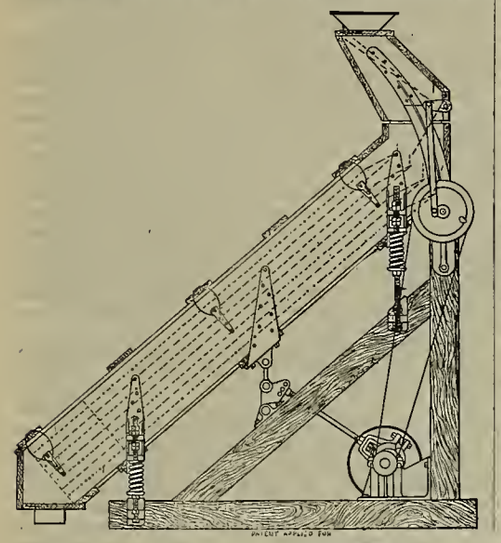
moved from it hy dissolving in nitric acid, leaving the gold in a very pure condition.

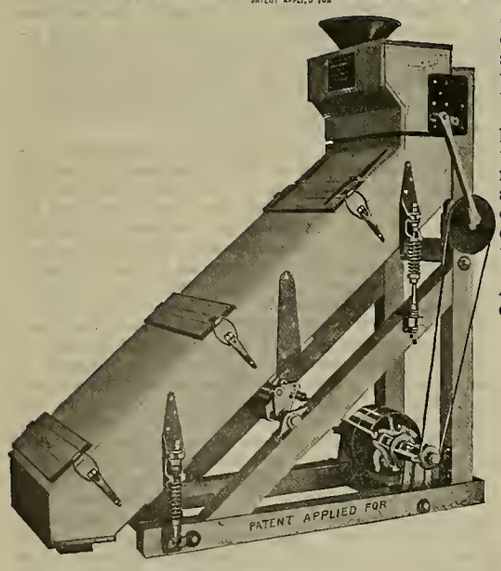
EXTRACTION OF GOLD.—The Siemens-Halske process, which is in use in South Africa, consists in dissolving the gold from the crushed ore in solution of cyanide of potash, and then subjecting the solution to electrolysis with iron anodes and thin sheet lead cathodes. The anodes are dissolved. Dr. Keith improves upon this process by adding a small amount of soluhle mercury salt to the cyanide solution. It increases the rapidity of solution, and mercury is deposited alongside of the gold on amalgamated copper cathode plates. The amalgam is scraped from these plates and the gold and mercury separated hy "retorting."

EXTRACTION OF NICKEL.—By the Hoepfner process the nickel ores are first roasted, crushed and leached in a mixed solution of cuprous chloride and calcium chloride. By electrolysis with carhon electrodes the copper is removed from the solution. The lead and iron are removed by chemical means. There then remains a solution of nickel chloride. This is electrolyzed and the nickel deposited upon a nickel cathode.

Sturtevant Toggle Separator.

The Sturtevant Mill Co., of Boston, Mass., has made special studies of screen constructions, herewith illustrated, and claims to have effected important improvements in inclined screens. Their separators have four screens (48 square feet in all),





Sturtevant Toggle Separator.

placed and firmly held, one over another, in a strong hox 2 feet wide, 6 feet long. Each screen is a substantial construction, and easily handled, for it is small. Each receives equal feed, evenly spread over the wire surfaces. One outlet discharges the tailings, another the fines. No conveyors are used to carry in or out, or to spread material. The screen hox is supported on springs, and shaken hy a toggle. The toggle has no lifting to do. It has only to shake, and this it does four times for each revolution of the driving pulley, which does not have to run fast, and moves so easily that little power is required.

Setting the toggle so as to vihrate the hox and its screens vertically is claimed to secure further increase in the capacity of these inclined separators. It was noticed that an inclined screen vertically shaken throws the material upon it upward in vertical lines. This could then obviously only fall hack to the point from which it started. Thus, no material could pass over the screen while in the air. It could only slide down while on the wire. Thorough screening was seen to he thus accomplished, all the surface being used.

The manufacturers say: "Sturtevant toggle separators are good, hecause they helong to a class of good things; they are the best hecause they alone have perfectly efficient screening surfaces, doing more work, lasting longer, and only occupying one-fourth the space." All inclined vihratory separators may he clothed with perforations varying anywhere from ½-inch to 200-mesh, as ordered.

Treatment of Impure Boiler Feed Waters.

Written for the MINING AND SCIENTIFIC PRESS by J. H. PARSONS.

The suhject above involves interests sufficiently extensive to demand the exertion of engineers towards the solution of its prohlems and the provision of remedies to counteract the evil effects of impure boiler feed water. The subject is partly a chemical and partly a mechanical one, and requires a study from the theoretical as well as the practical side.

Compounds and water purifiers, hoth chemical and mechanical, frequently fail to work for several reasons. Often the steam user expects and looks for too much. A successful treatment may not necessarily he a complete annihilation of all trouhles. No one compound can he made to do good work for all waters, and it is ahsurd for any one to offer such a compound for sale. Even were it possihle to prepare a standard remedy, the dose and form of application would not suit all cases. Where lime and magnesium exist in the water in the form of carhonates without sodium salts, it would he an easy matter to treat the water successfully with a simple remedy. But suppose the lime to he in the form of a sulphate and the magnesium a carbonate with a large excess of the former, the treatment could not he a success without a more energetic and thorough transformation of the salts. Then, again, in the presence of chlorides the magnesium salts change to chlorides, which, under heat, liherate hydrochloric acid, and this acts on the metal of the hoilers. This condition has to he understood, and we must determine whether it will arise when the water is heated hefore a formula for a good antidote can he devised.

In the case of iron pyrites, sulphate of copper and sulphate of iron in water under heat, free sulphuric acid is often produced in large quantities. After careful lahoratory tests, one can determine how much of the acid is formed under heat and pressure, how much of the acid will unite with the lime and magnesium contained in the water, and how much will remain as free acid. Different reactions require different remedies. The chemist must use great care in working out each formula. He must use the results of experience with hoilers with his knowledge of chemistry to make the formula a sure, economical and safe one. He must not put into the preparation anything which will of itself decompose into or form with the salts in the water a troublesome element.

An analysis of any sample of water may be correct; hut if misinterpreted, or if the final results which take place in the water under heat and pressure are misunderstood, it hecomes a matter of guesswork, and the remedy, if made, is not a scientific one, but a conglomeration of half a dozen, often more, ingredients, sent out with a hope that some one or two in the lot will do the work required.

It is only hy a careful preliminary study of the water used, and hy the use of a remedy which will precipitate each of the scale-forming salts contained

Fig. 1.—Pipe Filled With Lime Sulphate.

in the water in the form of a non-crystalline or non-adhering mud or silt, at the same time neutralizing the corrosive elements that it is possible to prevent incrustation and corrosion. By this method of treatment the rapid deterioration of the metallic sheets of the fire surfaces of the hoilers and the danger of explosion is lessened.

Fig. 1 shows a scale formation composed largely of

Fig. 2.—Magnesium Sulphate and Carbonate Scale.

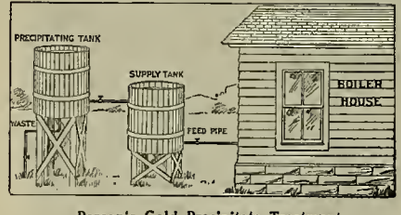
sulphate of lime. Fig. 2 shows a scale formed from magnesium carbonate and from magnesium sulphate.

For waters very heavy in salts of lime and magnesium—sulphates and carhonates—silica, iron and salt, the writer would recommend the treatment to secure the precipitation of scale-forming salts and neutralizing corrosive elements, without the aid of heat, a precipitating tank being used.

When properly treated, generally 85%—often more—of the scale-forming salts can he precipitated and all of the corrosive elements neutralized hefore the water reaches the hoilers. By doing this properly and drawing the precipitate out hefore feeding to the boilers, the trouble universally experienced when using impure feed water can be prevented.

There should he two tanks, each holding half a day's supply or more. The water from the first, or precipitating tank, after heing treated with the remedies made for this purpose, may he run into the second, or supply tank, and from this fed to the boilers, while the first tank, filled again, is heing treated and settled for the next supply. The waste pipe with stop valve should he placed in the lower extremity of the precipitating tank. One tank will answer if the supply water is drawn from it after the precipitate has had time to settle and has heen drawn off. It is easier, however, to handle the water and precipitates when two tanks are used.

The illustrations show the form of plant in use hy



Parson's Cold Precipitate Treatment.

the J. H. Parsons Chemical Co., 1509 Masonic Temple, Chicago, Ill., in their treatment of waters in which it is possihle to render boiler waters practically pure before feeding to the hoilers.

The company is treating waters ranging from 25 grains of solids per gallon to 590 grains per gallon by this system, without the aid of heat, and without any mechanical devices other than the empty tanks and pipe connections, as shown in the cut. The remedy used for precipitating in the first tank is made according to the requirements of each water as shown hy analysis.

Ten Largest Copper Mines.

Following is the list of the world's ten largest copper mines, hased on the output of 1900. They produce between them nearly one-half of the world's entire production. Seven of them are in this country, the rest in Mexico or Europe. In the suhjoined tahle their ascertained production for 1900, in pounds, is given:

Anaconda, Montana	107,000,000
Rio Tinto, Spain	80,039,680
Calumet & Hecla, Michigan	77,761,382
Boston & Montana, Montana	66,200,000
Mansfield, Germany	41,193,600
United Verde, Arizona	39,970,193
Copper Queen, Arizona	34,382,309
Boleo, Mexico	24,752,000
Mountain, California	23,956,000
Montana Ore Purchase Co., Montana	22,257,563

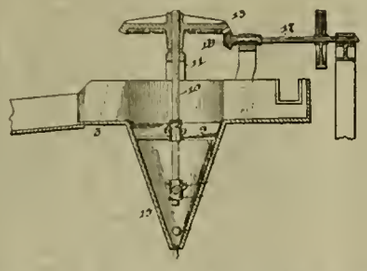
• THE African Concessions Syndicate is preparing to survey the Victoria falls on the Nyanza river, East Africa, with a view to planning a hydro-electrical power installation. The height of the falls is said to be 420 feet and the width about a mile. The syndicate estimates that the water passing over the falls is many times greater than at Niagara falls. The engineers to the syndicate are Sir Douglas Fox and Sir Charles Metcalfe. It is thought that it will be found possible to apply electrical energy generated at the falls for working about 300 miles of the Cape-Cairo railway, viz.: 150 miles north and 150 miles south. Another suggestion is that the tramways of Buluwayo, Rhodesia, which is 240 miles away, may he operated by power from this station.

Mining and Metallurgical Patents.

Patents Issued April 1, 1902.

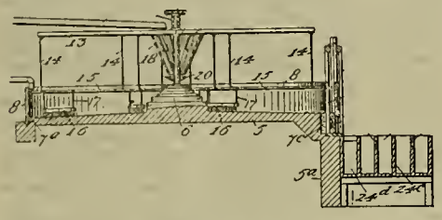
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ORE CLASSIFIER. — No. 696,739; J. Klein, Desloge, Mo.



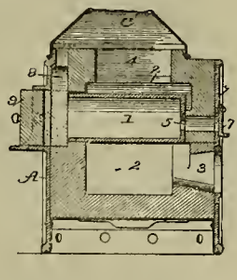
Hopper adapted to receive mixture containing ore and having ore outlet near its hottom and sludge outlet at its top, water pipe leading into hopper and directed toward ore outlet, air pipe leading into hopper below ore outlet, transversely of water pipe and directed toward sludge outlet, adjustahle agitator within hopper, driver for operating agitator, and means for automatically disconnecting agitator from driver when more ore is contained within hopper than can be discharged through ore outlet.

CONCENTRATOR.—No. 696,913; W. H. Sullivan, Denver, Colo.



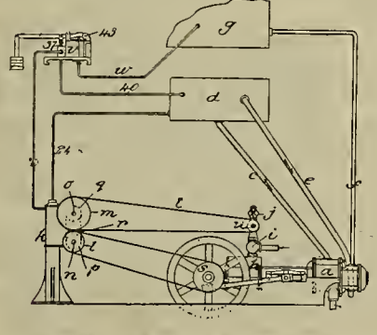
Fixed tahle having inclined surface with fixed trough ahout it deeper at one point than at another, pair of gates at deeper part of trough, gates being in different planes, pedestal 6 provided with series of steps, vertical shaft extending from pedestal and journaled therein, stationary frame 10 in which shaft is journaled at its upper end, sweeps connected to shaft, drags carried hy sweeps to move over tahle, hopper carried hy sweeps and surrounding shaft, hopper directing material on to steps of pedestal, trough for directing material to hopper and means for driving shaft.

ASSAYING FURNACE.—No. 696,548; A. C. Calkins, Los Angeles, Cal.



Combustion chamber having main top flue, muffle arranged horizontally in said chamher and having its front end open, and its rear end provided with air inlet and device for regulating admission of air thereto, means for temporarily closing front end of muffle, and supplemental flue or passage leading up from such end of muffle.

REGULATING DEVICE FOR AIR COMPRESSORS.—No. 696,504; H. C. Sergeant, Westfield, N. J., and W. Prellwitz, Easton, Pa.

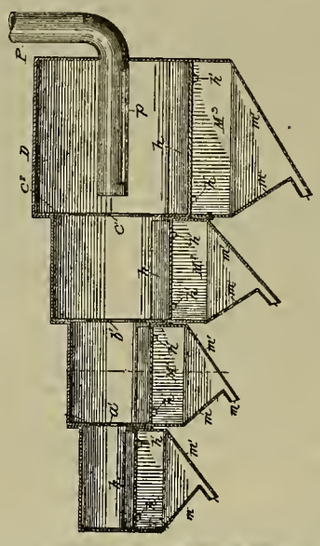


Air compressor and motor and governor for latter, of speed varying mechanism consisting of two expanding and contracting pulleys and belt between them, means for driving one pulley from motor shaft, means for driving governor from other pulley levers for expanding and contracting pulleys, screw spindle having right and left hand threads and nuts thereon for operating levers, toothed wheel on spindle, lever fulcrumed on spindle and two pawls carried hy lever for turning wheel and spindle in opposite directions, means for operating lever hy rotation of one pulley, two pawl-disengaging levers fulcrumed on spindle for disengaging pawls, and means under control of pressure of air delivered by compressor for separately operating disengaging levers.

GOLD DREDGER.—No. 696,576; T. B. Lee, Farmington, N. M.

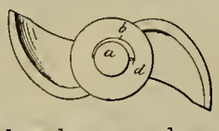
Tapering tuhular body parti-circular in length and provided with air hole in one end and with hit or hlade at its opposite end; in combination with cahles to move it forwardly, rearwardly and vertically to rotate it on its axis.

ORE CONCENTRATOR.—No. 696,604; A. H. Stebhins, Little Rock, Ark.



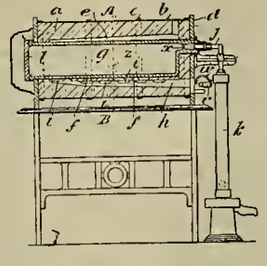
Plurality of drums of different sizes arranged in series, end of one drum heing connected to end of next larger drum of series, inlet for introducing ores to series of drums, and means tangential to drums for introducing separately into each drum independent blast of air or other fluid to cause material to circulate in curved paths within each drum at desired velocities.

CAM FASTENING FOR SHAFTS OF STAMP MILLS.—No. 696,403; A. Blanton Jr., Wallingford, Pa.



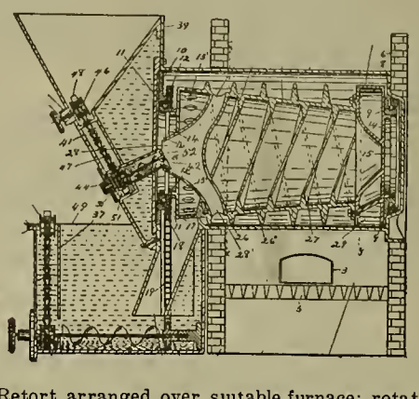
Shaft, curved wedge, secured against rotation thereon, and having outer face upon curve, radii of which, measured from center of shaft, gradually increase, and hub with opening corresponding in part with and bearing on face of shaft, and in part with and hearing on entire outer face of wedge.

RETORT FURNACE.—No. 696,456; D. Laird, Forfar, Scotland.



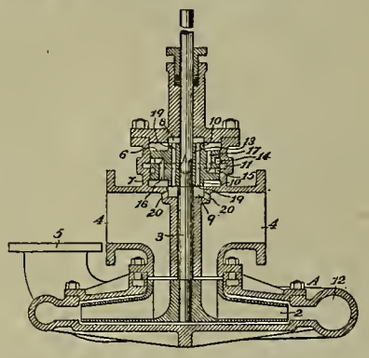
In retort furnace, retort g, dome a of fire clay, in which retort is placed; dome having helow retort inclined flame passage h, and around sides and upper part of retort, space e tapering toward end of retort, lateral passages i communicating hetween flume passage h and space e, fire clay hed f helow retort upon which it rests, fire clay hed heing supported hy dome a and hurner v w for liquid hydrocarhon or gas, and air under pressure.

AMALGAMATOR. — No. 696,452; E. J. Kiss, Fort Wayne, Ind.



Retort arranged over suitable furnace; rotatable agitator mounted in retort; means for feeding ore into retort; inlet chute, adapted to contain hody of mercury to form seal to prevent escape of mercury fumes from retort, and water seal closing outlet of retort, and in which mercury fumes of retort are condensed and amalgamated particles of precious metal are collected.

BALANCE ATTACHMENT FOR CENTRIFUGAL PUMPS.—No. 696,655; F. Ray, San Francisco, Cal.



In this device the centrifugal pump is halanced hy having the closed runner revoluble within a casing having central suction and peripheral discharge pipes. The shaft of the runner passes through a chamher, and carries a disk or plunger movable within the chamher. Suitahle passages connect the suction and discharge of the pump with this chamber, and the rise and fall of the vertically disposed shaft will open communication through grooves to either one end or other of the cylinder, and thus halance the runner and hold it essentially central between the top and hottom of the casing within which it turns.

ART OF TREATING ORES. — No. 696,469; R. McKnight, Philadelphia, Pa.

Heating with free access of air and agitation, mixture of ore containing refractory metalloid and haloid salt of alkaline or alkaline earth metal, until haloid salt of precious metal is produced and volatilized and coarser particles of precious metal have their surface coatings removed, and alkaline or alkaline earth metal unites with oxygen of air and with refractory metalloid, to form stahle oxysalt, collecting volatilized haloid or oxyhaloid of precious metals, and treating cleaned particles by amalgamation.

Assaying Sulphurets.

TO THE EDITOR:—In an answer to a question how the trouble with a method of assaying sulphurets may he overcome, you suggest roasting of the ore to he assayed. This is good, hut is a very slow and tedious process and involves chances of loss in several ways. Why not use the Aaron method? The writer has used this method for years, for all assays, and found it uniformly satisfactory. It consists in using only the amount of litharge necessary to produce the lead button desired—say 10 to 15 grams.

If there be used the full quantity of reagents taken for an ordinary assay, except litharge, and about half the weight of sulphurets (say 10 grams), with iron nails and plenty of borax, with some sand, watching the assay at the critical period, he will avoid both the excessive lead button and hoiling over, and the assay will be, in all respects, thoroughly satisfactory.

N. S. TROWBRIDGE.

Scott River, Cal., March 28.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

JUNEAU.

From the 1901 report of Supt. MacDonald of the Alaska-Treadwell G. M. Co. at Treadwell, it appears that the mines consist of three groups, the Mexican, the Ready Bullion and the Treadwell group. Together they operate 880 stamps and employ over a thousand men. The ore in these mines averaged for the Mexican $2.26 per ton, for the Ready Bullion $2.15, and for the Treadwell $2.07 and $1.80. The total operating cost of the Mexican and Ready Bullion mines for the year was $562,692.48, and the product $701,354.96, leaving a net profit of $136,662.48. The Treadwell group gave a net profit almost equal to the other two, because of the greater quantity of ore treated. Nearly three-fourths of the operating expenses are paid out in wages.

ARIZONA.

COCHISE COUNTY.

It is reported that the Calumet & Hecla Copper M. Co. has bought an extensive copper property adjoining the Copper Queen at Bisbee.

GILA COUNTY.

In a general way the metallurgical process at the Black Warrior mine, at Black Warrior, is as follows: The sulphide ores furnish their own fuel at practically no cost, and the sulphur is not wasted, as it is by the matte smelter process, but is converted into sulphuric acid, the manufacture of which costs less than a cent and a half a pound. A pound and a quarter of sulphuric acid is sufficient to leach a pound of copper. A solution of the acid and water is applied to the desulphurized ore, which is put into a vat. The solution carries off all the copper which is precipitated later by iron as cement copper, 85% pure. It is then melted into ingots and bars, this process involving the first cost for fuel. Oil is the fuel used in the melting furnace. Comparatively little water is required, for almost none is wasted in the process except by evaporation. The spent solution is pumped back into the tanks and restandardized with fresh sulphuric acid. The tailings are poorer than those obtained by any other process and contain one-half of 1%, which it is hoped to reduce to one-quarter of 1%. The plant at the Black Warrior has a capacity of 150 tons, but has so far been run at 100 tons. The labor employed is a man to run the crusher and put ore into it, four boys to open and close valves and pull levers, and two men. No chemist or assayer is required, the ore not being sorted, but treated as it comes from the mine.

GRAHAM COUNTY.

U. G. Wolfe, manager of the Polaris M. Co., has arrived at Clifton to take charge of the property. The company recently took over a group of gold claims in the Greenlee district, together with the 20-stamp gold mill at Evans Point. Work will be commenced at once on the mines, and the mill repaired.

The copper leaching plant recently erected and put in operation by the Williams-Blake Leaching Co., on the Gila river, above Safford, is reported to be doing satisfactory work. The product of one day's run is 900 pounds of 90% copper. A furnace has been erected for melting the copper into bullion 99% fine. The ore is hauled from the mines a distance of 7 miles for $1.25 a ton, and the mining is very cheap, the ore being blasted from open cuts. The ore used averages from 4% to 6% copper. The capacity of the present plant is about twenty tons daily.

MOHAVE COUNTY.

After a close-down of two months the Tennessee mill at Chloride has resumed operations. During the idleness of the mill H. N. Batsford, Supt., has kept a few men at work in the mine and has opened up some new and rich veins of ore, one of them being an extension of the Schuylkill vein, 600 feet north.

R. J. Holmes has bought the interest of C. J. Rhodes in the Homestake, Golden Era and six other mines in the Boundary Cone country, near Kingman. It is understood that he contemplates the erection of a milling plant on Silver creek, in the San Francisco mining district.

The Ben Doran mine, in Boundary Cone district, near Kingman, owned by J. D. Lane and M. F. Wilkinson, has been sold for $15,000 to Bauman Bros. and E. B. Smith of Fremont, Ohio. The mine was recently located, and the new owners propose to develop the property and to put machinery on the ground to begin sinking the shaft.

PIMA COUNTY.

A rich strike is reported in the mines of the Consolidated G. M. Co., in the Guijas district, near Arivaca. The vein on the first level has developed to 6 feet wide, and much of the ore is claimed to go over $100 to the ton. Dr. Galusha Anderson, of Chicago, Ill., is president of the company and C. E. Tolman superintendent. The company has just installed a mill to treat its ores.

M. Lulley has discovered a large body of gypsum about 20 miles west of Tucson. It is stated to be of a superior quality and desirable for cement manufacture. The mine is to be developed.

PINAL COUNTY.

F. W. Force of the Bob Tail M. Co.'s gold mine, near Ray, says a strike of very rich ore was made in a winze from the lower level tunnel, about 200 feet from the surface. The stamp mill has been started for a preliminary run on low-grade ore. J. F. Force, president of the company, is arranging for the building of a smelter and concentrating machinery for the company's copper mine.

YAVAPAI COUNTY.

Superintendent Henderson of the Rochester M. Co., operating properties at Placeritas, says the company will soon put in hoisting works, sink 300 feet and erect a 10-stamp mill.

Salinger & Yeaton, owners of the Victor mine, near Prescott, M. S. Taft, Supt., propose to soon erect a stamp mill at the mine.

The Murphy group at Gilbert, O. H. Perry, manager, is to be started up soon. The company is considering the erecting of a mill.

A solid body of ore carrying good values in copper, gold and silver, has been opened in the Copper Basin mine. The find was made at a depth of 100 feet. The property is owned by the Copper Basin G. & C. M. Co. of Prescott.

C. W. Platt, of Prescott, is said to be planning to build a mill for his mines on Kirkland creek.

The Big Five Placer M. Co., near Prescott, will install two gasoline engines, one to pump and one to run the placer mining machinery on the gravel drifted out.

The Niles M. Co., at Groom creek, is putting up several mine buildings, including five bunk houses, one large cook house and dining room, an assay office and two or three cottages. The company expects to build a mill as soon as the 500-foot level is attained. At the 300-foot level they have 800 feet of drifts. A large station pump is being installed.

The Groom Creek G. M. Co., at Groom Creek, S. Jones Supt., is down with its shaft to the 200-foot level, and will continue to the 500-foot.

The Midnight Test mine, at Groom Creek, has started up.

YUMA COUNTY.

Dr. Geer, general manager of the Arizona Dev. Co., operating at Harrisburg, says that a ledge of free-milling gold ore 8 feet wide is exposed in the bottom of the 300-foot shaft of the Mineral Belt mine. A shipment of four tons of ore yielded $88 per ton gold.

CALIFORNIA.

AMADOR COUNTY.

J. F. Parks, Supt. of the South Eureka mine at Sutter Creek, states that he is sinking the main shaft below the 2000-foot level, and will sink the shaft at least 200 feet before starting the new levels.

At the Fremont, E. C. Purrington Supt., the grading for the new hoist is finished. Concrete piers have been built for the framework. Some of these piers rise 24 feet from the ground to a level with the collar of the shaft. The top of the gallows frame will be 84 feet high from the collar of the shaft. This building is also of galvanized iron and 40x70 feet in dimensions. It is calculated that the hoisting machinery will be in running order in from sixty to seventy days. It has been definitely decided to erect a 60-stamp mill, work on which will be commenced to have it in running order if possible by September next. These large surface improvements are the outcome of developments in the mine run at the depths of 600 and 700 feet. An immense ledge has been encountered in the 600 and 700 levels, the quartz at the 600 level showing 110 feet in width.

L. P. Harvey is superintending the operations of the Buena Vista C. M. & R. Co. at Ione.

BUTTE COUNTY.

A Colusa company is prospectiug at Bidwell's Bar for the ledge from which the rich placers mined in early days are believed to have come.

The growth of the dredger mining industry at Oroville has been so rapid that in four years the capital that is invested in the dredger district, comprising about 5000 acres of the valley of the Feather adjacent to Oroville, has grown from practically nothing at all to more than a million dollars in machinery alone. There are at present fourteen dredgers at work, while six more are building or contracted for. These machines represent an outlay of about $50,000 each, or a total of $1,000,000, while machine shops and other equipment raise the total considerably. The Lava Beds Dredger Co. have, in addition to a dredger, a steam shovel for removing top dirt, with a full equipment of track, rolling stock and power for moving it away. The Feather River Exploration Co. has a large machine shop, the Marigold Co. has another, and a third—larger than the others—has just been built at Oroville at a cost for building and equipment of $30,000. In addition to the twenty dredgers that are built and building, several more are in contemplation, and it is probable that contracts for four or five more will be let within a short time. The companies operating dredgers are as follows: Feather River Exploration Co. owns 1200 acres of land, has three dredgers at work and two more building; Boston & Oroville Co. owns 643 acres, has three dredgers at work; Oroville Gold Dredging & Exploration Co. owns 360 acres, has one dredger; Oroville Gold Dredging Co. has 50 acres and one dredger; Indiana Gold Dredging Co. has 134 acres of land and one dredger; Lava Beds Dredger Co. has 300 acres of land and one dredger; Legget-Wilcox Co. has 350 acres of land and one dredger; Marigold Gold Dredging Co. owns 462 acres and has two dredgers; Kia Ora Co. has 153 acres and one dredger; Pennsylvania Gold Dredging Co. has 155 acres and is building a dredger; American Gold Mining Co. has 73 acres of land and is building one dredger; Butte Gold Dredging Co. has contracted for one dredger; Cherokee Gold Dredging Co. has 400 acres of land and is building one dredger; Sunset Gold Dredging Co. has 110 acres of land. The companies that are known to be contemplating placing contracts for more machines are the Legget-Wilcox Co., the Boston & Oroville Co., the Oroville Gold Dredging & Exploration Co., the Lava Beds Gold Dredging Co., the Cherokee Gold Dredging Co., and the Indiana Gold Dredging Co.

The Butte G. Dredging Co. of San Francisco has been incorporated, capital $200,000, to operate near Oroville. The directors are S. P. Connor of Alameda, J. S. Grant and W. S. Wood of San Francisco, and W. S. Noyes and B. Noyes of Oakland.

The Valley Power Co., which bought the Cherokee ditch and water system, is to build a new reservoir 5 miles above Magalia. The reservoir will have an earth dam and cover twenty acres; the water will average 25 feet deep. The water will be taken from it in an iron pipe, 30 inches in diameter, down to Butte creek. The distance is about 1½ mile and the fall is 1600 feet.

CALAVERAS COUNTY.

The Benson M. Co. has been incorporated, with office at Stockton, with directors J. C. Benson of Santa Cruz, C. E. Colby and C. H. Fairall of Stockton and N. Anderson and J. Anderson of Angels. The company will operate near Angels.

The shaft of the Fanny Marie mine at Glencoe will be put down another 200 feet. Additional machinery for all the works and also a 20-stamp mill will be erected.

On the Sugar Pine mine, near Angels, owned by the San Joaquin M. Co., H. F. Stewart Supt., there is now a 100-foot shaft and a 30-foot crosscut at the bottom. Five stamps of the mill are kept working on ore from the upper tunnel.

DEL NORTE COUNTY.

T. W. M. Draper of San Francisco, manager of the Waldo S. & M. Co., says that his company will begin at once the work of surveying a railroad route from Waldo to Crescent City. The first survey will be made from Waldo to Crescent City, and if the people of Grants Pass show a disposition towards it a later survey will be made from here to Waldo, completing the route through to the coast. The railroad will be standard gauge. It will be built by the same people as those connected with the Waldo S. & M. Co. The new road will be known as the Oregon & Pacific.

EL DORADO COUNTY.

J. C. Moore of Garden Valley is making a test run on ore from the Bright Hope quartz mine with a 2-stamp mill.

J. M. Nougues Jr., Supt of the Josephine mine, says that the work of retimbering tunnel No. 5, preparatory to installing power drills, is completed.

INYO COUNTY.

What is said to be a nugget of platinum has been sent from Coso valley.

MONO COUNTY.

The Blue Vein mining property, near Bodie, has been bonded to Eastern parties at $100,000, the first payment of $20,000 to be made in sixty days.

MONTEREY COUNTY.

Monterey county may have another Klondike. The hills and mountains of the Coast Range near Point Gorda are claimed to be exceedingly rich. The new gold fields are in the southwestern part of Monterey county, about 2½ miles from the Pacific ocean. A number of San Francisco people have organized the Ralston G. M. Co. and have bought 1060 acres of placer claims. A pipe line a mile long, a ditch and three giants form the hydraulic plant. The first three weeks' run produced gold valued at $2200. One nugget is worth $216, another $186 and a third $120. One of the specimens has some quartz attached to it. The tailings flow into the ocean. It is claimed that the black sand found in the sluices will yield $102 a ton. The district can be reached by way of King City and Jolon, with 10 miles travel by wagon and 15 miles of mountain trail. Steamers can land passengers at Point Gorda, which is only 2½ miles from the mines. Primitive mining has been going on in the district for many years. Water is said to be plentiful in the new district, and if investigation proves that more hills than one are rich in gold a rush will likely result.

NEVADA COUNTY.

Supt. Hosking will rebuild the hoisting works at the Eclipse mine, Gold Flat.

The Manhattan mine on Gold Flat, near Nevada City, owned by G. W. Baldwin, has been bonded to H. J. Griffin and F. Du Bois of San Francisco. They propose to commence work sinking and, should the indications prove favorable, will erect a hoist.

Manager Lezinsky reports that fine progress is being made in removing the Reward machinery to the California shaft. It is expected that inside of a month's time the machinery will be ready to commence pumping out the mine.

At the Grass Valley Con. mine, near Grass Valley, Supt. Coffin hopes to be running ore through the mill by the 20th inst. L. M. Hall, consulting engineer for the company, is superintending the installation of motors and the foundation for a 4-drill compressor.

J. C. Campbell is reopening the Murchie mine at Nevada City. The tunnel will be cleaned out and the shaft, which is down 140 feet, will be retimbered.

Dr. Sponogle and associates of San Francisco and the East will commence work on the Monarch mine, near French Corral. The operators have in view the erection of a mill in a few months.

PLACER COUNTY.

At the Pioneer quartz mine, near Towle, twenty-two men are now employed. An upraise of 347 feet has been made connecting the lower with the No. 2 tunnel. A. P. Chittenden is Supt.

SACRAMENTO COUNTY.

J. H. Canard, Supt. of the Prosperity Gravel M. Co. at Folsom, is in charge of the opening of a new drift mine on the Cohn ranch. The shaft is ready for hoisting machinery, and mine buildings will be erected immediately.

SAN LUIS OBISPO COUNTY.

A cinnabar ledge is reported extending from the San Carpojo, on the Monterey county line, to the Rinconada, near Santa Margarita. At Pine mountain the American Exploration Co. is blocking out ore in its mines preparatory to the erection of reduction works.

The Oceanic Quicksilver Co., a Los Angeles corporation, has blocked a body of ore. The company has a 48-ton furnace and a wire tramway connecting it with the mine, 5 miles from Camhria.

The old Josephine mines are being worked by the California Con. M. Co. of Kittery, Me.

Between the mines above named and the Karl Quicksilver M. Co.'s properties are a number of claims being developed by L. G. Sinnard.

The Karl Quicksilver M. Co. has completed a 60-ton furnace, and is reported to be producing 200 flasks of quicksilver per month. There are fifty men employed. A small town has grown up around the mine, and is known as Klaw postoffice.

SHASTA COUNTY.

The Texas G. M. & P. Co., now operating the Texas mine at Whitehouse, is installing an air compressor plant, which will be operated by electric power. It is reported that a rich strike has been made in the Texas shaft on No. 5 level.

A. Carlson of Keswick has bonded a claim on Flat creek to San Francisco people for six months.

J. Chambers of Keswick is doing some prospecting and development work in Flat creek district.

S. Bamberger of Salt Lake City, Utah, has obtained from the Shasta G. & C. M. Co. five adjoining claims and will come to DeLamar personally to inspect them.

President and General Manager W. F. Mitchell of the Shasta G. & C. M. Co. of Salt Lake City, Utah, is starting up work

on the company's claims in the Brushy canyon country, near DeLamar. A shaft will be sunk 100 feet and later, if the showing of copper developed is satisfactory, the company will erect a smelter.

The forces at the Mountain Copper mines and smelters have been enlarged and five full train crews have been put on the Iron Mountain Railroad.

SISKIYOU COUNTY.

J. H. Schroeder of Yreka intends putting up a stamp mill on his new mine at the head of Deadwood creek.

The Pine Grove placer mine at Buckeye Bar, Klamath river, is being operated by M. J. Whitney & Co. of Detroit, Mich., with an elevator plant. The gravel at bedrock prospects $4 to the pan.

A. Condrey has found rich prospects in surface soil and porphyry on Klamath river above Oak Bar. Ten claims have been located.

TRINITY COUNTY.

About one year ago H. Z. Osborne, U. S. Marshal for the southern district of California, bought the Dorleska mine for $5000. He organized a company and in one season, with a little sampler, ran through 756 tons ore that returned $35,-209.93. This wasn't away off in Arctic night and darkness among isolated inconvenience, but in California, where in each of the thirty-nine mining counties are equal opportunities for a little capital.

TUOLUMNE COUNTY.

Work on the Bed Rock blue gravel claim on Table mountain at Sonora is being pushed by C. L. Lang and associates. A cabin, blacksmith shop and changing room have been erected. The upper tunnel will be opened up and the channel tapped. It is estimated that when the gravel is struck it will open up about a mile of old river bed, which can be drained and worked through this tunnel.

The report of the manager of the Jumper mine at Stent to the shareholders' meeting in Glasgow, Scotland, last month, showed gross yield of the mine in 1901 as $417,300.46. The 60-stamp mill was run eleven months and 54,344 tons of ore were crushed. The balance sheet shows a profit of £32,019 8s 6d. The ore reserves in sight were estimated at 155,575 tons, an increase of 51,838 for the year.

The Republican mine at Jacksonville is to have ten stamps added to its mill. A chlorination plant is also under consideration. The mill produces daily two tons of sulphurets going $50 to $60 per ton and a saving is anticipated by working them at the spot.

A two-compartment shaft, 75 feet deep, has been sunk in the placer claim on the Doyle ranch, Columbia. It is estimated that some 50 feet more will be required before the gravel is reached. Machinery for pumping and washing gravel is to be installed.

The 20-stamp mill on the Dead Horse mine at Carters has been started up. Hugh Smith is in charge of the mill.

The Soulsby and Draper Mining Companies at Soulsbyville intend to use oil instead of wood for fuel. Wood is claimed to be cheaper, but the companies will not have to tie up money in a large supply of wood for use during the winter.

Work has been partially suspended in the Lost Fox mine at Carters until the mill is completed. The saw mill is at work cutting out timber.

YUBA COUNTY.

Supt. Matthews has men at work at the old Sweet Vengeance quartz mine, 2 miles west of Brown's Valley, where he is installing machinery to reopen the mine. A company of Eastern people has bonded the claim and with cheap power and improved machinery will endeavor to work it at a profit. The mine has been closed for thirty-six years.

COLORADO.

BOULDER COUNTY.

A pay streak 30 inches wide, showing tellurium and sylvanite, has been uncovered at the 250-foot level on the Lucky Star lode at Wall Street. The property is owned by R. A. Duncan, C. H. Cheney and C. H. Wise, all of Boulder.

The Colorado & Northern G. M. & M. Co. has opened up a vein of grey copper ore in the 1330 drift from the Dirigo tunnel at Ward. The vein is 2 feet wide and lies on the north wall of a 22-foot porphyry dyke that averages about $4 per ton in gold. The tunnel is over 2100 feet long and in running that distance several veins assaying from $4 to $30 per ton in gold have been crossed.

A strike is reported in the Lucky Star mine at Wall Street, owned by R. A. Duncan, C. H. Cheney and C. H. Wise, all of Boulder. In the 250-foot level the ore vein is 30 inches wide, tellurium predominating, 4 inches of it running from $35 to $40 per pound.

CHAFFEE COUNTY.

The Sunrise group of eleven claims situate in the Four Mile mining district, near Salida, has been bought by the Sunrise G. M. & M. Co., capital $750,000, incorporated by J. Weinstein, P. Mauro, N. Golforb, P. W. McCraffey, of Denver, and A. A. Mauro of Chicago, Ill.

CLEAR CREEK COUNTY.

Operations have been resumed on the Conqueror mine at Georgetown by Milwaukee, Wis., people, who recently bought a controlling interest from Mr. Wells. A Mr. Brown of Leadville is in charge of the work.

An average of 4 feet and 9 inches per round of holes was made in the Empire tunnel at Georgetown in March through extremely hard rock. Considerable trouble has been experienced in getting trammers to stand up to the work in removing the large amount of rock that is broken with each round of shots, a couple of shifts with drills being lost on this account. The first of April G. Lucas and R. Kelly made a contract to tram for 1000 feet at $2 per foot.

The Maxwell mill at Silver Plume, recently bought by Supt. Olds of the Mendota, has been started up with W. Jewell of Denver in charge of it.

J. W. Boughton of Philadelphia, Pa., has bought the interest of F. L. Miller in the Bimetallic group of claims, near Silver Plume, and expects soon to begin active operations and install a plant of machinery.

The amount of ore produced and treated at the mills in Georgetown in March, 1902, exceeded the production of March, 1901, by almost 50%, both in tonnage and value.

J. H. Pape and H. H. Dorsey have bought 104 acres of mineral lands near Idaho Springs, for $50,000, from W. Lewis and John Palmear, who have held the property twenty-five years.

The Newhouse tunnel at Idaho Springs has been closed down after it had reached a total distance of 13,220 feet, the cost of which amounts to $228,328.22. It is stated that there is a business difference between the Newhouse tunnel and the mine owners whose properties it penetrates. The tunnel has cut 103 veins carrying ore, and at present but three properties are working their veins.

The Gold Cord M. & S. Co., which for the past six months has been driving a drainage and transportation tunnel at Kokomo, has bought the Lexington group of mines on Soda creek, near Idaho Springs, and already have men cleaning up the old workings and extracting the ore.

C. H. Stevenson, owner of the Little Johnnie and Hamilton groups of seven claims on Soda creek, near Idaho Springs, has 700 or 800 feet of workings on the property, and is making arrangements to resume work after an idleness of several years. He intends to sink a shaft 200 feet.

The Seaton Electric Co. has completed its new auxiliary plant, near Idaho Springs, and the full capacity of the new plant has already been contracted for. The plant was built with a view to furnishing power for the mines of the district, but the power is all taken before the lines get to the mines.

EAGLE COUNTY.

A company has been formed in Denver to do extensive development work on his Horn Silver Mountain mine at Red Cliff. M. Edwards is Supt., and has called for bids on sinking the incline shaft 200 feet. The company will furnish the machinery, timbers necessary and take care of the water.

GILPIN COUNTY.

The Tucker mine, in Quartz valley, near Central City, has been sold to Chicago people by W. Woods for $150,000. This is the mine from which the lead ore was taken that furnished the First Colorado Regiment with lead for use at the breaking out of the War of the Rebellion in 1861. Many new improvements will be made on the surface of the property by the new owners.

The Gauntlet G. M. Co. has let a contract to sink the Gauntlet shaft in the mine at Central City another 100 feet, its present depth being 165 feet. Some fair grade lead and concentrating ores have been taken out in the bottom levels. Iowa parties are the owners and operators.

The air compressor formerly used on the Waterbury adit has been removed and installed in the Mammoth mine, near Central City. The company, composed of Chicago, Ill., and Colorado people, intend sinking the shaft from the 700-foot level to the 1000 point.

J. W. Ray of Cripple Creek has bought the After Supper mine at Black Hawk for Cripple Creek and Massachusetts people, the price being about $20,000. The former owners are W. Fick of Black Hawk, T. De Coar of Idaho Springs and J. Bitzer of Leadville. The new owners will, it is reported, put on a heavy plant of machinery, erect a larger shaft building, and will prosecute developments on an extensive scale.

GRAND COUNTY.

The High Lonesome G. M. & M. Co. has been incorporated by Denver people with W. E. Rammell secretary and treasurer and H. C. Merlick president. On one of the properties in Grand county a body of ore 25 feet wide has been opened up, giving an average assay running $8.18 per ton. The ore runs well in copper.

HUERFANO COUNTY.

Supt. D. M. Murray of the McMillan mines at Bianco is installing the machinery for a concentrator, which will have a capacity of forty tons a day to begin with.

LAKE COUNTY.

The 1901 reports to the meeting of the new Leadville Home M. Co., at Leadville, show it to be the largest proposition operating in the down-town section of Leadville. The company produced 81,000 tons of ore during eleven months, and also did a large amount of new development work. The receipts were $301,000, the expenses were $224,000. The company paid $112,-000 in dividends during the last nine months of 1901. Owing to the smelter conditions at the present time, they have been compelled to curtail shipments.

MONTEZUMA COUNTY.

(Special Correspondence.)—The latest gold camp in Colorado to attract the attention of the mining world lies in the La Plata mountains in the southwestern corner of the State. Here a strike of 20-ounce ore in the abandoned Neglected mine, which was quickly reported about the country, drew attention to the fact that J. Doyle, the locator of the Portland at Cripple Creek, has had an agent in the district for nearly three years investigating and buying an extensive group of claims. His properties lie at the head of East Mancos river, some 16 miles northeast of Mancos, the supply point. Two of the claims, the North Star and the Sundown, had been worked by storekeepers and ranch hands to the extent of two adits about 200 feet in length and about half an acre of ground stoped out. Part of the ore was smelted and part worked in a steam stamp mill, and values amounting to about $60,000 were recovered from this one stope, an average of over $40 per ton.

The ore here is a blanket formation at the contact of lime and quartzite, varying in thickness from 2 to 10 feet, but this deposit is cut at frequent intervals by vertical fissures, some of which have been opened up by prospect holes and short adits, showing good ore.

Mr. Doyle has built offices, laboratories, bunk houses, cook house, commissary, shop, ore bins, etc., and practically completed a 10-stamp combination mill, which will be started in the early summer. This is designed as a testing plant, it being the intention to build a large mill as soon as the most economical method of treatment has been worked out. These mines are being operated under the name of the Mancos Con. G. M. & Dev. Co., with P. J. Lonergan manager, and R. H. Toll Supt.

The formation contact has been traced for 15 miles, yet not three holes have been made on it beyond daylight, nearly all the work done in the district being confined to that required as the annual assessment, it being customary to make a different opening each year to indicate the amount of work. Fully 200 square miles is known to be gold bearing, the district showing 1000 to 10,000 colors to the pan, but it has never been half prospected, and there is room and work for an army of prospectors.

The region is well wooded and watered, the climate is excellent, and a good wagon road extends to the very heart of it. The season lasts fully six months and it is an ideal spot for outdoor work. It is likely that many will come here this summer, but they should not go too early, as the season is late and little can be done before the middle of May. Supplies and outfits may be purchased at Mancos, from which point a stage runs to the mines twice a week.

Mancos, April 2.

OURAY COUNTY.

F. Baker of London and J. H. Hammond of New York have been making an examination of T. F. Walsh's Camp Bird mines at Ouray, and it is reported that the mine will be sold.

The Genessee-Vanderbilt group of five claims at Red mountain has been sold for $25,000 to the Bluebell M. Co. The mines are worked through two tunnels, one being in 800 feet and the other 300 feet.

The Ceramic M. & M. Co. of East Liverpool, O., has bought the Box canyon group of four mining claims at Ouray and has begun development work. The claims are all on the same blanket vein and extend up the southeast slope of White House mountain for 6000 feet. W. A. Hart is local agent and Supt. of the company. It is the intention of the new company to erect a mill in Ouray during the summer for the treatment of their ores, and an aerial tram of about one-half mile in length.

PARK COUNTY.

F. C. Alsdorf, manager of the Kentucky Belle mines, at Alma, has appointed a Mr. Johnson, of Telluride, Supt. of the mines. Mr. Alsdorf is expected to soon commence the erection of a mill.

SAN JUAN COUNTY.

The Gold Tunnel & Railway Co. has prepared for extensive operation on the Highland Mary mine, near Silverton, by installing compressors and air drills and buying lumber and machinery for a mill. It is also about to commence the driving of the Oro tunnel, which was started some years ago to develop mines in Kendall mountain at from 2000 to 3000 feet depth.

H. S. Born and U. G. Nelson have bought a half interest in the Celia Kileroy claim at Silverton. The Kileroy is developed by two tunnels, the lower one being in 95 feet and showing 3½ feet of ore which gives average returns of over $10 per ton. This season the new owners propose to run another 125 feet in the lower tunnel.

SAN MIGUEL COUNTY.

The Blue Lake M. & M. Co. has been incorporated at Kansas City, Mo., to operate properties located in Bridal Veil basin, near Telluride. At the present time the company own the Lake View, Lake View No. 2, Revenue, Argenta, Syndicate and Occidental claims. W. W. Cramer of Telluride is in charge of operations.

SUMMIT COUNTY.

The Washington property, on Nigger hill, Breckenridge, is to be reopened and worked this season by H. S. Newsom, M. G. Evans & Co., who have a bond on the property. The mill will be moved from the hill to below the railroad track, where the ore can be dumped from the Berlin tunnel directly into it. P. Mixsell, of Idaho Springs, is superintending the resetting of the mill, which he expects to have in operation by June 15th.

TELLER COUNTY.

The Independence mine at Cripple Creek was located July 4, 1891, by W. S. Stratton, and operated privately by him until its transfer to Stratton's Independence, Ltd., of London, May 1, 1899. The mine's production from 1891 to the end of 1898 is placed at 41,694 tons of a value of $3,837,360. It is safe, therefore, to estimate the gross production of the Independence to the date of transfer at $4,000,-000. Mr. Stratton was paid $10,000,000 for the mine. T. A. Rickard, the consulting engineer for the purchaser, placed the mine's reserves in 1899 at 70,000 tons, value $6,712,000. He added to his report an estimate that the mine would produce $8,000,000 from the ground then developed. The mine has produced for the English owners approximately $8,500,000, making a total gross production of approximately $12,500,000. Mr. Stratton has estimated his profits derived by operation of the Independence at $2,400,000. This he made out of a gross production of $4,000,000. The English company has paid dividends to the amount of $3,187,-000 out of a gross production of $8,500,000. The total profits, therefore, amount to $5,587,000. Stratton developed ore to a depth of 800 feet. Ore was not opened below this point by the new owners until two years after securing the property. Good ore was found at 900 feet and some at a greater depth. The shaft is now down to a vertical depth of 1400 feet. John Hays Hammond became consulting engineer for Stratton's Independence in 1901. His first report, showing not quite $2,500,000 worth of ore in sight, caused the first sensation and a big break in the shares.

A station at a depth of 1300 feet in the shaft of the Blue Bird mine, on Bull hill, at Gillett, has been started. The landing will be made 12 feet square by 10 feet. The shaft will be put down to 1350 feet, which is as deep as can be made with the present plant. The company is considering buying another plant of machinery to cost $25,000. E. S. Johnson is president.

T. B. Burbridge of Denver and G. F. Fry of Cripple Creek have taken a five-year lease on the old workings of the C. O. D. property of the Rebecca Co. at Cripple Creek, and will start operations immediately.

The new plant of the Modoc Co. at Cripple Creek is in place and operations in the new shaft on the Ocean View claim have been started. The new shaft is a vertical three-compartment and it will be put down to the depth of 1000 feet and connections made to the levels of the incline shaft now operated through.

Another strike has been made on the Laura Lee mine, on Mineral hill, in an upraise in a crosscut, at a depth of 110 feet. The rock shows free gold in large cubes and will run from $300 to $400 to the ton. S. Peterson has bought the half interest of O. Stone, and is now sole

owner. Arrangements are being made for a plant of machinery.

In the Vindicator mine a 4-inch streak of ore has been opened in an upraise from the ninth level that it is said is yielding ore running from 50 to 600 ounces to the ton. In four days $20,000 worth of the ore is said to have been taken out and sacked.

The gold output for the Cripple Creek district for March, as indicated by figures furnished by the different reduction plants and smelters, is as follows:

Plant—	Tons.	Value Per Ton.	Total.
Colo. - Philadelphia			
Standard	24,000	$33	$792,000
Union	8,500	30	255,000
Dorcas	1,500	25	37,500
Economic	4,500	35	157,500
Smelters and miscel.	14,000	56	784,000
Total	52,500		$2,026,000

The regular monthly meeting of the board of directors of the Elkton Co. at Colorado Springs authorized Supt. Henley to go ahead and discharge all the dead bones on the payroll and to cut down the force materially. Other economies will also be introduced. It came out at the meeting that the 300 men employed at the mine had probably not averaged over four hours' work a day for some months. Quantities of whisky were taken to the mine. There was a regular system of proclaiming the approach of the manager among the men, so that they might resume their work in time to escape detection.

IDAHO.

The Black Pine group of four claims, owned by the Black Pine M. Co., of which F. J. Fetter and F. W. Little of Kansas City, Mo., are leading stockholders, and G. Fetter local manager, has had a shaft sunk on the vein to a depth of 154 feet. At this depth a large volume of water was encountered and the shaft abandoned. A tunnel has been started to drain the mine. It is estimated that 2700 feet will be necessary and that the depth attained will be over 600 feet.

CUSTER COUNTY.

The miners' union at Mackay has called out all the miners and other workmen employed by the White Knob C. Co. It is stated the strike involves 1000 men.

IDAHO COUNTY.

Reports from the Consolidated Hydraulic M. Co.'s operations at Lucile and Freedom state that the company will bring an ample supply of water on to the property, which has heretofore been considered of little value because of its height. The improvements contemplated include a suspension bridge across the Salmon 225 feet high and 480 feet long, to carry 5000 inches of water on to the Fockler high bar on the west side of the river. It is expected to have this in operation this year.

OWYHEE COUNTY.

Supt. A. F. Stevens of the Addie Con. M. & M. Co., is preparing to install the machinery and electrical equipment of the new 10-stamp mill at Silver City, which it is the calculation to have completed and in operation by July 1st. An assay office and mine office is being built at the tunnel.

SHOSHONE COUNTY.

A 6-foot vein of lead and copper ore has been struck in the Sonora Co.'s property near Burke, J. F. Moffatt, manager. It is about 1000 feet from the portal of the tunnel, and approximately where the second ledge in the property was expected to be found when the work was begun.

MICHIGAN.

HOUGHTON COUNTY.

The Calumet & Hecla M. Co. is installing electrical pumps in No. 7 shaft of the Hecla branch at the 12th, 24th, 26th, 36th and 48th levels. Electrical pumps have been in use in other parts of the mine for some time, and are said to have given satisfaction. With the additional pumps in commission the entire water of the mine can be handled without the aid of the bailers at the Red Jacket shaft. Although the installation of electrical pumps to take the place of steam pumps will mean fewer men to take care of them, the men will be placed at other work.

MONTANA.

FERGUS COUNTY.

The mill on the New Year property at New Year will be shut down to permit the enlargement of the plant. A new conveyor will be put in and five new leaching tanks placed in position, which will increase the capacity of the mill from 50 to 200 tons per day.

F. A. Case, lately Supt. of construction work on the automatic tramway at the New Year mine, is prospecting in the South Moccasin section, near New Year. Samples of cyanide ore have been assayed with satisfactory results.

FLATHEAD COUNTY.

G. H. Shawler, manager of the Mustang Consolidated Mines Co. of Spokane, says the prospects for his company putting in a mill this summer are encouraging. The company own three claims in the West Fisher gold belt and the principal work so far has been done on the Mustang claim. The vein is about 4 feet wide and carries values in free milling gold. In the vein is a foot streak of ore which goes over $100 in gold.

GRANITE COUNTY.

The Hope mine, near Phillipsburg, has been bought by the Granite-Bimetallic M. Co. President P. A. Fusz of the latter company will be president of the new Hope Co. Operations will be resumed in the mine.

MADISON COUNTY.

It is reported that the Revenue-Monitor and the Columbus groups at Richmond are to be consolidated, together with some twenty-five or thirty new and old locations. It is also thought that the Kennett and Kearsarge will be included.

The two Keystone claims at Richmond are being opened up by the Shafter people, who have a bond upon the property from the Elling estate.

The Red Bluff mine at Red Bluff is about to resume operations. C. B. Austin, manager of the company, has returned from Denver and states that the work of unwatering the shaft would begin immediately. The company has let the contract for a 100-ton concentrator. work upon the excavations and buildings to begin at once.

SILVER BOW COUNTY.

The Butte Copper Co. has been incorporated to work some claims in Saratoga canyon at Butte. It is said that the company has bonded and bought thirty-six claims in that section and will soon begin development work on them. C. Kleinschmidt of Butte has been made manager.

Several of the mines of the Anaconda, Parrott and Washoe groups of the Amalgamated Copper M. Co., recently tied up by the strike of the hoisting engineers, have resumed operations and ore is being hoisted. A full force of miners is engaged at the Parrott. At the Moonlight, Diamond and Green Mountain mines hoisting of ore has commenced.

NEVADA.

ELKO COUNTY.

The Eclipse G. M. Co. of Ogden, Utah, has been incorporated; capital, $200,000. The officers are J. F. Snedaker president and J. J. Driver secretary and treasurer. The company owns the Eclipse claim at Tuscarora.

The Dexter-Tuscarora output from its mine at Tuscarora for March was $6000. The cyanide product was only $1100, the mill having been shut down two weeks.

W. D. Higginbotham, manager of the White Rock Placer Co., expects to clean up $50,000 at least as the result of this season's run. The property covers the entire length of Barette canyon, about 65 miles northeast of Tuscarora.

LINCOLN COUNTY.

At the DeLamar Co.'s works, near DeLamar, the 500 H. P. engine is being taken up and with the boilers removed to Meadow Valley wash, alongside of the railroad, where they will be erected for the generating of electricity for transmission to the reduction works. Old machinery is being cleared away and preparations made for the erection of five Chilean mills upon their arrival.

NYE COUNTY.

A contract has been let by C. Peters to Clark & Brighton for the sinking of a 50-foot shaft on the Triangle fraction adjoining the Mizpah at Tonopah. Besides Peters the parties interested in the Triangle are Mrs. J. L. Butler and S. Bamberger of Salt Lake City, Utah.

The Southern Klondike mines, 9 miles south of Tonopah, are producing. About $26,000 worth of ore has been shipped from one of the mines owned by Bell & Court. One iron ledge, on which a shaft has been sunk about 25 feet, shows galena and iron that carries $20 in gold, besides silver and lead values. The main quartz ledge, owned by Bell & Court, is over 1 mile in length and from 4 to 14 feet wide. About 1 mile from Southern Klondike is Eastern Klondike, one ledge being worked by Sharp & Moore having produced ore that went over 700 ounces in silver per ton.

The Gold Hill Co. at Tonopah has made connection with the east shaft, and preparations are being made to sink the main working shaft to a depth of 500 feet. Hoisting works of sufficient capacity will be placed on the property.——The contract on the G. & H. tunnel has been completed, but the drift will be pushed on through the mountain. It is the intention of the owners to commence at once the sinking of a 500-foot shaft on the Silver State claim located in the tunnel.——The Halifax properties, located east Mount Oddie, are having a deep of shaft put down through strongly mineralized porphyry. No crosscutting will be done until the depth of 300 feet is reached. ——The Tonopah Con. Co. owns the McNamara claim, on which it is doing extensive work preparatory to extensive mining. The shaft, down 140 feet, is a double-compartment one, timbered from the surface. A steam hoist to supplant the present whim is one of the immediate improvements contemplated.

WASHOE COUNTY.

C. B. Bell, R. J. Sanders and S. H. Wheeler, who lately bought the Bony & Miller claim in Spanish Springs valley, near Reno, have taken out nine tons of ore which sold in Reno for $630. In addition to gold and silver, the ore carried 26.89% copper.

J. K. Miller of Colorado Springs, Colo., and associates have bought a group of claims in the Peavine district, near Reno. A vein 3 feet in width, showing values in gold and silver of from $27 to $80 per ton, has been opened up. They have also a copper property in the same district.

WHITE PINE COUNTY.

E. W. Tremont of Eureka says of the Pilot Knob copper claims, about 12 miles from Ely, that a large force of miners had been employed during the winter and the mines had been equipped with machinery and appliances for systematic prospecting.

NEW MEXICO.

BERNALILLO COUNTY.

A new gold camp is located in the Sandia mountain range, about 25 miles east of Albuquerque, where placer diggings have been operated for over a century. A month ago a representative of the Treasure Hill M. Co., operating at Kingman, Arizona, and composed of Colorado and Eastern people, bonded a group of claims for his company on a reef of rocks which he thought to be the source of the placer gold. Since then ore has been found in one of the claims averaging over $80 per ton. E. C. Gard of Denver is secretary of the company and is superintending work on the properties.

GRANT COUNTY.

Hamilton, Sanders & Jackson, owners of the Owl mine, at Gold gulch, near Central, recently made a very rich strike of gold ore. Shipments made netted $55 gold a ton. The mine is in a shale formation on the site of old Spanish diggings.

A railroad company is being organized in Lordsburg to build a 20-inch gauge road from the city to the mines south, connecting them with the railroad depot, the smelter and the concentrator. By its use a great saving will be made in the transportation of ores, and at the same time a good profit to its owners. It is not intended to make the road for passenger traffic. Most of the money for the building of the road will be subscribed by Lordsburg people, although considerable foreign capital will be interested. The surveys show that nearly every mine in the district can be reached with comparatively little trouble, and the pull will be a down hill one all the way.

LINCOLN COUNTY.

The Tellefore M. Co., at Red Cloud, is doing extensive development work and expects to ship ore in May. The Tellefore mine was worked fifty years ago and the ore packed to Santa Fe on burros.

The American G. M. Co. has consolidated its four groups of mines in the Nogal district and taken a bond on the Grover Cleveland and Champion. The company is capitalized at $5,000,000, with office at Chicago, Ill. Fully 6000 feet of development work has been done on the claims and all the mines show free milling ore. Heretofore only a 10-stamp mill has been used in treating the ore. The new owners will at once install a 30-stamp mill and add a cyanide plant. The officers are: President, A. T. Anderson of Hersher, Ill.; secretary, B. V. Phelps, Chicago, Ill.; general manager, J. M. Rice, and Supt., M. D. Gaylord, both of Nogal.

TAOS COUNTY.

A. G. Muller of Taos has made a rich strike near Cieneguilla. The vein is 28 feet wide and averages high in gold.

OREGON.

BAKER COUNTY.

M. C. Kestor, manager of the Buckeye mine, near Baker City, states that experiments have proved that the ore can be treated successfully. A roasting and leaching plant, capable of treating 100 tons of ore per day, will be erected this season. The company is installing machinery and making permanent improvements.

GRANT COUNTY.

The Monumental mine at Granite has resumed operations under the management of Colorado men. A large sinking plant is to be installed on the mine this season.

JOSEPHINE COUNTY.

J. E. Conner, owner of the Red Dog hydraulic placer mine on Briggs creek, near Grants Pass, has got his mine again in operation after repairing damages caused by a slide which carried away a large portion of the long flume.

The Golden Drift M. Co. has surveyed for its proposed ditch, which as projected will cover most of the valley adjacent to Grants Pass.

UNION COUNTY.

J. T. Miller of Chicago, president of the Eureka G. & C. M. & S. Co., recently organized with capital of $2,000,000 to work the ore of the Imnaha copper mines of Snake river, says he is satisfied there is ore enough in sight in the Imnaha mines to keep several smelters in operation, but that so long as transportation facilities are not provided smelters cannot be constructed or operated there. He states that the Eureka Co. would put in a 100-ton smelter by October 1 if a suitable boat was put on upper Snake river.

SOUTH DAKOTA.

LAWRENCE COUNTY.

W. H. Burrage of Boston, Mass., and associates have taken a bond on something over 1000 acres of Ragged Top territory at Lead, taking in the Spearfish and Deadwood-Standard Companies, the Potsdam group of claims and other nearby property. They are prospecting on a gigantic scale, employing 200 men, under the direction of Thomas Goodman, and it is stated that another hundred men are to be put on. The prospecting under way consists of opening a series of cuts, test pits, shallow shafts and other openings through the few feet of loose earth and rock found at the surface in the region. The purchasers are to pay something like $1,500,000 for the ground bonded, and their bond is to run for ninety days. If the transaction goes through the purchasers will organize a company and expect to erect one of the largest cyanide plants in the United States at some point on the ground.

The Mayham syndicate has bought the Columbus mine at Lead, with other groups adjoining on the north, making a total of about 300 acres, covering 6,500 feet along the strike of the mother vein of the country. The Columbus lode has been operated for many years by Ruth & Lardner with a 10-stamp mill. Mr. Ruth says the Columbus has produced $300,000 from free-milling ore.

The Black Hill Copper Co. is setting up a Chilean mill on the Benedict mining ground at Hornblende. A hoisting plant has been installed.

UTAH.

EMORY COUNTY.

The Kaiser M. Co. has been incorporated at Salt Lake City to operate the Copper Boy group of four claims near Summerville. The officers are J. A. Grose president and C. B. Jack secretary and treasurer.

JUAB COUNTY.

The Boston-Yankee Con. M. Co. has been incorporated at Augusta, Me., capital $1,000,000, by P. A. H. Franklin, Salt Lake City; E. C. Ramsdell, Boston, Mass.; H. T. Cram, A. J. Desmond and T. T. Haight, Portland, Me.

The Laclede M. Co., with properties near Diamond, has been incorporated. The company owns a group of ten claims, upon which a considerable amount of development work has been done by the owners of the stock of the new company. T. Weir is the manager and local representative and his associates are mostly St. Louis, Mo., people. The shaft is now down 328 feet and 600 feet of other development has been done on the 300-foot level. The plant now consists of an Ingersoll compressor, a hoist and an 80 H. P. boiler, which will be increased by two more boilers of the same capacity and a station pump. The shaft will be sunk to the 600-foot level.

N. Dunyon, Supt. Scranton in North Tintic, reports the mine in good condition, with shipments of first-class ore more than meeting operating expenses, while a lower grade, containing about 50% lead, has accumulated from development work to the amount of 1000 tons. About 125 tons of first class galena ore is shipped every month to Pennsylvania, the management being able to pay freight to that distant point and get a better net price than the smelter trust, operating here, is willing to pay. Unless better prices prevail, the Scranton will put in a concentrating plant. The ore shoot in which operations are being conducted measures in places 100 feet between walls.

PIUTE COUNTY.

The Mount Belknap M. & M. Co. has been incorporated, with office at Elsinore;

capital, $50,000. The officers are J. S. Hyde president and C. Hyldehl secretary. The company owns the Chief, Wolf, Black Hawk, Moon Shine, Reuben, Full Moon, Blue Bird and Half Moon, in the Mount Baldy district.

IRON COUNTY.

At the Johnny mine, at Stateline, twenty-two men are developing the property and blocking out ore, of which it is estimated there is now a value of about $35,000 on the dump. The work along the vein shows 104 feet of high-grade milling ore. A pump has been installed, a tank erected and 40,000 gallons of water are being taken from the mine daily, part of it being pumped to the Ophir mill, three-quarters of a mile away. About June 1st the Johnny will begin the construction of a 20-stamp mill, with machinery of a capacity to operate a 40-stamp mill. The Ophir mill, at Stateline, has been started up. Sixty men are employed in mine and mill and 300 tons of ore were handled during the first four days. The ore is reduced by roasting and leaching. The Margaret, which is situated between the Johnny and the Ophir at Stateline, has let a contract for continuing its double-compartment shaft, which is now down 100 feet on the 200-foot level, and is opening up milling ore in the old workings.

The Rice group of eight claims at Stateline has been bonded by Salt Lake people.

SANPETE COUNTY.

The discovery of a mountain of rock salt has been made near Gunnison and a large plant will be installed for refining. A number of Gunnison business men, including H. A. Kearns, Dr. A. F. Andrew, H. Robins and E. H. Clark, have been prospecting and at a comparatively slight depth came upon an immense deposit of the finest kind of rock salt. They have drilled in a number of places until they have several thousand tons of the salt in sight. Some of the rock shows by analysis about 98.88% of sodium chloride, with impurities consisting chiefly of iron oxide, which gives the crude mineral a reddish tinge. In boring for the salt several wells of salt water were found, the brine being of about 25% density. A small plant has been started and is making about two tons a day of table and dairy salt. The salt manufactured at Gunnison has a purity of about 99.76%, and the product so far has found a ready sale at the mine. The managers of the plant are preparing to install a boiling plant of a capacity of ten or fifteen tons a day, together with a crusher for reducing the rock salt. They assert that they can make and sell the product at a good profit at the prevailing prices. A test shipment of 300 tons will be made to San Francisco in a few weeks. It is expected a company will be incorporated under the name of the Gunnison Salt Co.

SALT LAKE COUNTY.

The lower terminal building of the United States Co.'s aerial tramway at Bingham has been started under construction. The tramway will be about 3 miles in length and have a carrying capacity of 1000 tons of ore daily.

SUMMIT COUNTY.

The Daly-Judge M. Co., paying $800,000, has bought the entire property of the Anchor M. Co. and contiguous holdings from Mrs. Mary Judge. By this the Daly-Judge Co. becomes the owner of a solid body of over 1200 acres of patented mineral land at Park City. These holdings now include the territories that have from time to time been held by the Utah M. Co., the White Pine G. & S. M. Co., the Jones Bonanza M. Co., the Anchor M. Co., several fractional claims belonging to Mrs. Judge and the Daly-Judge Co.

TOOELE COUNTY.

The management of the Golden Star Co., operating at Gold mountain, near the Annie Laurie mine, is preparing for the erection of a mill. A large amount of ore has been blocked out, and a combination stamp and cyanide mill with a capacity of from 50 to 100 tons daily is to be employed in reducing the ore.

WASHINGTON.

FERRY COUNTY.

R. H. Clarke of Spokane says the company owning the Meteor mine, at Meteor, is planning a tunnel 1000 feet long to reach the vein at a point 400 feet deep under the main shaft.

The Alamo G. M. & M. Co. at Meteor is sinking a shaft on the Red Dog claim. The ledge is 7 feet wide and has an 18-inch pay streak showing argentite.

LINCOLN COUNTY.

The White Rose M. Co. has been organized at Davenport, with C. H. Neal president, L. D. Todd secretary, J. C. Bowen manager and G. T. Eves Supt. The company owns seven claims in the Meteor mining district and will begin development immediately.

SNOHOMISH COUNTY.

Gold has been found in Index in paying quantities by F. Collins and R. Martins, who were digging an entrance to a cellar and struck the pay at a depth of about 3 feet. Other discoveries have been made. None have been developed.

It is reported that a large vein of $100 a ton gold ore has been struck in the Bonanza Queen group at Silverton. The new prospect exposed 8 feet of high-grade ore and 14 feet of concentrating ore at a depth of 60 feet.

WYOMING.

LARAMIE COUNTY.

The new Rambler mine on Douglas creek is to have a smelter. J. T. Holliday of the board of directors has completed arrangements for the erection of a copper matte plant of about forty tons daily capacity to begin with.

The King Solomon mine, 6 miles from Tie Siding, has been sold to I. Conkling and associates of Denver, Colo., who will install a plant of machinery and develop what is believed to be a rich vein of copper in the shaft.

FOREIGN.

BRITISH COLUMBIA.

(Special Correspondence).—The Mines Exchange, Ltd., of Nelson says conflicting stories concerning the new placer diggings on Horse Fly creek, Cariboo district, are being told by returning prospectors, but nothing can be known as to the extent and value of the field until after the snow has left the ground. A large number of prospectors are going in, traveling by the Horse Fly lake route. Later, when the snow is gone, it is thought that the river trail will be the preferable route. The new diggings are 190 miles by stage and 60 miles by trail from Ashcroft, on the railroad.

The Silver Cup mine at Lardeau, owned by the Horn - Pane people, has been bought by W. B. Pool and J. J. Young for, it is reported, $500,000. There is now 800 tons of silver-lead ore mined and ready for shipment, valued at $116,000, the product of the mine since November, 1901.

The Triune mine has been bonded by C. W. McCrossan, manager of the Lardeau S. & R. Co. If the smelting of the Triune ore is satisfactory the smelter will be enlarged to treat the ores from other Lardeau properties.

H. Z. Brock, manager of the Northwestern Development Syndicate, is procuring an electric 60 H. P. plant to be installed on the Camborne group at Lardeau. It is intended to put in three electric power drills.

The Turnover and Runover claims, located in Bayonne Camp, owned by H. L. Jackson of Ymir, have been bonded by C. P. Hill for $50,000. These claims adjoin the Bayonne group, bonded last fall by Finch & Campbell of Spokane for $100,000.

The annual report of the Crow's Nest Pass Coal Co. says that the net profits for 1901, after paying all operating expenses and all charges of every kind, amounted to $270,848.39. After paying dividends at the rate of 10% per annum the balance of $28,142.89 was carried forward to the credit of profit and loss. Thirteen hundred and twelve men were employed during the year, and 636 coke ovens have been constructed, with a capacity of 1000 tons of coke per day. Of the sum of $2,265,548.06 expended by the company during the year, $911,407.15 were paid out in wages and $346,092.41 for freight. The operations for the coming year will be on a much larger scale than that of the past year.

A strike of 2½ feet of high-grade ore at a vertical depth of 800 feet has been made in the Hewitt mine, near Silverton. The vein was cut at a point 1000 feet from the portal of the tunnel.

Nelson, March 20.

The Mines Exchange, Ltd., of Nelson says: The Burlington M. & M. Co. has been incorporated at Spokane, Wash., capital $150,000, by W. D. Wrighter, W. S. Rogers, C. W. Geih and J. H. Travers of Spokane and T. A. Noble of Pittsburg, Pa. This company owns a property in the Iron Horse group of claims situated in the dry ore belt of the Slocan. The property is equipped with a hoisting plant and connected with the railroad by a wagon road. It is claimed that there is a good shoot of ore in the Enterprise vein. There is considerable excitement in the town of Kaslo over the reported discovery of gold placer ground on Cooper creek some 4 miles from town. A company has been organized to work the deposit by the hydraulic method. At an annual meeting of the Simcoe M. Co., at Ymir, S. D. Brisay was re-elected president and treasurer. The company owns the Big Horn group of claims about 7 miles from Ymir, on which considerable development work has been done. It was decided at the meeting to resume operations. The management of the Estella mine in East Kootenay have bought the Thunder Hill concentrating plant which they are re-erecting at the Estella mine. The capacity of the plant is in the neighborhood of 100 tons per twenty-four hours. The Estella consists of a group of eight claims, with 2000 feet of development work done, exposing ores carrying grey copper, copper oxide, galena and pyrite, gold and silver.

Nelson, April 5.

It is reported that work will be started up on the Lightning Creek G. Gravels & Drainage Co.'s properties on Lightning creek, $30,000 having been provided for it. The shaft is down to a depth of 120 feet to bedrock and a drift out 150 feet. It is expected to open the old channel in a few feet more advance.

A strike is stated to have been made on the Leonora mine, at Mount Sicker, the rich vein already uncovered being encountered at a depth of 320 feet, in No. 3 tunnel. The ledge is about 30 feet wide, with a narrow vein of very high-grade ore. The trestle over the E. & N. Railway is finished, and track-laying on the Mount Sicker line commenced.

Fifteen men are employed driving a tunnel below the old works at the Hardie Mountain cinnabar mines. The mines are the property of the Hardie Cinnabar Mines, Ltd., of London, capital £50,000. The headquarters of the company are at Kamloops.

Two samples of ore from Princeton, one from the Olympia claim, owned by McRae Bros., and the other from Diamond B., owned by J. Beaver, have been found to contain platinum in commercial quantities. For several years past platinum has been recovered from placer workings in the Similkameen and Tulameen rivers, and considerable quantities have been found associated with the gold in Granite creek. A number of attempts made to locate the source of these placer deposits have finally resulted in success.

The Marie-Marilia M. Co. of B. C. has been incorporated in Minneapolis, Minn., to operate the Pedro group of claims on Canyon creek, Lardeau-Duncan division of West Kootenay. J. M. Miller of Rossland is a director.

The Luke Creek Gold-Copper M. Co. has been incorporated in Minneapolis, Minn., to operate two claims in the Fort Steele mining division.

A 3½-mile aerial tramway is under consideration for the True Blue mine at Kaslo. The plan is announced in connection with work on a new tunnel to tap the ore body at several hundred feet greater depth. If the showing at that point is satisfactory the tramway will be put through.

At the Granby smelter at Grand Forks four furnaces were in operation on the 2nd inst., increasing the capacity to 1500 tons daily.

A strike is reported made on the Monitor mine at New Denver. The pay streak in the drift shows 3 feet of solid ore of a high grade.

It is reported that the option given by the owners of the Anderson Lake mines on McGillivray creek at Lillooet to A. Hawks of Snohomish, Wash., will be taken up and the immediate development of the properties started on a large scale. The mill will, it is reported, be at once increased to twenty stamps.

It is reported that J. J. Hill and associates have bought a large interest in the Granby smelter at Grand Forks.

CANADA.

A summary of the mineral production of Canada for the year 1901, prepared by the geological department, shows the total mineral production for the year was $69,407,031, as compared with $64,488,037 in the year previous, or a total increase of $4,918,994. The entire gold production is valued at $24,462,222, of which the Yukon gold fields contributed $18,000,000. Of copper there was $6,600.104; pig iron, from Canadian ore, $1,121,113; lead, $2,199,784; nickel, $4,594,523; silver, $2,993,668, and iron exports, $762,284. These, with the gold production, makes a total of $42,824,698 metallic production. There was $26,282,333 non-metallic and $300,000 products not returned, which, added to the non-metallic makes, made a total production of $60,407,031. Coal production is valued at $14,671,122; coke, $1,264,360; petroleum, $953,415; asbestos, $1,186,434, and building material, $4,820,000.

MEXICO.

The Mexican Anthracite M. Co., C. P. Eagan president, is pushing development work at San Marcial. The shaft, now down about 240 feet, is expected to reach the big bodies of coal at 430 feet. A hoist and a 22-drill air compressor are in operation. The survey for the railroad between San Marcial and the Sonora Railway near Moreno is progressing under F. R. Brown, the chief engineer, who has twenty-three men engaged in the work. As soon as the survey is completed construction work will begin.

J. F. Delgado, owner of the Palagonite mine, near Escondido, Lower California, is projecting a large plant for the manufacture of mineral paint from the products of the mine. A small plant testing the material has made a satisfactory paint. Palagonite is a soft fine-grained stone easily worked.

San Francisco people are negotiating to buy the Ibarra mines, near Calmalli, in Lower California. They are a large group and many thousand dollars have been expended in their development. The price is $350,000.

Utah Strike M. Co. of Mantl, Utah, capital $50,000, has been incorporated, with T. E. Christenson president and E. T. Parry secretary and treasurer. The company owns the Utah Strike claim in the Cusihuirachic district of Chihuahua.

SIBERIA.

Exclusive mining privileges in the Eastern Siberia peninsula, it is claimed, have been granted by the Russian Government to J. Rosene of San Francisco and Col. Wonlarsky, retired, of the Russian Imperial Guard. The boundaries of the tract are as follows: East, Behring sea; south, Behring sea; north, Arctic ocean; west, line from Anadir bay through the River Angouirma to the Arctic. The area is as big as Washington, Oregon and California combined. The exploration and development will begin as soon as possible. Trading stations will be established at St. Lawrence bay, Plover bay and Anadir. The concession admits machinery, provisions and all the supplies of the company for twenty-five years free of duty. The policy in purchasing will be to buy from Russian concerns as much as possible, but the United States will be drawn upon heavily for machinery and supplies. The Northeast Siberian Company, incorporated in St. Petersburg with Rosene as manager, will develop the concession.

SOUTH AFRICA.

At Johannesburg to the 7th ult., twenty-six mines, each running fifty stamps, had been restarted. The native labor association has undertaken sufficient supply of natives from the east coast. They are reported coming in at the rate of 1000 per week.

THE PHILIPPINES.

H. Bernhardt, who for over a year has been engaged by the U. S. Coast and Geodetic Survey in the Philippine Islands, has returned to San Francisco. He says: "I saw at Leyte, in the Island of Samar, a ledge of gold quartz running down to the water's edge and extending many miles into the interior. The country is well wooded. In Mindanao island we found veins of coal."

Commercial Paragraphs.

THE Santa Fe Railway Co. will build new shops at San Bernardino, Cal., costing $107,855.

THE Sullivan Machinery Co. has established a branch office at 306 St. Louis St., El Paso, Texas.

THE Scott Supply & Tool Co., Denver, Colo., have moved into larger quarters at 1725-7 Blake St., that city.

THE Philadelphia office, at 612 Arch St., of the Stilwell-Bierce & Smith-Valle Co., of Dayton, Ohio, is now in charge of O. G. Smith.

SCHAW, BATCHER & CO., of Sacramento, Cal., have the contract for building works for a $200,000 water company organized at Keswick, Cal.

THE Western Chemical Mfg. Co. of Denver, Colo., is a reorganization of the Western Chemical Co., with increased capital and business resources.

H. D. & H. W. MORRIS, representatives of Chrome Steel Works, have removed their office from 194 Crocker Bldg. to 26 Montgomery St., San Francisco, Cal.

THE old established assaying office of L. Falkenau, 538 Sacramento St., San Francisco, Cal., is now in charge of the Falkenau Assaying Co. (incorporated), Louis Falkenau president.

JOHN W. STANFORD, of Calivo, Philippine Islands, wants catalogues of saw mill, wood working, mining and brick making machinery. He says there will also be a good market in the Philippines for turbine wheels and electric apparatus.

WILLIAM B. SCAIFE & SONS' mill, Oakmont, Penn., is enlarged and several new departments added. A new department is contemplated for the manufacture of the Kendel car trucks. A large contract for the Mexican Government has just been completed.

THE new rock drill invented by A. C. Bates of San Francisco, Cal., has been tested and is now placed on the market by Griffitts & Howlett, manufacturers of

mining machinery, 85 Fremont St., San Francisco. Those who have seen the drill in operation ascribe to it many points of excellence.

THE Chicago Pneumatic Tool Co. has absorbed the Standard Pneumatic Tool Co. and New York & Franklin Air Compressor Works, and are now sole manufacturers of the Boyer hammers, Little Giant drills and reversible boring machines, also compressors. Eccles & Smith, 91 Fremont St., are sole Pacific coast agents.

THE Standard Oil Co. is putting in a 276-mile 8-inch pipe line from Bakersfield to Point Richmond, Cal. The route follows the line of the Santa Fe road to Kernell, thence to Corcoran, thence to Lethent on the S. P. From there it runs straight to Mendota, thence following the railway line to the Point Richmond refinery. Pumping stations will be built every 25 miles.

PRESIDENT L. D. WOODFORD of the Tom Thumb G. M. & M. Co., Spokane, Wash., writes: "Three new Leyner drills of the latest work and improvement were shipped from Denver, Colo., to replace our three old drills, upon which radical improvements have been made. This was done at a cost of $275. Both of these purchases were made upon the recommendation of the superintendent, who reports that each will save its original cost in the present shaft work alone."

Personal.

FREDERICK BAKER, of London, is in Denver Colo.

A. P. CHITTENDEN is Supt. Pioneer G. M. Co., Towle, Cal.

V. M. CLEMENT of Salt Lake City, Utah, is in New York.

T. K. WILKINSON, of San Francisco, Cal., is at Gardnerville, Nev.

MANAGER HENLEY is now operating the Victor mine at Elkton, Colo.

GEORGE C. CARSON, late of Redding, Cal., is now in Birmingham, Ala.

J. F. WARNER has been appointed assistant State engineer of Wyoming.

A. J. UNDERWOOD is consulting engineer La Reine mine, Tintic, Utah.

U. G. WOLFE is manager of the Polaris M. Co. gold mine near Clifton, Ariz.

VICTOR M. BRASCHI of the City of Mexico, Mexico, is in San Francisco, Cal.

HARRY K. WHEELER, M. E., of Los Angeles, has returned from San Francisco.

R. A. CAMPBELL of the Miocene G. M. Co., at Harpers, B. C., is in Rossland, B. C.

THOMAS GOODMAN is in charge of extended prospecting work at Spearfish, S. D.

W. H. ELWOOD of Idaho Springs, Colo., is now Supt. Old Galena mines, Washoe, Nev.

M. L. BOWEN, manager Yo Tamhien mine, near Globe, Ariz., has gone to New York.

ROY D. HUNTER, Denver manager Sullivan Machinery Co., has returned from Chicago.

ALEXANDER REID has gone to China as chief mining engineer for the Pekin Syndicate.

SAM BECK of Prescott, Ariz., has been appointed Supt. Burson mine, near Wickenburg, Ariz.

OTTO VON GELDERN of San Francisco is planning a $70,000 irrigation system for Modesto, Cal.

W. S. JONES, M. E., of New York, is in the Cooks Inlet country of Alaska examining mines.

B. T. LEWIS, of Los Angeles, Cal., is examining mines in the Searchlight district of Nevada.

H. NILES, manager Ft. Bayard M. & M. Co., Silver City, N. M., has returned from New York.

LEWIS T. WRIGHT, manager of the Mountain Copper Co. at Keswick, Cal., is in San Francisco.

P. J. NEVINS, of New York, is manager of the French Gulch placer mine at Breckenridge, Colo.

D. J. SAYER, manager Butterfly-Terrible mine, near Ophir, Colo., has returned thence from Denver.

C. E. TOLMAN is now superintendent Con. G. M. Co. of Arizona, in the Guijas district, near Arivaca.

HOWARD DAVIS, superintendent of the Mammoth Bar River mine at Auburn, Cal., is in San Francisco.

J. EDDY of San Francisco has been appointed superintendent of the Gold Tunnel mine at Nevada City.

FRANK H. PROBERT of Los Angeles, Cal., has gone to St. George, Utah, to examine a copper property.

J. C. STEELE, Supt. Golden Jubilee mine, near Carrville, Cal., has returned there from San Francisco.

K. SCHMIDT has been appointed master mechanic Greene Copper M. Co., at La Cananea, Sonora, Mexico.

JOHN STARK, Supt. of several mines operated by W. S. Stratton at Cripple Creek, Colo., has resigned.

A. NEBEKER has resigned as superintendent of Coconino Co. mine and reduction works near Kanab, Ariz.

LEON M. HALL, consulting engineer Grass Valley, Cal., Con. M. Co., has returned to San Francisco, Cal.

J. GALLAGHER of Tuttletown, Cal., has been appointed Supt. Juhilee M. Co., at the Hazel Dell mine, near Sonora.

A. F. STEVENS, superintendent of the Addle Con. M. & M. Co., of Silver City, Ida., has returned from New York.

CHARLES DAVIES has sailed for the Ashanti G. Corporation, West Africa, where he will be assistant manager.

HARRY A. LEE, commissioner of mines bureau, will have charge of Colorado's mining exhibit at the St. Louis Exposition.

C. D. RIDGEWAY, of Telluride, Colo., succeeds Jno. Madill as superintendent Cochran M. Co., Deadwood, South Dakota.

C. REDPATH has been appointed superintendent of the John A. Logan and American Eagle mine at Cripple Creek, Colo.

H. F. STEWART has been appointed Supt. San Joaquin M. Co., at Angels Camp, Cal., succeeding J. McClay, resigned.

FRANK L. SIZER, M. E., has returned to Butte, Mont., after two weeks absence examining one of the newer districts of Montana.

F. J. SIEBERT, manager Tonopah Co., at Tonopah, Nev., is in Philadelphis, Pa., to attend a stockholders' meeting of the company.

RICH. B. STANFORD, formerly of Goldfield, Colo., is operating the Von Tromp and other mines for the Estey Syndicate, at Columbia, Cal.

W. L. WATTS has returned to Los Angeles, Cal., from a two months' trip through the Colorado river region in southern Nevada.

MANAGER THOMAS HOATSON of the Calumet & Hecla and Supt. Brady of the Michigan are inspecting the Empire mine, Marysville, Mont.

DR. DAVID T. DAY has resigned as chief of Department of Mines and Metallurgy at the St. Louis Exposition and will he succeeded hy Dr. J. A. Holmes, State Geologist of North Carolina.

J. L. SHAFTNER of Cleveland, Ohio, president International Miners' Congress, is in San Francisco. He says he expects a big meeting of the members of the Association at Butte, Mont., next July.

J. MADILL has resigned as Supt. Cochran M. & M. Co. at Lead, S. D., to take up the management of his own properties in the same locality. C. D. Ridgeway, late of Telluride, Colo., succeeds him.

WILLIAM WATTS and a crew of fifteen carpenters, who have been constructing a gold dredger at Wheatland, Cal., have gone to Sonora, Mexico, to remain about four months, constructing dredgers.

E. SARLIN, a mining engineer of Helsingfors, Finland, has been making a tour of the mines in California, Colorado and Arizona, studying American mining methods and machinery. He states that there are extensive placers in northern Finland which are to he opened up soon.

KASAKU ASANO of Tokio, Japan, a representative of the Ashio Copper Co. of Japan, has been at Clifton, Ariz., investigating the methods of treating copper ores. He is in the United States for the purpose of gaining knowledge of American copper mining methods and machinery, with a view to making changes in his company's plant in Japan.

Recently Declared Mining Dividends.

	Payable.
Vindicator Con. G. M. Co., Colo., quarterly, 3 cents extra, 2 cents per share, $55,000	April 25
Portland G. M. Co., Colo., quarterly, 6 cents per share, $180,000.	April 15
Mary McKinney G. M. Co., Colorado, quarterly 3 cents per share, $30,000	April 10
Finance Con. M. Co., Colorado, ½ cent per share, $2000	April 10
Daly-West M. Co., Utah, monthly 40 cents per share, $72,000	April 10

Books Received.

"Locomotive Sparks," hy W. F. M. Cross, 8 vo., 172 pages, illustrated, is a study of the fuel losses from locomotives in the form of sparks. It is a compilation of data of observation and experiments useful to students of locomotive performance and designers of spark arresting and fuel saving devices for locomotives. Published hy John Wiley & Sons, 43 East Nineteenth St., New York. Price $2.

Latest Market Reports.

SAN FRANCISCO, April 11, 1902.

METALS.

SILVER.—Per oz., Troy: London, 24¾d (standard ounce, 925 fine); New York, har silver. 53¾c, refined (1000 fine); San Francisco, 53¾c; Mexican dollars, 44½c San Francisco, 43c New York.

COPPER.—New York: Lake, 1 to 3 casks, $12.25; carload lots, $12.00; Electrolytic, 1 to 3 casks, $12.00; carload lots, $12.25; Casting, 1 to 3 casks, $12.00; carload lots, $12.25. San Francisco: $14.00. Mill copper plates, $17.00; hars, 18@24c. London: £53 7s 8d per ton.

SPELTER. — New York, $4.35; St. Louis, $4.00; London, £17 16s 3d per ton; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lh. lots, 10c; 300 to 500 lbs., 11c; 100-lh. lots, 13@15c.

TIN. — New York, pig, $27.00; San Francisco, ton lots, 27c; 1000 lbs., 27⅛c; 500 lbs., 27¼c; 200 lbs., 27½c; less, 28c; bar tin, ℔ lb, 30c.

PLATINUM.—San Francisco, crude, $17 ℔ oz.; New York, $18 per Troy oz

QUICKSILVER. — New York, $51.00 large lots; London, £8 15s; San Francisco, iocal, $47.50 ℔ flask of 76½ lbs.; Denver, $51.00. Export, $45.00.

BABBITT METAL.— San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER. — Half-and-half, 100-lb. lots. 18c; San Francisco, Plumbers', 100-lb. lots, 14.20c.

NICKEL.—New York, 50@60c ℔ lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $17.25; gray forge, $17.75; San Francisco, har, 2.75 ℔ lb.,3c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $31.75; open hearth billets, $32.25; San Francisco, bar, 7c to 12c per lb.

CEMENT.—Germania, $2.65; K. B. & S., $2.65; Hewmoor, $2.50; Trowell, $2.50 per hbl.

LIME.—Santa Cruz, $1.60; Rocbe Harbor, $1.60 per hbl.

LUMBER.—(Retail): Pine, ordinary sizes, $18.00@19 50; extra sizes higher; redwood, $19.00@20.00; latb, 4 feet, $3.90 @4.00; pickets, $19.00; sbingles, $2.00 for No. 1 and $1.75 for No. 2; shakes, $13.00 for split and $14.00 for sawed; rustic, $25.00 @31.00.

GENERAL SUPPLIES.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.50; Cut, $3.50; 10d to 16d, Wire, $3.55; Cut, $3.55; 8d, Wire, $3.60; Cut, $3.60; 6d and 7d, Wire, $3.70; Cut, $3.70; 4d and 5d, Wire, $3.80; Cut, $3.80; 3d, Wire, $3.95; Cut, $3.95; 2d, Wire, $4.20; Cut, $4.20. Special rates for carload lots.

POWDER.—F. o. b. San Francisco: No 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one toss 15½c. No. 1** 50%, carload lots, 11½c; led, than one ton, 13½c. No. 2, 40%, carloan lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ℔ set; 14 oz., 40s., 9c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $6.50; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymho, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $9.56, long ton; Colorado Anthracite, $14.00. Coke, $15 per ton in bulk, $17 in sacks; Sunnyside, $11.75, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 29@30c ℔ lb.; carloads, 27@28c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c ℔ lb.; soda ash, $1.90 ℔ 100 lbs.; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5¾@6¼c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 5c; alum, $1.90@2.00; flour sulphur, French, 2½@2¾c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.25 @1.50 ℔ 100 lbs.; sks, $1.05; chloride of lime, spot, $2.50@2.60; nitrate of potash, in hbls, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, boiled, hhl., 76c; cs., 81c; raw, hhl., 74c; cs., 79c; lots of 5 bhls., 1c less; Lucol oil, hoiled, hhl., 66c; cs, 71c; raw, hbl., 64c; cs, 69c. Kerosene —Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in hulk, 13½c; Mineral Seal, iron bbls, 19c; wooden bhls., 22½c; cs, 25c; Mineral Sperm, cs, 26½c; Deodorized Stove Gasoline, bulk, 15½c; do., cs., 21½c; 86° Gasoline, hulk, 20c; do., cs., 26½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14c; do., in cs., 20½c; Lard Oil, No. 1 bbl., 60c: cs., 65c; Neatsfoot Oil, bbl., 70c; cs.. 72½c; No. 1 hhl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6¾c; 1 ton and less than 5 tons, per lb., 7c; 500 lbs. and less than 1 ton, per lb, 7¼c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In bhls., 1 ton and over, 6¾c; do. in kegs, 7¼c.

RED LEAD AND LITHARGE —One ton and over at one purchase, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7¼c; less than 500 lbs., 7½c.

ASSAY LITHARGE.—Per lb., 9c.

BISMUTH.—Subnitrate, per lb., $1 60.

BONE ASH.—3c ℔ lb.

BORAX.—Crystal, 7c: calcined, 20c.

CHROMIUM.—(90% and over) per lb., $1.25.

COPPER.—Carbonate, 20c; Red oxide, ℔ lb., 60c.

MAGNESIUM.—Per lb., $3.00.

MANGANESE.—(90% and over) ℔ lb., $1.25.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—25c. ℔ gramme; 1000 grammes=2⅛ lbs.

PHOSPHORUS. — (American) ℔ lb., 80c.

SILVER.—Chloride, ℔ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ℔ lb, $1.00

URANIUM.—Oxide, ℔ lb., $3.50.

ZINC.—Metallic, chemically pure, ℔ lb., 50c.

ZINC.—Dust, ℔ lb., 10c.

ZINC.—Sulphate, ℔ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

EMERGENCY SHACKLE.—No. 696,136. March 25, 1902. E F. Diamond, Oakland, Cal. The object of this invention is to provide a means for connecting cars so that they may continue their journey after the couplings have become broken or disabled. It consists of rectangular yokes with a single open side to fit over a portion of the drawhead, pins or rods extending through holes in said yokes and chains connecting the pins of one drawhead with those of the other, through which power may be applied to draw the cars.

QUICKSILVER SEPARATING AND CONTINUOUS ORE FURNACE. — No. 696,323. March 25, 1902. C. Fitzgerald, San Francisco, Cal. One-half assigned to W. B. Gester, Newcastle, Cal. This invention relates to improvements in furnaces for roasting ores, and particularly ores containing mercury. It consists of inclined muffles having spaces above and below, a partition within the lower space whereby the heat is directed to the front, thence passes around the partition and beneath another portion of the bottom to the rear; ore inlets and outlets and pipes embedded in the walls of the furnace having one end opening to the outer air and the other entering the muffles, and means by which heated air may be delivered thereto, and a vapor outlet, and means for condensing mercurial vapors.

BED BOTTOM ATTACHMENT.—No. 696,239. March 25, 1902. John Hoey, San Francisco, Cal. This invention relates to attachments for bed bottoms, using woven wire and similar mattresses. It consists in the combination with the wooden side bars of such a mattress or bed bottom having adjustable and reversible plate and lug, which is designed when in its normal use to retain the bed bottom frame in position upon a pedestal frame, and its other use is, when turned, to protect the ends of the side frames and prevent their being split and damaged during transportation.

REVOLVING CYLINDER EXPLOSIVE ENGINE.—No. 696,251. March 25, 1902. J. D. McFarland, Jr. San Francisco, Cal. One-half assigned to John Bruckman of same place. This invention relates to an engine having cylinders mounted radially with relation to an axis and suspended with a

Pacific Coast Iron Manufacture.

The great hodies of hematite, magnetite and specular iron ore which have heen discovered in many of the islands of southeastern Alaska and along the coast of British Columhia during the last four years are ahout to he exploited on a considerahle scale for the manufacture of iron and steel. In 1899 far-seeing manufacturers of iron and steel in Pittsburg and other Eastern centers of the industry commenced making inquiries for availahle iron ore deposits on the Pacific coast. Their work, conducted quietly, is only now hecoming puhlic in the form of results well on the way toward final accomplishment.

According to accounts they have bought many specially desirahle deposits of ore close to tide water and are planning great coke plants and hlast furnaces.

This journal has repeatedly called attention to the dormant value of these Pacific coast iron ore deposits and a few months since presented an elahorate analysis of the actual commercial conditions, which made iron and steel manufacture on the Pacific coast a present commercial possibility for not only the local, hut for the world's markets as well, in competition with the already estahlished Pennsylvania and Ohio industry. The plans just hecoming puhlic confirm the correctness of the forecast this paper made.

The westward-facing shores of the Pacific have come to their own in the way of commercial transportation in the East. It is also notahle that capital does not have to lock itself up five months in the year in ore carrying ships and docks that cannot be used during that period on account of ice. That this is not a small matter is evidenced hy the ore carrying rates on the great lakes which this year are to he several cents less a ton hecause the earlier hreaking up of the ice is expected to permit of two trips in April where none are ordinarily counted on.

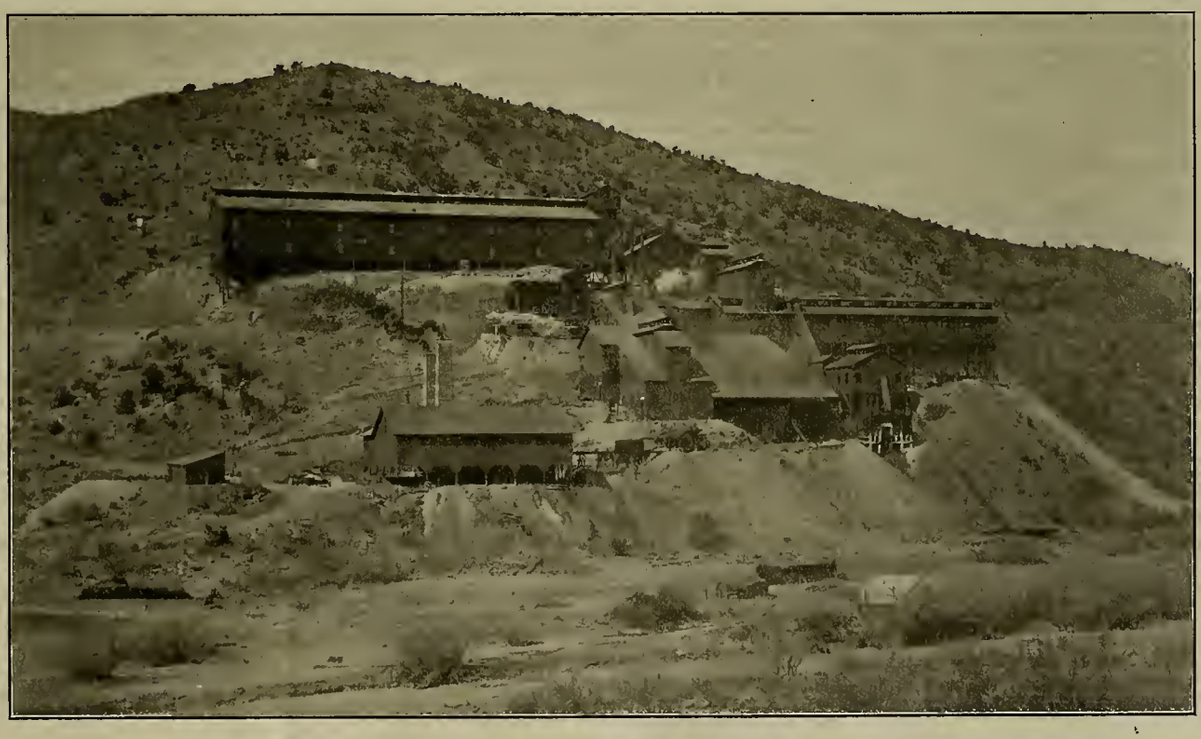
Opening a Platinum-Bearing Lode in Arendal, Norway.

The estahlishment of one great iron and steel plant is under consideration at San Francisco. The second to he projected, hut prohably the first to go into operation, is a 200-ton blast furnace to he located at Tacoma, Wash. The former expects to use California iron ores and will have to import coke. The Tacoma plant has its coke and limestone close at hand and will freight its ores hy water from the island districts to the northward. The plants that will follow these pioneers will in all prohahility he located at the iron mines on the islands of southeastern Alaska. The conditions are there the most favorahle for reducing the reducible item of transportation to its lowest limit. Prince of Wales Island to an exceptional degree offers natural facilities for iron manufacture and is commercially well located. The ship transportation of coke from, say Puget Sound, to the furnaces at the iron mines on Prince of Wales Island, and the return transportation thence of the finished iron and steel, will only require half the vessel tonnage to the ton of iron production that the transportation of the iron ore from Prince of Wales Island mines to Puget Sound would necessitate. This arises from the fact that the weight of coke required to produce a ton of iron is practically the weight of the waste in a ton of iron ore, and while the total weight transported is practically the same in either case, it makes in the first case an even load of ahout half each way, while in the last it is all in one load one way, which of necessity means douhle the ship tonnage for the same weight of iron produced.

This may not he a very great difference in cents per ton, hut it is the little differences in cents per ton that decide the competitive survival of great industries at the present time. The situation for profit in Pacific coast iron manufacture seems favorahly assured. It is gratifying to he ahle to record the initiation of the husiness of its estahlishment.

A Platinum-Bearing Lode.

The accompanying illustration is of the discovery of a lode hearing platinum, located at Arendal, Norway. The discovery was made in the summer of 1901, and developments so far made indicate a commercial quantity of the metal in the rock. An experimental treatment plant of ten tons daily capacity has been erected. The deposit is quite extensive. All of the men shown in the view are standing on the outcrop of the ore hody.



Black Warrior Copper Co., Amalgamated, Leaching Plant at Black Warrior, Ariz.—(See Page 218.)

conditions justifying large scale iron and steel manufacture. They have always had the iron ores for the seeking, closer even to tide waters than are the Michigan and Minnesota ore heds to the lakes. Cheap coke supplies promise to meet the demand now ahout to he made for them. The facilities for, and costs of assemhling the raw materials are at once superior and cheaper than in the East. Iron ore can he mined and transported through the entire twelve months of the year. Capital does not have to lock itself up for several months each year in stock ore piles—in fact it is possible to eliminate for some installations the stock ore pile entirely and dump the ore from the mine car directly into bins feeding hy gravity the hlast furnaces. There is the same fortunate situation for the limestone required as flux, and water transportation for coke as against rail

---

THE electrical utilization of water powers can hardly result in a development of power supply in excess of a market consumption. If electrical power can properly he termed a commodity, it is so flexihle a commodity, and so interchangeahle into light and heat, that it will find new uses which will consume any production that is made. The only limit use will have will be found to be the commercial one of the cost of creating the supply.

The Secretary's Decision in the Scripper Cases.

The Secretary of the Interior has rendered a decision in the cases of the Kern Oil Co. vs. Clarke, and the Gray Eagle Oil Co. vs. Clarke, involving petroleum bearing lands in the Bakersfield oil field of Kern county, Cal. The decision which has been announced upholds every point that was made in Commissioner Hermann's decision on the same cases a year since. While, as would appear from the telegraphed summary of the opinion, there are no new grounds for it advanced, it is stated that the discussion of the questions involved has been elaborated, and authorities have been compared and cited more fully. It may be taken that the decision just rendered indicates and finally settles the policy of the Interior Department in its definitive rulings as to the future classification of public lands. The Secretary's opinion is that the provision of the statute which declares that forest reserve lien selections can only be made on vacant land, refers to the physical condition of the land, and prevents the selection of lands which are occupied for mining or any other purpose, even though no entry of them has been made at the local land office.

This last declaration is of vast importance to the mining industry. It is common sense applied to the definition of common conditions in a mining district. Practically a reaffirmation of Commissioner Hermann's definition, it illustrates the value to a great industry of a mind familiar with its details in a place where decisions are made affecting the prosecution of the industry. It is notable that it is bringing the definition of what constitutes mineral lands back to what the framers of the statute meant, and is putting the Interior Department mineral land rulings in accord with many decisions of trial courts and with some decisions made by appeal courts.

Heretofore many rulings have been made which did not recognize the physical occupancy of the land for mining as evidence of its character and proper classification as mineral land. With this recognized, the classification of railroad grant lands in mineral-bearing districts becomes a much simpler matter, and, presuming good faith to the parties on both sides, the irritating friction that has existed for years should largely disappear. The effect of the ruling is to make a physical fact the conclusive evidence of the classification in place of the opinions of experts or inexperts as to whether mineral which cannot be seen will or will not pay commercially. Is the land in bona fide occupancy as mining claims? will be the main question. If it is, the land is mineral. If it is not, the land is non-mineral.

It is reported that the scrippers will now take their contention into the courts. Beaten in law, and by the facts and by public policy, they have still another trial simply because an executive department is not a court. In the face of the clear logical definition of the meaning of the statute that the Secretary of the Interior makes, it would seem unthinkable that the scrippers should obtain a reversal of the decision. The only possible contention that can be made is over the provision of the statute requiring physical discovery as a condition precedent to the right to validly locate a mining claim. To meet this it will be necessary for the claimants under mining locations to show to the courts beyond the question of a doubt the common physical relation of the minable values in placer deposits to the surface on which locations must be made. This common physical relation is that the valuable mineral is covered by some depth—sometimes considerable—of barren overburden which has to be removed or penetrated to make the physical discovery. Nature rarely does this removing or penetrating, but commonly provides traces or prospects to indicate to the miner what particular surface to choose, from which to explore downward. This common physical relation of the mineral in the placer to the surface is the common physical relation in the gold-bearing placers. Actual discoveries are only uncommonly made on the physical surface. If the scrippers should succeed in having the court rule that a physical discovery of mineral is the condition precedent to a valid placer location, the entire practice of fifty years in making placer locations is reversed, and the real intent of the statute relating to placer mining is practically nullified. The decision of the Interior Department that bona fide occupancy made by a placer mining location vests an exclusive conditional grant in the locator is the Interior Department's recognition, though a tardy one, of the actual physical condition that miners and the public have always recognized. Nowhere and at no time have miners as between themselves ever questioned placer locations made in good faith—even though no precedent discovery was made. That is, they do not ignore occupancy and proceed by making the actual discovery to initiate a superior title. The miners have always recognized occupancy in good faith as the basis of a location and exclusive possession under it. The statute was intended to recognize this common practice. The Interior Department by its decision here reviewed so declares it. Properly and fully presented, the courts can be depended on to make it their ruling.

What the Smelter Combination is Doing to Colorado.

Other interests in Colorado, besides that of the mine owner alone, are beginning to feel the effects of the policy of the smelter combination. It has needed something of the kind to make the communities solely supported by the mines realize their dependence on them. In the feeling inspired by the sense of a common injury there is a general enlightenment as to the cause. Compressed into a sentence, it can be said, that the policy of the smelter combination which begins by keeping empty the pocket of the hundreds of mine owners in Colorado, ends by keeping empty the stomachs of the thousands of people in the mining communities and wherever in the United States anything used for mining is produced.

This seems a strong sweeping statement, but it will stand the analysis of the most cold blooded investigation as to the facts. The policy of the smelter trust in Colorado is not simply a matter of private injury to a few mine owners, but is a public wrong striking at every material interest of the State.

The contemplation of the situation is not a correction of it. It is not worth while to discuss how the smelter combination does it. The why it does it is easily answered: Its policy pays them money at the present time. It is profit they are after and which they are getting. The important matter is: What is Colorado going to do about it? The question, as pointed out, is broader than the pockets of the mine owners. The latter have so far been left to act alone under every possible disadvantage that public indifference could put in the way. If the public will cease being indifferent, if it will grasp firmly and unyieldingly the idea that it must insure the possibility of profit to the mine operator if it would insure for itself a full stomach, it can by permanently joining the mine operators destroy the smelter combination in Colorado.

In commenting on the recent meeting of Colorado mine owners at Denver, this journal suggested that the miners—the men who work for wages paid from the product of mines—had a joint interest in destroying the smelter combination, and that they should join in doing it. The suggestion was tentative. Behind it was the idea that the other industrial and the trading interests should be allies against the one octopus-like interest. It appeared as though the statement of the idea then would complicate the consideration of the situation by those most interested. If so then, it is not now, and it appears that even part of the transportation interest is feeling the effect of the knock-out drops administered by the smelter combination. It may have been made sick enough to see the mistake it has made in community of interest. If it can be made to see that there is a greater permanent profit for it in a community of interest with the mine operators and people of Colorado than in a community of interest with the smelter combination, the finish of the latter is in sight.

The best remedy for the trouble with the Colorado mining industry is one created and applied by the industry itself. For any other a fee must be paid, and it can easily occur that the doctor's fee kills the patient after his other ailment is cured.

Congress could pass a law taking off the return of duties paid on lead-silver ores on the metal being re-exported. That would stop the importation of the ores from Chili, Mexico and British Columbia, which are used to flux the dry gold-bearing ores to the exclusion of our own production of sulphide ores. But this remedy being a political one could not possibly be applied before mining in Colorado was pretty well killed.

This journal has frequently indicated the lines on which protective action to be effective must be conducted. Mine operators must own and operate their own smelters and mills—not necessarily individual plants, not necessarily co-operative plants. The business organization of smelting and milling by the present interests controlling is a good model for imitation. The profit of smelting and milling as a distinct profit from the profit of mining must be eliminated. The furnace and mill must be machines kept in good service condition, but not fattened at the charge of the mine. Transportation must be made absolutely equal and fair in its charges, giving special advantage to no one interest over another. These things must be accomplished, otherwise metal mining will become in Colorado what coal mining and iron mining have become in other communities.

Some positive action should be taken by the Government at Washington to settle finally for all time the irritating Alaska boundary question. The modus vivendi is simply making a worse matter of a bad one. It is a concession of occupancy and practical sovereignty over land which we know to be our own and expect our title to be confirmed to. It is an attempt to do indirectly what the people of this country would not permit its Government to do directly. There is nothing surprising in the reports that old boundary monuments are being destroyed by the Canadian officials. Having provided them with the opportunity, they use it. Aside from all sentiment in the matter, the land the Canadians are seeking to bluff this country out of is valuable mineral land. This has reference not only to the Porcupine district west of Lynn canal, but the entire strip of mainland and islands south to the Portland canal. As exploration extends inland on the mainland strip, new discoveries of mines are being made, which, though in the prospect stage now, offer the promise of becoming valuable mines later on. The officials who have the matter in hand may be assuming that it is only a matter of a few years when the placers in Porcupine district will be worked out and the disputed territory become valueless. It is a mistake to assume this. There are lode deposits in the district; and with the working out of the placers, they will receive a development which is likely to make the population fixed for many years to come. In the end it will be realized that there has been nothing gained, but much lost by not settling the boundary question in the beginning.

Concentrates.

REFINING copper by electrolysis costs from ½ cent to ¾ cent per pound.

IT is best to plan the power plant of a stamp mill in a ratio not less than 2½ H. P. for each stamp head.

CAST IRON NAILS are preferable for use in flume building to steel wire nails. They should be burned before being used.

BATTERY AMALGAM almost invariably carries more gold than the amalgam taken off of the plates outside of the battery.

A LODE that enters a location across one side line and leaves the location across the same side line has no extralateral right.

USEFUL WORK in pumping to the extent of 45% of the original water power is good practice with a long-distance electric transmission.

THE chlorination process is not adapted to working sulphurets containing copper. The consumption of chemicals is too considerable.

THE carat unit of weight for gems is four grains. As used in describing gold, it refers to the number of parts of pure gold in twenty-four parts of alloy.

THE necessity for doing assessment work on a mining claim ceases with the issuing of the Receiver's certificate at the local land office showing that the patent has been paid for.

IN reducing the strength of an acid by water, the acid should be poured into the water, not the water into the acid, and the mixture should be stirred during the pouring.

BELLITE is a mixture of nitrate of ammonia and dinitro-benzol. It absorbs very little moisture after compression, hot, into cartridges. It is a powerful but safe explosive.

AGRICULTURAL LAND PATENTS in California issued between 1866 and 1872 contained a clause reserving the extralateral rights of lodes the apices of which were in adjoining land.

IN tempering rock drills, heat the edge and as little behind it as is practicable. Heating too far back develops a tendency to break off when the first few blows are struck on it in a hole.

BORT, the variety of diamond used in diamond drills, is all mined from alluvial deposits in the Province of Bahia, Brazil. The supply is decreasing while the consumption is increasing.

THERE is no market in California for tungsten ores. The Illinois Steel Co. at Chicago, Ill., or the Colorado Iron Works at Pueblo, Colo., use small quantities, and some is exported to Europe.

A CLAIM located on January 1st of 1902 does not require any expenditure for assessment work during 1902. A full $100 expenditure must be made in 1903 and no work done in 1902 will count towards it.

TO have a constant pressure for the feed water supply for stamp batteries and for hydraulic classifiers the preferable method is an overflowing tank. So long as some water overflows the pressure remains constant.

ROCK CLASSIFICATION is not a matter of exact definitions. The chemical and physical composition is infinitely varied. Geologists use the microscope to determine rocks. For practical mining use the eye will do very well.

THE strike of an ore vein is the general direction of a horizontal line in it. The dip of a vein is always the slope's angle measured between a line in the vein at right angles with the strike line and a horizontal plane through the strike line.

THE pay lead in the Transvaal gold mines is always narrow and sometimes very thin—6 inches to 2 feet is about the range. The uniformity of payable values over large areas is the condition that makes them so profitable for large-scale working.

TANGENTIAL WATER WHEELS are now in use operating under heads ranging from 8 feet to 1700 feet, and plans are being made for some projected power plants in California which will call for tangential water wheels operating under 2000 feet head.

A SMALL MILL on a mine is apt to make a higher showing of average ore value than a large mill on the same mine. The difference is in the grades of ore, not in the mills. It almost invariably happens that the small mill gets more closely picked ore.

THE forging of large masses of steel and iron by steam hammers is almost entirely abandoned now. In its place hydraulic pressure is employed. The hammer blows do not work the metal as uniformly as the hydraulic press, and the latter is found less costly of operation and maintenance.

A $3 A DAY MAN who works with the men may be able to superintend and direct the miners in a drift placer mine, but he is not because of this ability necessarily the cheapest manager for such a mine. A $10 a day man, who does not work with the men, is much more likely to prove the cheaper manager.

THE stamp milling practice in the Transvaal mills results in a 24-hour duty of about 4½ tons to the stamp. California stamp mill practice varies from as low as 1.6 ton duty to 5 tons duty to the stamp head. Transvaal mills crush ordinarily through a 30-mesh screen and California mills through a 40-mesh screen.

AT one stamp mill in California the final tailings are reported to assay from 12 cents to 20 cents to the ton, at another the final losses in the tailings are 50 cents a ton. The last seems large compared to the other, but it was found that it cost more per ton to reduce the loss than the added amount saved would pay.

THE use of cyanide for cleaning amalgamated silver plates is to be made sparingly. It has a tendency to harden the surface of the plate so that it will not catch and hold amalgam. Weak nitric acid solution, salt solution or lye are all preferable. A rubbing up with a paste made of wood ashes will sometimes prove efficient.

UNDER the Forest Reserve law, the Secretary of the Interior is authorized to grant permits to construct ditches and power plants; but he is not granting any pending a reforming of the law by Congress, two bills for which are now pending. It seems that under the law as it stands a permit granted could be revoked at any time.

IF the locator of a mining claim fails to do the annual assessment work for any year, the claim becomes forfeit and can be located by some one else; but the original locator can revive his claim by starting work on it before it is located by some one else. He must, however, complete by continuous work the $100 assessment to hold the claim.

THE fact that a school land section has been patented by the State and sold by it does not operate to prevent a valid mining location being made on a lode known at the time the State took its patent. The State has no right to mineral lands under the school land grant, and if patented to it by mistake the patent is void as to mineral lodes.

THE character of coal is not fixed by a chemical analysis. Anthracite and bituminous coal shade into each other through a great number of ratios of fixed carbon volatile matter and ash. Technically, a coal that contains no volatile carbon is anthracitic, but the percentage of ash may be so high as to class it with the bituminous coals.

PLATINUM, supposed only a few years since to be limited in occurrence to placers, is now known in rock in place. There is a chance of finding it in quantities sufficient to mine, and it is worth while to assay antimonial, arsenical and other copper ores, particularly gray copper or tetrahedrite, for platinum. Deposits of chromium should also be assayed for platinum.

IT is not customary to use quicksilver in the head boxes of a hydraulic mine sluice. In boxes part way down the line and in the undercurrents its use is common. Undercurrents have been put in some of the California streams where the tailings from hydraulic mines located several miles above would pass through them and a paying amount of gold and amalgam recovered.

THE provision of the statute requiring placer claims to conform to legal subdivisions of the public land survey is not followed strictly in making locations. That is, a placer location is not invalidated by reason of not conforming to the subdivision lines. The safest way is to locate and describe by monuments and boundaries so placed as to include the land believed to constitute the placer.

IT is desirable to separate platinum and placer gold by panning instead of melting them together into a bar and letting the refinery do the parting. These two metals can be parted by careful panning. The platinum can then be sold separately. The refineries buying bullion in the bar would not be likely to make any payment for the platinum, and if they should, would couple it with a refining charge.

PLACER GOLD when used in commercial transactions in mining camps usually passes current at a discount which allows a safe margin to the trader over the costs of transportation to the mint and refining. The gold which is current at $16 an ounce would be worth about $17 an ounce at the mint. Fine placer gold is, as a rule, purer than the coarse gold from the same localities and brings more per ounce.

WHILE a locator of a mining claim takes by the location any improvements made by former locators, those improvements can not be used as part of the $500 expenditure required for application for patent. A subsequent deed to the improvements, even if real consideration be given, does not give the right to so use them. The improvements were forfeit with the location, and no title remains which could be conveyed by deed.

THE day wages rate of miners' labor is not necessarily a measure of comparative cost of mine labor. Low wages almost invariably mean less efficient workmen. As these miners gain in efficiency it will be found that they demand and receive higher day wages. A careful analysis of mining labor costs in different countries will show that the lowest labor cost is associated with the higher, if not the highest, day wages rates.

THE most conservative accounts of Thunder Mountain, Idaho, describe it as a district of free milling gold ores occupying an area of from 5 to 8 miles square. The formation is eruptive, generally described as rhyolite, though some accounts state the presence of phonolite. The country rock carries the gold. It is generally low grade, with, it is stated, wide zones and bodies of $5 to $7 a ton rock and occasional narrow streaks of very high grade ore. The rock is soft as far as developed and there is an absence of pyrite. While the district is not exactly a poor man's district, it would seem to be an exceedingly promising one for poor men's mines, the kind of mines that can be operated without dependence on smelters, custom mills, or even railroads.

THE beds of streams which have been meandered by the United States land survey are public waters, but not unless so declared navigable waters. In neither case are they vacant public lands to which a notice of location of a placer claim could give an exclusive possession to the locator. The States have control of such beds, and they may provide laws for their acquisition for gold dredging, or they may permit mining customs and regulations to control their mining use.

THE costs of mine output should be estimated in units of ore, the raw material for the metal output rather than in the units of metal. Comparisons can be made much more intelligently between the costs per ton of ore output than between the costs per ton of metal produced. While different mine operators have different methods of charging development work costs, the preferable method would seem to be to charge it up to the current mine output, rather than to capital account.

THE waste incident to development through stock exchanges cannot be unreservedly termed an avoidable waste. Neither can the waste incident to a rush into a new district be considered an avoidable waste or one which on the whole it would be desirable to be without. Both agencies concentrate in short time periods the energy of large masses of capital into mines, and waste. Which are mines and what is waste are known the sooner as a result of this intensive energy of application. The ratio of the two would not likely be made much different if the same amount of capital were put into the business with deliberation through a long period of years.

THE effective capacity per hour of placer gold-saving tables is a variable for which no general rule or formula has been deduced. There is rarely in the practical use of such apparatus an identity of physical and commercial conditions. Each installation has its special peculiarities, and its capacity is determined by trial rather than by rule. In practice it is usual to adjust grade and width of the table to the kind and quantity of gold bearing material to be handled. Having adjusted grade and width to save the gold, the capacity of the particular table is measured directly by measuring the material that passes over it. In dredger practice, where the material is screened down very fine before going on the table, a rough working rule might be obtained from a sufficient number of carefully conducted and recorded tests.

THE quartz ledges of the Cœur d'Alene gold belt are divided into two distinct classes. The one on which the most work has been done are small veins running from a few inches up to 3 or 4 feet. The value is ordinarily from $6 to $8 per ton. There are frequently pockets found in all of them which will run as high as $2000, or even higher. These pockets are sometimes extensive, as much as $60,000 having been taken from a single pocket. Several others have approached those figures. If one of these veins is opened at a pocket it can be worked by poor men, as enough can be taken from the pocket to open up the claim and tide the owners over until another pocket is struck. If a pocket is not found at first the owner holds on, doing his annual assessment work, knowing that sooner or later he will strike one, and if it is one of considerable size he will be independent thereafter, though it is not likely that any mine will ever be found among ledges of this class that will become known throughout the mining world, although there will be a lot of them that will make comfortable fortunes for their owners, and a combination of several of them may become a really great mine. It is in these ledges that the success of the camp lies, as the conditions will always insure a divided ownership.

CLAIMS of gains of percentages of efficiency in processes and machines should always be investigated closely before acceptance. There is always the possibility of an error in the calculations, and frequently one of the elements that should be estimated is not in the promoter's showing. A machine or process may make a saving at one point that increases efficiency, but the gain involves a compensatory loss at another point which is overlooked. Commercial metallurgical processes cannot be made too refined. The profit difference between what is paid for the metal recovered and what it sells for is what counts. Better a loss of some of the metal than an increase of cost of all of it. This point is usually overlooked by the inventors of machines to save the last ultimate particle of fine gold in auriferous sands. Assuming that common methods and appliances would save 80% of it, the more refined appliances would be doing remarkably in commercial practice to save three-fourths of the remaining 20%. If it saved this additional quantity at no increase of average cost of recovery for the 80% it would be commercially desirable, but, and here is the point commonly overlooked, it is far more apt to so increase the cost of saving the 80% obtainable anyway, that there is no actual economy, but a loss. Capital locked up in machinery and in mining ground is an element of cost, just as much as is labor employed in mining. A rapid working out of a gold mine without recovering all the gold may be more profitable than a slow working recovering more of it, the operating costs being the same in both cases.

Some Experiments with Concentration.

Written for the MINING AND SCIENTIFIC PRESS by WM. H. WASHBURN.

Your recent article on "Doing and Telling" suggests the possible usefulness to some of your readers of "telling" about an experience of the writer in stamp mill work some time since. The ore was principally quartz, carrying very fine gold, associated with pyrites and nagyagite. This combination of tellurium, as well as others, is not considered easy to concentrate, being readily carried off as slimes. In view of this, the results obtained seem well worth consideration. The mill was of ten stamps of 1000 pounds each, with two concentrators of the table type, one being intended for each battery of five stamps, and the mill, which was new, was so started up. Careful experiment and repeated assays, however, proved that one concentrator made a closer saving when taking the tailings from ten stamps, than was had when both were in use, and taking only the tailings from five stamps each. Consequently but one machine was used for a time. The amount of concentrates saved under this plan was about 1000 pounds per twenty-four hours, of an average assay value of $100 per ton. The total saving by amalgamation in the battery and on the apron plates was about 70%, and about 22% by concentrates, making a total saving of 92%.

Although this was considered a very satisfactory showing for the class of ore, running as it did, between $11 and $12 per ton, one concentrator being idle, we decided to try running it tandem with the one in use, which we will call No. 1. Both being on the same level, a steam siphon was used temporarily, to elevate the tailings from No. 1 to No. 2. The result showed an additional saving of about fifty pounds of concentrates per twenty-four hours, having an assay value of about $80 per ton, the tailings from No. 1 machine assaying about 90 cents and those from No. 2 about 75 cents per ton.

As a further experiment the middlings from No. 1 machine were turned in with its tailings and allowed to go over to No. 2 machine, the middlings elevator of No. 1 machine being stopped.

This was an additional improvement, the concentrates from No. 1 being much cleaner, and their value raised from about $100 to an average of about $110 per ton. About 150 pounds of concentrates per twenty-four hours were had from No. 2 machine, having an average assay value of about $80 per ton, the tailings assaying about 50 cents per ton. The middlings elevator of this machine was run in the usual way.

The steam siphon pump, causing an appreciable difference in the amount of wood consumed (which in this instance cost $6 per cord), it was dispensed with by raising No. 1 machine about 4 feet above the floor, on cribbed timbers, to allow the tailings to flow to No. 2 by gravity.

The difference in the appearance of the pulp on No. 1 machine was quite noticeable after the middlings were sent over to No. 2. The line of demarkation between the sand and the concentrates was more clearly defined, the usual broad band of middlings being almost entirely absent. By keeping the machine in proper working order, the above described results were had, figuring from average monthly assays, checking up with the bullion obtained as well as the smelter returns from the concentrates afterwards received.

Having reached so satisfactory results, no further changes were attempted, lest we should be like the Eastern mining superintendent, who reported a prospective saving of 102%.

The samples were taken every hour, day and night, those from each shift being assayed separately.

In order to check the sampling, on several days the assayer took samples every half hour for the whole shift, the regular mill samples being taken at the same time as usual, every hour, both lines of samples being assayed separately, and checking up so closely as to prove they were correct. Even the tailings water was assayed separately in the search for any possible mistake in results obtained.

It may be stated, however, that the first month's run did not show a total saving of over 75%, and the results above named were only had after making some changes in the speed of stamps and arrangement of the mortars. During the time these results were had the amount of ore crushed did not exceed one and three-fourths tons per stamp per twenty-four hours. The ore of lower grade was held back and run through by itself at the rate of two and one-half to three tons per stamp per twenty-four hours, according to grade, with a corresponding lessening of the percentage saved, the tailings being kept at an average assay value of about 50 cents per ton for all grades. This was deemed best from a commercial point of view.

If we may be permitted to theorize from these facts, it would seem that, at least where a number of concentrators of the table type are used, that it would give better results to cut out the middlings from all but one, and send them over that one, keeping the concentrates so obtained in separate lots to be disposed of as their value would indicate.

It seems probable that a concentrator of the belt type might prove to be well adapted for a final separation of the middlings from the sand, as it would be a partially sized product as it left the table machines. Each type of machine seems to have merits of its own, which would indicate that when worked in connection with the other would give better results than either without the other. These are only suggestions, however, and remain to be proved by actual experiment, so far as the writer knows.

As the ore from different mines calls for treatment according to their different conditions and combinations, it should not be concluded, without actual experiment, that the above outlined arrangement of batteries and concentrators would produce the same results in all cases, but there are doubtless many classes of ore to which it could be applied with satisfactory results.

Mining in San Diego County, Cal.

TO THE EDITOR:—Tourmalines of all colors, and of every grade up to gems of great value, are being mined in San Diego county. The mineral lies in a belt running diagonally across the county. Beginning at Pala, near the lithia mines, it runs southwest across Mesa Grande and to the Mexican line near Potrero.

Fluorspar is also found near Potrero in large quantity and in the immediate vicinity of almost a solid mountain of spathic iron ore. Charles Raber located a number of claims on this mountain of iron and is sinking to test values as to depth. At Grapevine Springs, just east of Warner's ranch, numerous veins of graphite ore have been recently discovered which range from 10 or 12 inches to that many feet in width. Also there is one large deposit whose surface indications would lead to believe that a vein 200 feet in width lay beneath. These veins run northwest and southeast, are situated in a gold mining camp and, strange to say, some of them assay $4.50 to $5 per ton. The outcrop is quartz merely stained with graphite, and grows more graphitic with depth. At 10 feet it looks to be pretty nearly all graphite of the amorphous or nonfoliate variety. It has been tested here as a stove polish, a fireproof paint filler and a foundry facing, for all of which it seems admirably adapted. These claims are held and being explored by F. W. Carter of San Diego.

Immense reefs of low-grade gold-bearing quartz are found on the desert slope of the county at an elevation of about 4000 feet. The most notable one of these is known here as the Big Ledge and extends from Warner's ranch in a southeasterly direction to the desert, a distance of 15 miles. Many claims are being held on this ledge by the old hocus pocus method of relocation every other year in somebody else's name, or charging the Government $100 for camping on the claim the night of the 31st of December. Only one claim, that of W. R. Farnsworth, has been worked to any extent. A crosscut near the surface showed a quartz formation of 120 feet in width between a contact of granite and schist. A paystreak 12 feet wide at the surface of sulphurets carries $1 or $2 per ton. At the depth of 50 feet this paystreak had increased to $14 per ton.

The desert slope of this county is prospected after the most cursory fashion and is still a most inviting field for work.

San Diego, April 5.

Texas Fuel Oil Tests.

Prof. J. E. Denton of Stevens Institute reports some tests made by him of crude petroleum as fuel at Beaumont, Texas. The tests were made in a horizontal return tubular boiler 6 feet in diameter, 18 feet long, and having a grate surface of 45.5 square feet. In the tests data for comparative purposes were obtained from the same boiler when burning buckwheat anthracite coal. With Beaumont crude oil the equivalent evaporation from and at 212° was 15.49 pounds of water per pound of oil. The corresponding figure when using buckwheat coal was 11.79 pounds of water per pound of combustible, and 8.94 per pound of coal. The efficiency of the boiler determined by the oil tests was 78.5% and by the coal tests 77.6%. A quantity of steam varying from 3.1% to 4.8% was consumed in the oil blast. In the two tests with coal the horse power developed by the boiler was 92.6 and 119.1. In the five tests with oil the horse power varied from 112.7 to 220.1, the evaporation per pound of oil from and at 212° in the first mentioned case being 15.05 and in the second 14.75.

THE Senate Committee on Mines and Mining has under consideration a bill introduced by Senator Kearns of Utah to amend the mining statutes affecting the description and measurements of mineral claims. The bill provides that the locator or possessor of a claim shall have the exclusive possession and ownership of all the surface thereof, and all veins or lodes therein contained within the surface lines thereof extended vertically. It is believed the bill will be reported favorably.

A Suggestion Relating to the Cyanide Process.

TO THE EDITOR:—The latest variation of the cyanide process in successful practice is one in which the zinc shavings are coated with a film of lead, so as to form a galvanic couple. This recalls an incident of the early electric light days, when cheap, simple primary batteries were sought for for domestic use. My battery was zinc and cast iron in a solution of caustic potash. At first, an iron pot holding the solution, the zinc suspended in it, was the complete cell unit. An improvement was the increase of iron surface by the addition of cast iron chips, picked up under a turning lathe, put in the pot. Next a zinc cell held the solution and a porous bag held the chips; then a wire netting held the chips; finally a roll of iron netting, pressed flat, and a sheet of zinc, in a glass cell holding the solution, was arrived at. The addition of a very small quantity of permanganate of potash gave a great increase of current for a short time. This cell was efficient and reliable for a time, but finally it would stop giving current; and here is the point I wish to bring to notice: On examining the cell, I found the iron galvanized, beautifully plated with zinc, so that I placed it with a new clean iron and obtained a good current from it until the zinc plating was eaten through.

Now, if the coating of the zinc with lead forms an effective galvanic couple, hastening the precipitation of the gold from KCy solutions, then iron and zinc, being a much stronger galvanic couple, would seem to be a much more efficient precipitant.

I am not cyaniding, nor is anyone near me doing it, but the matter can be easily tested by some one who is cyaniding by following this method: Get a dozen yards of closely woven galvanized iron wire netting; fold it in layers a foot wide, backwards and forwards, one fold above another; then press it to a close mat and bind fast. Put this mat in a barrel; set the feed pipe at the bottom, the outlet near the top; then turn on slowly the gold-charged cyanide solution. After running awhile, test the outflow for gold; if none is present, increase the flow, and so find the rate of deposition. Run until the zinc is eaten through in spots; probably a blue tinge in the solution will indicate this; then wash the mat clear of the precipitate and take it out. Assay the precipitated gold for presence of zinc; probably none will be present.

Now, following out my zinc-iron cell experiences, determine the best conditions for plating the iron netting with zinc; put the well washed mat from the barrel into the plating cell, and, recoating it with zinc, make it ready for use again. From the data thus obtained, if favorable, the size and number of mats needed, the replating cells, etc., for any output may be calculated. The advantages that would seem to be offered are: No loose zinc, no cutting into shavings of highly finished sheet zinc, no zinc mixing with the precipitated gold, and the cheapest form of zinc-smelter pig for plating. The wire mats are easily made, easily washed, easily handled and easily examined. There would be no royalty tax on process, and it is possibly a more economical means of precipitating easily cleaned gold from cyanide solutions.

JOSEPH VOYLE.

Copper Statistics From Germany.

Advance figures of comparative annual production and consumption of copper compiled by Aron Hirsch & Sohn of Halberstadt, Germany, are as follows:

	1901. Tons.	1900. Tons.	1899. Tons.
Estimated consumption of copper in Germany	89,548	116,900	102,618
Imports from the United States	42,422	66,264	47,742
German copper production is estimated	30,333	32,423	37,676

The German consumption for different purposes is estimated as follows:

	1901. Tons.	1900. Tons.
Electrical purposes	28,000	43,000
Sheet copper	16,000	18,000
Brass and wire	30 000	35,000
Chemical purposes	2,000	2,000
Ship building, railroad and casting	18,000	19,000
Totals	90,000	117,000

The total production of the world is estimated at 502,704 tons for 1901, as against 486,084 tons for 1900.

The increase from Canada is estimated as only 1400 tons, which is probably under estimated by possibly 7000 tons.

The copper consumption of the various consuming countries is estimated as follows:

	1901. Tons.	1900. Tons.
Germany	89,548	116,900
United Kingdom	107,021	112.908
United States	175,800	166,140
France	46,180	61,832
Austria	21,016	22,704
Totals	439,565	480,484

An Inexpensive Engine Railing.

By W. H. WAKEMAN.

Laws enacted by some of our Legislatures require the owners of steam plants to provide railings around their engine flywheels, which will protect employes and visitors from accidents caused by coming in contact with these swiftly revolving wheels. It is the business of an inspector to see that every flywheel, not otherwise closed in, has a railing around it that insures safety, and here his duties end. It is the object of this article to show how a good railing was provided at small cost.

An estimate of the cost of brass railing, with suitable trimmings, was secured, but inasmuch as it was prohibitive for this place the writer concluded to use iron pipes and fittings with a brass ornament for each post, as the next best thing.

Fig. 1 is a plan of the engine room, showing the location of the engine, pump, etc., and railing as required. Between the outboard bearing of engine and pump there is a passageway much used by visitors and others, therefore the railing is located 32 inches from the center of this bearing, making it inconvenient for those passing by to meddle with the slight feed oil cup on it.

The railing is 36 inches from the main belt on this side, as it is desirable to have it farther away here than on the other side of the belt.

A study of the plan will show that no unions or left hand threads are required in order to connect the horizontal rails, but after one rail was completed with posts 21 inches high to center of rail, another line of rails was laid out and connected, just the same as the first. To support this second line the posts were raised 16 inches, making it 37 inches to center of upper rail.

When the second length of pipes comprising the

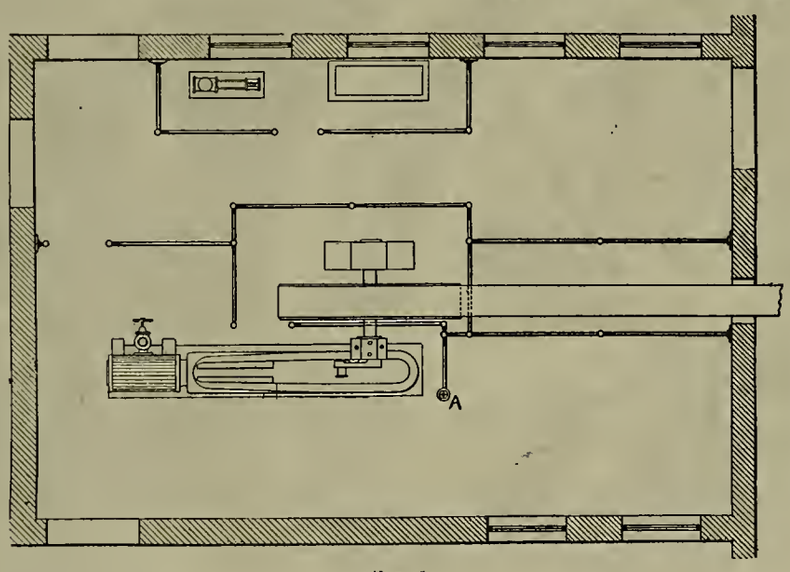

FIG. 1.

posts were to go on it became necessary to use unions or else provide fittings in one of the lines with left hand threads. The latter plan was adopted as having the best appearance when finished.

One-inch iron pipe, with malleable iron fittings, was used, which appears very neat, but when bought all of these fittings were tapped with right hand threads.

This point is specially mentioned because when engineers find that no left hand malleable iron fittings are available they sometimes use cast iron ones instead, as they can easily secure them, but when two kinds of fittings are used on one job it makes the whole look like a misfit or something worse. To overcome this difficulty it is only necessary to take a left hand pipe tap and use it on the fittings the same as if they had never been threaded at all. The result will be a clean thread except at two points opposite each other, where the left hand cross the right hand threads, and either a right or a left hand threaded pipe can be screwed into the fitting at pleasure.

This plan is recommended for railings. If anyone wishes to try it for other work they have the privilege of doing so, but it is not warranted to be satisfactory.

The top thread on each post was cut left-handed, so that when the upper rail was placed in position, and the upper half of each post screwed down into the lower half with a right hand thread, the left hand threads were also engaged in the upper fittings, thus making each post complete and at the same time fastening the upper rail in place and completing the job. The threads on all these joints are nicely covered, so that it is impossible to tell (without unscrewing a joint) where the left hand threads are.

The top of every post in this railing consists of a tee, a cross, or an ell, with slide outlets, and into each is screwed a brass acorn, nickel plated, except where there was a good reason for using something else, thus greatly improving the whole, and giving it a finished appearance. All of the iron work was given two coats of first-class black paint, followed by two coats of varnish, giving it a glossy and smooth surface that is easy to keep clean.

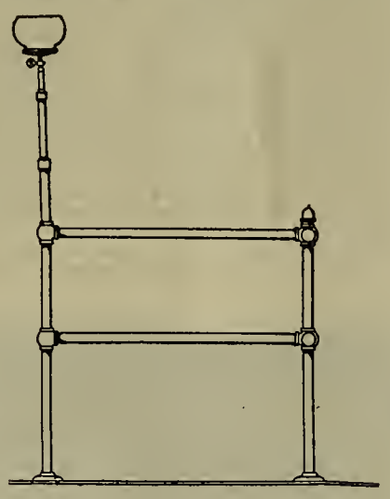

FIG. 2.

Fig. 2 illustrates a gas light located at the point A in Fig. 1.

A $\frac{3}{8}$-inch gas pipe was run up through the floor and continued inside of the post, terminating in a burner as shown.

Fig. 3 illustrates an entrance for the engineer's

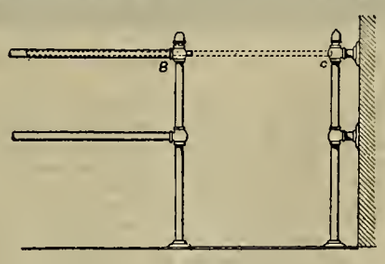

FIG. 3.

use, with means for closing the same. A piece of round iron about 2 inches long was inserted in the end of a $\frac{1}{2}$-inch pipe and welded there so as to make the end solid. Holes of suitable size were then bored in the posts B and C and $\frac{1}{2}$-inch pipe inserted in them. When this is wide open the $\frac{1}{2}$-inch pipe projects out of the post $\frac{3}{16}$ inch, which is enough to afford means for drawing it out, yet is not sufficient to be unsightly or otherwise objectionable.

Such a bar for closing the entrance is often convenient to remind visitors that while they are always welcome, outside of the railing is the most suitable place for them.

While making this railing it was necessary to cut 177 threads on 1-inch pipe, of the ordinary length for pipe fittings, and as this called for much hard labor if done by hand, the following plan for making it easier was adopted: Both handles were removed from the die stock, which was then fastened to the face plate of a lathe, as shown in Fig. 4.

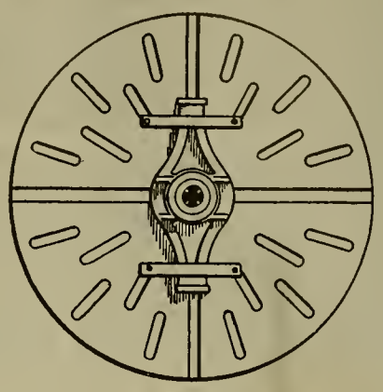

FIG. 4.

A proper support for the other end of the pipe was provided, so that when inserted into the die stock and the lathe started a thread would be cut with very little labor. The pipe was prevented from turning by means of a Stilson wrench, the handles of which rested on the lathe bed while cutting the thread. It was reversed and held by hand when running the die stock backwards.—Electricity.

Assaying Sulphide Ores.

TO THE EDITOR:—Referring to the communication in your issue of March 22, under title "A Trouble in Assaying," I think your correspondent can easily satisfy himself that the best way to assay sulphide ores is by the aid of nitre as a desulphurizer. My experience is that nail assays for sulphide ores are always troublesome and unsatisfactory, and I never use them. To properly roast an ore requires considerable time and care, as well as fuel, so one could not run an assay in this way at commercial rates without its costing more than he could obtain for it. If he is running assays for himself, then he should value his own time. However, if he favors roasting, let him weigh out half an assay ton and roast carefully either in cupel furnace, in roasting dish or in crucible. The latter is, perhaps, the quicker method. To the charge of pulp add one-fourth assay ton of charcoal. Thoroughly mix and place in a new crucible. The charcoal prevents matting of the charge. Subject to heat until all sulphur is eliminated. Cool crucible slowly without taking pulp out. Then flux as follows:

Soda, bicarb.	20 grams	= 1 teaspoonful
Borax	½ assay ton	= 1 teaspoonful
Litharge	1½ assay ton	= 1 teaspoonful
Silica	20 grams	= 1 teaspoonful
Argols	2 grams	

Mix and cover with teaspoonful of salt.

I would never go to the trouble to roast, but for an ordinary base ore I would take half an assay ton of the raw pulp, flux as above, except leaving out the argols, and I would increase the litharge to two assay tons and put in ten grams nitre.

If the ore is very base, containing practically no gangue, I would increase the litharge to two and one-half or three assay tons, silica to thirty grams and nitre to fifteen grams.

A graduate of Freiberg would say that the roasting system is "the easiest and surest method known to metallurgy," but if your correspondent will run assays both ways and see how results check I am satisfied he will find that by fluxing direct, varying the amount of nitre till he gets a button of proper size, he will secure results that will be more satisfactory than by roasting, and at less than one-fourth the time and expense. Furthermore, his pours will be as nice and perfect as from ordinary siliceous ores.

The silica used in above is broken glass, crushed to pass a twenty-mesh screen. It works more satisfactorily than the regular powdered silica.

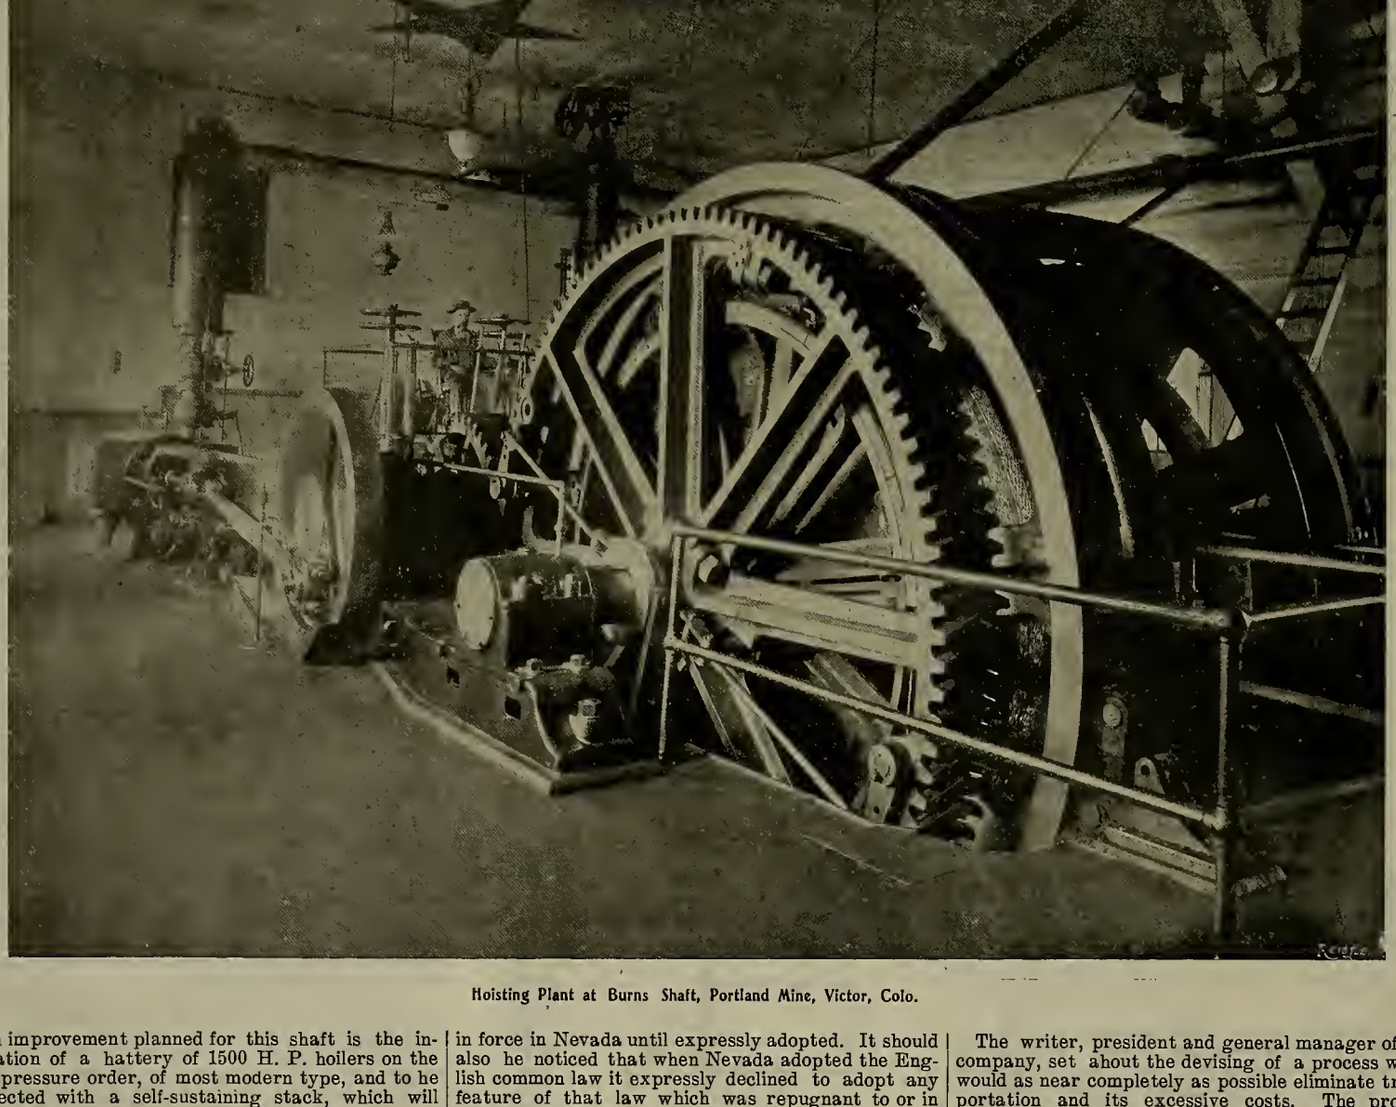
One of the best custom assayers in Montana estimates the amount of nitre needed to oxidize the sulphurets by taking a teaspoonful of the pulp in a small gold pan, flushing the lighter part to one side and then estimating amount of concentrates shown. If pulp seems half sulphide, he uses 210 grains (thirteen and one-half grams) nitre; if one-fourth sulphide, 105 grains, etc. This is a practical and quick way of forming an estimate and saves running preliminaries. He seldom misses fluxing his ore correctly or getting proper sized button on first guess. The novice may guess a few in this way and run preliminaries with them. In a little while he can easily tell the exact amount of nitre needed. The assayer above mentioned uses less litharge and silica than I recommend, but takes longer time for fusion. I consider extra cost for flux is more than offset by saving of time in securing a melt.

Helena, Mont., April 5. MATT. W. ALDERSON.

The Portland Gold Mine at Victor, Colo.

The Portland gold mine at Victor, Colo., is a typical Cripple Creek district mine and at the same time one of the leading mines of that district. In its present shape it represents the consolidation of thirty-six mining claims and fractions, covering nearly 200 acres of surface. The mine has many miles of underground workings and is equipped with large plants of machinery.

Notable among this machinery is the hoist and air compressor, views of which are shown, and which are installed at the Burns shaft, which has attained a depth of 1080 feet. The hoist is equipped with double-deck cages and has a capacity of 4500 feet depth and a maximum lift of 1000 feet per minute. The hoiler room contains five hatteries of two hoilers each, making a total of 1000 H. P. The two air compressors have an aggregate capacity of forty-six drills. There are two dynamos with a combined capacity of 1050 lights, as well as one extra 10x12 hoisting engine, used for the third compartment of the shaft for repairing steam, air and water columns.



Hoisting Plant at Burns Shaft, Portland Mine, Victor, Colo.

An improvement planned for this shaft is the installation of a hattery of 1500 H. P. hoilers on the high pressure order, of most modern type, and to he connected with a self-sustaining stack, which will dispense with the old hattery now in use.

In connection with the shaft there are ore houses so arranged that the ore passes hy gravity over the sorting tahles, where a large force of ore sorters are kept at work, thence by gravity to the railroad cars, where they are weighed on company's track scales.

Grouped in convenient proximity to this shaft are the carpenter, machine and hlacksmith shops, all equipped with up-to-date machinery.

There is now being erected an ore washing machine on an improved pattern of the one now in operation at the No. 2 shaft.

ALL other things heing equal—adaptability, soundness, efficiency—the engineering work which costs the least money is the hest. I do not know of any other product of man's creative powers of which the same can be so truly said. The "cash" basis is the real foundation upon which the engineer builds, and this consideration draws us at once from judging engineering as merely something cleverly done hy an ingenious person. It also very often serves to distinguish hetween college, textbook or rule-of-thumb engineering aud the real thing.—James Mansergh, in Cassier's Magazine.

Extralateral Rights Under Prior Patented Land.

Written for the MINING AND SCIENTIFIC PRESS.

In considering the legal aspect of the very interesting case of Wedekind vs. Bell, concerning the Reno Star mine at Reno, Nev., certain features of the local laws of Nevada have heen heretofore overlooked. The real foundation of that litigation lies in the contention of Wedekind, the discoverer of this mine, that under the common law, as the same is in force in Nevada, he has a right to follow his vein wherever it may go. Heretofore, where the question of extralateral rights under prior patented land has heen considered, it has heen assumed, without discussion, that the rule of the English common law, that to whoever owns the surface helongs all that lies heneath it, is a rule in force and applicahle to those cases. The correctness of that assumption, when applied in Nevada, is the very gist of this controversy.

It will he recollected that the State of Nevada was organized in 1864 out of territory formerly helonging to Mexico, and that the English common law was not in force in Nevada until expressly adopted. It should also he noticed that when Nevada adopted the English common law it expressly declined to adopt any feature of that law which was repugnant to or in conflict with the laws then existing.

Mining had heen carried on in that region long hefore the State was organized, and the Pacific coast customs of miners were in force and had heen recognized by hoth the legislative and judicial departments of the Government. It is a generally recognized feature of those customs that the miner who owns the apex has the right to follow the vein upon its dip, without regard to the ownership of the surface of the adjoining land. That heing a common law of the miners and a part of the common law of the Territory and of the State when it adopted the English common law, that rule of the English common law (upon which the Bell people rely) it is claimed hy Wedekind never was adopted, hecause it is directly in conflict with the then existing Nevada common law, which recognized extralateral rights in all instances.

In other words, there was in that Territory a recognized system of customs and usages, under which the owner of the apex could follow his vein on its dip, constituting a common law of property, which the English common law never supplanted. It is generally recognized that there is no national common law, and that the common law in force in one State frequently is not in force in another. It is not questioned in this case hut that the Government has parted with its title to the mineral and the land ahove it. The main issue is, what rights has the owner of the surface of the land to the mineral heneath it, under the common law in force in Nevada? It is a local rather than a federal question.

The Fleming Leaching Process for Sulphide Copper Ores.*

Written for the MINING AND SCIENTIFIC PRESS by J. A. FLEMING.

Several years since the writer, associated with Eastern people as the Black Warrior Copper Co., bought 1700 acres of copper claims near Globe, Ariz., and has since then heen engaged in developing the property and perfecting the process of reduction devised hy the writer to meet the special conditions.

Owing to the location of the mines, transportation was extremely expensive and made the cost of fuel so considerahle that the employing of the customary furnace methods of reduction was out of the question. The mine could not stand the drain of these cost charges.

The writer, president and general manager of the company, set ahout the devising of a process which would as near completely as possible eliminate transportation and its excessive costs. The process devised and now in profitahle every-day operation does this. Nothing is transported but refined ingot copper from the mine and scrap iron to it. Later the latter is to he eliminated hy making the iron direct from the ore at the mine.

The process is an imitation of one of nature's own methods. The crude sulphide ore is roasted hy the heat supplied by the comhustion of its own sulphur. This roasting is done in closed kilns, and the sulphur is suhsequently converted after leaving the kilns and passing into lead lined chamhers into sulphuric acid. No fume from the roasting of the ore is wasted into the atmosphere, and the destructive effects of the sulphur fumes on vegetation are thus entirely ohviated.

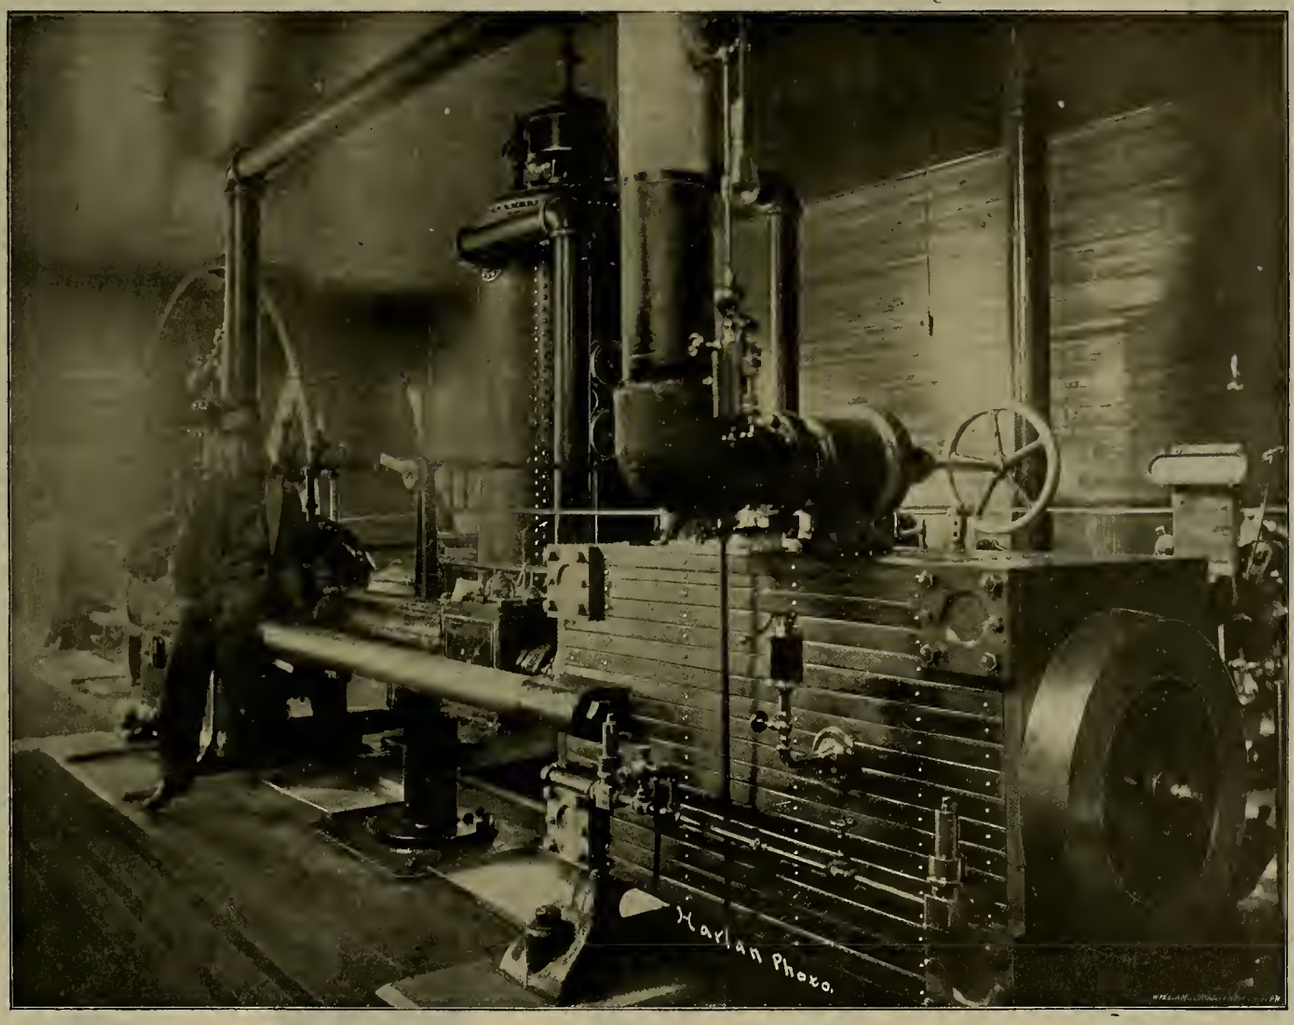
The sulphuric acid so made is then used to leach out the copper in the roasted ore. After leaching, the tails from the vats are treated by amalgamating and cyaniding to recover the gold and silver values, and the final spent tails, consisting of oxide of iron and silica and other gangue materials, with a trace only of copper, go to the waste dump. The copper solution is conducted to precipitating tanks, and the

*See illustration on front page.

copper precipitated by scrap iron is collected, melted in a melting furnace, poled and cast into ingots. The copper made goes 99.76 fine.

The process, which is described so briefly, is not by any means new in its chemistry, but, as developed at the Black Warrior works, is the result of cut and try methods extending over five years. In its final shape as now in operation it is exceedingly simple and the manipulation is almost exclusively mechanical and largely automatic. It does not require a chemist or skilled labor. Ordinary labor, largely that of boys, open and close valves, pull levers, and take the temperature of the solution from time to time. Two men on a shift tend to the roasting and acid plant, working through 150 tons of ore daily. The plant is almost indestructible so far as the ordinary wear and tear of commercial operation is concerned. With 7% copper ore the cost of making copper I estimate as about half what it could be made for by the usual smelting method.

The illustration accompanying this is a view of the works at Black Warrior. They have been in operation for three months now and the results obtained are satisfactory and all that were anticipated. The process is well adapted to the conditions under which we are producing copper. It made us entirely independent of custom smelters and refineries, and very nearly independent of railroad transportation. It is particularly adapted to low-grade copper sulphide deposits and to small mines.



The Big Compressor, Portland Mine, Victor, Colo.—(See Opposite Page.)

Power Required to Deposit Copper by Electricity.

Written for the MINING AND SCIENTIFIC PRESS by T. K. WILKINSON.

It is not possible to state any definite figure for the power required to deposit copper by electricity, because the amount required to deposit a given quantity in a given time will vary according to the current density. By current density is meant the number of amperes per square foot of depositing surface.

For illustration, take the actual working results obtained in one of the large electrolytic copper refineries. A current of 4000 amperes at 65 volts pressure (260 kilowatts) deposited in 200 tanks 44,000 pounds per twenty-four hours. Therefore, 2 kilowatts deposited 14.1 pounds per hour. Current density was 12 amperes per square foot. By reducing the current to 2000 amperes, the voltage would fall to 32.5 (65 kilowatts), and the amount of copper deposited per twenty-four hours would be 22,000 pounds; so that in this case 1 kilowatt would deposit 14.1 pounds per hour; current density, 6 amperes per square foot.

From the above figures it will be seen that whereas in one case 2 kilowatts deposited 14.1 pounds per hour, in the other case it required but 1 kilowatt to deposit 14.1 pounds per hour; but in the second case, were it desirable to produce 44,000 pounds in twenty-four hours, at the lower power cost, it would be necessary to employ twice as many tanks. By reduction in the rate of deposition, 1 kilowatt per hour can be made to deposit increasing amounts of copper; but the size of the plant will increase at the same time, and it will be necessary to stop the increase in the size of the plant at the point where the saving in power and the interest on the investment in the larger plant meet. Accordingly, the size of a refinery will depend largely on the cost of power. At present there is but one refinery in the United States where power is so cheap that the plant can be small and the rate of deposition high. That is at Great Falls, Mont., where the Boston & Montana Copper Co. use the water power of the Missouri river. All others use steam power, and a current density of 10 to 15 amperes per square foot is the usual practice in these steam power refineries. As steam power is much more expensive than water power at Great Falls, all the other refineries are larger in proportion to their production than the Great Falls plant.

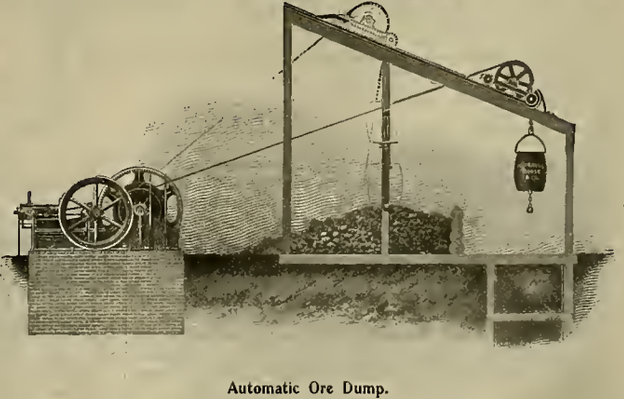
In any refinery the care given to details in consumption of power will have an important bearing on the result, and, other things being equal, the plant in which the closest attention is given to the condition of conductors, contacts, composition and temperature of electrolyte, etc., will show the lowest power cost. Here in California electrically transmitted power should be cheaper than steam power, and, as far as cost of operation is concerned, a refinery on San Francisco bay ought to compete favorably with the Eastern refineries.

PROF. E. D. CAMPBELL of analytical chemistry in the University of Michigan is making a series of experiments on Portland cement that will take years of labor before finally completed. Prof. Campbell has devised a furnace in which the factors of time and temperature can be absolutely controlled, and his test will cover Portland cement manufacture from every variety of rock and clay used.

Fairbanks-Morse Automatic Ore Dump.

The automatic dump herewith illustrated is an improved device for accomplishing the dumping of a mine bucket in a simple, reliable manner. It also, of manufacturers claim, removes a possible danger thethe bucket falling back into the shaft, and being automatic saves the service of the man ordinarily required for dumping a bucket.

Referring to the cut it will be noted that the cable runs over a removable sheave in the same manner as over a fixed sheave used in the ordinary gallows frame. With this device, when the bucket reaches the proper position, the carriage or trolley carrying the sheave moves up the track, which is inclined, until it is caught by the hook as shown by the dotted lines. The movement of the trolley up the incline with the bucket is so arranged as to land the bucket on the platform, as shown on the middle upright post. This platform is arranged with a slot which is formed in such a manner that the chain on the bottom of the bucket passes into the slot, then by relieving the clutch mechanism of the hoist, allowing the drum to slacken the cable, the platform on which the bucket rests then automatically dumps. This is arranged for by the bearings carrying the platform being out of the center and the weight of the bucket immediately overbalances the dump as soon as the hoist is lowered. The ball on the end of the chain, attached to the end of the bucket, holds the bucket while it is being dumped. When the bucket is empty



Automatic Ore Dump.

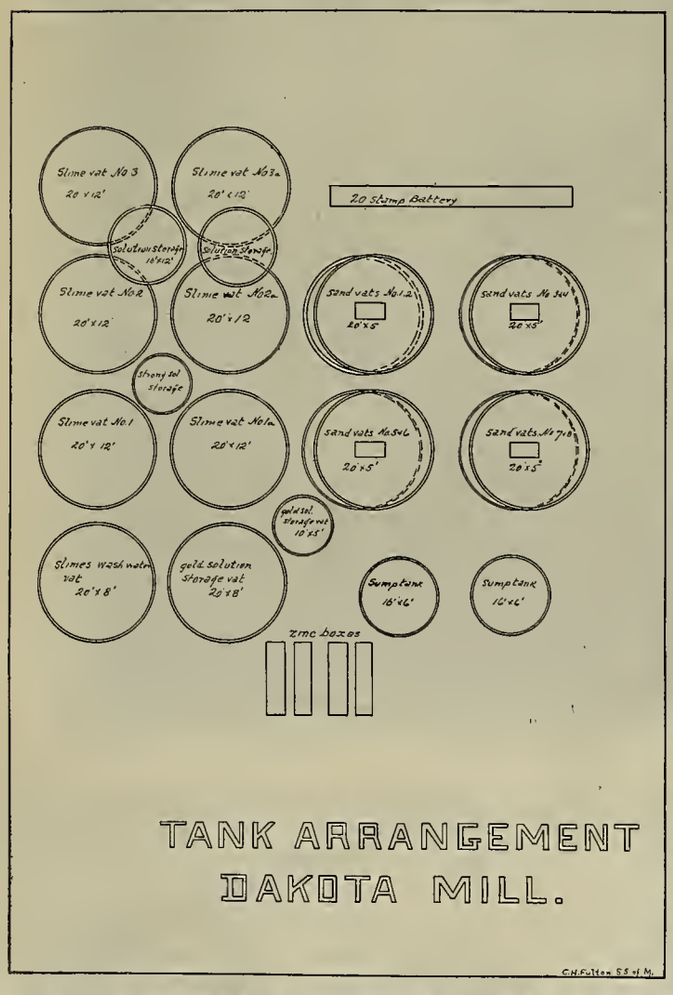
the hoist again pulls it back into position until it reaches the trolley, when the hook which holds the trolley and bucket back in its position over the shaft and the bucket is lowered down into the shaft. This arrangement permits the setting or adjusting for various positions of the shaft and hoist, and the dumping into different compartments, and by means of chutes under the control of the man at the hoist, or hy the use of tram cars, the dump can be placed at almost any desired point. In constructing the gallows frame no more timber is required than would be used in the common frame.

Additional information concerning the working of this device will be given by Fairhanks, Morse & Co., Chicago, the manufacturers.

The Cyanide Plant of the Dakota Mining and Milling Company.

This cyanide plant is situated in the First Ward of of Deadwood, South Dakota, and is the most recent plant but one to begin operations. It was constructed during the summer and fall of 1901 and went into commission in October. The mill is a wet fine crushing mill, having a capacity of sixty tons in twenty-four hours.

THE CRUSHING OF THE ORE.—The ore goes from the bins, which are filled from railroad cars, to a Gates No. 4 D crusher, passing, however, first over the grizzly. The crushed ore is carried by elevator to the main storage bins, from which it is fed by suspended Challenge feeds to four 5-stamp batteries. The weight of the stamps is 900 pounds, the crushing being done through a 20-mesh woven wire screen. The mortars have a double discharge, and instead of being the ordinary lip mortar are provided with a gutter below the screens, cast as one piece with the mortar. These gutters take the pulp discharge from the batteries and send it to the charge box of the spiral pump. A heavy canvas is hung over the screen and gutter to prevent splashing.



The pulp from the batteries is lifted by a Frenier sand pump (capacity 6000 gallons per hour) to the launders feeding the separator boxes. The height of lift is about 17 feet. The separator boxes, which separate the sands and slimes, are 5x4 feet in cross section and 5 feet deep. The slimes in the overflow go to the slimes vats, while the sands are discharged at intervals into the vats directly below the boxes.

THE TANK CAPAOITY OF THE MILL. — There are eight leaching vats, huilt in four tiers of two each, for the double treatment of the sands. The vats are of red cedar, 20 feet in diameter and 5 feet deep. The sands, after leaching in the upper vats, are discharged into the vats beneath by hottom discharge gates.

There are six slimes vats, built in two rows of three each, each three vats comprising a unit for the treatment of one lot of slimes. The vats are 20 feet in diameter and 12 feet deep, 2½-inch staves, and built of red cedar. There are two sump tanks, 16 feet in diameter and 6 feet deep; two gold solution tanks, one 20 feet in diameter and 8 feet deep, the other 10 feet in diameter and 5 feet deep. Then there are two weak solution storage tanks, 16 feet in diameter and 12 feet deep, and also a strong solution storage tank, 12 feet in diameter and 7 feet deep. All these tanks are of red cedar. There is one tank 20 feet in diameter and 8 feet deep used as a settling tank to settle out sediment from the syphoned slimes solution.

THE TREATMENT OF THE SANDS.—The sand vats are charged in about twenty-four hours, hy means of the separator boxes, and the pulp is then leached with a 0.2%, or four-pound cyanide solution, followed by the weak solution of two pounds per ton. The sands are then transferred, by shovelling through the bottom discharge gates into the second vat below. The transference takes ahout twelve hours and costs about 5 cents per ton. In the second vat the sands are leached again, the extraction made by the second leaching being about 8%. The tailings are discharged by sluicing, the time consumed in discharging heing about two hours. The total time consumed in treating sands, including charging and discharging vats, is five days. The extraction made on sands varies with the different ores treated, averaging about 83% to 84%.

THE TREATMENT OF THE SLIMES. —The slimes, coming from the separator boxes, flow into one of the two lowest slime vats (Nos. 1 and 2 on tank plan). When one of these vats is filled (the filling being done by carrying the slimes to the bottom of the vat by a wooden pipe), the syphon is started and the solution syphoned off, fresh slimes pulp meanwhile running into the vat continually. This can be done, as the slimes settle very rapidly with most of the ores treated at the mill. When so much slime has been charged into the vat that the syphoned solution begins to be seriously discolored, twenty-five pounds of slacked lime are fed in to the launder taking the slimes overflow from the separator boxes, and when this has been carried into the slimes vat, the pulp is changed into the lowest slime vat of the second unit, where the above operation is repeated. The slimes in vat No. 1 are then allowed to settle for one hour, when the syphon is again started, and now follows the settling of the slimes down until the solution has been drained within a few inches of the settled slimes. The total time of settling is ahout ten hours. The settled slimes in this vat are now sluiced out with "barren solution" to the centrifugal pump, which lifts the material to the next slime vat of the unit. When the vat has been filled the pulp is drawn off at the bottom by the centrifugal pump and returned to the vat over the top. This circulation is carried on for an hour. Then the slimes are allowed to settle, the clear solution at the top being syphoned off during the settling. When the slimes have settled, fresh barren solution is added and they are circulated by the centrifugal pump for another hour, twenty-five pounds more of lime being added in the course of the pumping. The slimes are then again allowed to settle, while the solution is syphoned off as before. When settling is complete the slimes are sluiced out with wash water to the centrifugal pump, which now raises the pulp to the last slime vat of the unit. Here the slimes are allowed to settle again and the solution syphoned off. After the solution has been drawn off wash water is added by a nozzle and pipe device situated in the vat. This serves to thoroughly wash and agitate the slimes for the last time. The slimes are now allowed to settle, while the solution is drawn off by the syphon. Then the slimes are sluiced out to waste, having passed through three vats. Through the syphon used the discharge pipe passes out through the side of the vat. The extraction made on slimes is about 88%, but at present only about 80% to 82% is saved, the halance passing out in the tailings in the retained moisture. More thorough washing, with facilities for handling the increased bulk of wash water, will undoubtedly raise the percentage saved. The total time consumed is about six days.

THE PRECIPITATING DEPARTMENT.—Precipitation is carried on in four zinc boxes, two for syphoned solution and two for sands solution. They are ten-compartment boxes, each compartment having a cross section of 20x15 inches and a depth of about 18 inches. Some extra precipitating barrels are being put in to accommodate an increased amount of solution. The precipitates can be sluiced from the boxes to the acid treatment tank, where they are washed and treated with dilute sulphuric acid in the usual way, transferred to a filter tank, filtered, washed and dried, and then smelted. The slags are treated at the Golden Reward smelter.

The precipitation in the boxes is good for both sands and slimes solutions, the slimes solutions usually carrying from .05% to .08% free cyanide. Considerahle sediment sometimes accumulates in the boxes, but does not seem to give any trouble in precipitation.

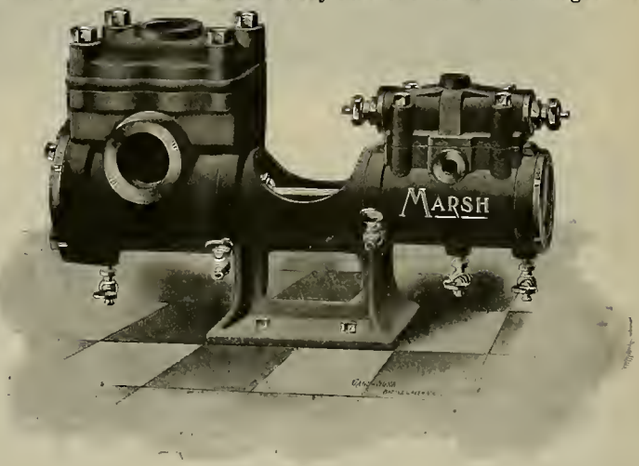
THE NATURE OF THE ORE TREATED. — The ores treated at the mill come mainly from the vicinity of Portland, and are siliceous Potsdam ores, with the values very finely distributed. The mill also treats custom ores to a considerable extent. Recently some siliceous ores have been treated which were but slightly oxidized, seemingly with considerable success.

The method of slimes treatment described is due to Mr. Empson, the superintendent of the mill.—From Bulletin No. 5 of the South Dakota School of Mines.

Direct Acting Pumps for Cyanide Plants.

In some plants, both of large and small capacity, it is often inconvenient to install centrifugal pumps on account of distance of the desired location of pump from the source of power, steam engine line shaft, etc., or the first cost of such an equipment is considerahle. The Simonds Saw Co., agents of the Marsh steam pump in California, have designed a pump which they consider peculiarly well adapted to such stated use. These pumps range in capacity from 200 gallons of solution per hour upward, and the solution end including piston, valves, piston rod, etc., are of selected materials to combine resistance to chemical action and mechanical wearing qualities.

The Marsh cyanide pump is illustrated herewith, the cut giving a good idea of its compactness. The manufacturers say that two of its advantages are absolute regulation under varying loads and economical use of steam (or air)—only sufficient steam being admitted to do the work—and impossibility of the pump running away or racing when the suction is lost in any way. The Marsh cyanide pump may be seen at Simonds Saw Co., 33 Market St., San Francisco; its agents will furnish descriptive matter on any of their goods.



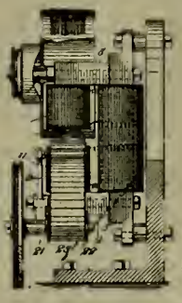
Marsh Cyanide Pump.

Mining and Metallurgical Patents.

Patents Issued April 8, 1902.

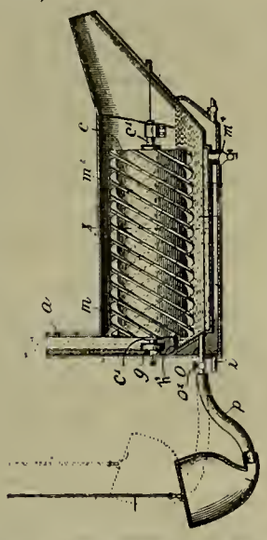
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ORE SEPARATOR.—No. 697,351; J. M. McClave, F. H. Kirby and E. R. Cumbe, Denver, Colo.



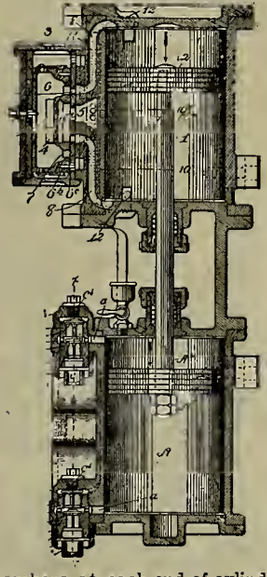
Electromagnets of opposite polarity, revolving drum movable between poles of magnets, one magnet being arranged within drum, series of shoes or pole pieces attached to magnet within drum and having ends extended beyond magnet in direction of rotation of drum, bands of magnetic material surrounding drum, carrier belt movable between drum and lower electromagnet and swinging frame on which belt is mounted.

AMALGAMATING MACHINE. — No. 697,176; G. C. Scott, Columbus, Ohio.



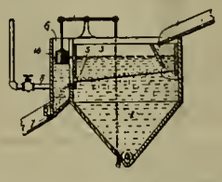
Casing having inlet opening at one end and outlet opening at other, amalgamating body rotatably supported within casing and adapted to run in body of mercury contained within casing, pipe section o leading outward from body of mercury, mercury reservoir or holder, means for raising holder to higher level than pipe section and lowering it to level below that of pipe section and flexible connection between outlet pipe and reservoir.

AIR COMPRESSOR.—No. 697,414; Frank L. Reeder and A. B. Freville, Louisville, Ky.



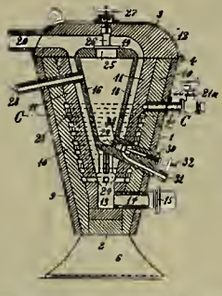
Valve chambers at each end of cylinder, passages connecting each end of cylinder with chambers, passage connecting chambers, which have each interior annular groove registering with passage connecting chamber and cylinder, and integral double valve seat bushings having tapered threaded engagement with chambers, bushings have perforations registering with interior grooves, and bushings, jam nuts engaging projecting portions of bushings, and having air inlet perforations, and screw plugs engaging perforations of end walls of chambers.

APPARATUS FOR SCREENING CRUSHED ORES OR OTHER MATERIALS.—No. 697,353; W. McDermott, London, England.



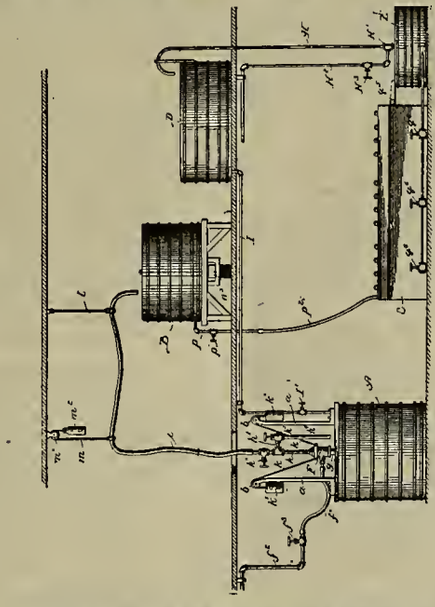
Main tank subdivided into reception and discharge chambers separated by screen, chamber below screen being closed against inflow of water except through screen, upper chamber being provided with restricted discharge passage on level with upper surface of screen and leading into water chamber, water supply for water chamber adapted to maintain head of water same as that in main tank so as to prevent interflow, discharge for water chamber, separate discharge in main tank for slimes and water which have passed through screen, means for feeding material under treatment into chamber above screen and for causing it to move thereon, float in water compartment, valve on slime discharge valve in main tank and connections between float and valve for automatically regulating discharge of slimes.

APPARATUS FOR MAKING IRON OR STEEL.—No. 697,213; E. Meininghaus, Dusseldorf, Germany.



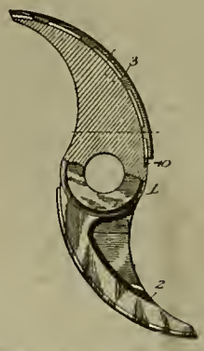
Producing wrought iron or steel direct from ores with crucible 16 having opening 25 in enlarged top, self-closing valve 26 upon opening, screw spindle 27 guiding valve, outlet pipe 28 near upper end of crucible for letting out slags and also molten metal from crucible, opening 29 at bottom of crucible, communicating with two channels 30 and 31, first one of which serving for opening or closing opening by plug 33 at end of spindle 32 passing through channel 30, other one, 31, serving for letting out fluid metal out of cruoible or for blowing air and gases into crucible.

APPARATUS FOR THE TREATMENT OF ORES.—No. 697,178; E. L. Sharpneck, Chicago, Ill.



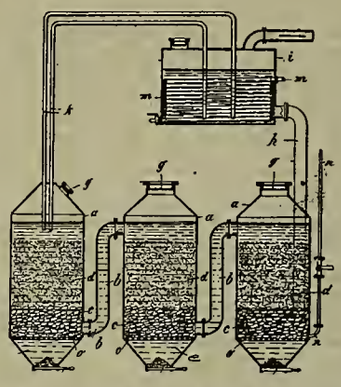
Leaching tank, filtering tank, valved conduit extending between tanks, valved branch pipe extending from conduit below valve in back to leaching tank and jet pump interposed in conduit between leaching tank and branch pipe, whereby liquid contents of leaching tank may be circulated through conduit and branch pipe or transferred through conduit to filtering tank.

CAM FOR STAMP MILLS.—No. 697,119; J. C. H. Vaught, Phillipsburg, Mont.



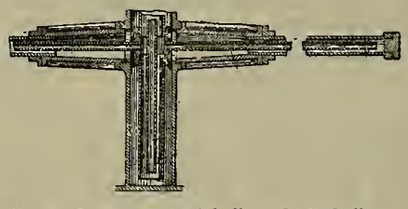
Cam provided at its engaging face with longitudinal groove having series of tapering recesses with undercut edges, and shoe detachably interlocked with cam and provided at inner face with rib having tapering enlargements engaging recesses.

PROCESS OF TREATING METALLIC SULPHIDES.—No. 697,138; A. Germot, Asnieres, and H. E. L. Fievet, Paris, France.



Process for conversion of sulphides into sulphates by subjecting them to action of ozonized air by holding them in suspension in liquid in presence of acid and blowing current of ozone into liquid.

ROASTING FURNACE.—No. 697,062; L. T. Wright, Keswick, Cal.



Series of floors, central hollow shaft, hollow arms carried thereon over respective floors, open bottom pipe inserted in shaft, second open bottom pipe in shaft into which first pipe discharges intermediate to first pipe and shaft, open ended pipes leading from intermediate pipe into hollow arms, and feed and exhaust pipes connected to first pipe and hollow shaft.

New East River Bridge at New York.

The second cable suspension bridge across East river from New York to Brooklyn, which is officially known as the Williamsburg Bridge, has the following structural dimensions:

Extreme length between terminals	7,200 feet.
Length between anchorages	2,800 feet.
Length of river span	1,600 feet.
Height of cables at top of tower above high water	333 feet.
Height of lowest part of bridge at center of main span, above high water	150 feet.
Width of bridge	118 feet.
Diameter of cables	19 inches.
Number of cables	4
Number of wires in each cable	7,696
Size of each wire, No 6, about $\frac{1}{16}$ of an inch diameter.	
Combined weight of cables	4,400 tons.
Combined strength of cables	90,000 tons.
Weight of main span	12,000 tons.
Cost of cables	$1,250,000
Cost of complete bridge, about	$15,000,000

The cables are being furnished by the John A. Roebling's Sons Co., who furnished the cables for the first East river suspension bridge.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

The Geological Survey reports of coal in Alaska that much investigation of the coal supply of the Yukon river has taken place. In addition to coal mines in British Northwest Territory, the Alaska Exp. Co. has started some developments about 60 miles above Circle City on the upper Yukon. The oldest mine is Drew's, opposite the mouth of Hess creek, where the workings are extensive, and the equipment includes steam hoisting apparatus, coal bunkers, etc. The Pioneer mine, below Hess creek and 30 miles above Rampart, is similarly equipped. Both mines produced considerable coal in 1900. Near Nulato, farther down the Yukon, the Blatchford and the Pickart mines produced some coal, and the Clemens Thein mine and the Williams mine, both between Nulato and Anvik, were small producers in 1900. The coals are chiefly lignites, with some bituminous coals, and, in a few localities, semi-anthracites. Developments so far have been entirely along waterways. The southeastern and the southwestern Alaska coal fields are on tide water along a coast affording good harbors open to navigation the entire year. They can be mined cheaply and can find a ready market for local steamboat and domestic use. No developments have been made of the higher grade coals of southern Alaska.

JUNEAU.

On Woewadski island, near Wrangel, the Olympia M. Co. of Seattle, Wash., are operating a 20-stamp mill on ore that yields about $7.50 per ton. P. D. Range is manager.

The Rodman Bay Co. is completing the work on its 150-stamp mill at Rodman hay on Baranoff island, near Sitka. The company has a mountain of low-grade ore.

T. H. Ellis, manager of the Detroit-Alaska G. M. Co., has started up the company's placer property at Windfall creek, near Juneau.

The Yellow Jacket Co., which owns four quartz claims at Windham hay, has completed the construction of 1½ mile of wagon road to the mine. This property will have the second stamp mill erected in that district, a 10-stamp mill being now en route for the property.

A mill test is being made on ore taken from the Humboldt and Occidental claims, near Skagway. The Humboldt property is being developed by a Skagway company, and 68 feet of tunnel has been driven on the property. The Occidental is being developed by a syndicate of ten claim owners, and a tunnel 120 feet long has been driven and numerous crosscuts run. Should these properties show a $1.50 value in the mill test, they can be worked at a profit, as they lay on the beach and water can be flumed 4 miles to supply them with power.

ARIZONA.

COCHISE COUNTY.

Supt. J. G. Hearne of the Black Diamond mine of Pearce says that the 200-ton smelter which the company is installing will be ready for operation by June, nearly all of the machinery for the smelter, power plant and tramways being on the ground now.

J. Brockman, Supt. of the Commonwealth mine at Pearce, states that the 17 miles of railroad which he is building from Pearce to Cochise will cost about $6000 per mile. The road will be provided with its own rolling stock and the entire equipment will be of the latest design. The road is being built to haul the supplies for the Commonwealth mine and the other mining camps in the neighborhood.

GILA COUNTY.

An important strike of sulphide ore has been made on the 300-foot level of the Rattler mine of the Manhattan property at Troy. The Rattler mine is opened by the Sisson incline shaft, with levels at 100, 200 and 300 feet in depth, all in good ore. This mine is expected to supply a large part of the ore for the smelter soon to be erected.

GRAHAM COUNTY.

The Shannon smelting plant at Clifton is practically completed and ready to be started up. The force at the mine has been increased to 125 men.

MARICOPA COUNTY.

The Garcia mine at Wickenburg is to be started up immediately. There is a 10-stamp mill on the mine and development work to the amount of 350 feet. The owner is a Canada company. J. B. Young is superintendent.

J. Burson, Supt. Arizona G. & C. Co., which is operating the Royal group of claims between Wickenburg and the Colorado river, says there is about 650 feet of development work done now and that it is proposed to put in a smelter this fall.

At the Granite Wash, near Wickenburg, Senator Dorsey and associates are prospecting to put in a 60-stamp mill. They have thirty-six claims and have 3000 feet of work done. The ores are free and concentrating. G. Treadwell is Supt.

A California company is working the Desert mine, near Wickenburg, and it is reported has struck a 3-foot vein of $50 gold ore. This company is said to be figuring on replacing with a new mill the old one that burned down several months ago.

MOHAVE COUNTY.

The mining claim near the Boundary Cone, owned by O. D. M. Gaddis, J. N. Cohenour and A. James, of Kingman, is reported honded at $15,000. The ledge is a large one, with streaks of very rich gold ore on one of the walls.

Gold Road camp, near Kingman, is to be named Acme. A postoffice is to be established there. The camp and surrounding mines have about 200 men at work at present. The number is increasing daily.

The C. O. D. Mines Co. is preparing to sink a new deep working shaft on the C. O. D. mine, at Boundary Cone. The old shaft is too small and, it is estimated, would cost as much to put in shape as to sink a new and big working shaft. A flow of water encountered in the 200 level assures enough water to supply the mill, heretofore running on short time on account of lack of water.

SANTA CRUZ COUNTY.

F. Powers is reported to have sold a three-fourths' interest in the World's Fair silver mine near Patagonia for $500,000, to T. Brockman, D. M. Harringer and Senator Penrose and his brother, who are owners in the Commonwealth mine at Pearce.

YAVAPAI COUNTY.

M. S. Taft and V. A. Salinger of the Victor M. Co., near Prescott, on Lynx creek, propose to install a 3-stamp mill on the Victor mine.

The Iron Queen mine at Bighug has several hundred feet of development work, and the G. A. Treadwell M. Co. operating it is figuring on putting a smelter of 100 tons daily capacity on the property, the smelter to be in operation in a few months. Oil will be used as fuel.

Supt. Henderson of the Rochester M. Co., operating at Placeritas, says the company will soon put in hoisting works, sink 300 feet and erect a 10-stamp mill.

CALIFORNIA.

AMADOR COUNTY.

W. J. McGee, trustee for the Bay State M. Co., has given the Rhetta M. Co. of Stockton, W. W. Worthing president, a new bond to purchase the Bay State mine, near Jackson. The sum of $6200 was paid under the old hond and the company has spent over $75,000 on the mine. The new bond provides for a payment of $1100 on May 1st, and all over $3 50 per ton realized from the mine is also to be paid on account.

The Sargent G. M. Co. has been incorporated in San Francisco by W. H. Roden, S. Ducas, W. B. Coffee, J. H. Dawson and F. Kirchhoffer, capital $100,000, to operate the Sargent mine on the Mokelumne river, south of Jackson. W. R. Thomas of Sutter Creek will be manager.

The Amador & Calaveras Red. & M. Co. has been incorporated at Jackson, capital $200,000. The directors are T. A. Nelson, E. H. Cary, J. Marshall, N. W. Mahaffey of Jackson and F. H. Cordway of Lodi.

At the Plymouth Rock mine, at Plymouth, J. H. Durst Supt., the tunnel is now in over 400 feet and is expected in another 150 feet to reach the ledge.

On the Creek mine at Plymouth, believed to be the north extension of the vein of the Pacific and Empire mines, W. Axford and J. Reeves of Plymouth have started a vertical 4x6 shaft, which is expected to strike the ledge at 160 to 170 feet.

On the Illinois quartz mine at Plymouth, owned by T. Boyson of Sutter Creek, a ledge of quartz containing rich arsenical sulphurets has recently been discovered by Supt. Storms of the Baliol mine at Jackson, who was making an examination of the ground.

The Hercules quartz mine, near Plymouth, has been sold by W. F. Detert of Jackson and M. Brinn of Sutter Creek to C. H. Shields of Plymouth for $5000. It appears that the Mexicans worked the surface croppings many years ago and took out a considerable amount of gold. Development work has been started by the new owner.

BUTTE COUNTY.

It is reported that Col. F. McLaughlin has become interested in the Big Bend tunnel proposition, owned by Dr. R. V. Pierce of Buffalo, N. Y. The Big Bend tunnel affords an opportunity for the development of electric power on a large scale. The tunnel was originally constructed for mining, and through it the waters of the North Fork of Feather river may be diverted and the bed of that stream rendered dry 13 miles. The tunnel is 2½ miles long, 16 feet wide and 12 feet high. It is estimated that the river carries at its low stage 40,000 miners' inches of water. The available fall from the point where the water leaves the tunnel back to the river is 300 feet. It is estimated that more than 25,000 H. P. can be developed.

CALAVERAS COUNTY.

A rich strike has been made in the Lightner mine at Angels. A pocket found shows ore assaying from $25,000 to $30,000 a ton. The ledge is 16 feet wide in one place and 3 feet in another.

The Buffalo Blue Gravel mine, near Mokelumne Hill, has been unwatered, cleaned out and retimbered, a suitable hoist and a 3-stamp mill erected, and work in the mine commenced by the owner, C. A. Werle. The shaft is 200 feet down to the bottom of the channel, and about 900 feet of drifts have been run. The channel is about 120 feet wide, with about 10 feet of gravel, which averages about $1.50 to the carload. The mill is built near the collar of the shaft, saving rehandling of the gravel, which is dumped directly from the bucket upon the grizzly. The mill is kept in operation about twelve or fourteen hours daily, crushing about fifty tons of gravel. Ten inches of water under 285 feet head run the hoist and mill.

Operations have been resumed at the Giuffra quartz mine at Mokelumne Hill by Los Angeles people, with Col. Rohinson as manager. A hoist is being erected and as soon as completed sinking on the vein will commence. There is a mill on the property.

The Utica Co., at Angels, propose to enlarge the electric plant situated near Murphys, the preliminary work having been commenced. A ditch will be dug for another pipe line. The work now in contemplation will take several months. The increased demand for power all along the line throughout the mining sections has prompted this decision for improvements.

At the Horn mine, in Pioneer district, near Jackson, G. W. Horn Supt., 160 feet is being run to reach the vein opened in the shaft. It will open up the ledge over 100 feet below the bottom of the shaft.

P. Bernasconi of Fourth Crossing, near San Andreas, is doing prospecting work on a big ledge and has commenced a perpendicular shaft which is to cut the ledge at about 100 feet depth.

At the Del Monte mine, near Glencoe, the machinery for the air compressor is on the ground and is being put in position.

EL DORADO COUNTY.

The 10-stamp mill at the Montezuma mine, at Nashville, is said to he crushing some rich rock from the 300-foot level of the mine. It is reported the company contemplates the erection of a new hoist.

INYO COUNTY.

The Bishop Light & Power Co. has been incorporated at Bishop by J. L. Davis, A. S. Kilpatrick, G. A. Clarke, A. T. Dickey and S. E. Vermilyea, who are the directors of the company. The capital is $20,000, and the company will construct an electric power plant.

Leidy Bros. & Vanfleet have bought the Storey mill, near Laws, and will run it on ore from their No Sabe mine.

KERN COUNTY.

The Dean & Jones M. Co. at Slate-range, near Randsburg, is crushing about 1300 tons of ore per month. They regularly employ about fifty-five men.——The Arondo M. Co., of which Mr. Dean is president, is operating in the Argus range. At present a road is being built, grading for buildings and preparation made for the putting in of a plant. This property is a low-grade cyaniding proposition, and the process will consist of dry crushing and cyanide treatment. The ore is very soft. Enough development work has been done to warrant the construction of a 100-ton plant.

NEVADA COUNTY.

The Gold Crown M. Co. has bought the mill of the Live Oak Drift mine at Forest Hill, in Placer county, and will install it at the Gold Crown mine at Omega.

Supt. C. M. Root of the New Independence mine on Wolf creek, above Moore's Flat, has taken in new machinery and started up work on a considerable scale.

The Yuba-Monarch M. Co., at French Corral, has let a contract to G. Warner and C. Alpers to run a tunnel on the mine.

The Red Cross mine, at Omega, has been sold to the Western Exploration Co. hy J. A. Brent. Besides the Red Cross, Brent also sells the Green Pine, Forest, Omaha and Marchands quartz claims in that vicinity. At present the mine is under lease to a party of miners, who are taking out some good ore and keeping the mill running.

The Champion and Spanish M. Cos. of Nevada City have elected the same board of directors for both companies, as follows: C. J. Schuster, H. Mohr, J. Fetz, I. Rosenthal, J. Ott, F. Zeitler and M. Nonnerman, all of San Francisco.

PLACER COUNTY.

Thos. Brown has bought the old Paragon mine at Bath from D. Wheeler and the Breece estate.

R. Jones, Supt. of the Canada Hill gravel mine, near Westville, says that his present force of twelve men would soon be largely increased.

PLUMAS COUNTY.

The hydraulic mine on Hungarian hill, known as the Plumas Imperial, has been leased hy C. Hazzard to San Francisco parties, with M. A. Delano Supt.

SAN BERNARDINO COUNTY.

A ledge of antimony ore has heen discovered near Randsburg by J. T. Reed, S. S. Thomas, E. Swartout and J. S. Lord of San Bernardino. Samples of the ore assayed showed 49% antimony. There is said to be a 12-foot ledge of it.

SHASTA COUNTY.

The Afterthought mine at Buckeye has been bonded by Z. F. Bullock to J. H. Roberts of Redding at $3500. The bondholder agrees to pay $1750 on November 11, 1902, and an equal amount on September 11, 1903. Fifteen per cent of all ores extracted must be paid to Bullock on the purchase price.

A. Leiter of Igo reports $1200 gold was taken out of a 60-foot square piece of placer ground at Horsetown. The ground is worked in a primitive way by stripping it down to within about 4 feet of bedrock and then shoveling the 4 feet of pay gravel on top of the bedrock into sluice boxes. A Mr. Heinz, representing a Salt Lake, Utah, company, has bought 80 acres of ground at Horsetown, and during the summer will build a dredger on the ground. He expects to operate it with electric power.

The Mountain Copper Co. of Keswick uses 1050 H. P. of transmitted electric power to operate the smelting plant and mine.

E. Holden has honded four asbestos claims west of Sims to parties at $4000. The ledge of asbestos on the claims is said to vary from 18 inches to 3½ feet in width.

The Excelsior and Most Anything quartz mines in Flat Creek mining district, near Keswick, belonging to O. La Plant and H. E. Bedford of Keswick, have been bonded at $6000 to J. R. B. Coon and D. C. Mitchell of San Francisco. The bond calls for continuous development.

SIERRA COUNTY.

The New Independence M. Co. is operating under bond three gold quartz claims on Wolf creek, near Alleghaney. R. M. Donne is president, F. E. Harmon secretary and treasurer, C. M. Root superintendent and R. J. Simmons managing director. A shaft is now down 220 feet on the vein. The installing of a new hoisting plant is under way, in charge of G. A. Nihell of Nevada City. Improved devices for gold saving will be added to the mill now on the mine. The company expects to have the mine and mill fully equipped and ready to start within the next sixty days. It has an abundance of timber on the property and a ditch 4 miles long with a never-failing free water supply, which is so situated that it will give 1000 feet fall.

SISKIYOU COUNTY.

The Pine Grove placer mine, now being worked hy M. J. Whitney & Co., with an elevator, near Oak Bar, has been sunk to bedrock and has struck gold realizing as much as $4 to a pan of dirt.

The Portland Co., operating the old Len Miller mine and several other properties on Indian creek, near Fort Jones, under the management of Mr. Scott, are now running the 10-stamp mill and employing about thirty men.

R. M. Bennett and G. F. Raynolds, who have been inspecting their mining properties at Hornbrook, state that they have decided to build a 10-stamp quartz mill at their mine, which has received extensive development under the superintendency of Mr. Mattern.

Mining on the lower Klamath is extensively carried on this season, as there is an abundance of water to keep the giants well supplied. The Van Brunt, Minnetta B., Siskiyou and other claims at Happy Camp are in full blast and good cleanups are anticipated.

The Blue Ledge mine in the Jo creek country, north of Happy Camp, on the western slope of Siskiyou mountain, will be worked considerably as soon as the snow is off, and the prospects are favorable for the development of a rich and extensive mine in both gold and copper.

TRINITY COUNTY.

(Special Correspondence).—At the Dorleska mine at Abrams twenty men have been employed throughout the winter under Supt. M. H. MacIlwaine. The vertical shaft has been sunk to a depth of 200 feet, and a crosscut started west for the vein. The contract for running 500 feet of tunnel No. 2, given last September to Mortimer & Carter, has been completed, and a second contract for 500 feet additional given to the same parties, is now under way. The tunnel is to connect with the third level at the shaft, and will be about 1300 feet in length, 400 feet of crosscut and the remainder drift on the vein. The new mill will start up as soon as horses can be got in to haul ore. Last season, from ore extracted in development work, over $35,000 was produced in a small prospecting mill. The company has a sawmill and store at the mine. The Union Con. G. M. Co. of Los Angeles operates the mine. H. Z. Osborne is president and general manager.

I. W. Zent of Deadwood has $500 as the result of two weeks' run made by himself and M. G. Carter in an arrastra on ore from locations between the Brown Bear and Lappin mines. They have a good shoot of high-grade rock ready to stope out.

The Brown Bear mine, at Deadwood, is running a full force of men. By May 1 the power plant will be started and air drills will resume pushing the crosscuts ahead.——At the Lappin, recently bonded by Eastern people for $110,000, a triple-compartment shaft is being sunk from the tunnel and is now down 135 feet.

Mr. Duval, who owns a quartz mine near Carrville, will erect a 5-stamp mill this spring. The mill will be run by water power.

TUOLUMNE COUNTY.

The sale of the Hunter or New Era mine near Carters, owned by C. A. Holland, W. T. Carter, A. Hines and Mrs. B. Gallagher, is reported to New York people. The mine has a 10-stamp mill with a ditch and water rights. A very rich vein has been struck since the papers were signed and men are at work taking out all ore possible before the mine actually changes hands.

The Hardtack mine, near Carters, owned by McAvoy, White & Sears, has been bonded by C. A. Holland and associates. It is the pian, so it is reported, to consolidate the Hardtack and New Era mines and use one mill with tramway for both properties.

A new 10-stamp mill will be installed at the Sunnyside mine, near Carters. C. G. Smith is Supt.

J. Daly has sold to Baker Bros. of Carters his half interest in the Galway and Old Glory mines, a quarter interest in the Little Johnnie and a third interest in the Never Sweat and River View mines, situated near Carters.

Baker Bros. and J. Daley bonded the Sunnyside mine, near Carters, to C. A. Smith and Los Angeles people. About $6000 has been expended on this mine running a 300-foot crosscut. Improvements will be made, including a plant operated by electricity.

The Black Oak mine, near Soulshyville, is putting in a new hoist.

Supt. J. L. Partz of the Goldwin mine, near Columbia, says he is now taking out rich ore on the 600-foot level. He is looking into the matter of electricity for power. The 10-stamp mill is running part time.

The Piedmont G. M. Co. has sold to H. Brunner of San Francisco the Sweeny quartz mine, situated at Quartz Mountain.

COLORADO.

CLEAR CREEK COUNTY.

The preliminary work on the Conqueror group, near Empire, for development contemplated by the new owners is progressing. A large compressor is on the ground. The mill owned by the company will be refitted throughout and additional machinery installed. M. Brown is manager.

The Dillingham-Chamberlain sampler at Idaho Springs will double its capacity by an increase in the storage and ore bins, which will enable it to handle about 100 tons a day. The extension is made necessary by the closing down of the other samplers at Idaho Springs.

H. A. Ridel of Colorado Springs has bought of J. I. Coddington the Wm. Lewis group of claims, near Idaho Springs, for $20,000. A company is to be organized and a tunnel driven to develop the group.

The Ninety-four Tunnel Co., at Yankee, it is stated, will increase the capacity of its dry process mill to forty tons by putting in heavier machinery.

The Cumberland Co., at Yankee, it is stated, will add several stamps to their mill soon.

On the Ruby mine, near Georgetown, some improvements are being made. The adit has been enlarged and retimbered. Manager Burgess has erected an office building. Surveys have been made for a water power owned by the company, and plans for the installation of a power plant are being made.

F. Evans of Denver has made a strike in the Stag group of claims, near Idaho Springs, at a depth of 150 feet. Over 3 feet of pay ore has been opened, 12 inches of it running 68% of lead, in addition to the gold and silver. The balance runs $15 a ton and can be concentrated.

CUSTER COUNTY.

The Florence M., M., S. & R. Co. has bought of T. E. Blunt the Combination, Nebraska and Summit claims near Silver Cliff. Arrangements are to be made at once to reopen them and ship to Florence for treatment.

EL PASO COUNTY.

E. Weighley of Chicago, Ill., an owner in the Cripple Creek-Dean mill, states that he is arranging for the reopening of the cyanide plant in May. The capacity of the mill will be increased from 60 to 100 tons a day.

GILPIN COUNTY.

A half interest in the Old Town mine at Russell has been bought by F. E. Himrod of New York City, at a price supposed to be not less than $50,000. G. K. Kimball retains the remaining half interest.

Boston people are reported to have bought the Rocky Mountain mill at Black Hawk. The new owners, it is stated, will make changes at the concentrator and may increase its capacity.

A new company is being formed at Idaho Springs to work a group of claims at Russell. The promoters are G. K. Kimball, Jr., S. B. Bontems and M. W. Tanner. They have four claims adjoining the Old Town mine and have already put on a good plant of machinery and begun working. S. B. Bontems is secretary and treasurer of the company, with office in Denver.

The Bant lode at Black Hawk has been sold to W. A. Garrett and J. H. Johnson of Holdrege, Neb. Garrett & Johnson are interested in the International M. Co., operating the P. K. mine in Silver gulch, also near Black Hawk, and represent a company of Nebraska people. A shaft building and hoisting plant sufficient for a depth of 1000 feet have already been contracted for, and active developments are being planned.

The Victoria mine at Gilpin is being operated by W. C. Stevens & Co., with P. Peterson as manager. The mill ores will be crushed at the Peterson mill, which has been started up. The smelting ores will be shipped. The mill ore shows by assays a value of about three ounces to the cord and a test sample of smelting ore ran $50 to the ton. There is about 10 inches of smelting ore on the hanging wall and another streak about 6 inches wide on the foot wall. The entire width of pay ore is about 6 feet. The Peterson mill contains fifteen slow drop stamps with amalgamating plates and Gilpin County bumping tables. It will also be run as a custom mill.

The Charter Oak mine on Quartz hill, near Russell, has been started up by E. W. Davies for Eastern people. Mr. Davies will have charge and W. H. Quintrall will be foreman. The shaft is now down 500 feet and it is the intention to sink it from 200 to 300 feet deeper at once. The machinery will be overhauled.

GUNNISON COUNTY.

The Augusta Co. of Denver is planning to remodel the old mill at its mine near Gunnison, and the wagon road will be extended to the mouth of the new tunnel; a tram will be connected with the mill from this point, and before the season is closed the mill will be treating the low-grade ores both from the mine and the new tunnel.

HINSDALE COUNTY.

It is said that the Golden Fleece mill at Lake City will be overhauled at once and that its capacity will be increased to 100 tons. A new compressor of about fifteen drill power will be installed at the mine.

LAKE COUNTY.

Mr. Dunbar, representing the Eastern interest in the Home Extension M. Co., at Leadville, says the Boston G., C. & S. Co. has about completed arrangements to remodel the old plant and resume operations. The company will issue bonds to provide sufficient working capital to repair the plant and start it up.

MINERAL COUNTY.

The Home M. Co., which has a lease on the Bachelor mine at Creede, has started up work, using the Bachelor power plant. The Bachelor will be developed at a depth further down than any work heretofore done at Creede.

The Corsair M. Co. at Creede has decided to sink a shaft and open up the ground below its tunnel level, and will erect a plant of machinery on the ground for that purpose. C. S. Thompson has been appointed Supt.

PUEBLO COUNTY.

Engineer E. W. Hathaway, who has in charge the surveying and preliminary work for the new zinc smelter at Pueblo, has let the contract for the earthwork to be done to T. Corrigan of Pueblo at $10,500. There were five bids received, ranging in price upward to $16,500. There are 62,000 yards of earth to be excavated.

SAN JUAN COUNTY.

In the Spotted Pup of the North Star group of mines at Silverton a 4-foot streak of high-grade gray copper ore has been opened.

The Quartz M. Co. has resumed operations on the Washington group, near Silverton, under Supt. A. Kunkle. The width of the vein at the bottom of the shaft is claimed to be 118 feet, with values in gold and silver from $7 to $15 per ton.

The Sultana M. & M. Co., capital $1,000,000, has been incorporated, with J. M. Conway, of Silverton, at the head. It owns the Grand Turk group of claims on Sultan mountain, near Silverton. The Sultana Co. is composed principally of Peoria, Illinois, people.

The Western States G. M. Co., of Tennessee people, has been incorporated to operate Deer Park mines, including the Montana group, at Silverton. A. H. Mundee, of Silverton, is manager, and is to let a 100-foot contract on the proposed tunnel into the Montana vein. He says that in all probability air drills will be put in before fall.

J. B. Warner, manager of the Silver Ledge mine at Silverton, says the company plans the erection of a 100-ton concentrating mill and deep development work on the Silver Ledge vein. He is letting contracts for the preliminary work for the mill.

The Sunnyside mill at Eureka has started up with water power and the engines used during the winter months have been shut down. Six months of the year the Animas river furnishes power for the present capacity of the mill. Preparations are being made for adding twenty stamps to the mill.

SAN MIGUEL COUNTY.

At the Japan mine, near Telluride, work will commence on reconstruction of buildings that were destroyed by the explosion and fire a few months ago. A new compressor house will be built and the boarding and bunk houses will also be enlarged. About twenty men are employed now.

The Ophir Con. Co. has commenced excavating for a 30-stamp addition to the mill at Ophir Loop. The present plant has twenty stamps. The present mill was erected less than a year ago. About forty men are employed and the shipment averages a car of concentrates a day. The tunnel on the Silver Bell will be further advanced by the immediate installation of a compressor plant and power drills.

Tomboy G. M. Co., Ltd., has bonded the Columbia-Menona properties and is overhauling the works. The company has held a lease on part of the Columbia mill for the treatment of ore from the Argentine, and will now have a two years' option on the mining property.

OURAY COUNTY.

The electric power plant of the Revenue Tunnel M. Co. at Ouray, which has been under construction since early last fall, is now completed, with the machinery placed in position. It is hoped to get the new plant in operation by May 1st. It will furnish light and power for the mills and mine of the company, and in addition to other plants nearer the mine, which are now driven by water power from Canyon creek.

TELLER COUNTY.

The largest consolidation yet made in the Cripple Creek district has been announced by the Woods Investment Co. It embraces all the properties of eight large mining companies along the line of the United Mines tunnel, which is to be 9462 feet long. A new company is being incorporated in Colorado, with $5,000,000 capital, part of which is to be issued in payment for the properties taken in by the merger. The consolidating companies are the Consolidated Mines, New Zealand, Damon, Columbine-Victor, Battle Mountain Con., Columbine-Gold, Bonanza Queen and the United Mines Transportation companies. The holdings of the company embrace 375 acres. The Portland Co., with 200 acres, is the next largest holder of Cripple Creek property.

The El Paso Con. G. M. Co., at Cripple Creek, has settlements on 500 tons of the 600 tons shipped from the mine during March. The returns are considered high and indicate an average value of $52.40 a ton. This is within 30 cents a ton of the average shipments sent out by this property during 1901. The gross production of the El Paso for March will be close to $32,000—all taken out in doing dead work, driving drifts and opening levels. The mine is making about 100 tons of ore on every 200 tons of rock hoisted to the surface.

The Buckhorn property at Cripple Creek has been leased to a leasing company, operations to be started soon. The showing on the Buckhorn consists of very narrow seams, from which some very rich ore has been obtained.

The Anaconda M. Co., at Cripple Creek, has decided to cease operations on company account and lease the remaining portion of the property. The action is due to the great amount of work that was performed last year by the various lessees, who mined something like $200,000 worth of ore, which netted the company better than $50,000 in royalties. The company owns a total of 93 120 acres of ground on Gold hill, and at the present time there are thirty sets of lessees operating various blocks of ground.

A. H. Heller, who bought the dump of the Ironclad mine at Cripple Creek, is removing it to the Arequa mill, which he has leased. As high as 75 tons a day is being taken and is found to average over $5 to the ton.

The Elkton Con. M. Co. and the El Paso Con. M. Co. have contracted with the United States Reduction Co. to send their entire output for three years to that concern.

James F. Burns, president of the Portland M. Co., at Victor, says regarding the condition of the Cripple Creek mining industry as follows:

"I consider that with a judicial system of development, Stratton's Independence will again become a great producer and still be ranked among the great mines of the district. Even though the bonanza ore that was shown nearer the surface may not continue, the bodies will be larger. I have always maintained that the Cripple Creek district would finally be a low-grade proposition with values ranging in the neighborhood of from $25 to $30 per ton, but as the values decrease the veins become wider and larger.

"With fair and just treatment charges by the smelters and mills, in connection with the low rates of transportation made possible by the Short Line railroad, Cripple Creek's output would be $40,000,000 per year instead of $20,000,000, and would have a boom like that of 1895, but on a larger scale.

"The helpless mine owner is in the grasp of the smelter and mill trusts. The mill trust, with a capitalization of $10,000,000 and $3,000,000 of bonds, paid $250,000 in dividends in two and one-half months, and it is claimed that they made a profit of $120,000 during the month of March. If the stocks and bonds of this combination were sold at market quotations to-day, they would bring about $7,400,000 on an invested capital of less than $1,800,000.

"The mining business is not 'in it' with them. The business of ore treatment is evidently much more profitable than the business of ore production. This trust will not make contracts with mine owners for ore f. o. b. at mill, but demands that they be f. o. b. at mine, which gives the mills all of the advantage of reduced freight rates without a corresponding reduction to the mine owner in the treatment charge. Thus you see the combination absorbs the benefit which was intended for the mine owner. They give us the flimsy excuse that the smelter trust will not allow them to quote prices f. o. b. mine, thereby showing that the mill and smelter trusts are either the same or have a mutual understanding. As a result of the rate war now on between the two railroads, the rate on all ore is $1 per ton to Colorado City, but the mill trust compels the mine owner to pay the schedule rate, thereby making a profit of from 25 cents to $1.50 per ton.

"The latest developments are that the smelter and mill trusts are forcing all samplers in the district to form a sampling combine, which if not a part and parcel of the parent combination will be a feeder to the same. Those that refuse to join the trust will be confronted by the ultimatum of the smelter and mill combinations that their ore will not be received, which will prevent the independent sampler from assisting the fettered mine owner.

"It is time that the mine owners wake up and get together to the end that they own or control plants for the treatment of their own ore. They have a railroad and with their own mills they would be out of reach of the trust and would soon sound its death knell in Colorado.

"If some of the largest producers, such as the Strong, Gold King, Ajax, Anchoria-Leland, Mary McKinney, Isabella, Gold Coin, Independence and many others, would co-operate in building a modern combination mill as nearly automatic as possible, with a capacity of something like 600 tons, the cost of which in round numbers would be about $500,000,

they could be absolutely independent. Running at its full capacity it would handle 18,000 tons per month at as small a cost as the combination could handle the same. Making a liberal estimate and putting the cost of treatment at $5 per ton and transportation at $1, we would make a saving of $2 50 per ton on one-ounce ore, based on present rates of treatment. But supposing there would be a saving of only $1.50 per ton, the size mill above mentioned would make a monthly saving of $27,000 or $324,000 per year. This would be 60% on tbe investment, and in less than two years the plant would pay for itself. In addition to all this, there would be an elimination of all the little leakages that continually manifest themselves in custom mills."

W. S. Stratton is about to sink a deep shaft on the Reform claim on Bull hill at Cripple Creek. The shaft is down 300 feet and will be driven to 1000 feet. The mine has not been worked for five or six years.

IDAHO.

ADA COUNTY.

An Eastern company has bought the Friday mine, near Pearl. This mine was worked to some depth a few years ago. It will be reopened immediately.

The Delhi 10-stamp mill, near Boise, has commenced crushing. This mine and mill are owned by W. A. Magee of Pittsburg, Pa. The ore is said to be milling $12 per ton in gold. The ledge is a very large one and opened up to the depth of 400 feet.

The Overlook group in Neal district, consisting of twenty-one claims, owned by G. M. Parsons, E. W. Johnson and J. W. Murphy of Boise, and people in Chicago, Ill., and Madison, Wis., will be developed on a large scale the coming summer. The company is to commence the erection of a mill with a capacity of sixty tons per day immediately.

BOISE COUNTY.

On Willow creek, near Idaho City, several mine owners have been working during the winter at developing several small ledges, which are from a few inches to 2 feet in width. The vein owned by C. Small averages 2 feet in width of ore that mills from $40 to $100 per ton in free gold. The claim owned by J. Constable has a vein that is only 5 inches to 1 foot wide, but mills from $100 to $150 per ton in free gold.

BOX ELDER COUNTY.

Manager P. W. Madsen, of the Century mine at Park Valley, reports that the main shaft is now down 100 feet on the vein, and the entire distance shows an average of $14 in gold to the ton. A force of men are at work clearing the ditches and opening the springs that supply the mill.

IDAHO COUNTY.

C. Kincaid of Pierce City reports a rich strike of free-milling gold ore as having been made in the Pioneer, near Pearce. The strike was made in the 132-foot level. The vein is 28 inches wide and assays range from $35 upward a ton. The Pioneer is principally owned by L. Grant of Detroit, Mich.

J. Dahl is preparing to operate on his Big Creek placers near Dixie. He has found as high as $15 to the pan on bedrock in his diggings, and will this year attempt to determine the extent of the deposits. The gold is all coarse, the nuggets usually being from the size of a pea to as large as a hazel nut.

The 10-stamp mill for the Crackerjack mine at Buffalo Hump is being teamed in. The plant consists of a 35 H. P. engine and boiler, a saw mill and the stamp mill proper. The saw mill will be set up first to saw out the timbers for the mill house. The stamp mill is not expected to be in operation before late summer or fall.

It is reported that the Buffalo Hump syndicate mill at Buffalo Hump will be enlarged this year, making it a twenty-stamp instead of ten, as at present. The Jumbo also is to be enlarged from its present size of four stamps up to eight or ten. It has produced from $1000 to $1300 per stamp per month all winter, and the mine is claimed to have ore in sight to justify the increase in mill capacity. A wire tramway was recently put in from the tunnel mouth down to the mill, 300 feet, to replace the old gravity chute which was about worn out. It is said to work finely.

On the Hogan Bros.' Buffalo Queen property at Crooked river, near Buffalo Hump, the 10-stamp mill is on the ground and the mill house is under construction. It is the intention to double the capacity of the mill as soon as possible—this year, probably—and the framing is being done with that in view. The company has a water power sufficient for a 40-stamp mill.

The discovery of a lode on the head of Botha creek which gives an average value of $120 a ton is reported from Thunder mountain.

KOOTENAI COUNTY.

The Idaho-Continental M. Co., operating the Continental group, near Port Hill, is planning to secure a railway into the mines at once. A. Klockmann, managing director, of Duluth, Minn., states the Great Northern may build a line to the mine from Port Hill, otherwise there is a strong probability that a railroad company will be formed by the stockholders of the Idaho-Continental Co.

SHOSHONE COUNTY.

The Standard & Hecla silver-lead mines in the Cœur d'Alenes are to be consolidated to reduce expenses. The Standard is capitalized at $2,000,000 and the Hecla at $1,000,000. Practically the same men own both mines. It is proposed to issue $3,000,000 in capital stock for the new corporation, which will be known as the Standard-Hecla Con. Co.

WASHINGTON COUNTY.

A rich strike is reported made on Snake river by J. Smith, a prospector and miner, who says that for some months past he and his partners have been working on a group of twelve claims 22 miles from Baker City, Or., on the Snake river, and have developed some very rich ore.

C. W. Luck of Weiser and W. H. Tibbals of Salt Lake City, Utah, have bonded the Sturgil Bar placers, near Weiser, at $200,000, the first payment of $50,000 to be made in three months. Luck & Tibbals claim to be acting for an Engli h company.

MICHIGAN.

HOUGHTON COUNTY.

An average of 750 tons of rock daily is being treated at the Baltic mill, at Houghton. A third head at the Baltic is expected to go into operation shortly, while two heads of the Champion mill should be in operation around midsummer and four heads should be in operation in either mill by fall, making eight in commission before the winter sets in. These eight heads will handle an average of 3600 tons of rock daily, allowing 450 tons to each head. It is claimed that Baltic and Champion rock runs thirty-six pounds of copper ingot to the ton of ore treated. It is figured that copper can be produced at 7 cents per pound.

MONTANA.

BEAVERHEAD COUNTY.

J. Innes, who has been working on his mines at Bannack all winter, it is reported, has struck a fine body of quartz carrying gold and copper.

CHOTEAU COUNTY.

J. Smith has located the Surprise and Rock of Ages claims on a wide lead of low-grade ore near Highwood. The vein assays $4.05 per ton and the lead is traceable for several hundred yards on the surface.

FERGUS COUNTY.

Spring work has commenced at the sapphire mines of the New Mines Sapphire Syndicate at Yogo, under J. Stites, the foreman. A large amount of development work is projected this year in addition to the mining of the gems. P. Ramond is bookkeeper in the company's office and C. Gadson is superintendent.

E. J. Morison of Billings has bonded a group of five claims at Kendall from F. L. Stephens, Ruth Stephens and Marion Walters at $20,000. Not much work has been done on the property, but the surface showing is of values from $1 to $4.50 per ton.

A 5-stamp mill will soon be in operation on the property owned by Lyons, Oliphant & Helsing, near North Moccasin, the work of placing the plant having already been commenced. The ore is free milling and runs from $3.50 to $5 per ton.

JEFFERSON COUNTY.

Recent development in the King Solomon mine, near Clancy, has opened up a large body of high-grade ore at the 150-foot level. The pay shoot is 180 feet long and 5 feet in width, assaying from $25 upward per ton. Mr. Moreland, the present owner, contemplates the erection of a complete concentrating plant, including a mill for crushing the ore.

LEWIS AND CLARKE COUNTY.

The Montana M. Co. has begun the development of the Noya claim, owned by J. Shafer, in the Park district, near Helena. The Noya is an undeveloped claim, with a large surface showing of gold-bearing ore. Work is being done on a shaft with a horse whim, and later a steam hoist will be erected.

MADISON COUNTY.

H. I. Wilson and T. M. Hodgens of Butte have begun work on the Elgin mine, near Rochester. They are now negotiating for machinery to be used on the property. The ore of the Elgin is gold-bearing. The development work is in charge of S. C. McClure.

The Conrey M. Co. has decided to erect a large machine shop at Ruby. It will be fitted with a steam hammer, turning lathes, etc. It is stated that the dredger boat belonging to the company will be started up immediately. The machinery of this dredger has been thoroughly overhauled and remodeled. The new dredger will be completed and ready for operation by the first of May.

G. D. B. Turner, formerly manager of the Red Bluff M. Co., has started work on the Pole creek placer mines belonging to A. W. Tanner of Norris. Mr. Turner has bonded these mines. Besides gold, they yield rubies and garnets of sufficient values to defray the expenses of working. To work them to the best advantage a large ditch has to be brought to the mines.

The January Dell M. Co., recently organized in Butte, with capital of $200,000, owns a group of six claims near Twin Bridges, and the Jenny Dell and the October claims, near Walkerville. It is understood that the company intends to sink the shaft of the Jenny Dell 125 feet, which will give a total depth of 300 feet.

One of the richest strikes of mineral ever reported in this State is stated to have been made in the Kearsarge mine at Summit, near Virginia City. From a 2-inch streak the vein has widened to more than a foot, and the ore in it is nearly all gold. R. B. Turner is the general manager of the Kearsarge and Kennett, having been appointed recently.

PARK COUNTY.

A. C. Jardine, Supt. of the Bear Gulch M. & M. Co. at Livingston, says that there will be a 40-stamp mill installed at the mine this summer. The work on the sawmill will be commenced at once.

SILVER BOW COUNTY.

A. Leathers and associates are developing a claim at Butte that, it is claimed, has an excellent showing of mineral. The shaft is down 100 feet and in ore. Nearer the surface a shoot of ore was struck that is rich in gold.

NEVADA.

ELKO COUNTY.

At the Lucky Girl quartz mine on Bull Run mountain, 45 miles north of Tuscarora, ground is being broken for a 75-ton cyanide plant, which will be erected immediately. The 20-stamp mill is kept running.——The Bull Run mine, operated by a local company, has a 10-stamp mill and cyanide plant running.

LINCOLN COUNTY.

A half interest in the Blossom and Coyote mining claims, near Searchlight, has been bonded at $25,000 to the Southern Nevada M. Co. of New York. Terms were $5000 cash and four monthly payments of $5000 each. This gives the company the whole of both claims.

WHITE PINE COUNTY.

The Monitor mine, near Ely, owned by Governor Sadler, S. Hilp, A Jackson, A. E. Cheney and T. Wren, is reported sold to the New York & Nevada C. Co.

NEW MEXICO.

GRANT COUNTY.

The Lena concentrator at Lordsburg has been started up. Owing to the lack of facilities for transporting ore it is not being run to its full capacity, but all the different mills and tables have been tried and all work satisfactory. The product is a fine quality of concentrates and assays of the tailings show that a close saving is made.

The mill of the Helen M. Co., at Graham, is treating sixty tons of ore daily. A force of seventy-five men are at work in the mill and mine. At a depth of 855 feet a 6½-foot vein of $55 ore has been uncovered.

The property formerly owned by A. A. Hamilton and associates in Gold gulch has been sold to H. Finch and others of Colorado, who are making tests of ore to determine the best method of treatment preparatory to erecting a plant. A 10-stamp mill will probably be decided upon.

The Pacific Union Smelting Co. of San Francisco, Cal., has bought an eighty-ton stack and necessary machinery for a smelting plant to be erected by it at Lordsburg.

The National G. & S. M. Co. of Chicago, Ill., which recently bought the Old Beck and four other mines at Stein's Pass, is arranging to erect a fifty-ton concentrator with sufficient motive power to increase to 100 tons capacity.

The Mineral Mountain M. Co. of Chicago, Ill., is putting in a pumping plant on its mine at Stein's Pass. A fifty-ton concentrating plant and hoist are also being erected.

LINCOLN COUNTY.

The Eagle M. Co. of Parsons City has bought every mining claim, water right and homestead on the Bonito river from Parsons nearly down to Angus. The plans of the company anticipate the erection of an enormous cyanide plant for treating low-grade ores, which will take a large amount of water from the Bonito.

OREGON.

BAKER COUNTY.

The development of the Gem mine, in Sparta district, and the increase of richness of its ores are stated as the reasons for another enlargement of the plant. The Gem Con. M. Co. has been incorporated by A. Geiser, W. Pollman and D. W. French at Baker City, capital $1,000,000, to provide the additional capital.

The Don Juan mine, near Sumpter, owned by N. H. Thibault, with D. D. McLeod as manager, has been developed by 900 feet of tunnel, with winzes and upraises. A winze 100 feet deep has been sunk about 400 feet in on the tunnel and is being put down 150 feet farther. Five additional stamps have been started up in the mill.

One giant is ready to operate on the placer property of the Deer Creek Placer Co., of Sumpter. A second giant is to be installed soon. N. C. Richards is president of the company, and F. E. Hobson secretary and Supt.

The Uncle Sam group, on Bald mountain, near Sumpter, has been sold by R. H. and S. S. Start, of Sumpter, to a Detroit company, of which R. W. Hawley, of Detroit, Mich., is president, and D. F. Hawley, of Sumpter, vice-president and manager.

The Stice Gulch placer claims, near Sumpter, have been sold by H. K. Brown and J. S. Kenyon, of Baker, to V. T. Craig, of Craig, Neb., and J. A. McLaughlin, of Lincoln, Neb. The Stice Gulch Placer Mines Co. has been incorporated with H. K. Brown, president; D. L. Killen, secretary and treasurer, and J. S. Kenyon, Supt. and manager.

The North Pole mine, near Baker City, has recently shipped 25 tons of ore, said to be valued at $200 per ton, which is claimed to be rather low-grade ore for this mine.

GRANT COUNTY.

E. J. Godfrey, the principal owner of the Red Boy mine, of Granite, who recently made a consolidation with the Concord property, adjoining the Red Boy, and bought with J. H. Robbins, of Sumpter, the Golconda mine, which has since been merged into the Red Boy-Concord combination, is planning to install near Olive Lake, about midway between the properties consolidated, a large electric light and power plant.

JACKSON COUNTY.

Mr. Mendenhall, owner of the Roaring Gimlet mine, 2 miles from Gold Hill, has shipped twenty-five pounds of gold panned out by hand from the rich pocket recently struck in the ledge. Mr. Mendenhall bought the mine in March from Sutton & Reese, paying $10,000 for it. He has already taken out $20,000.

Major Andrus, Supt. of the Bill Nye mine, 4 miles west of Gold Hill, has made a rich strike in a 50-foot shaft on the ledge. It is nearly all $200 rock The mine has already paid $20,000 in developing it to a depth of 240 feet, and but little of the ore has been stoped out.

The Scandia Tunnel Co., of Spokane, Wash., has elected Dr. O. T. Melde president and C. J. Johnston secretary. The company is working on a long crosscut tunnel near Granite. W. Wade is manager.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Pluma M. Co. has the hoist and pumps in position at the shaft in northeast Lead, and the plant will be started up this month. The company has bought the machinery of the Galena M. & S. Co., removing it from the Eureka and Hoodoo shafts, in Bear Butte district. The Pluma shaft is about 200 feet deep, and it is the intention of the company to continue it to the 500-foot level and to then crosscut.

PENNINGTON COUNTY.

The University G. M. & M. Co. has commenced development on the ground bought of B. J. Heath, near Rochford. An open cut has been run across one of the ore veins, showing it to be over 40 feet wide at the surface. It is a white quartz, carrying gold.

UTAH.

BEAVER COUNTY.

The Frisco Silver Queen M. Co. of Richfield has been incorporated, capital $100,000, with H. Tuft president and J. Dorius, Jr., secretary. The company owns the Blue Bird Nos 1, 2 and 3 and the Humbug Nos. 1, 2, 3 and 4 claims in the San Francisco district.

Manager H. Jefferson of the Butte & Beaver property, near Milford, is running a drift from the bottom of the 100-foot shaft and has crossed some good stringers of ore.

Galena ore is now being taken out of the Orphan Boy mine, near Milford,

which will average about $100 in lead and silver.

J. H. Dupaix states that preparations are under way for a resumption of operations at the Amelia G. & S. Co.'s mines at Star. Several veins from 1 to 4 feet wide have been opened, the ore carrying silver values from $15 to $150 per ton.

The Utah Southern G. & C. M. Co. has been incorporated at Salt Lake City, capital $500,000, with E. B. Critchlow president and F. A. Earls secretary. The company owns the Bonanza and Bonanza No. 2, Annie J., Last Chance, Daisy and Daisy No. 2 and Ouray claims in the Beaver Lake district.

SALT LAKE COUNTY.

The Columbus M. Co. has been incorporated at Salt Lake City, capital $150,000, with T. Jacobson president and A. E. Snow secretary and treasurer. The company owns the C. K. and C. K. No. 2 and Columbus Nos. 2 and 3 claims in the Little Cottonwood district.

SUMMIT COUNTY.

The Utah Zinc Co.'s mill at Park City, erected to work the zinc ores of the Anchor mine, has been sold by Mayne & Leonard to W. Quinby of Boston, Mass. The plant, it is said, will be enlarged and put in operation.

SEVIER COUNTY.

The Annie Laurie mill in March treated 7300 tons of ore. The grading for the new tanks to increase the mill's capacity has commenced. Another electric plant will be installed to furnish power for the additional mill machinery.

JUAB COUNTY.

In cutting a station at the 800-foot level in the South Swansea shaft a fine body of ore was struck, with a strong flow of water. The ore body presented a fine face of galena, and is the same vein as in the 700-foot level, where it measures 20 feet between walls. With 100 feet of stoping ground above, Supt. Wheeler will at once begin hoisting.

Six thousand pounds of very rich ore has been sacked from a recent strike in the Mammoth mine, and stoping continues on a 2-foot breast. The ore is a mass of horn silver and heavy spar that is said to carry from twelve to fourteen ounces in gold. S. McIntyre, Jr., manager, believes it will net $15,000 a ton. The ore was opened on the first level below the tunnel.

In the Mammoth mine at Tintic an unexpected find of exceedingly high-grade ore has been made near the main shaft, 350 feet down and 150 feet below the old workings. The ore shoot is 2 feet wide, and picked samples have yielded values up to $400 a ton. The mineral is horn silver.

Marble quarries are being developed by F. A. Sweet, of Salt Lake City. The locations are in Juab county, and the rock is claimed to be of superior quality, translucent and almost snow white. The ledge was found less than a month ago, and the work of development is being actively carried on.

TOOELE COUNTY.

At the Cygnet mine at Stockton, T. H. Benton, manager, ore is being stoped on the 200-foot level from a chimney 20 feet long and 4 feet across. The ore is galena and carbonates and yields about 45% lead and 10 ounces of silver to the ton. The concentrator is being operated.

WASHINGTON.

KITTITAS COUNTY.

The Jumbo placer mine on Williams creek, near Ellenshurg, is producing a large quantity of coarse gold and many nuggets, having a value of $5 and up. The largest one contained $168 in gold.

SNOHOMISH COUNTY.

The owners of the Nonpariel group of claims, near Index, are about to put in a compressor plant and power drills. The tunnel is now in 220 feet, with a vertical depth of 200 feet. The face of the tunnel is in a concentrating grade of copper ore.

The Big Index G. & C. M. Co. has been incorporated by W. Frankfurt, J. C. Rathbun, G. R. Davis, F. J. Melvin, C. H. Thrall, H. E. Daniells and G. A. Knox, of Seattle. The company owns fifteen claims near Baring Station on the Great Northern railway.

STEVENS COUNTY.

The Hester M. Co. of Seattle has elected J. T. Ronald, T. Foran, C. W. Thompson, J. Gibson and F. Utterdacht trustees. The company's properties are in the Pierre Lake district and embrace two groups of claims with about 500 feet of tunnel and shaft work.

WYOMING.

CARBON COUNTY.

A vein of rich gold ore has been struck in the Rose mine at South Pass. The mine is owned by C. C. Hamlin of Colorado Springs, Colo., A. Kendall of Rock Springs and associates. A cyanide mill will be built to handle the ore.

In the construction of the aerial tramway from Grand Encampment, towers for the first section of 4 miles have been completed and the second section commenced. A new camp will be established at a point about half way between the smelter and the Ferris-Haggerty mine. The cables, which have arrived at Walcott, come on spools in sections weighing seven tons each. Fourteen-horse teams will carry them to their place in the line. The supply of timbers for the towers is not equal to the demand, owing to bad roads in the hills.

FOREIGN.

BRITISH COLUMBIA.

In the 1901 report of the Con. Cariboo mine at Bullion, Manager J. B. Hobson summarizes the work accomplished as follows: Total time occupied in washing in pit No. 1, 104 days 1½ hours; total quantity of water used, 258,250 miner's inches. Quantity of gravel washed—top deposits from upper bench, 2,417,162 cubic yards; gravel from lower bench, 3126 cubic yards; total quantity of gravel washed, 2,420,288 cubic yards; average duty of water per miner's inch, 9.37 cubic yards; gold product for season, 8351.78 ounces (troy); value of gold, $142,275 51. The average yield of the upper bench, clay, gravel and slide rock, from which 1687.78 ounces gold were recovered, was 14½ cents, while the lower bench gravel showed an average return of $1.27 per cubic yard of gravel washed. As previously stated, owing to the short water supply, only a small quantity of the available bedrock gravels were treated—in all about 3126 cubic yards—from which was recovered coarse gold amalgam and nuggets to the value of $3978, giving a very high return.

R. Dore, owner of the Grace Dore nickel mine, near Fort Steele, reports that recent assays gave returns of from 9% to 14% nickel. Developments consist of 85 feet of open cuts, 40 feet of tunnel, and a shaft 22 feet deep. The ledge has 3 feet of good ore, which carries high values in nickel and cobalt, with small values in gold and silver.

The Silver Crown M. & M. Co., at their annual meeting in Spokane, Wash., arranged to begin extensive development work on the Alice and Zuni claims, near Cody. Ore from the ledge, it is claimed, averages about 200 ounces in silver and 70% lead.

The banks of Atlin during the season of 1901 exported $211,000 of Atlin gold, and royalty was paid on $193,000. It is estimated that the hanks purchased considerably less than one-half the season's output, which would make the production for the camp last season over $500,000.

The Triune group, consisting of the Triune, Enterprise, Silver Chief, Kamloops and Revenge claims, near Ferguson, have been sold by the Ferguson Bros. to the Metropolitan G. & S. M. Co., Ltd., of Minneapolis, Minn., for, it is reported, $600,000. The new owners intend to work the mine on a large scale. A smelter within 1500 feet of the mine and an aerial tramway to carry the ore down to the smelter are contemplated in the near future. Two tunnels have been driven on the property and ore has been encountered from the grass roots down. The shoots are large and carry galena, lead carbonate and zinc blende, the carbonate being of extraordinary richness. The galena carries antimonial silver.

W. G. Rohh, manager of the Wellington mine at Whitewater, reports that from the last shipment of 15½ tons the net returns were $1592 37, being 236½ ounces silver, 44 6% lead and 19.1% zinc.

C. A. Sandiford states that a new company has been formed in England to work the Wakefield, near New Denver, and operations will commence in May, with W. Macdonald as foreman.

The final payment of $8000 on the Eva and Highland Mary claims in the Lardeau has been made by the Imperial Dev. Syndicate to A. F. Rosenherger. This property was located two years ago.

It is reported that J. Dalton has bonded his copper claims in the upper Rainy Hollow district, beyond Porcupine, to the London Exploration Co. for $125,000. J. Vickers has also given a working bond on his property in Rainy Hollow, presumably to the same company.

The Ruth mine, near Slocan, owned by an English company, with H. B. Alexander, manager, at Kaslo, has developed a body of ore in the mine, from which a shipment of 27 tons showed values of 180 ounces of silver and 14% of lead.

A. F. Gwin of the Yreka C. Co. of Tacoma, Wash., has started work on the Comstock group of copper-gold properties on Comstock mountain, Quatsino Sound, recently bought by the company. He states that for some time operations will be practically confined to quarrying the ore and conveying it to the shipping point, about 1 mile from the mine, where a temporary wharf is being built. The company expects to have several hundred tons ready for shipment soon. The average value of the ore is stated to be $21, mainly in copper.

R. Pierson, J. G. Pierce and J. M. Starbuck of Seattle, Wash., have bought the southern portion of the Wreck Bay, Vancouver Island, placer claims, and are negotiating for the claims worked hitherto by the Wreck Bay Placer M. Co. The new owners intend this year working the beach with machinery.

The Queen Victoria mine, which is situated near Beasley siding, in Nelson district, has a large surface showing of ore, which crops out on a bluff, and the development work so far done shows already a body of ore 400x300x150 feet. This ore is claimed to have an average value of about $9 a ton.

MEXICO.

Cananea, Sonora, is said to have 7000 population at the present time, and is divided between the old town, where the smelter is, and the new commercial town, one mile this side, where many houses are being erected. Two new furnaces are being added to the six now in use, and eight converters are shortly to be put in place. A new steel building, 100x300, is being finished, which will contain an electric overhead railway.

TRANSVAAL.

Considerable attention is being given to the practicability of gold dredging in the rivers in the eastern portion of the Transvaal and Natal. It is considered that in South Africa the working costs would not exceed 8½ cents per cubic yard, and it is estimated that with a suitable dredger at least 150 cubic yards per hour could be worked. The great drawback to gold dredging in South Africa would be that work would be possible only during a limited portion of the year, for when the rivers are in flood in summer dredging operations could not be carried on successfully, nor in mid-winter, when many of the water courses are practically dried up, so that the working season would probably amount to only six months in the year.

YUKON TERRITORY.

The Gold Commissioner's office at Dawson shows that the business transacted by it in 1901 has exceeded that of any previous year. Many abandoned and new creeks were opened, including Henderson, Montana and All Gold and their tributaries. More than a thousand claims each were recorded on Montana and Henderson creeks and their tributaries. The report contains these figures for the year ending November 30th: Free miners' certificates granted, 12,400; placer grants, original entries, 6330; renewals, 3700; relocations, 3800; assignments and mortgages, 10,150; documents relating to quartz claims, 1105.

Personal.

J. A. JENKINS, C. E., of Grass Valley, Cal., is at Keswick, Cal.

HENRY BRATNOBER of San Francisco, Cal., is at Seattle, Wash.

H. T. TRIPP is Supt. of the Sumdum M. Co. at Sumdum, Alaska.

E. W. HUNT, C. E., of Rico, Colo., is sojourning in Los Angeles, Cal.

M. BROWN is manager of the Conqueror group of mines at Empire, Colo.

H. F. CALENBERG is Supt. of the Jupiter Con. mine, at Iowa City, Cal.

C. S. THOMPSON has been appointed Supt. of the Corsair M. Co. at Creede, Colo.

S. C. MCCLURE has been appointed Supt. of the Elgin gold mine at Rochester, Mont.

F. W. HOAR, Supt. of the Old Dominion copper mine at Globe, is at Boston, Mass.

J. A. HUTCHINSON of Boise, Idaho, was in Salt Lake City, Utah, early in the week.

W. J. STEVENS has returned to Wardner, Idaho, from a sojourn at Grass Valley, Cal.

C. B. LAKENAN of Grass Valley, Cal., has been appointed Supt. Coe mine, at that place.

GEORGE E. ROBERTS of Washington, D. C., Director of the Mint, is in San Francisco.

T. HOATSON of the Calumet & Hecla mine at Houghton, Mich., is at Marysville, Mont.

G. MILLER of Ashland, Or., has been appointed millman at the Dewey mine at Gazelle, Cal.

G. S. BINCKLEY of Los Angeles, Cal., has been appointed manager of the Esperanza M. Co., operating on Cedros Island, Mexico, and will take personal charge at the mine this month.

O. CHATFIELD, foreman of the New Independence mine at Wolf, Cal., is in San Francisco, Cal.

P. BONERY, Supt. of the La Grange hydraulic mine at Weaverville, Cal., is in San Francisco.

ROBERT JONES, Supt. of the Canada Hill drift mine, near Westville, Cal., is in San Francisco.

J. H. DURST, Supt. of the Plymouth Rock mine, near Plymouth, Cal., is in San Francisco.

J. C. UNDERWOOD, manager of the Lozier M. Co. at Llana, Sonora, Mexico, is in New York.

R. B. PARK of Cleveland, O., has been appointed assayer at the Gold Bug mine at Georgetown, Cal.

J. B. YOUNG of Toronto, Canada, has been appointed Supt. of the Garcia mine at Wickenburg, Ariz.

J. BURSON, Supt. of the Arizona G. & C. Co. of Wickenburg, Ariz., is sojourning at El Paso, Texas.

RICHARD WALLACE has been appointed Supt. of the Independence Con. G. M. Co. at Cripple Creek, Colo.

WILBUR PARKER of the White Chief M. & M. Co., Chinipas, Chihuahua, Mexico, is in San Francisco.

W. G. NEBEKER has returned to Salt Lake City, Utah, from a trip to several mining districts in Idaho.

H. G. KANE, foreman Deer Creek M. Co.'s claims at De Borgia, Mont., is sojourning in Madison, Wis.

J. A. FLEMING, manager of the Black Warrior copper mine at Black Warrior, Ariz., is in San Francisco.

W. D. PINGSTER, manager of the Star mine at Columbia, Cal., has returned there from San Francisco.

T. MOFFETT of Butte, Mont., has been appointed manager of the Oregon Monarch G. M. Co. at Sumpter, Or.

T. D. BABBITT, manager Dewey mine, at Thunder Mountain, Idaho, was in Salt Lake City, Utah, on the 15th inst.

A. C. JARDINE, Supt. of the Bear Gulch M. & M. Co. at Livingston, Mont., has returned from St. Johns, N. B.

LAURENCE W. TATUM, M. E., of Chicago, Ill., manager of the Oro M. Co., has gone to the company's mine in New Mexico.

JOHN H. LANDIS has been nominated by the President as Supt. of the mint at Philadelphia, Pa., to succeed H. B. Boyer, resigned.

J. E. LAWRENCE, consulting engineer for the Sonora Dev. Co. of Moctezuma, Sonora, Mexico, is sojourning at Los Angeles, Cal.

N. TREWEEK of Lead, S. D., has been appointed consulting engineer for the Hidden Fortune M. Co., operating near that place.

GEORGE GRUSS has returned from Kalgoorlie, West Australia, and is at his former home at Genessee Valley, Plumas county, Cal.

J. A. YEATMAN, engineer of the Byron Jackson Machine Works at San Francisco, Cal., has returned from a trip to Salt Lake City, Utah.

A. F. HOLDEN, managing director of the United States and Centennial-Eureka Mining Companies of Bingham and Tintic, Utah, is in Boston, Mass.

JOHN R. MACLAREN of Glasgow, Scotland, is in Victor, Colo., engaged on an examination of Stratton's Independence mine for some of the Scotch stockholders in that company.

R. A. TREVARTHEN has resigned the superintendency of the Portland mine at Victor, Colo., on account of ill health. F. G. Peck, secretary of the company, is temporarily in charge.

Commercial Paragraphs.

THE Hendrie & Bolthoff Manufacturing & Supply Co. of Denver, Colo., will remove to their new offices in the Sheridan building, Denver, about May 15th.

THE Allis-Chalmers Co., represented by Geo. E. Ames, have removed their offices from 137 Montgomery St. to Rooms 622-623, sixth floor, Hayward Bldg., corner California and Montgomery Sts., San Francisco, Cal.

THE E. H. Sargent Co. of Chicago, dealers in chemicals and assayers' supplies, have bought the business of Richards & Co., and will remove to 143-145 Lake St., Chicago, where they will carry a large stock of chemicals and assayers' supplies.

G. L. HOLMES, who has charge of the placer mining machinery department of the Link Belt Machinery Co. of Chicago, is in New Mexico on business for his company. Mr. Holmes will make a most extended trip visiting all the prominent

placer mining camps of the West, Mexico and British Columbia.

THE J. Thompson & Sons Manufacturing Co. of South Beloit, Ill., has taken out incorporation papers under Illinois laws, with capital stock fixed at $300,000. The plant is to be greatly enlarged, new factory buildings being in course of construction at South Beloit. The company manufactures gas and gasoline engines, and hoisters, tools, etc.

UNITED STATES CONSUL HOLLIS at Lourenco Marques, Portuguese East Africa, reports that there is a demand in that country for steel cars, locomotives and other rolling stock, mining and electrical machinery, pitch pine, Oregon pine, etc., from the United States. The consul says he believes that a large trade in these lines can be created in Southeast Africa, the Transvaal, Mozambique and adjoining States.

THE Denver Engineering Works Co. of Denver, Colo., are receiving orders for large electric power and pumping plants for shipment to Mexico, the most recent installation being in the Candelaria mine, State of Zacatecas, which plant consists of two 125 H. P. engines, direct connected to 75 K. W. Crocker-Wheeler generators, together with switchboards and regulating apparatus. The Denver Engineering Works Co. have also just completed a carload shipment of sheet steel jackets for the copper matte furnaces at the Bingham Copper & Gold Mining Co.'s plant in Utah, which shipment will be followed by several carloads of similar jackets, now in process of construction. The large number of sheet steel jackets manufactured by this company has warranted the purchase of special machinery for this class of work.

Recently Declared Mining Dividends.

	Payable.
Gwin Mine Dev. Co., California, No. 32, 25 cents per share, $25,000	April 15
Ontario S. M. Co., Utah, 30 cents per share, $45,000	June 20

Latest Market Reports.

SAN FRANCISCO, April 16, 1902.

METALS.

SILVER.—Per oz., Troy: London, 24⅛d (standard ounce, 925 fine); New York, bar silver. 53½c, refined (1000 fine); San Francisco, 53½c; Mexican dollars, 44½c San Francisco, 43c New York.

COPPER. — New York: Standard, $11.00@11.50; Lake, 1 to 3 casks, $12.50; carload lots, $12.25; Electrolytic, 1 to 3 casks, $12.25; carload lots, $12.12½; Casting, 1 to 3 casks, $12.25; carload lots, $12.00. San Francisco: $14.00. Mill copper plates, $17.00; bars, 18@24c. London: £52 17s 6d per ton.

LEAD.—New York, $4.12½; Salt Lake City, $3.60; St. Louis, $4.00; San Francisco $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, $4.75. London, £11 12s 6d per ton.

SPELTER. — New York, $4.35; St. Louis, $4.00; London, £17 16s 3d per ton; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN. — New York, pig, $28.00; San Francisco, ton lots, 27c; 1000 lbs., 28½c; 500 lbs., 28½c; 200 lbs., 28½c; less, 29c; bar tin, ℔ lb, 32½c.

PLATINUM.—San Francisco, crude, $17 ℔ oz.; New York, $18 per Troy oz.

QUICKSILVER. — New York, $51.00 large lots; London, £8 15s; San Francisco, local, $47.50 ℔ flask of 76½ lbs.; Denver, $51.00. Export, $45.00.

BABBITT METAL.— San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER. — Half-and-half, 100-lb. lots, 18½c; San Francisco, Plumbers', 100-lb. lots, 15.60c.

NICKEL.—New York, 50@60c ℔ lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $17.25; gray forge, $17.75; San Francisco, bar, 2.75 ℔ lb.,3c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $31.75; open hearth billets, $32.25; San Francisco, bar, 7c to 12c per lb.

CEMENT.—Germania, $2.65; K. B. & S., $2.65; Hewmoor, $2.50; Trowell, $2.50 per bbl.

LIME.—Santa Cruz, $1.60; Roche Harbor, $1.60 per bbl.

LUMBER.—(Retail): Pine, ordinary sizes, $18.00@19.50; extra sizes higher; redwood, $19.00@20.00; lath, 4 feet, $3.90 @4.00; pickets, $19.00; shingles, $2.00 for No. 1 and $1.75 for No. 2; shakes, $13.00 for split and $14.00 for sawed; rustic, $25.00 @31.00.

GENERAL SUPPLIES.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.50; Cut, $3.50; 10d to 16d, Wire, $3.55; Cut, $3.55; 8d, Wire, $3.60; Cut, $3.60; 6d and 7d, Wire, $3.70; Cut, $3.70; 4d and 5d, Wire, $3.80; Cut, $3.80; 3d, Wire, $3.95; Cut, $3.95; 2d, Wire, $4.20; Cut, $4.20. Special rates for carload lots.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one toss 15½c. No. 1** 50%, carload lots, 11½c; led, than one ton, 13½c. No. 2, 40%, carloan lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ℔ set; 14 oz., 40s., 9c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $6.50; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $9.56, long ton; Colorado Anthracite, $14.00. Coke, $15 per ton in bulk, $17 in sacks; Sunnyside, $11.75, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 29@30c ℔ lb.; carloads, 27@28c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c ℔ lb.; soda ash, $1.90 ℔ 100 lbs.; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5¾@6½c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 5c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.25 @1.50 ℔ 100 lbs.; sks, $1.05; chloride of lime, spot, $2.50@2.60; nitrate of potash, in bbls, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, boiled, bbl., 76c; cs., 81c; raw, bbl., 74c; cs., 79c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 66c; cs, 71c; raw, bbl., 64c; cs, 69c. Kerosene —Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bbls, 19c; wooden bbls., 22½c; cs, 25c; Mineral Sperm, cs, 26½c; Deodorized Stove Gasoline, bulk, 15½c; do., cs., 21½c; 86° Gasoline, bulk, 20c; do., cs., 26½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14c; do., in cs., 20½c; Lard Oil, No. 1 bbl., 60c; cs., 65c; Neatsfoot Oil, bbl., 70c; cs., 72½c; No. 1 bbl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6¾c; 1 ton and less than 5 tons, per lb., 7c; 500 lbs. and less than 1 ton, per lb, 7¼c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6¾c; do. in kegs, 7¼c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7¼c; less than 500 lbs., 7½c.

ASSAY LITHARGE.—Per lb., 9c.

BISMUTH.—Subnitrate, per lb., $1.60.

BONE ASH.—3c ℔ lb.

BORAX.—Crystal, 7c: calcined, 20c.

CHROMIUM.—(90% and over) per lb., $1.25.

COPPER.—Carbonate, 20c; Red oxide, ℔ lb., 60c.

MAGNESIUM.—Per lb., $3.00.

MANGANESE.—(90% and over) ℔ lb., $1.25.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—25c. ℔ gramme; 1000 grammes=2⅛ lbs.

PHOSPHORUS. — (American) ℔ lb., 80c.

SILVER.—Chloride, ℔ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ℔ lb., $1.00

URANIUM.—Oxide, ℔ lb., $3.50.

ZINC.—Metallic, chemically pure, ℔ lb., 50c.

ZINC.—Dust, ℔ lb., 10c.

ZINC.—Sulphate, ℔ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Catalogues Received.

The Sturtevant Mill Co. has issued a catalogue descriptive of the crushing and grinding machinery manufactured by it. It is well illustrated and full of information concerning rock crushing. The catalogue will be mailed on application to the Sturtevant Mill Co., Boston, Mass.

The California Wire Works of San Francisco has issued Catalogue No. 21, part 1, descriptive of the Hallidie endless wire ropeway. It contains many excellent illustrations of installations of this type of aerial tramway at mines. The methods of construction and operation are very clearly and completely described and the catalogue is a useful handbook of information to mine owners and others having difficult transportation problems to be solved.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING APRIL 8, 1902.

696,932.—VOTING MACHINE—A. J. Roiling, S. F.
697,395.—VEHICLE—F. Bosoh, Crescent City, Cal.
697,323.—PENCIL SHARPENER—E. Burke, Lakeview, Or.
697,303.—MITER BOX—R. H. Dorn, Los Angeles, Cal.
696,961.—OIL BURNER—Lizzie C. Graessle, San Jose, Cal.
697,084.—HYDRANT—W. Henderson, Los Angeles, Cal.
697,085.—SMOKE PREVENTER—J. H. Hobart, Denver, Colo.
697,087.—WIRE BED BOTTOM—J. Hoey, S. F.
697,088.—THRESHER FEEDER—M. I. Howe, Stockton, Cal.
697,257.—READING STAND—J. Kriwanek, S. F.
697,093.—VAPORIZER—G. H. Larkin, S. F.
697,376.—MECHANICAL DIRECTORY—G. W. Maxwell, Los Angeles, Cal.
697,377.—MECHANICAL DIRECTORY—G. W. Maxwell, Los Angelee, Cal.
697,378.—MECHANICAL DIRECTORY—G. W. Maxwell, Los Angeles, Cal.
697,379.—MECHANICAL DIRECTORY—G. W. Maxwell, Los Angeles, Cal.
697,380.—MECHANICAL DIRECTORY—G. W. Maxwell, Los Angeles, Cal.
697,381.—MECHANICAL DIRECTORY—G. W. Maxwell, Los Angelee, Cal.
697,382.—MECHANICAL DIRECTORY—G. W. Maxwell, Los Angeles, Cal.
697,368.—WASHER FASTENER—J. W. Shaw, Berryessa, Cal.
697,181.—BODY WARMER—R. E Smith, Portland, Or.
697,032.—TRUSS—T. C. Spelling, S. F.
697,038.—CAN TOP—J. B. Stewart, Chico, Cal.
697,183.—SUGAR PADDLE—C. Stout, Pomona, Cal.
697,224.—VEHICLE REACH—Travis & Denny, Medical Lake, Wash.
697,296.—WATER ELEVATOR—G. R. Tyler, Pomona, Cal.
697,120.—JEWELERS' TOOL—R. H. Wade, Elma, Wash.
697,054.—PULLEY KEY—F. Wiggine, Tacoma, Wash.
697,058.—HARROW TOOTH FASTENER—Glenn & Porteous, Freeno, Cal.
697,059.—CULTIVATOR—Glenn & Porteous, Fresno, Cal.
697,062.—ROASTING FURNACE—L. T. Wright, Keswick, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

READING STAND.—No. 697,257. April 8, 1902. John Kriwanek, San Francisco, Cal. This invention relates to a means for supporting books and the like, and it consists of a foldable adjustable frame, an adjustable stand having tubular sleeves, an arm adjustment carried thereby, upon which arm the book-holding frame is adjustably secured. In conjunction with this device is a clamp adapted to hold the leaves of the book, or any number of them that may be desired.

VAPORIZER, MIXER AND REGULATOR FOR OIL BURNERS.—No. 697,093. April 8, 1902. G. H. Larkin, San Francisco, Cal. This invention is designed for use in connection with burners for hydrocarbon oils. It consiete of a chamber having diaphragms formed therein to produce tortuous passages through the chamber. Steam and oil inlets connect with one side of the chamber and a burner pipe discharges from the opposite eide. These tortuous passages provide for such a continuous mixing and movement of the oil and steam that it will he discharged through the nozzle in the best condition for burning.

SMOKE PREVENTER.—No. 697,085. April 8, 1902. J. H. Hobart, Denver, Colo. The object of this invention is to provide for the consumption of smoke which arisee from the imperfect combustion of fuel in boiler furnaces and the like. The furnace has a bridge wall at the rear and beneath the boiler there are double arches forming an intermediate passage for the products of combustion, and means for supplying air to produce a draft transversely to the movement of said products through the passage. A second wheel having pigeonhole openings ie located in rear of bridge wall, with means for supplying air into passages above the openings and delivering it downwardly into each of the pigeonholes and transversely to the line of movement of the products of combustion.

WIRE BED BOTTOM.—No. 697,087. April 8, 1902. John Hoey, San Francisco, Cal. The object of this invention is to combine two elastic and essentially parallel separate and horizontal fabrics in a bed, so that all the desirable qualities of the readily yielding upper fabric may, when the weight is increased, be supplemented by a secondary and preferably less yielding surface below. In conjunction with these is employed a continuous yielding pad interposed between the surfaces, so as to gradually transmit the pressure from the upper to the lower one.

WANTED.—By a young School of Mines graduate, a position with reliable mining company as assayer, chemist and surveyor. Considerable surveying practice, besides one season with U. S. Geo. Survey. Can handle both and more, if necessary, for small company. State salary. Have had practical mining experience. Good references. Address "Worker," care of this office.

WANTED.

Consulting Mining Engineer,

familiar with making examinations of mines, prospects and mineral lands. Address stating experience and references. Moderate salary to start, with advancement to competent man. Position permanent if found satisfactory. Address A., care of Mining and Scientific Press.

L. Vogelstein,

90-96 Wall Street, NEW YORK.

....REPRESENTING....
ARON HIRSCH & SOHN,
HALBERSTADT, GERMANY.

COPPER, ARGENTIFEROUS AND AURIFEROUS COPPER ORES, MATTES AND BULLION, LEAD, TIN, ANTIMONY, SPELTER.

DELINQUENT SALE NOTICE.

LARKIN MINING COMPANY.—Location of principal place of husiness, San Francisco, California; location of works, near Placerville, El Dorado County, California.

Notice.—There are delinquent upon the following described stock on account of assessment (No, 12) levied on the 5th day of March, 1902, the eeveral amounts set opposite the names of the reepective shareholders, ae follows:

Names.	No. Cert.	No. Sharee.	Amt.
W. E. Lutz	10	100	2 00
J. B. Quigley	291	250	5 00
J. B. Quigley	314	500	10 00
J. B. Quigley, Trustee	315	500	10 00
Dr. Owen Buckland	324	200	4 00
Dr. Owen Buckland	325	200	4 00
Dr. Owen Buckland	326	100	2 00
W. J. Likens	336	200	4 00
Chas. Downing	344	1,334	26 68
H. M. Holbrook	362	1,000	20 00
Dr. Owen Buckland	369	500	10 00
J. B. Quigley	375	250	5 00
W. C. Johnson	397	75	1 50
Ella Kirkham	404	200	4 00
W. T. Lally	414	300	6 00
W. T. Lally	415	200	4 00

And in accordance with law. and an order of the Board of Directors, made on the 5th day of March, 1902, so many shares of each parcel of such stock as may he necessary, will he sold at public auction, at the office of the company, 112 Main street, San Francisco, California, on MONDAY, the 5th day of May, 1902, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. F. REMINGTON, Secretary.
Office—112 Main street, San Francisco, California.

MICA Makes short roads.
AXLE And light loads.
GREASE Good for everything that runs on wheels.

MINING AND SCIENTIFIC PRESS

Whole No. 2179.—VOLUME LXXXIV. Number 17. SAN FRANCISCO, CAL., SATURDAY, APRIL 26, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Portland G. M. Co. Mill Near Colorado Springs, Colo.

On this page appears a bird's-eye view of the new Portland G. M. Co. mill now nearing completion near Colorado Springs, Colo. The view is on too small a scale to give an idea of the real magnitude of the plant, and of its technical completeness for the purpose for which it is designed.

Some idea of the magnitude can be gained from the figures of the quantities of material moved and placed, and an enumeration of the structures and appliances constituting the plant. In making the excavations 28,000 cubic yards of earth was moved. In building there was used 6,666 perches of stone masonry, over 1,000,000 brick, 50,000 cubic feet of concrete, 1340 tons of structural steel and more than 1,000,000 feet of lumber. The buildings consist of a crushing and sampling department, roaster, barrel house, concentrator, melting and refining building, power house, machine shop, boiler house, warehouse, office, pump house and cottages. They aggregate a floor area of 190,000 square feet, of which 40,000 square feet is cement. Enormous quantities of corrugated steel are used as siding and roofing and iron stairways connect the working floors. There is a 9-foot diameter self-sustaining stack 171 feet high. A system of narrow-gauge tram roads connects the buildings and departments. Seventy carloads of machinery have been installed, and 100,000 pounds of sheet lead and 50,000 pounds of lead pipe have been used. The steel ore bins have an aggregate capacity of 3,000 tons of ore. The water system embraces over a mile of 10-inch and 12-inch pipe and reservoirs of 33,000,000 gallons capacity. Automatic devices are installed for weighing the ore. The entire operation of the plant is to be by transmitted electric power. The machine shop is capable of turning out any work required by the plant. The treatment capacity is 300 tons daily, and the plans have been so made that a duplicate unit can be constructed harmoniously with it.

More interesting even than the technical features of the plant are the conditions under which it came to be built. The Portland G. M. Co., in common with other companies operating mines in Cripple Creek, Colo., has been sending its ore to custom smelters and custom mills. The recent combinations made in these interests have resulted in increasing the milling cost charges and deductions to such an extent that the profits in the mining of the ore were being absorbed by the smelters and the mills. The Portland Co., becoming satisfied that the profit their large production of ore was paying these outside interests could be added, where it properly belongs, to the company's dividends by building and operating their own mill, has built the mill, and it is safe to assume will increase their dividends as anticipated. It has made the mine independent of all combinations designed to fatten at its expense.

The fact that the mills built in the early days of the Cripple Creek mines have not been successful in operation should not be permitted to condemn the milling of the ores as being impossible. The early built mills were not built for Cripple Creek ore. Later ones that have been built for these ores have given satisfactory returns to outside milling companies. There is no reason why the same, or better mills more adapted to the Cripple Creek ores, should not produce equally satisfactory returns when operated by the mine owners. Certainly such mills owned and operated by the mine owners would permanently settle questions of smelter and milling trusts and combinations so far as those mines are concerned.

Bird's-Eye View of the Portland Mill, Colorado Springs, Colo.

An authoritative statement of an American Government official at Vladivostok, Siberia, declaring that the ukase of the Czar by which all mining is prohibited in the maritime province of Siberia for a distance inland from the shore of 100 versts, 66 miles, is still in force and will be enforced, should put a final quietus on the schemes of promoters who are announcing that they have concessions to mine for gold within the prohibited area. The prohibition extends to Russian as well as foreign mining. The Russians will not mind it and outsiders should not. The order covers the entire coast from Vladivostok, northward to the Arctic ocean. The only exception made to the order was in favor of two associations which had already started operations under old concessions. These are not on the market and it would be safe to leave them alone if they were offered. For the individual gold seeker there is nothing to look for in an attempt to mine in this territory but a chance at Russian prison life, which those who unfortunately have known it say is unattractive. No one should invest in any Siberian mining scheme proposing to mine in the maritime province no matter how attractive the proposition is made to appear.

THE price of silver has had a persistent downward course for several months past, and it is now below the low point reached several years since. There is nothing encouraging in the market, and but one prospective influence that would tend to raise the price in the future. The one prospective influence is the opening up of China by the construction of large engineering works, railroads principally and after them, electrical and mining plants. These making large local expenditures for labor will pay for that labor in silver, thus increasing the quantity that annually disappears as consumption in China. This industrial development in China, which seems the only prospective influence that can cause a rise in the price, is still in the future. It is not born yet. Dealing with the situation as it is, producers of silver must look to lowered costs of production rather than higher sale prices to maintain profits. It seemed as if the lowered sale prices of lead and copper would restrict silver production and appreciate the price. This has not happened, however.

THE interests which have been attempting to permanently control the production of, and price of copper seem finally to have given up the attempt, and the indications are that copper will be allowed to take the price the market makes for it. The Metals Selling Co. of New York has lost the handling of the copper production of some large mines, which will hereafter be sold in the open market competitively. While there is considerable talk about copper appreciating in price to 14 cents a pound, it would seem that the present price of about 12 cents is closer to the average for a considerable period of time in advance of the present than 14 cents would be. As the situation clears, it becomes more and more apparent that the dominating production of copper will come from Arizona, Mexico, British Columbia and California. The ores that are being worked in the mines of these States and of British Columbia carry considerable gold values. The mines are not very deep, are easily worked and the ore bodies are enormous. Methods of reduction other than smelting, which are particularly applicable to these ores, have made it possible to produce copper from them cheaper than it can be produced in the older mines of Montana or in all but a very few of the Lake Superior mines. Mexico at the moment is notably increasing the production of copper and is preparing to increase it still more. From all accounts this production is made at a very low cost figure, and the enormous quantity of it can not fail to affect the market price. It is hardly probable that it will reduce it materially. The ultimate effect will be, rather, to close mines in the older districts that can not produce copper which will sell at a profit at 12 cents, or, it may be, as low as 10 cents. Copper production is a good business at 10 cents. The fact that a price can not be permanently held at 17 cents, or even 14 cents, should not discourage investment in and development of copper mines. The industry, however, should from now on adjust itself to 12-cent copper and cease dreaming about the golden time when copper was 17 cents.

MINING claim locations are not taxable in California, but some of them are taxed and some of them are not taxed. A good deal depends on the assessor and more depends on the claimant of the claim. The assessors, as a rule, are not given to examining the records to find what location claims a miner or prospector has. Unless the claimant tells the assessor, the latter is not apt to assess locations which have no improvements on them. Locations that are improved so that they have the repute of mines are always found by the assessor and a tax levied. The assessment valuation is usually made by the claimant and should not be high enough to hurt even his conscience. Practically the producing mines pay less than the prospecting or developing mines. There has been a practice in some counties of assessing the claims as personal property, and collecting the taxes in the same way as taxes on other personal property are collected. Other counties assess the claims as possessory rights, the same as claims filed under the homestead and pre-emption laws. As a rule, where mining locations are taxed the assessment has been so low that the sum of taxes to be paid has not justified the cost of a lawsuit to prevent the collection. It would seem that if any one were to litigate the question to a finish that it would be found, as stated in the beginning of this, that mining locations are not taxable. The deterrent condition against litigation, besides the smallness of the sum of money involved, is the fact that prospectors always want to sell their locations, and litigation over taxes would cloud an otherwise clear title and prevent a sale.

THE law that the mining industry in California gets is the kind that is always either useless or injurious to it. The Constitutional Amendment No. 28, to be voted on in November, while not aimed at it, scatters so, that its adoption would involve the mining industry in some political and business troubles it has been heretofore free from. Its adoption would be injurious to the industry. The provision of its scattering load that strikes mining is that giving the Commission created by the amendment the fixing of charges and determining the cost to mine operators of the electric light, power and water they buy from others. The fixing of maximum charges for water is under the existing law the duty of county supervisors. The other two are new inclusions in Government duties. Practically the several boards of county supervisors have found it impracticable to fix water charges for mining, and they have not done it. These county supervisors are, however, elected by miners and representatives of the mining industry of their several districts. The new Commission, not having this local responsibility and knowledge, would surely undertake to carry out the law. It is with power and electric light that the greater mischief will be effected. The amendment takes away entirely the right of mutual contract between the seller and buyer of electric light and power for mining. It introduces the varying dictum of an irresponsible third party, the Commission, who theoretically neither produce nor consume the electric light or power, as the substitute for the right of free contract. Neither the production of electric light or power is a monopoly nor can it be made a monopoly at any point in California, least of all in the mines. There are many sources of electric light and power and the individual is always free to manufacture his own supply. The sale of electric light or power to consumers needs no regulation except the power of contract by the parties directly interested. The consumer is not compelled ever to buy at the seller's terms or do without. In the mining regions of California the conditions and costs of power production differ at every plant. The conditions of consumption differ with every consumer. Private contract between the seller and consumer can and will naturally recognize the conditions. Commissions and Government regulation cannot do this. The whole inelastic practice of government would be a disturbing, disorganizing influence on business relations now perfectly harmonious, and from their nature impossible of being anything else. The fact that under the amendment the right of free contract for power will be taken away from the mine operators is sufficient cause for the vote of every miner in California against it.

THE Council of the Dominion of Canada have fortunately become convinced that the Treadgold concession would result in the serious injury of mining and commercial development in the Klondike and have revoked the grant, or at least materially modified it. This action is probably due to the personal representations of Governor Ross and the committee sent by the people of Dawson and the Klondike to Ottawa. The immediate effect of the change in policy is a striking proof of the impolicy of the concession. The claims that Treadgold and his associates were to have under the concession have been reopened to location by miners. According to reports, there were some 4000 of these claims, and a rush to get them has taken place, most, if not all of the claims, being taken at once. They will all be more or less developed and worked this season and will employ a large number of people. In the possession of Treadgold and his company it is unlikely that a tenth part of them would have been even prospected, and still more unlikely that a tenth of the number of people would have been employed. It is people who make a country, and people will not go into a country of solely mining resources unless they have the opportunity of profit from those resources. It is clearly to the interest of the Canadian Government to keep the placer mining localities open to individuals, favoring, if any favor at all be given, their small placer mining enterprises, rather than the larger ones of corporations. The country of the Klondike has prospered and grown as a result of this condition. One of its best recommendations to gold mining enterprise by individuals is the high rate of wages its mines have been able to pay labor. With these high rates of wages the mines are less attractive to outside capital, but a placer gold mining country can stand this condition as long as the placers will pay wages. The excuse for the Treadgold concession, the necessity of bringing in water by the expenditure of considerable capital, was simply an excuse, it was not an economic reason. The Klondike mines are rich enough to pay from their output the cost of bringing in water, and the history of other placer mining districts proves that the owners do bring in water supplies when the time comes that it will pay them. In the case of the Klondike it is estimated that $500,000 will provide an ample supply. The yield of the mines for this season is estimated at about $30,000,000, so the total cost of a permanent water supply is but a comparatively small proportion of a single season's yield of the mines.

IT is reported that the representative of some prospective buyers of a mine in Colorado declined to consider the proposition, unless the owners of the mine could show a written pledge of an authorized officer of the American S. & R. Co., that the company would treat a specified number of tons of ore from the mine daily. Nothing more conclusive as showing the dependence of the mining industry of Colorado on the smelting and milling combinations could be stated than this. It confirms what this journal has repeatedly insisted would be the condition of the mining industry as a result of such combinations of the smelters and mills. The condition makes the value of a mine dependent not on what it can produce, but on what the smelting and milling combinations will buy of it. Practically it makes the smelting and milling combinations the real owners of the mines, without the slightest risk or cost to themselves. These two combinations pay larger and surer dividends than all of the mines combined. But they pay them from the product of the mines, not mines that they themselves own, either directly or indirectly through subsidiary companies, but from the mines of outside owners. The condition is not normal for gold and silver mines under any circumstances, and should not be for lead mines. It is not necessary that it continue. But relief can only be permanently had when the smelters and mills are made as integral a part of the mining plant as are hoists and air drills. It cannot be had by more combinations of smelters that depend on custom working of ores.

Concentrates.

SILVER is the best conductor known for electricity, copper is second, gold third and aluminum fourth.

THE camber of a bridge is the rise of the chords at the center of a span over their level at the supported ends.

ONE TON of coal is about the equivalent for steam making of two cords of dry pine wood. Which is the cheaper depends on the prices.

CERTAIN PETROLEUM OILS obtained from wells in Ohio are refined by the use of certain copper sulphide ores. The process is a trade secret.

THERE is no statutory requirement that placer locations should be made in rectangular forms where they are not legal subdivisions of a section.

JUNIPER, when it can be had, makes an excellent charcoal for mine blacksmith work. Willow and alder also make a superior charcoal. Pine, fir, spruce, cedar and oak are desirable in about the order named.

THE usual loss of quicksilver in milling California gold quartz is about two ounces daily to each five stamps. It is less in some mills and very much more in others, dependent on the character of the ore and the rate of crushing.

NATURAL cement rock is burned at comparatively low temperature, as the hydraulic properties are affected by high temperature burning. Portland cements are burned at extremely high temperatures, 1800° F. to 2732° F., and even higher.

"CONCENTRATES" does not know of any smelting works where purely cobalt ores are reduced. Cobalt is generally associated as a lesser component of commercial nickel ores, and the nickel smelting plants recover the cobalt as a by-product.

PLATINUM ASSAYS can be made by any assayer. It is not necessary to send samples to Swansea, Wales, or indeed to any special point. If anything, Swansea assayers see less platinum than do the local assayers in most Western mining towns.

VERY good concretes can be made for foundations and fillings of piers, etc., in proportions of 1 cement to 4 sand and 11 gravel; 1 cement to 5 sand and 14 gravel; or, if stone be used in place of gravel, the quantities would be 9 and 12½, instead of 11 and 14.

TEN-ACRE legal subdivisions in placer claims can be patented without official survey. Five-acre subdivisions or two-and-one-half-acre subdivisions must be surveyed by a U. S. Deputy Mining Surveyor acting officially under instructions from the U. S. Surveyor General.

IN mine timbering it is calculated that square timbers are about one-fourth stronger than round ones of the same diameter. The safe load of a timber column is 600 pounds per square inch for heights less than 20 feet. Freshly cut timbers are from 25% to 40% weaker than when seasoned.

IT is probable that solutions of minerals hot, and under pressure, have made many more mineral deposits than have been made by the volatilization of the minerals either with or without steam. The pressures of great depth are so great that it is doubtful if much matter could exist in the gaseous state.

THE power required for a 20-stamp mill of 950-pound stamps will be not less than 2 H. P. and the extra power for crusher and other machinery depends entirely on the specific description of the machinery and the work required of it. Probably a 75 H. P. boiler and a 60 H. P. engine would make a satisfactory power plant.

WOOD PULLEYS can, in case necessity arises, be built up of inch boards. Small ones can be cut out of a single block, split with the saw and bolted over the shaft. After setting the pulley on the shaft the engine should be started up and the face of the pulley turned to a true circle, with the center crowning to hold the belt.

AT the Grand Forks, B. C., smelters there has been no trouble from fumes. The ores treated are self-fluxing and do require roasting in heaps in the open air, but go direct to the furnaces. There being little sulphur and arsenic in the ore, only a light smoke is given off and vegetation has not been killed in the vicinity.

THERE is no large or regular commercial demand for molyhdenite. Several of the large steel makers use comparatively small quantities for making certain grades of steel. The sale price of molybdenite is largely fixed by the supply in the market seeking buyers. The commercial grade of mineral must carry over 50% of molyhdenum.

THE idea of the early California miners that the gold-bearing blue gravels mined in the drift mines of the Sierra Nevada mountains were remnants of one original stream, which they called the blue lead, has long since been disproved. They are remnants of the beds of many streams substantially the predecessors of the existing stream beds.

IT has been held by the Supreme Court of New Jersey that the value of property proposed to he bought by a corporation must be reasonably near the price proposed to he paid. Any stockholder may require the acts of the directors to be reviewed, provided he believes himself injured. The fact that two-thirds of the stock assents to the acts of the directors does not bar him.

THE number of yards a miner's inch of water will "wash" in hydraulic mining in average ground cannot be stated. Other conditions besides the ground determine the commercial practice which ranges from 1 yard to the 24-hour inch to 24 yards to the 24-hour inch. Several articles have been published hy this paper giving the figures of ground washed in several instances.

THE use of explosive mixtures of air, with gas or oil as the prime mover energy in engines of the turbine type, has heen suggested, and it is possible some experiments have been made. Nothing of the kind has heen reported with any details. It would seem as though the theorems on which the different types of gas engines have been developed would not apply for a turbine type of engine.

THERE is no mother of gold. The suggestion that there is, is some old woman's tale. There is no indicator that can be used to point out the location of gold. By noting the stories of those who say there is it will he observed that the fellow who does the indicating, with the indicator, never gets any of the gold the indicator points at. The gold he gets is always out of some one's pockets.

THE difference between gravel and broken stone for concrete would seem to be largely a difference of opinion. Gravel has a less percentage of voids to be filled with sand and concrete. Tests made as to strength do not show any uniform superiority of broken stone over gravel. Given the choice hetween clean, hard gravel and a good grade of broken stone, it is safe to assume that the cheapest is the hest.

A STEAM POWER PUMP can be used to provide a hydraulic head of water for "piping" in a hydraulic mine. It would be used to pump water to a reservoir from which a second line of pipe would take the water to the hydraulic pit under a gravity instead of a pump pressure. Some installations have heen projected for doing the pumping with water power. Steam power is almost sure to prove too expensive to lift water for hydraulic mining.

NO SPECIAL proceeding is required to group four quartz claims so far as assessment work is concerned provided the same people own all the claims. When proof of assessment work is recorded the notice should show that the work was done for the several claims, naming them. If done for them in common one year it need not he the next. The grouping or consolidating for assessment work is thus a temporary matter of convenience.

THE case of the Ivanhoe M. Co. vs. the Keystone M. Co. is cited in Lindley on Mines as establishing finally the doctrine by the decision of the U. S. Supreme Court, that Congress in making school land grants to the States did not intend to depart from the uniform policy theretofore adopted in reserving mineral lands from sale, and that mineral found within a sixteenth or thirty-sixth section, known to be such at the time the grant took effect, did not pass to the State.

THE standard rule for the fixing of the horse power of boilers is that one horse power is the equivalent of an evaporation of thirty pounds of water per hour from a feed water temperature of 100° F. into steam at a gauge pressure of seventy pounds to the square inch. Engines have been improved so that they no longer take as much as thirty pounds of steam per hour to produce one horse power. Fifteen pounds is common and eleven pounds extra good work from a multiple expansion engine.

THE lower the velocity of flow of the water in the pressure pipe of a water power plant is the larger the portion of the total head effectively utilized, but the larger the pipe required for a fixed discharge of water. In deciding whether to use the larger pipe and lower velocity or the smaller pipe and higher velocity, the capital value of the earning of the power gained hy the saving in effective head of the larger pipe is measured against the saving of cost of pipe effected by the installation of the smaller pipe.

THE direction of the strike of mountain ranges has nothing to do with or without the presence of gold and silver. There are many more mountain ranges with a northerly and southerly strike than there are mountain ranges with an easterly or westerly strike. Naturally mines of gold and silver are more in evidence in the former. East and west ranges also carry gold and silver mines. This is the case with the mountain ranges in Spain, the Alps in Italy, and the Altai mountains in Siheria and Manchuria.

GAS produced from hituminous coal can be used to burn lime. A kiln built to use wood fuel or coal fuel might, or might not, he with a little alteration, adapted to use gas fuel. There would he an economy in operating expense to manufacture gas from the coal to use for the lime burning. How much economy would depend on the kind of gas made, and there would he an offset to saving by the interest and depreciation of the investment in the gas producing plant. With wood at $1.90 a cord and coal at $1.75 a ton no large saving would he possible.

VOIDS in aggregates of different gravels and hroken stones vary considerably. Sand contains of voids ahout 30%. Gravel, ¼ to ½ inch, contains voids of 36%. Broken rock, 1 to 2 inches in size, about 47%. A simple method of determining the percentage of voids in gravel or broken stone is to take a water-tight box of exactly one cubic foot capacity. Fill this with the material to he tested, shaking it well down, strike off the surface level and weigh. Broken stone, which is more or less porous, should first be soaked in water and drained dry. Water is poured into the box until it rises even with the surface and the hox weighed again. The difference is the weight of water in the voids. Estimating the latter at 62.25 pounds per cubic foot the percentage of voids is calculated.

IF all the proceedings necessary to obtain a patent to a mining claim are completed except the payment to the receiver of the local United States Land Office for the land, the claim may hecome forfeit and open for location by another person if the annual assessment work is not kept up. For example, in one calendar year in which no assessment work was done the claimant might carry through all the proceedings required by the statute to obtain a patent except the payment for the land, and if the latter was not made in that calendar year the claim would become forfeit and locatable on the first day of January of the suceeding year.

FAILURE to record a mining claim notice of location within ninety days after making it does not forfeit the location in California. It is hetter in every way, however, to conform to the law and record the notice. The record of the notice of location is legal notice to any adverse claimant that the location has been made and prima facie evidence of the facts it states. The posting of the notice on the ground is not by itself such a notice to any adverse claimant, and a locator who has not recorded his notice of location would be compelled to take the burden of proof as against an adverse clalmant in any court contest as to the right to the ground.

PUBLIC MINING RECORDS are not evidence of particular lands being mineral lands. This ruling of the Commissioner of the Land Office, if quoted to this journal correctly, probably was intended to mean that the records were not competent evidence of mineral or non-mineral character. If the miners who made the location were to make affidavit directly to the fact that there was valuable mineral known on the land at the date of the railroad land grant, that they had bona fide mining locations on the land, and that it was occupied for mining at the date of the grant, and occupied for mining at the date of the making of the affidavits, it is probable that the Commissioner would order a formal hearing to make findings of fact as to the real classification of the land. The public records of mining locations would then be competent evidence to corrohorate the testimony of the witnesses.

THE Supreme Courts of Colorado and the United States have held that blind leads discovered while projecting a tunnel through a prior valid claim cannot be claimed to be a discovery in the tunnel, and that tunnel claims located solely for the purpose of discovery have no right of way through lodes which lie in their course. The Supreme Court of Colorado has held in a late case that a vein discovered in a tunnel 250 feet beneath the surface may he located on the surface by simply projecting the course of the dip as disclosed in the tunnel to the surface and marking the boundaries of the claim from that point. It should be noted though that in this case the tunnel in which the discovery was made was not located or claimed under the statutes of the United States, but was commenced upon patented property belonging to another person and the work was done by his permission.

A BLACKSMITH describes his method of working steel into tools as follows: The steel is worked at an orange heat during the forging. When shaped, the next step is refining. This is done by hammering in water. A little water is put on the anvil and the face of the hammer is wetted. The steel must be at nearly red heat when this is done. The refining is repeated by reheating several times. After finishing this, the steel is heated to a dark red, so that it just shows the color, and dipped in raw linseed oil. The tool is reheated and dipped three times. The fourth time the reheat is carried to an orange color and dipped in the oil until nearly cold. The oil is then wiped off and the metal polished, care being taken not to hreak while polishing, as the metal is extremely hard. A large piece of iron is then heated to a red heat. The tool is laid on this with the heavy side down to draw whatever color is desired, different tools requiring different colors.

PLACER PATENTS have been repeatedly issued by the United States where the placer mining claims located suhsequent to May 10, 1872, did not conform to legal subdivisions. Old locations, made prior to 1872, are excepted from the requirements of conformity to legal subdivisions, and claims located later adjoining them had to conform to the already fixed houndary lines, and could not he located in legal subdivisions. It is not required that on unsurveyed lands there shall be any conformity to legal subdivisions, nor if the puhlic land survey is made suhsequently it is not necessary to change the locations to make them conform to the subdivisions of the public land survey. The provision of the law that only placer mining lands can be patented as such has aiso been made unavoidably the reason for not requiring strict conformity with the letter of the statute. River bed claims could not well be made to conform to legal subdivisions, and the Land Department officials have practically recognized this, and have also recognized the fact that the public land surveys in the mining districts, particularly where the older surveys were made, are so inaccurate that the mining claim locator could not without a survey locate his claim properly on legal subdivisions. The provision of the statute has, therefore, so frequently heen honored in the breach that strict conformity with it need not he considered an essential of a valid placer location.

Experiments With Bromo-Cyanogen on Southern Gold Ores.*

By S. H. BROCKUNIER.

During the examination of a gold property in Georgia last summer, I had occasion to study the effect of different chemicals upon the ore, the object being to find a more economical method of extraction than chlorination, as practiced there, had proved to be. Some of my notes and results may be of interest to others.

The country rock consists of mica schist, hornblende schist and black slate. The vein matter is quartzite and schist, containing some stringers of quartz, the whole forming a body from 20 to 50 feet wide. All of the rocks in the vicinity have become disintegrated to a depth of from 50 to 75 feet, forming the so-called saprolite.

I found the workings to represent two distinct classes:

I. Open-cut surface ore: Very soft, oxidized and disintegrated; containing much alumina, silica and iron; average value, $4 per ton.

II. Ore from lower levels: Quartzites and schist; very hard; containing much silica and manganese, some alumina and from 2% to 10% of pyrites; average value, $8 per ton.

Class I. was soon dismissed. The only way to make it pay would have been by the use of steam shovels and a large crushing plant. The tendency to slime would be the principal difficulty.

Class II. presented an interesting study. The values seemed to cling closely to the sulphurets; yet, while little or no gold was visible to the eye, it was almost always possible to obtain colors by panning. The gold so obtained was always very finely divided.

The stamp mill was started as nearly like its previous working as possible, in order to observe and correct its faults. The old method of 4-inch drop, 4-inch discharge, 100 drops per minute, 35-mesh screen, no inside plates and five stamps to one vanner, was not at all satisfactory. We almost immediately shut down twenty stamps, put all the vanners on the other twenty, increased the drop to 6-inch and the discharge to 7-inch, the number of drops to ninety and the screen to 40-mesh. This gave better amalgamation and we were able to use inside plates; but at the best we could only save 20% of the value of the ore by amalgamation.

The mine ore was concentrated twenty tons into one at a cost of $1 per ton of concentrates, which were hauled to the chlorination plant for treatment. I understand that this plant was erected from specifications of the well-known Thies process. It consists of two 40-foot single-floor reverberatory furnaces, two 4-ton chlorination barrels and a full equipment of filters, precipitation tanks, etc.

Laboratory tests had shown that the ore was difficult to roast and that the extraction would not be high; nevertheless, we made a fair test of the plant, with the following results:

TABLE I.—COST OF ROASTING ONE TON PER FURNACE PER 24 HOURS.

Labor	$2 40	
Wood	1 20	
		$3 60
(Decided loss of gold by volatilization.)		
Cost of treatment per ton, chemicals, labor, etc	$2 50	
Total cost per ton of concentrates		$6 10

The extraction was from 60% to 70%, which, on $12 roasted concentrates, meant $8.40, obtained at a cost of $6.10. The additional cost of mining, milling, concentrating and hauling being considered, it was clearly a losing business.

Experiments were now begun in two directions: (1) The classification, and (2) the chemical treatment, of the pulp from the stamps. These were afterwards combined, so that the experimental plant consisted of three tanks, each 6 feet in diameter, 4 feet deep, and placed so that the overflow passed from the first into the second and from the second into the third. The pulp from the stamps entered the first tank and was there kept agitated by a current of air through perforated pipes in the bottom of the tank. The heavier particles settled in this tank. The second was merely a settling tank, where the middlings sank through still water, allowing the slimes and finest particles in suspension to overflow into the third tank. These slimes were caught in the third tank by a perforated false bottom, which was overlaid by a filter bed of cheese cloth, matting and charcoal.

TABLE II.—RESULTS IN CLASSIFYING SURFACE OXIDIZED ORE.

65% settled in first tank; assay value per ton	$6 80
34% " second " " " "	4 00
1% " third " " " "	4 40

TABLE III.—RESULTS IN CLASSIFYING UNOXIDIZED MINE ORE.

35% settled in first tank; assay value per ton	$8 00
63 5% " second " " " "	12 00
1.5% " third " " " "	6 00

These results were rather surprising, because we had been told that the quantity of slimes was much larger and that the principal values lay in them. Our tank system clearly disproved this, because all the gangue was caught. That the values were not in the slimes was further confirmed by experiments on a canvas table.

Laboratory tests with "straight" cyanide upon unroasted ore showed an extraction of 40% to 60% of the gold, but with large consumption of cyanide, which was partially, but not effectually remedied, by a preliminary alkaline wash. With roasted ores an extraction of 80% was secured, but the loss of cyanide was still too large.

We then undertook a series of experiments with bromo-cyanogen of varying strengths, and the final results were entirely satisfactory.

We made our bromo-cyanogen by the following reaction:

$$5NaBr + 16HCl + K_2Mn_2O_8 + 5KCy + H_2O = 5BrCy + 2MnCl_2 + 5NaCl + 7KCl + 9H_2O.$$

Care was taken to have final solution slightly alkaline.

Our first attempts to make the bromo-cyanogen in this way were not successful, hydrolysis of the cyanide occurring and ammonia being formed.

It would have been cheaper to use KBr; but it was not available at the time.

Other oxidizing agents and acids were tried; but the best results were obtained by above method.

One and one-quarter ton of mine ore, assaying $6.80 gold per ton, was taken for our first trial; there was, therefore, $9.06 in gold to be extracted. The ore was treated in the first tank, where it had been separated in our tank experiments. One-third of a ton of bromo-cyanogen solution was run on, the original strength of which was: KCy = 0.07%; KCyBr = 0.10%.

TABLE IV.—RESULTS OF TREATMENT WITH KCyBr SOLUTION.

Time.	Milligrams of Au per A. T.	Extraction. Per Cent.	Strength of KCy. Per Cent.
At beginning	....	....	0.07
After 3 hours	0.22	16.0	0.05
After 16 hours	0.24	17.9	0.027
After 24 hours	1.14	83.8	0.025
After 30 hours	0.56	41.0	0.005
After 48 hours	0.28	16.9	0.0006

The pulp was stirred by air before each sample was taken. Assays of the gangue during the treatment showed that the loss of values in the solution during the leaching was by precipitation, and experiments were therefore undertaken to discover the cause and remedy.

The same amount and grade of ore treated with plain cyanide (strength 0.147%) showed an extraction of only 10.93% in forty-two hours and a loss of 75% of cyanide. The effect of air forced through KCyBr solution was investigated; but it caused no such great loss of cyanide as is shown in these tests. With roasted ore and KCyBr solution we obtained a 60% extraction, but at the cost of large consumption of cyanide.

Treating ore with preliminary alkaline wash decreased the consumption of cyanide, but lessened the percentage of extraction. We finally gave the ore both an acid and an alkaline wash and obtained the following result:

Two tons of ore treated, assaying $8 per ton, therefore $16 in gold to be extracted.

1. Preliminary wash of dilute H_2SO_4 (1 part acid to 300 to 500 parts water): contact one hour.
2. Wash of plain water.
3. Alkaline wash of KHO, in this case two pounds KHO to one to two tons water (determined by titration): contact one hour.
4. One-half ton KCyBr solution run on (strength of KCy 0.33% and of KCyBr 0.30%).

TABLE V.—RESULTS OF KCyBr TREATMENT AFTER ACID AND ALKALINE WASHES.

Time.	Milligrams of Au per A. T.	Extraction. Per Cent.	Strength of KCy. Per Cent.
At beginning	....	....	0.33
After 30 minutes	....	....	0.33
After 5 hours	0.55	33.8	0.32
After 8 hours	0.56	35.0	0.32
After 24 hours	0.75	47.0	0.31
After 36 hours	1.00	62.5	....
After 45 hours	1.10	69.2	0.30

Our extraction, therefore, was $11.07 gross, or $5 53 per ton from our $8 ore. To this add the 20% extracted by the stamps, and we have a total extraction from the raw ore of 75.3%. From $10 ore—which was the value of the ore under discussion before treatment by the stamps—we therefore obtained $7.53 per ton. The cost of this process for mining, milling and treatment, under a fair estimate, was $5 per ton, leaving a net profit of $2.53 per ton.

We think that the extraction from raw ore can be raised to 85%, and that, with a large plant specially constructed, the cost can be much reduced.

It was found by blowing the slimes out that, by this arrangement of tanks, the resulting ore could be treated directly in the tanks without subsequent handling, merely diverting the pulp coming from the stamps to a second series of tanks while the first series was being treated. In our work the third tank was merely a safeguard, as in none of our tests did values in it run high enough for treatment. We used the air introduced into the bottom of the tanks to stir the pulp at regular intervals and found it more thorough and economical than hand labor.

Exhaustive experiments are contemplated to decide more exactly about the preliminary washes, to determine the adaptability of electrolytic precipitation to this process and to enlarge the plant.

I am convinced that the future of gold mining in the South, and perhaps in some other sections, depends upon this or some similar process for the extraction of values, rather than upon the methods heretofore pursued.

Acknowledgments are due to Charles I. Auer and John H. Bower, who materially assisted in these experiments.

Concentration of Ores by Oil.

Written for the MINING AND SCIENTIFIC PRESS.

The Elmore process of concentration of ores with gold is still the subject of experiments at the testing mill in London erected for its investigation. This mill is, on a practical working scale, of a capacity of ten to twenty tons per day, according to the ore. Tests have been made on shipments from a number of different places, including California, British Columbia, Western Australia, Africa and South America. A late test on copper ore from Copperopolis, Cal., which it seems impossible to concentrate by water, has been very successful. Concentration first effected after crushing in the Huntington mill by treatment on a Frue vanner showed an excessive loss of the floating and brittle copper-bearing minerals, and the production of a concentrate not very rich in copper, owing to the proportionally higher saving of iron pyrites present to that of the copper pyrites. The tailings of the Frue vanner treated by the oil process were almost absolutely cleaned from mineral, both iron and copper pyrites giving a concentrate 50% higher in value than the vanner concentrates and tailings containing a mere trace by assay of copper.

Tests made on the low-grade ore of one of the Rossland mines in British Columbia gave the following results: The concentrates by the oil process contained 6.08% of copper, while concentration by water gave only 2.6%, the silver and gold contents being proportionally higher and the tailings showing much higher recovery in the case of the oil than by water concentration.

At the present time working tests are being made on the telluride ores of Western Australia, which by the existing processes are costing at least 15 dwts. to work, so that ore below one ounce of gold per ton is necessarily passed by, while it is believed to exist in very large quantities. The oil process is capable of treating the finest of slimes and float mineral, provided, always, this mineral is of the character adapted to absorption by the oil. Tests on some Colorado silver ores, in which gray copper and brittle silver ore is disseminated through a gangue, part of which is heavy spar, have been successfully made by the oil process with the saving of a high-grade concentrate without excessive loss—a result impossible by a separation dependent upon specific gravity alone in concentration by water.

A 50-ton mill is now running in Norway on an ore consisting of copper and iron pyrites in quartz, the mineral carrying gold in addition to copper value. The arrangement of the mill is as follows: Three batteries of five stamps, with screens of 20-mesh, deliver to three McDermott "sizers" or submerged screens of 30-mesh. The coarse discharge from these sizers goes to one Wilfley table, and the fines passing the screens are treated on three 6-foot Frue vanners, the tailings of which pass through the oil process plant, consisting of two units of three mixing cylinders each. The results of working this mill are not yet published. In addition to this plant lately started, two mills of 100 tons per day and one of 50 tons are now being built for English copper mines.

In Foundry some rules for casting aluminum are given by H. Tuttle. The metal, he says, should be poured as cold as possible, thin castings being harder than those of heavier sections, but on general principles the rule holds good in all cases. A convenient way of ascertaining the temperature of the metal is to stir it with a pig of aluminum if its color is red until it is white, the melting of the pig serving as a guide to this point. The end of the cooled pig is then dipped three-quarters of an inch or so into the metal, the aluminum chills around the pig, and when the latter is withdrawn from the melted metal it remains like a little cup on the surface of the handle. The time required for this chloride metal to melt gives a good idea of the metal in the crucible. Dry sand is to be used and sponging the mold is to be avoided. The metal is to be poured very rapidly, as it is not as liable to wash away portions of the mold as other metals on account of its lightness. It is not necessary to ram the molds nearly as hard as for iron. Soft ramming will prevent the breakage of castings, as aluminum just after it solidifies is very weak and crumbling and will scarcely bear its own weight.

Compressed Air for Mining from Electric Power.

Written for the MINING AND SCIENTIFIC PRESS by JOHN B. TREGLOAN.

This paper records some actual results obtained, using a 10x18-inch duplex, single stage, belt driven compressor, the area of the outlet ports being 9 square inches on each end of each cylinder, the port area being reduced to 6¼ square inches where it enters the main pipe, a disadvantage, but in this particular compressor, unavoidable. The water jacket covered only three-fourths of the surface of cylinder, one-quarter being taken up by the air ports, another defect in construction. The working pressure varies from seventy-five pounds to eighty-five pounds, blowing off at eighty-five pounds. The compressor runs fifty-nine revolutions per minute, the valves being the ordinary poppet type.

30 H. P. Motor and 10x18-Inch Duplex Compressor, Spring Hill Mine, Amador, Cal.

In driving this machine a 30 H. P. General Electric induction motor is used, speed 900 R. P. M., voltage 550, the current being transformed from 10,000 volts in a separate building, about 250 feet from compressor house, and measured on the low tension side by an integrating Schallenberger watt meter, 746 watts being considered the equivalent of a mechanical horse power. The current is transmitted from the Standard Electric Co.'s plant, near Jackson, Amador Co., Cal., a distance of 8 miles. The price per H. P. meter measure is $6.50 per month, which is the maximum rate, and which is reduced somewhat according to the amount of H. P. contracted for above a certain amount.

The compressor pumps directly to a small receiver—in this case too small by 500 cubic feet—the total storage being only about 100 cubic feet, allowing altogether too sudden fluctuations in air pressure and not enough to carry all the air compressed during the small periods of idleness, of power drills and hoisting engine, without blowing off air.

Air Pipe From Compressor Entering Boiler, Spring Hill Mine.

This brings up an important point in compressor practice, that blowing off air is a large item of expense, is wasteful, and an apparent negligence of proper installation, but for some unaccountable reason is generally considered unavoidable in a compressor plant. Have plenty of storage and the right size compressor, and compressed air will be economical and not expensive, as is the opinion of most users of air compressors.

In this case the blow-off of the receiver is so arranged that it empties into the steam boiler, where it is reheated and used in hoisting engine, passing in just above the water line, through front end of boiler, as shown in the illustration herewith. When the power drills are not operating the lever is raised and all the air passes to the boiler for hoisting purposes. Attention is called to the sketch showing the general arrangement of plant; where possible to do so elbows are avoided and long sweeps are used, by bending the pipe — these bends being made very carefully to avoid any crushing of side of pipe.

Where pressure in receiver rises above seventy-five pounds it overcomes the weight and escapes through the 3-inch check valve; it passes out the side opening of 2½-inch tee, through which passes the stem shown in dotted lines and passes to steam boiler. A check valve shown in the photograph prevents the steam from backing out of boiler when air is below steam pressure — this arrangement makes the blow-off on steam boiler the blow-off of compressor.

Air is used cold in the power drills, but in the engine it is reheated to about the temperature of steam at forty pounds pressure.

The average consumption of fuel used in combination with electricity for sixty days was:

Twenty H. P. per day at a cost of	$270 00
Wood burned in mean time, 37½ cords at $6	225 00
Total cost for power	$495 00

Under former conditions it required:

Two cords of pine wood per day, 120 cords, at $6	$720 00
Water power for compressor (very favorable conditions) two months	350 00
Total by wood and water	$1,070 00
Tons of rock broken by power drills, and hoisted 550 feet	2,667
Tons of water hoisted 600 feet	3,600

Under the present conditions should the power drills and hoisting engine be idle all at once for more than one minute the air blows off, due to lack of storage, which as soon as rectified should make a difference of at least ten cords of wood. Electricity at $6.50 per H. P. month is about 21 cents per horse power for twenty-four hours, consuming, as this plant does, about 20 H. P. per day, means $4 50 per day to produce enough air at eighty pounds pressure to operate two power drills (3¼-inch cylinders) and leave a surplus for hoisting engine sufficient to save the use of over one and one-quarter cord of wood per day. Had all the air pumped to eighty pounds been conserved by ample storage the use of less than one-half cord of wood would have been sufficient for all reheating purposes and supplying steam at times when air pressure was low.

Below is given the fuel cost of power by oil, where it will be noted that the cost per horse power for twenty-four hours is 38 cents; by electricity for twenty-four hours, 21 cents, at $6.50 per H. P. month; by wood, at $6 per cord, 53½ cents, as near as can be estimated. Very few mining plants are equipped with as perfect a boiler plant as was the boiler plant used in gaining these results by oil:

FUEL COST OF POWER BY OIL.

One barrel 16° oil =	330 pounds
At $1.50 per barrel delivered =	$0.00455 per pound
Heat units per pound =	18,000
Heat units per pound of steam at 100 pounds, with feed water at 50° F. =	1,167
Theoretical evaporation pounds of water per pound of oil =	15.4
Actual evaporation, assuming 65% efficiency for boilers, including steam required for vaporization, pump, etc. =	10.00
Allowing 35 pounds of steam per H. P. hour on engine, including feed pumps, etc., pounds of oil per H. P. hour, will =	3.5
Fuel cost per H. P. hour=$0.00455 × 3.5 pounds =	$0.0159
Fuel cost per H. P. hour for 24 hours =	$0.38
Fuel cost per H. P. hour per month =	$11.40
Fuel cost per H. P. hour per year =	$136.80

The cost of reheating air in a steam boiler is very trivial; for every twenty-four pounds of good coal used in reheating compressed air at about eighty pounds pressure an additional horse power for twenty-four hours can be secured, whereas it requires under good conditions from 96 to 120 pounds of good coal to get one horse power for twenty-four hours from steam.

Two cords of good pine wood is generally taken as the equivalent of one ton of good coal, and fuel oil at $1.12½ per barrel is about the equivalent in heat production under a steam boiler to good coal at $5 per ton. The efficiency of an electric motor is from 85% to something above 90%, whereas from use of wood, coal or oil there is a tremendous loss of heat, in radiation and in heat going up the stack, so that probably 15% would represent about the efficiency of a steam plant.

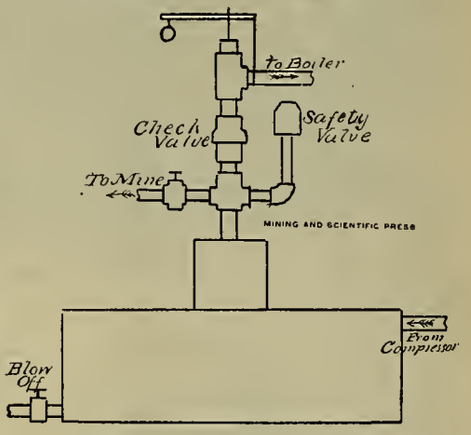
For the guidance of those who may contemplate the use of air the following general directions will prove most satisfactory, from a power standpoint as well as maintenance:

Get a compressor that does not require to be run above 200 feet of piston speed per minute.

Use a two-stage tandem straight-line machine when possible.

Have heavy flywheels.

Avoid countershafting, by using large flywheel.



Have the stroke at least double the diameter of cylinder.

Have long stroke machines rather than short ones.

Have storage that will require the compressor at least one-half hour to fill.

Have the compressor equipped with an unloader.

And above all, have a compressor as nearly equal to the work to be done as possible. The larger the compressor the more dead work, in friction. These may seem commonplace suggestions to a great many, but are the elements that, either considered or neglected, go to make a successful and satisfactory plant or a very unsuccessful and unsatisfactory one. As much intelligence and experience is required in the installation of a compressed air plant as in electrical or other power plant installations.

Amador City, Cal., April 1.

A Cheap Bullion Retorting and Melting Furnace.

To THE EDITOR:—The retorting item in the interesting article of C. P. Richardson, of April 5, recalls to mind that a useful fuel for retorting seems to be generally overlooked. I allude to fir bark—plentiful in most camps on this coast.

In using a forge for retorting and melting, clean out the "duck's nest," lay on a piece of firebrick, old crucible or other infusible material. Make a wall of common brick, rock or other available material, banking up outside with cinders, etc., on the forge, leaving from 2 to 3 inches of space between the wall and retort. Break the dry bark to pieces about 2 inches square (a sharp pick is handy for this); fill in loosely around and over the retort. Pour on a little coal oil and light. If the retort is not more than two-thirds full the bellows can be worked gently, drawing fire to the bottom, and the speed in heating can be thus regulated. The bark burns without flying or going out. It will gradually heat to retorting point without the bellows' aid, and is thus allowed to heat when the retort is filled to its limit. Sufficient bark is kept on to finish at a red heat.

While retorting the crucible is well warmed. As soon as the retorting is finished, the gold is removed while hot, broken up and put into the crucible with proper flux. The crucible is then set in place of the retort, the charred bark put around it, coal added while the bellows are worked, and air vents made around the crucible. In the absence of coal, bark may be used.

This may seem like crude work, but it is so expeditious, efficient and cheap, that I prefer it to any other method where not more than fifty to sixty pounds of amalgam is handled at one time. Starting with everything cold, three hours is sufficient time for one man to retort, and melt to bullion, the above amount of amalgam. E. L. BALLOU.

Igo, Cal., April 15.

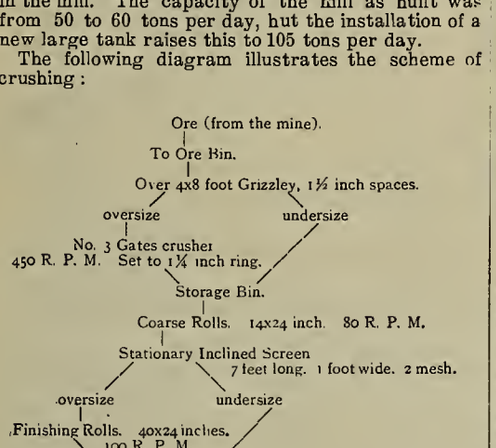
The Cyanide Plant of the Wasp No. 2 Mining Co., Kirk, S. D.

This mill was built during the early part of 1900 and began operations about September, 1900. It has been running continually since then. It is a dry crushing mill, but has no facilities for drying the ore, there being but little necessity for that, due to the coarse crushing that is done and the dry nature of the ore. The mine is within 250 yards of the mill, the ore being transported in trains of four cars, by mule haulage. The cars hold 1500 pounds of ore, are of the end dump type, and discharge into the main storage bin, of small capacity, which feeds to the crusher floor.

NATURE OF THE ORE TREATED.—The ore is of the quartzite variety from the Potsdam. In the greater part of the ore the gold is carried seemingly on the cleavage planes of the quartzite, and is not finely disseminated, as is usually the case, although the mine also has some of this latter class of ore. The fact that the gold is carried in the cleavage planes makes coarse crushing permissible, manifestly a great advantage. Very little pyrite is present, but some antimony in the form of stibnite is found, although only in small quantities, not sufficient to cause trouble in cyaniding. The value of the ore varies considerably, generally running between $4 and $20 per ton, the greater part being nearer the first figure than the last. The ore is at times quite acid, requiring considerable lime to neutralize it.

THE CRUSHING OF THE ORE.—The mill site is very favorably situated as regards slope, full advantage being taken of gravity, there being but one elevator in the mill. The capacity of the mill as built was from 50 to 60 tons per day, but the installation of a new large tank raises this to 105 tons per day.

The following diagram illustrates the scheme of crushing:



Ore (from the mine).
To Ore Bin.
Over 4x8 foot Grizzley, 1½ inch spaces.
oversize
undersize
No. 3 Gates crusher
450 R. P. M. Set to 1¼ inch ring.
Storage Bin.
Coarse Rolls. 14x24 inch. 80 R. P. M.
Stationary Inclined Screen
7 feet long. 1 foot wide. 2 mesh.
oversize
undersize
Finishing Rolls. 40x24 inches.
100 R. P. M.
Bucket Elevator.
Shaking Finishing Screen. Situated on a level with coarse rolls.
oversize
undersize
Returned to Finishing Rolls. by gravity
Finished Product Bin.

THE CRUSHING AND SCREENING MACHINERY.—The grizzly is 8 feet long, 4 feet wide, with 1½-inch spaces. It is inclined at 45°.

Coarse crushing is done in a No. 3 Gates crusher, breaking to a 1¼-inch ring. The capacity of the old No. 2 crusher was about 60 to 65 tons per twenty-four hours, and it was found necessary to put in a No. 3 Gates in order to come up to the increased tankage capacity when the new tank was installed. It has been found that a No. 2 Gates has a too limited capacity, even for a 60-ton mill, as the wet ore rapidly decreases its capacity. It is also the experience that the mouth openings are rather too small for the mine rock, so that too much sledging has to be done.

Coarse Rolls (One Set): These are Gates rolls, 24 inches in diameter and 14-inch face, making eighty revolutions per minute. The ore is fed to the rolls by Tulloch automatic feeds. The rolls are not housed, as the ore is damp enough to avoid much dust.

Finishing Rolls (One Set): These are of the same make as the above and the same size, but make 100 revolutions per minute. A Tulloch feed also supplies these rolls.

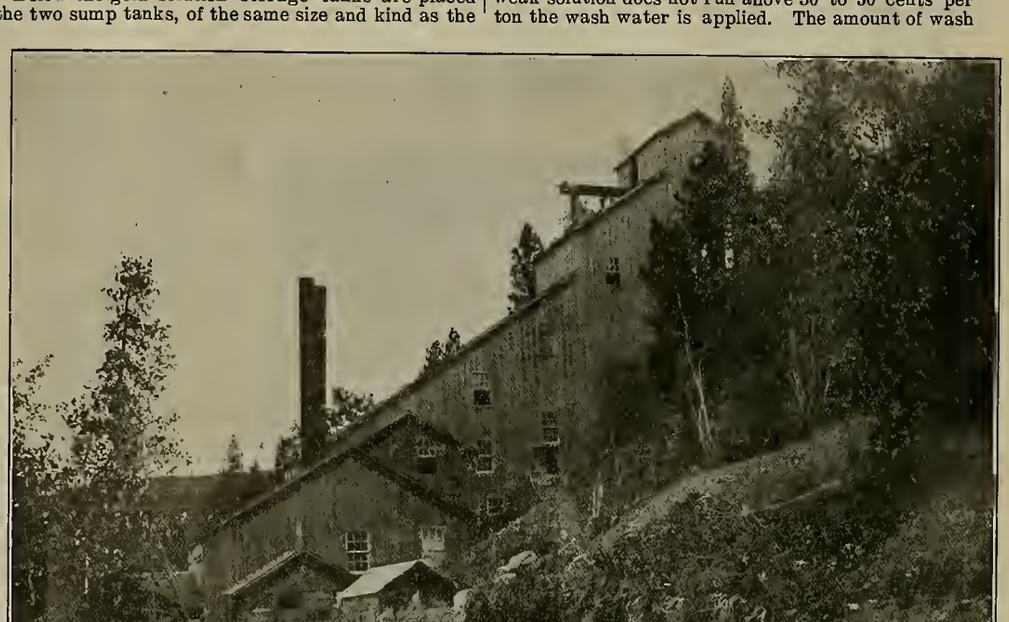
Stationary Inclined Screen: This is 7 feet long, built in two partitions, each 1 foot wide, giving 14 square feet of screening surface. It is inclined at 45°. It is 2-mesh wire cloth, or four openings per square inch.

Combined Shaking and Stationary Inclined Screen: This is the finishing screen. The first 8 feet is a shaking screen and the balance, about 8 feet, being stationary. It is 2 feet wide, giving a screening surface of 32 square feet. It is 2½-mesh. This inclined screen is on the principle of the Berthelet separator, the material passing through it considerably finer than the mesh would indicate. Practically, the product passing through this screen is not above 6-mesh. This is the size of the material cyanided.

THE LEACHING DEPARTMENT OF THE MILL.—There are four leaching vats, 16 feet in diameter and 7 feet deep. The vats are of Oregon fir, 2½-inch staves, bound by seven ⅝-inch iron hoops. The capacity per vat is 55 tons of crushed dry ore. A new wooden 100-ton vat has lately been installed. The vats have a central discharge gate—14x14 inches—discharging the tailings into launders underneath the tanks. The new vat is of larger size.

Below the leaching vats are situated the two gold solution storage tanks, 10 feet in diameter and 6 feet deep, also of Oregon fir, with 2½-inch staves.

Below the gold solution storage tanks are placed the two sump tanks, of the same size and kind as the above. These tanks were used formerly for precipitation tanks, employing zinc dust as a precipitant. This, however, has recently been discontinued.



Wasp No. 2 Mill at Kirk, South Dakota.

The two solution storage tanks are situated above the leaching vats, and are 10 feet in diameter and 10 feet deep, with 2½-inch staves. The main solution pipe lines in the mill are 2½ inches in diameter, each leaching vat being connected, as is customary, with both the strong and weak solution gold storage tanks. There is no vacuum connected with the leaching vats, as the coarseness of the ore permits of rapid leaching and good drainage. As already stated, when the mill began operations precipitation by zinc dust was employed. This, however, was discontinued for reasons discussed farther on, and at present precipitation is carried on in wooden barrels by means of zinc shavings. There are five barrels for the strong solution and six barrels for the weak solution, the barrels being 3 feet deep and 2 feet in diameter at the middle. They are provided with a screen at the bottom, on which the zinc rests, and a rectangular compartment on one side, 8x4 inches, by which solution descends below the screen, rising up through the zinc as in the ordinary form of precipitation boxes. The advantages claimed for the barrels are, first, that the round shape tends to avoid channeling, which causes irregular precipitation, and, second, that the cleanup is much facilitated, because the barrels can be handled individually.

THE CYANIDING OF THE ORES.—The leaching vats are charged by means of a belt conveyor, which takes the ores from the finished product bin and carries it to the five leaching vats. This belt conveyor was installed recently, the mill as originally designed having the vats filled by end dump cars running on tracks over the vats. The conveyor is in two parts, that is, there are practically two conveyors placed at right angles to each other. This is necessitated from the fact that the vats are placed in a row at right angles to the discharge end of the bin. The reader is referred to the diagrammatic sketch for further explanation. The conveyor proper is a 16-inch rubber belt, the first conveyor 50 feet long and the second 40 feet long. The speed of the belt is 600 feet per minute. By these means a vat is charged in from two to two and one-half hours, accomplishing a great saving in time over the old method of charging by cars. The tailings are discharged from the vats by sluicing with a water pressure of 60 to 65 pounds per square inch. The time needed to discharge a vat is two and one-half to three hours. The favorable situation of the mill gives unlimited grade to carry off the tailings.

While the vat is filling, and about one-half full, the strong solution is turned on, 6 pounds of potassium cyanide per ton of solution. The amount of strong solution run on is about 15 tons, which is allowed to stand three to four hours generally, sometimes much longer, according to the nature of the ore. When the strong solution is started draining the weak solution is run on and allowed to remain undisturbed in contact with the ore for at least one hour; then leaching is started, fresh weak solution being continually added to replace that which drains off, until wash water is applied. The weak solution contains 2½ to 3 pounds of cyanide per ton. The amount of weak solution thus brought into contact with this ore is from 40 to 50 tons. When the gold value of the weak solution does not run above 30 to 50 cents per ton the wash water is applied. The amount of wash water is about 6 to 9 tons. The total time consumed is about ninety-six to one hundred hours, including the charging and discharging of the tanks. The total amount of the solution used, including the wash water, is 70 to 75 tons per vat.

The amount of lime used to neutralize the acidity of the ore and give the requisite protective alkalinity to the solution is 6 pounds per ton of ore. This is added unslacked on the cars, before the ore is dumped into the first bin.

The protective alkalinity is afforded by 2½ pounds of lime per ton of solution.

The consumption of cyanide is 0.63 pound per ton of ore, and the actual extraction ranges between 80% and 85% of the values contained in the ore.

THE PRECIPITATION BY ZINC THREAD AND THE CLEANUP.—The precipitation by zinc is practically perfect, but little trouble of any kind being experienced. The rate of flow of both weak and strong solution through the barrels is 3 tons per hour. The tailings solution issuing from the barrels runs from 4 to 10 cents per ton.

The barrels are all provided with a strap on each side, so that they can easily be lifted. When ready for the cleanup the barrels are hoisted up and dumped into one of the gold solution storage tanks, which has been emptied for the purpose. The men get right into the tank and wash the precipitates, taking out all the material that will not pass a 10-mesh screen. This is put back into the barrels. The fine material in the tank is then pumped through a Johnson filter press, having 2x2-foot frames, which was formerly used in the zinc dust precipitation. The precipitates are thoroughly washed in the press and then partly dried by forcing air through the press. Then the precipitates are discharged and are ready for the acid treatment.

A small Worthington duplex pump operates the filter press by water pressure. An air pump can also be connected, so as to force air through the filter press. The precipitates, after the drying, are charged into the acid tank, which is 4x4 feet in cross section and 5 feet deep, lined with heavy sheet lead. It is provided on the inside with several coils of ½-inch lead pipe, carrying steam to heat the acid if necessary. The bottom of the tank has a slight slope toward the discharge opening, a 1-inch lead pipe in the bottom. The acid tank is provided with a close-covered hood, which can be raised and lowered, to facilitate charging. The precipitates are treated with dilute sulphuric acid, of the usual strength, long enough to dissolve the zinc, then allowed to settle and the solution siphoned off. Then water is added and the mixture is pumped back through the filter press. Here it is again thoroughly washed with water, then dried with air. The dried precipitates are then heated to a dull red in sheet iron pans —2x4 feet in size—in a large iron muffle, then

smelted in graphite crucibles with the following flux: Seventy parts crude borax, thirty-five parts soda and twenty parts sand. The consumption of zinc is 0.9 pound per ounce of bullion produced.

THE PRECIPITATION BY ZINC DUST AS FORMERLY CARRIED ON.—As already mentioned, the precipitation by means of zinc dust was carried on in the sump tanks. These tanks for this purpose were provided at the bottom with a perforated circular iron pipe, connected with the air pump. The bottoms of the tanks were inclined ½ inch per foot toward the discharge pipe to insure complete drainage. When the tanks had filled with gold-bearing solution the air was turned on, giving the solution a circular motion, with also ascending and descending currents. The air pressure used was 45 pounds per square inch. Then zinc dust was added in the form of an emulsion around the edge of the tank and the contents of the tank agitated by air for ten minutes. Then the material was pumped through the filter press, leaving some of the zinc dust and precipitates in the bottom. The amount of zinc dust used to start with was 1 pound per ton of solution. This was gradually reduced to ¼ pound for the strong solutions and ½ pound for the weak solutions in succeeding precipitations. It took two hours to pump 12 tons of solution (the amount usually precipitated) through the filter press. The tailings solution from the filter press usually had a value of about 10 cents per ton, showing that precipitation was good.

The objections to the method arose in treating the precipitates taken from the presses. These usually packed very hard, so that it was difficult to disintegrate them for the acid treatment. It was found that the dilute sulphuric acid would attack the dust precipitates but very slightly, it being practically impossible to get the zinc out. This fact may be due to the coating of metallic gold on the zinc particles, protecting them from the acid. At the Golden Gate mill in Utah, and in several other plants where the process is in use, a mixture of sulphuric and nitric acids is used, seemingly with success. Finally the acid treatment was discarded and the zinc precipitates were roasted and then smelted. The usual zinc thread precipitation then replaced the zinc dust precipitation.

METHODS OF SAMPLING ORE, TAILINGS AND SOLUTIONS.—The pulp is sampled at the finished product bin by the following device: The belt of the conveyor has one hole on the center line of the belt, and every time this comes under the discharge spout of the bin some of the pulp shoots through, falling on the apex formed by two slant boards coming together under the center line of the belt. This divides the material into two samples, which are collected on the floor or in large boxes. No information is available as to the accuracy of the sample thus obtained.

Sampling the Tailings: The tailings are sampled by pipe sampler, four samples being taken irregularly distributed over the surface of the vat. After sluicing has commenced a face sample is taken at the center of the vat.

Sampling the Solutions: The solution pipes entering the gold solution storage tanks and leaving the zinc boxes are tapped by a cork and a small rubber tube. No clamp is used, however, and the tube dips to the bottom of a five-gallon stone jar, the overflow going back into the tanks. When the gold solution tank has been filled the solution man dips to the bottom of the jar with a dipper and fills a small bottle, which goes to the assay office. The jar is then emptied and placed for another sample.

THE POWER PLANT OF THE MILL.—Steam is furnished by two Erie return tubular boilers, 75 H. P. The engine is a Sioux Corliss, 12x36-inch cylinder, eighty-five revolutions per minute, steam at 85 pounds per square inch. A separate small upright engine furnishes the power for the conveyor and for the dynamo for electric lighting.

THE NUMBER OF MEN EMPLOYED IN THE MILL.—Day shift: One crusher man, one roll man, one engineer, one tank man, one solution man, one millwright, one superintendent, one assayer; night shift: one roll man (takes rolls and crusher), one engineer, one solution man; total, eleven men. This figure applies while the mill was treating 65 tons per day. Wages for engineers are $3.50 per day, other mill labor $3 per day.

THE COST OF CYANIDING.—The cost of cyaniding is $0.832 per ton, in detail as follows:

Labor	$0.411
Cyanide	.188
Zinc	.031
Repairs	.086
Fuel	.116
Total	$0.832

The figure stated was for the month of October, 1901, when 3294 tons were treated, making a daily average of 106 tons.

A TON OF CALCIUM CARBIDE requires 4500 kilowatt-hours of energy for its manufacture and gives 10,000 cubic feet of acetylene. In burning, this gas gives out 250,000 candle-hours of light. The same amount of energy would produce 1,440,000 candle-hours if consumed in incandescent lamps, about twice as much if used in Nernst lamps, and nearly 5,000,000 candle-hours if used in working open-arc lamps.

The Holthoff Machinery Company.

The Holthoff Machinery Company, recently organized in Milwaukee, Wisconsin, for the manufacture of mining and metallurgical machinery, has its new plant about ready for operation. The works are located at Cudahy, a suburb of Milwaukee.

The officers are W. D. Gray, president; H. C. Holthoff, vice-president, and B. T. Leuzarder, secretary and treasurer, all of whom are well known to the public by reason of their long association with the E. P. Allis Co., and who resigned shortly after the company was taken over by the Allis-Chalmers Co.

Holthoff Machinery Co.'s Works, Cudahy, Wis.

The new works, as illustrated herewith, consist of a boiler and sheet metal shop, 250x100 feet; a machine shop, 250x110 feet; a pattern shop, 120x60 feet; with a two-story office building, 80x32 feet. Provision is also made for a foundry, 250x100 feet, which will be erected in a very short time. The other buildings are nearly completed, and the company will occupy its new offices by April 1st. It is expected the entire plant will be in operation May 15th. The shops are equipped with the best machinery which can be purchased, and it is the purpose of the company to manufacture a full line of mining and metallurgical machinery, including stamp mills, chlorination mills, cyanide mills, concentrating mills, silver-lead and copper furnaces, converters, smelters, copper bessemerizing plants, transmission machinery and mine equipment, together with boilers and all kinds of heavy sheet metal work. With the long experience which these gentlemen have had in this line of business and with a new plant equipped with every modern convenience for doing work quickly and economically, the company should be able to obtain its share of the business in sight.

Mr. Gray was at the head of the flour mill department of the E. P. Allis Co. for about twenty-five years and has engineered the construction of many of the large milling plants in the United States.

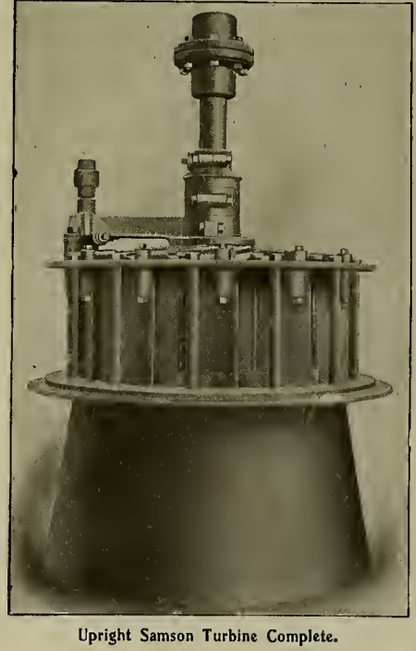
Mr. Holthoff has had an experience of some twenty-two years in connection with mining and mining machinery. For fifteen years he has followed the business of mining and mechanical engineer in the mining regions of the West, designing and superintending the construction of mining and metallurgical plants, and is well known throughout the mining world. He was with the E. P. Allis Co. as chief engineer of their mining machinery department for some seven years, designing and supervising the constructing of machinery built by them in that line.

Mr. Leuzarder was with the E. P. Allis Co. seventeen years, and for the last fourteen years of that period was at the head of their accounting department. When the Allis-Chalmers Co. was organized, he was elected comptroller of the company, which position he resigned to organize and associate himself with the new enterprise.

AT the Striberg mine in Sweden the ore is a rich hematite, containing 60.44% of iron, associated with poorer ore containing 51% of iron. The gangue consists of quartz, epidote, chlorite and mica. Dressing plant of a very elaborate character, driven by electricity, has been erected, and in the period from May to November, 1901, about 11,000 tons of crude ore were treated. On an average 100 tons were treated a day, yielding 60 tons of concentrated ore, of which 17% was picked ore of more than 20 millimeters in size; 40% was coarse jigged ore of 20 to 5 millimeters; 15% was medium jigged ore of 5 to 1 millimeter; and 28% was fine jigged ore of less than 1 millimeter. On analysis these classes of ore yielded the following percentages: Picked ore, 59.01 iron, 0.048 phosphorus, 0.008 sulphur; coarse, 62.21 iron, 0.033 phosphorus, 0.008 sulphur; medium, 62 65 iron, 0.033 phosphorus, 0.015 sulphur; fine, 65.68 iron, 0.018 phosphorus, 0.034 sulphur. In all, at the concentrating works fifteen men are employed. The cost of installation was 160,000 kronor. The cost per ton of ore obtained is 5 kronor.

Samson Turbine and Cascade Water Wheels.

Herewith are illustrated the latest and best types of Samson turbine and Cascade water wheels as manufactured by The James Leffel & Co. of Springfield, Ohio. The forty years' constant practice that this company has had in the water wheel line, frequently under the most difficult circumstances, has given them the opportunity to understand the qualities necessary to meet successfully, under all conditions, the



Upright Samson Turbine Complete.

present exacting requirements of a water wheel plant. In the Samson wheel the double wheel feature has been retained. The easily operated balanced gates have also been preserved, qualities supplemented by the addition of the double diameter feature, the outward discharge element and other improvements for which letters patent have been

Five Nozzle Cascade Wheel.

granted in this and other countries. The Samson turhines are huilt on hoth upright and horizontal shafts in a great variety of styles. These are frequently of special designs and capacities to conform them to unusual and complex conditions.

The Cascade water wheel is illustrated herewith. There are no wearing parts except the journals of the shaft, which indicates durahility and a minimum of cost or expense for repair. Any ruhhing and consequent wearing of the metal surfaces, causing leakage where close and neat fits are necessary, is said to he ohviated in the Cascade wheel. Harron, Rickard & McCone, 21–23 Fremout street, San Francisco, have heen appointed Pacific coast agents for this line and will he pleased to furnish catalogues and information regarding the styles of wheels shown ahove, or regarding the standard and special wheels of this manufacture.

Boiler Scale Solvents.

By D. B. Dixon.

A boiler free from scale and corrosion is greatly desired hy all engineers, hut is a very difficult thing to attain in practice. Boiler feed water is never found chemically pure, always containing foreign suhstances in solution and when hoiled until it all escapes as steam. We find on the hottom, sides and tuhes of the hoiler a coating or deposit, which, if hard, we call incrustation or scale; if in the form of a powder, we call it sediment. The water also holds mineral matter in a state of mechanical suspension. Incrustations are injurious to hoilers hecause they are poor conductors; cause loss of heat and waste of fuel estimated from 15% to 40% of the fuel used, dependent upon thickness of the scale; cause over-heating of the hoiler plates, which is sure, sooner or later, to hurn out the meal, and may result in an explosion of the hoiler; and corrosion of the metal occurs rapidly in parts of the boiler upon which the deposits are more liahle to accumulate. Incrustations due to the deposition of matter held in solution in the water have only heen spoken of, as those are by far the most frequent. But it is known that a quantity of fatty matter in the feed water of a hoiler causes a deposit, and that this may lead to the destruction of the hoiler, inasmuch as the part of the hoiler shell under the incrustation hecomes more heated than other parts and is apt to occasion rupture. Cases have come under the notice of boiler inspectors where oil, used to luhricate the cylinders, has heen carried into the hoilers with the feed water, and settling upon the furnace crowns formed a thin, hard incrustation, which resulted in burning the plates, followed by a crack necessitating repairs.

The best means to prevent incrustation is the purification of the water, or the removal of the incrustants before the water enters the hoiler. In order to ascertain whether and how a certain feed water can he purified to the best advantage, it is necessary to have a sample of it analyzed. The sample should he put in a clean new jug and not he less than one gallon. There are certain things that may he done to prevent rapid scale formation in boilers located almost anywhere. That no scale will form is not to be inferred, but that the formation will be very much slower than if nothing is done to prevent it at all. When a new boiler is installed it is too often run without any move heing made to prevent the formation of scale, and this continues until it is seen on the tuhes and plates. Then a decided move is made, but usually it is too late, for the methods adopted are too mild to cope with scale forming on the scaled surface. If a hoiler is taken in time and before the scale has accumulated to any appreciable extent—whether the hoiler has just been thoroughly cleaned or is new does not make any difference—and a surface and hottom hlow-off are opened several times a day, it will he found that the formation of hard scale will take place much more slowly. Even when the water is very bad, a good surface blow-off device properly placed in the hoiler will prevent scale formation. There are many compounds on the market for preventing incrustation: some are very costly, and few of them are alike applicahle to all cases. Some of them increase corrosion of the hoilers while they prevent incrustation, and in the employment of others practical difficulties arise which render their use inconvenient and even dangerous. Slah zinc is often used in boilers and hot water tanks to prevent scale formation and the corrosive action of the water on the metal of which the tank or boiler is composed. The action appears to he an electrical one, the iron heing one pole of the hattery and the zinc heing the other. Under the action of the current of electricity so produced, the water in the tank is slowly decomposed into its elements, oxygen and hydrogen. The hydrogen is deposited on the iron shell, where it remains. It will not unite with iron to form a new compound, hut if any iron rust is present it will remove the oxygen from this and deposit the metallic iron on the plates. The oxygen of the water that is decomposed, instead of going to the iron, goes to the zinc and forms oxide of zinc, and in the course of time the zinc will be found to he almost entirely converted into oxide. On account of the action outlined, it is generally helieved that zinc is always a good thing to prevent both scale and corrosion, and that it cannot be harmful to the boiler under any circumstances. But such is not always the case, and in making use of zinc the boiler should he frequently opened and the action carefully watched, so that if any undesirable effects show themselves they may be checked in time to prevent serious trouble. Carbonate of soda is used to a very great extent as an "anti-incrustator," and it also prevents "pitting." A simple way of adding the soda is to dissolve it in the feed water prior to its injection into the hoiler. A sufficient quantity will have heen added in all cases where the water (sampled at the gauge glass top) will turn a piece of red litmus paper slightly blue, showing that the water is slightly alkaline. A very simple method of removing the incrustation of hoilers is said to have been discovered hy a French engineer. After extinguishing the fires the hoiler water is hlown off very gradually, at the same time admitting an equal volume of cold water, so that the water gauge shows no charge of level. As soon as the water has in this manner been sufficiently cooled down it is suddenly hlown off. This latter operation is said to remove the major part of any incrustation which may he present, what remains heing very easily detached hy scraping. The cleaning of the boiler must, however, be taken in hand immediately upon completion of the hlowing-off operation, as otherwise the furstone will harden and adhere again to the boiler plates.

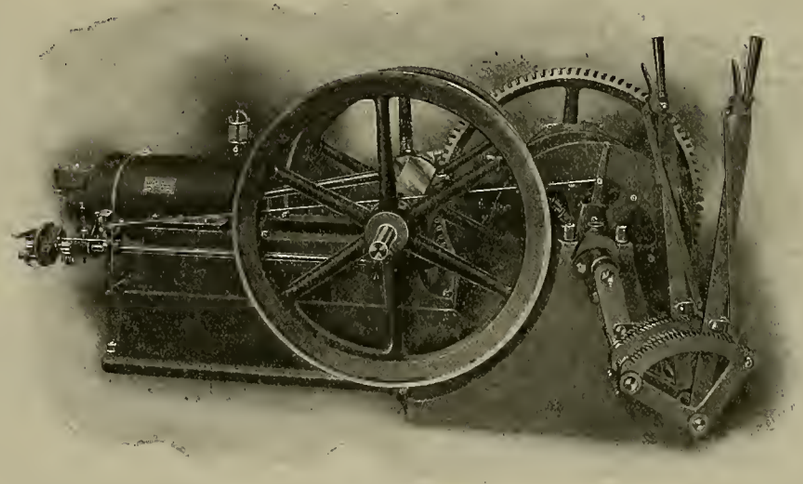
Kerosene oil possesses properties which make it useful in removing old scale from the shell and tuhes of a steam hoiler, and it is extensively used for this purpose. But, unfortunately, it is not always applied judiciously, hence the many failures attending its use. It can also be used to prevent the formation of scale. We have seen wheelharrow loads of scale loosened from the shell and tuhes of a hoiler during a week's run, after kerosene oil had heen applied. Three treatments with kerosene oil during three weeks' time left all parts of the interior of the boiler "metallically clean." The greatest difficulty experienced in the successful use of kerosene oil for removing scale is that the quantity usually applied is too small to he of perceptihle henefit. Kerosene oil is highly penetrative, and it will penetrate through a considerahle thickness of any porous suhstance—especially boiler scale. Ordinary kerosene oil will wholly evaporate if kept at a temperature of ahout 200°. For this reason it is of little henefit if fed into a hoiler where the temperature is higher than this, hecause it will soon evaporate; while it remains it will rest on the surface of the water—very little being carried below the surface hy the circulation of the water. To make kerosene oil effectual in removing scale from the inside of a hoiler, from a feed water heater, or other place where scale has accumulated, it should be applied in liheral doses and at a time when the hoiler, heater, or other device is comparatively cold. In using kerosene oil for removing old scale from a boiler, it must he used with some judgment, else the loosened scale will gather on the fire sheet, or between the tuhes, and injurious effects may result. When the scaled hoiler is open and dry the kerosene oil may be applied to the extent of a gallon or so to the lower rows of tubes, using a syringe for the purpose. If the scale is thick and porous it will readily ahsorh the oil—if the scale is dense and close grained more time should be allowed for the oil to penetrate. After a sufficient quantity of the oil has heen introduced the boiler should be closed up, filled and run for ahout a week, then opened and the loose scale cleaned out. Another application of oil should then be made and the same process gone through with. This method will effectually clean the scale from a hoiler in the course of a very few weeks.

Another way of applying the oil has heen used to good advantage. When the hoiler is empty put into it ahout a hucketful of kerosene oil, then let the hoiler fill very slowly. The oil will float on top of the water and he absorhed by the scale as they come in contact, until all the oil is absorbed. In this way the oil can be applied in greatest quantity to the scale which is nearest to the bottom of the hoiler. A few such applications will effectually loose all the scale. Kerosene oil acts for this purpose, hy reason of its penetrative power, working through the scale until it comes in contact with the iron, thus overcoming the adhesion between the scale and metal. When heat is applied to the hoiler the oil soon hegins to evaporate, and hy its expansive force further loosens the scale and forms cracks in it, through which the water enters until it reaches the metal, after which the force of the steam further assists in breaking up and removing the scale, which will fall off in chunks, leaving the tubes and shell metallically clean where the hreaking up process has taken place.

An ahsolutely clean surface inside of a hoiler is not desirable. A thin incrustation not thicker than an egg shell, near the firing, is not injurious. It is frequently of henefit even, as it protects the boiler shell and tubes from the influence of injurious components of the feed water. But after all has heen said as to the merits of the various hoiler scale solvents and preventers, the only sure, satisfactory and rational course to pursue is to have the feed water analyzed and a physic made to suit its requirements. Any and all solvents—with the exception of kerosene oil—should he introduced gradually and continuously with the feed water. Usually, all that takes place when a compound is doing what it is supposed to do, is that the scale or deposit is rendered soft and comparatively easy to remove. The hoiler requires regular cleaning and scaling just as if no compound were used. This is not always done, however, for it is thought by some that when a compound is used all the work on the part of the engineer or fireman in removing the scale and keeping the hoiler clean is heing amply accomplished hy the compound.—American Manufacturer.

Improved Witte Gasoline Hoist.

The cut herewith is an illustration of the improved Witte gasoline hoist, which has given satisfaction where introduced as a practical, reliahle and substantial machine. The manufacturers state that the Witte is the simplest successful gasoline engine built. Gearing on the crank shaft revolves a shaft, extending the length of the engine, on which are placed the ignitor trip, cams to operate the exhaust and gasoline valves and the governor. A heavy suhhase of neat design extends in front to carry the drum, which is operated hy a powerful friction clutch. A heavy wood-lined hand brake is provided, and an ingenious speed regulator permits the load to he started slowly, without jerk on the cahle. The engine runs slowly at all times when not hoisting, except when otherwise desired.



Witte Gasoline Hoist.

Witte engines are in use to-day for hoisting, air compressing or pumping where coal can he delivered at the mine for $3 per ton and gasoline costs 18 to 20 cents per gallon. This preference is claimed to be due to successful experience, demonstrating that a reliahle gasoline engine properly installed is more efficient than steam, easier handled and calls for no expense account for repairs and maintenance.

Witte hoists are built in sizes from 4 H. P. to 100 H. P., single or douhle drums, and speed and load arranged to suit customers.

The Tracy Engineering Co. of San Francisco, Cal., manufacturers' agents for the Witte gasoline engines and hoists, will furnish those interested with detailed information relating to their installation and operation.

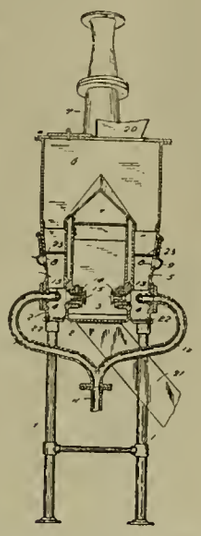
The total numher of stationary boilers in use in the United States, as enumerated in the census of 1880, was 72,304. It has heen estimated that on Dec. 31, 1890, there were approximately 100,000 stationary boilers in use, and the estimate is made that at present there are about 170,000 hoilers under insurance.

Mining and Metallurgical Patents.

Patents Issued April 15, 1902.

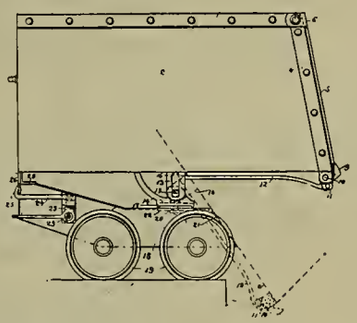
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ROCK PULVERIZER.—No. 697,505; H. Luckenhach, Seattle, Wash.



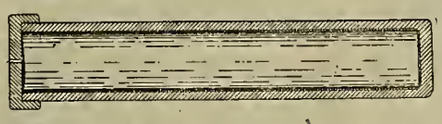
Central chamher, wing compartments, oppositely disposed nozzles discharging contents of wing compartments into central chamber, each wing compartment having opening above nozzle and pocket heneath nozzle and covers for openings provided with perforations in upper parts.

AUTOMATIC DUMPING ORE CAR.—No. 697,685; C. H. Snow, San Francisco, Cal.



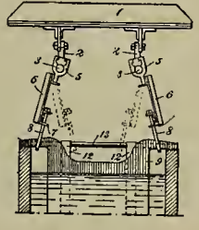
Wheeled truck having two memhers of turntahle carried thereon, upper member having upturned sides, trunnions projecting from sides, car hody having supports extending downwardly from hottom and turnahle upon trunnions, upwardly arched central portion of trunnion shaft having one end of rod turnahly connected therewith, hinged automatically closing door at end of car hody, pivoted latch adapted to engage bottom of door and having downwardly projecting arm and connection between arm and opposite end of rod whereby tilting of car unlatches door.

APPARATUS FOR ASSAYING ORES.—No. 697,774; W. T. Armstrong, San Jose, Cal.



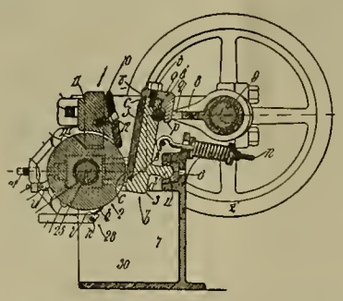
Receptacle having suitahle closure, an ore-containing envelope or cupel of fibrous material adapted to he inserted into it, whereby ore is prevented from coming in contact with sides of it during process of reduction.

METALLURGICAL CRANE.—No. 697,788; D. W. Blair, Perth Amboy, N. J.



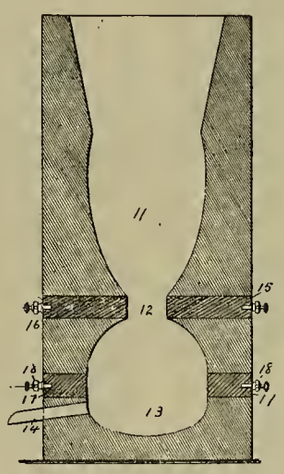
Metallurgical crane, comprising frame to he located over metallurgical hath having anodes and cathodes disposed alternately, plurality of shafts mounted upon frame and plurality of L-shaped hooks connected with shaft, all hooks of each shaft heing disposed in same plane and normally having hills turned in same direction, hooks being free to rock in planes extending across hath, and also free to travel in general longitudinal direction of hath; arrangement heing such that hooks are free to simultaneously engage all anodes, or to simultaneously engage all cathodes.

ORE CRUSHER.—No. 697,802; A. C. Calkins, Los Angeles, Cal.



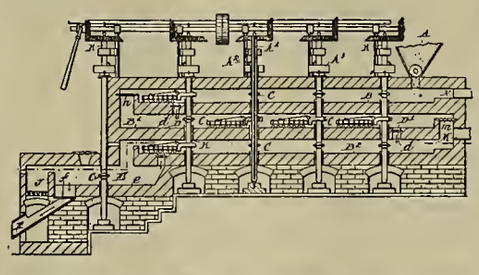
Frame; eccentric shaft mounted in frame; vihratory jaw provided with seat for face plate and having at lower end lip to retain face plate in seat and heing provided at upper rear side with socket for connecting rod; wearing face plate seated in seat; connecting rod mounted on eccentric of shaft and socketing in socket and provided with opening, rearward of socket; clamp piece for top of hody of vibratory jaw and provided at front with lip to extend in front of face plate and provided at rear with finger to extend through opening in connecting rod to hold end of connecting rod in socket; and means for fastening clamp memher to upper end of hody.

ELECTRIC FURNACE.—No. 697,810; M. R. Conley, New York, N. Y.



Body portion made of refractory non-conducting materials and formed with main inner chamher, neck at hottom of inner chamher, hearth helow neck, heating zone forming wall of neck and made up of series of plates or parts adapted to be heated to incandescence hy passage of electric current through them, and second heating zone in hearth formed also of plates or parts which are adapted to he suhstantially flush with furnace wall and incandescence under influence of strong electric current.

ORE ROASTING FURNACE.—No. 697,863; T. D. Merton, Spottiswoode, Victoria, Australia.



Plurality of superposed communicating hearths, series of hollow vertical shafts passing through hearths, water supply pipe having series of depending hranches corresponding in numher with and located in respective shafts, driving shaft common to all and operatively connected with shafts, arms extending radially from shafts, means for connecting arms rigidly yet removahly to shafts, bars connected to arms, rabbling shoes detachahly depending from bars, notched lugs extending from arms, and stay rods connected to bars and having eyes to engage notched lugs.

METHOD OF RECOVERING METALS BY ELECTROLYSIS.—No. 697,831; H. A. Frasch, Hamilton, Canada.

Process of recovering nickel hy electrolysis, consisting in supplying cathode with solution of nickel-ammonium chloride containing excess of ammonia, and supplying soluhle anode consisting of different metals with solution of sodium chloride, separating two solutions hy horizontal permeahle diaphragm, and by electric current precipitating nickel in metallic form upon cathode, forming at anode solution of chlorides of various metals contained in anode, displacing chloride solution from helow diaphragm hy addition of fresh sodium chloride solution, and further electrolyzing cathode solution until last trace of nickel has heen removed from cathode electrolyte, and utilizing remaining solution of free ammonia for production of fresh nickel-ammonium chloride.

PROCESS OF TREATING COPPER-NICKEL SULPHIDE ORES.—No. 697,370; D. P. Shuler, Sudhury, Canada.

Treating ores containing nickel-iron sulphides with copper-iron sulphides, hy suhjecting comminuted ore to magnetic separation so as to produce headings and tailings, headings being richer in iron and sulphur than tailings, hut generally poorer in nickel; thus hringing about, by magnetic separation, variation or readjustment of relative proportions of iron and nickel, so as to produce proportions which are proper for making of nickel-steel, then roasting headings, and finally smelting them to produce pig-iron containing proportion of nickel which makes it suitahle for direct manufacture of nickel-steel.

PROCESS OF PURIFYING ZINC BEARING ORES.—No. 697,898; C. R. P. Steinau, Cleveland, Ohio.

Process of purifying zinc bearing solutions containing hydrochloric acid, iron, manganese, cobalt, nickel, copper, lead, arsenic, cadmium or other metals kindred with zinc, which consists in treating solutions with zinc powder, to precipitate those metals which are kindred with zinc, then removing any iron and manganese that may he contained in solutions, then treating latter with hydrate of an alkali and with hydrochlorite of same alkali, to remove part of cohalt and nickel, and, lastly, again treating partly purified solution with zinc powder, to precipitate remainder of cohalt and nickel.

RECENTLY a factory has heen built at Stangfjorden, in Norway, for the electric treatment of peat by the Jebsen process. According to a description given hy the Zeitschrift fur Electrochemie, the peat is first submitted to air drying, and is pressed until the water contents are reduced to 20% or under. It is then charged into retorts of special design, heated internally by electric resistance coils. A gas useful for heating purposes, and a tarry oil, distill over, while a very pure form of peat, charcoal or coke remains in the retorts. The tarry oil can he worked up for the recovery of paraffin, ammonium sulphate and methylalcohol. The electric plant at Stangfjorden consists of five 128 H. P. turhines and five dynamos of equivalent power. A daily treatment of 100 metric tons of air-dried peat is possible with this plant in the twelve retorts which are at present installed.

A WIRE ROPE needs a lubricant that will penetrate all the wires, and, as a preservative, it must be free from acids and prevent rust. A good lubricant is made of tar, summer oil and mica axle grease, in varying proportions to suit varying conditions.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

President Roosevelt has designated Juneau as the location for the Alaska land office and the office of the United States Surveyor General for Alaska, removing it from Sitka.

ARIZONA.

COCHISE COUNTY.

The new Copper Queen smelter at Douglas is to he controlled by a separate corporation, to be known as the Douglas Reduction Works, which suggests the belief that the works will constitute the central reduction plant of the Phelps–Dodge interests in the Southwest. The smelter is to he 235x150 feet, the power house 270x100 feet, and the boiler house 200x40 feet. All these structures will have railroad tracks running within them. The machine shop, blacksmith shop and foundry will he built at once, and are now under way. The ores received hy railroad will he handled in a novel manner. They will be mixed in pits, instead of at the furnace mouth, as usual. There will he no ore bins, hut instead three pits, 38x100 feet in size, excavated 12 feet deep by steam shovels. The three pits will lie parallel to each other, will be lined with concrete, and will have a capacity of nearly 100,000 tons of ore. In each of the pits will he a traveling steam shovel that will hoist the mixed ore into cars on trestles 18 feet ahove. At the smelter the ore supply tracks will he 50 feet in height, and thence the main work of handling the charges will be by gravity.

At a meeting of stockholders of the South Bishee Co., forty-six mining claims near the Copper Queen property at Bishee were sold to G. R. Camphell of Calumet, Mich., for $1,200,000—$150,000 in cash and the balance within two years.

MARICOPA COUNTY.

The Oro Grande mine, near Wickenhurg, has let a contract to N. Garcia to sink the 3-compartment working shaft. Three shifts are heing worked on the new shaft, which will he the permanent working shaft, and the mill will be erected hetween it and the workings farther down the hill. When sufficient depth is attained a large douhle drum hoist will he installed.

The Buckhorn M. Co., of which G. D. Gray is president, is engaged in huilding a new wagon road from their mine to Wickenhurg, which will be 4 miles shorter than the old road.

The sale of four groups of mines near Wickenburg to T. E Otis and associates of New York for $1,000,000 is reported. The claims include four developed mines and ahout forty claims and prospects in the Picacho Blanco district. The Exposition mine and surrounding claims, together with the claims of W. B. Troy of New York and the Trilhy and White Cloud mines of the San Domingo group, make up the purchase.

MOHAVE COUNTY.

A rich strike has been made 12 miles south of Peach Springs of ore found in the contact between the slate and granite, running 30% in copper and $130 in gold to the ton. There are ten claims in the group, all carrying free gold. One claim shows a 3-foot ledge carrying $20 in gold and 30% copper. The owners are W. Tucker of Ash Fork, W. Crowell, J. M. Little and D. M. Alexander of Williams.

Ground is heing broken and grading done for the Vulcan smelter at Chloride. It is expected to have the plant in operation by the first of June. The company has let a contract to F. W. Theis to develop for them all the water they may need for the plant.

PIMA COUNTY.

H. R. Bacon, Supt. of the Oceanic gold mine, near Tucson, says it is now ready for a stamp mill, and Mr. Wores, the owner, is preparing to place one upon the property at once.

SANTA CRUZ COUNTY.

J. W. Milligan and J. M. Douglas, who in December located the Old Kentuck claim, near Washington, have sunk a shaft 35 feet deep and struck an ore body 3 feet wide, carrying gold, silver and lead. They bonded it at $25,000.

YAVAPAI COUNTY.

H. E. Armitage is about to start up work on the Hercules property, located 10 miles from Hot Springs Junction, and will make extensive exploration of the ore bodies with a diamond drill.

Moynahan & Co. are preparing to place a 10-stamp mill on the Home Run mine, Groom creek, about 7 miles south of Prescott.

The site for the 300-ton smelter of the Del Rio Smelter Co. at Del Rio is being laid out and construction is to begin soon.

Supt. Pickerell says the shaft on the President mine, near Prescott, is now down 425 feet and work is heing pushed hy three shifts.

Baker & Bowers, owners of the Starlight mine, hetween Prescott and Jerome, have a shaft down on the property 150 feet and will put in machinery to sink deeper.

The Myrtle M. Co., operating a group of claims on Ash creek, near Prescott, are putting up bunk houses and other necessary huildings, and propose to soon put on from twenty to twenty-five miners.

E. D. Treadwell has commenced work on the erection of the smelter for the G. A. Treadwell M. Co., at Mayer, and is putting in a water supply pipe line from Wolf creek.

CALIFORNIA.

AMADOR COUNTY.

F. Giannini and associates are sinking a shaft on the Giannini property in Drytown, on what is called the west vein. The shaft is down 40 feet in a ledge 4 to 5 feet wide of rock that prospects $5 to the ton in free gold. The ore is heavily sulphuretted.

F. Drew has honded the talc vein west of Drytown and is making a test of the rock. It is claimed to show at least $3 to the ton on the plates.

CALAVERAS COUNTY.

The new gallows frame at the Gwin mine, near Palorma, will he of steel and 100 feet high. This will he the first steel gallows frame to he erected along the mother lode, and the highest one, exceeding that of the Oneida at Sutter Creek, which is 80 feet high. Besides the twenty stamps to be added to the eighty now installed, there will he a sampling mill through which samples from the face of the drift will be run daily.

At the Easyz Bird mine, near Mokelumne Hill, huildings have heen erected and the work of developing the mine is going ahead. The vein is from 4 to 8 feet in width in good milling ore between well defined walls.

New machinery is arriving at the Fanny Marie mine at Glencoe. Under ground an upraise of 40 feet has heen run on a 3-foot vein of good ore.

J. Maltman and I. A. Ryant are opening up the Pioneer mine at Angels. The 55-foot shaft is being cleaned out and retimbered. A horse whim is used for hoisting, and a 5-inch plunger pump operated hy a 16-foot overshot water wheel for pumping.

EL DORADO COUNTY.

H. G. Koppikus is having a test run made on ore from the Clipper quartz mine at Georgetown.

LOS ANGELES COUNTY.

The Blast Furnace Smelting Co. has been incorporated at Los Angeles with S. L. Kistler, F. B. Pittingill, E. Nicholson, J. E. Eichelberger and L. F. Kistler directors, and capital $1,000,000. The company is to estahlish a smelter in the vicinity of Los Angeles.

MADERA COUNTY.

The Western Iron & Steel Co., capital $15,000,000, has heen incorporated at Phœnix, Ariz. The directors are B. F. Brening, M. Pollasky, J. H. Bridges, W. G. Bussey, H. W. Hodge, I. C. Stump, J. W. Stanford, S. P. Thomas, A. E. Pierkowski. The principal office is in San Francisco and the iron mines it proposes to exploit are in Madera county. The blast furnaces are to he built on San Francisco bay.

NEVADA COUNTY.

The Remington Hill drift mine, near Nevada City, F. A. Gourley Supt., has heen started up. The owners intend to sink a shaft for the channel and will install hoisting and pumping machinery.

PLACER COUNTY.

The Bloomer M. Co. has struck some rich pay ore in their claim in Dutch ravine, near Newcastle. The main shaft is now down 200 feet and the find is in the 130-foot level. The mine is owned hy F. E. Brye, A. L. Smith and G. L. Threlkel of Auhurn, the latter being the Supt.

SACRAMENTO COUNTY.

It is claimed there will he at least five new gravel mines in operation near Folsom in addition to the Blue Ravine and Gray Wing mines that are now running. There is now a strip of country ahout 2½ miles in length which is supposed to he on the same channel as the two noted, every acre of which is under bond hy mining companies, some of which are operating and others making preparations to.

SHASTA COUNTY.

O. L. Jezler of Redding has struck a ledge of gold-bearing quartz at the hottom of a well he is sinking in that place. The well is to he turned into a mine.

The fire in the sulphide ore hodies of the Iron mountain mines, from which the Keswick smelter gets its supply, is again gaining ground. The fire started eighteen months ago. Since active work was hegun six weeks ago two levels, important sources of ore supply, have had to be abandoned on account of the fire and the drifts sealed up. The remaining levels are hot.

The Eastern owners of the Balaklala copper mine at Kennet are making a thorough examination of the mine property with a view of erecting a smelting plant having a daily capacity of 2000 tons. The borings with diamond drills at the mine show, it is stated, the existence of 10% to 12% copper ore, averaging gold and silver values of $12 to $14 per ton in large quantity.

H. C. Woodrow, Supt. of the Texas mine at Whitehouse, says the mine is temporarily closed hecause the Mountain Copper Co. refuses to accept any more low-grade ore, which constitutes the hulk of the mine's output. The Texas for sixteen days during March yielded 800 tons, and is capahle of landing 2000 tons a month at the smelters. The property is shut down simply because the ore cannot be reduced until the company can install its own plant.

A 5-inch ledge of 28% ore discovered at Whitehouse has widened out to 12 feet of ahout 16% ore carrying $5 gold a ton. The showing of copper was unexpected, as the miners were looking for gold quartz.

The tunnel of the South Fork M. & Dev. Co. at Chicago mountain, near Igo, now in 1500 feet, is to he extended 1000 feet. B. F. Rogers is Supt. He states that it is the intention of the company to build a smelter if the rock is encountered in paying quantity.

A matte smelter is to be located near the town of Copley on the railroad ahout 12 miles north of Redding. J. J. Chambers of Redding owns a piece of mining property adjoining the town, on which an Eastern company is proposing to put in a 100-ton copper smelter, to he gradually enlarged to work 500 tons daily.

SIERRA COUNTY.

The people who honded the Mabel mine, near Forest, have extended the main tunnel and sunk a shaft 40 feet to bedrock. A fine body of gravel was exposed and a good prospect of gold taken out, but the poor facilities for handling water stopped work in the shaft. They have incorporated as the Mahel Mertz G. G. M. Co., with F. M. Sponogle as president and W. W. Barham secretary, with office in San Francisco. Operations are to he resumed at the mine and a new tunnel will he run.

SISKIYOU COUNTY.

(Special Correspondence).—At the Pine Grove placer mine on the Klamath river, owned by H. J. Barton of Oak Bar, and bonded to M. J. Whitney & Co., a Detroit company, the latter have reached bedrock with their elevator and have found gravel that prospects from $2 to $3 to the pan, and from $10 to $20 to the pan is obtained on hedrock. From four days' work with four men $375 has heen taken out without cleaning hedrock.

Oak Bar, April 18.

At the New York mine on Indian creek, near Yreka, J. B. Scott manager, a fine hody of ore, very rich in free gold, has heen struck. The vein is from 15 inches to 3 feet wide. On this property there is 4000 feet of tunnel work. The new stamp mill has heen started up.

San Francisco people have bonded at $20,000 the Yellow Jacket mine, on Indian creek, near Oro Fino, from Goodfellow & Henderson. It is a porphyry dike, 40 feet wide.

At the Minetti B mine at Nolton, which is heing operated hy White & Martin, $23.85 was recently taken from a single pan of gravel taken from hedrock.

Six dollars to the pan has heen obtained on hedrock on the Tom Quigley claim, on the Klamath river, at the mouth of Beaver creek, near Oak Bar.

G. W. Tyrer of the Tyrer M. Co., near Klamathon, is developing a quartz proposition on which ahout 1200 feet of development work has heen done. A shaft will be sunk on the ledge soon. They have a new 10-stamp mill on the property.

A rich strike has heen made at the Golden Eagle mine, on Indian creek, near Oro Fino, owned by A. C. Brokaw & Co. The ledge is a foot wide and the rock goes ahout $100 a ton.

D. B. McDaniel of Ashland, Or., has started work on his quartz properties, near Coles.

Coleman & Starkey have commenced work on their contract, digging 3 miles of ditch for the Espey mine, on Hungry creek, near Coles.

TRINITY COUNTY.

G W. Payne, manager of the Alta Bert Dredging Co., operating a dredger at Trinity Center, is preparing to install new dredging machinery, etc., for the dredger of a heavier character than that now used. As soon as the new machinery is installed the dredger will run night and day. The gravel on the ranch is from 15 to 30 feet deep.

The water in East Weaver creek has been turned into the Sweepstake mine ditch, the pipe line across the hreak at the head of Garden gulch having heen completed. The giants at the mine are running and everything is working satisfactorily.

It is reported that a San Francisco company has bonded the Graves ranch at Trinity Center for gold dredging, and are arranging to prospect it. The driller for prospecting the ground is now on the way there. If the prospects are satisfactory the ranch will he bought and a dredger placed upon the ground.

At the Texas Jack mine, near Trinity Center, three tunnels have been run and the lead exposed in the first two. There is a large amount of free milling ore on the dump which is claimed to average from $26 to $40 a ton.

At the Oriole a drift has been run in 75 feet on the ledge and an upraise made to the surface The vein averages about 20 inches and the ore is free milling. There is ahout eight tons of ore out said to average $200 a ton, and ahout seventy tons of ore that will go about $15 a ton.

The Altoona Quicksilver M. Co. has fifteen men at work on the Fairview mine, near Minersville, under J. H. Porter, manager. Three tunnels have been run and the lead opened up in several places on the surface. No. 1 tunnel has heen run on the lead about 100 feet and shows a well defined vein, which averages 3 feet in width and ahout $10 per ton in gold free milling. The face of this drift is ahout 100 feet below the apex of the lead. No. 2 tunnel runs on the lead 375 feet. The lead in this tunnel is also about 3 feet wide and averages $10 in gold. No. 3, the lower tunnel, is in 360 feet, and it is helieved will cut the ledge within the next 50 feet.

C. and J. Ruggles have uncovered a large body of rich ore in their mine near Carrville that carries gold to the extent of $1800 per ton. Just across the Trinity river from the Ruggles claim, Blagrave, Stoddard & Cooper have discovered ore just as rich.

TUOLUMNE COUNTY.

The Gladys M. Co., operating near Coulterville, has bought a new hoist. H. S. Weaver is president and A. W. McQueen is secretary, hoth of San Francisco.

T. Donohue, foreman of the dredging company at La Grange, says a steam power prospecting drill is being set up under H. Cornish of Oroville. These drills bore holes 6 inches in diameter. Two more are to be installed.

A. Richey has sold to J. C. Dixon a half interest in the Mustang quartz mine, 3 miles northeast of Arastraville; also a half interest in a water right on Mustang creek.

T. H. Woodside and associates, who are working the Nate Clark gravel mine on Table mountain, near Springfield, have commenced the construction of a ditch from Gold hill to their property so as to wash their gravel at the mine. Their incline shaft is down 120 feet and is in gravel which prospects. Another 100 feet will be sunk hefore commencing to hreast gravel.

O. H. Perry of Boston, Mass., has sold his interest in the Clio mine and mill site at Jacksonville, together with all improvements, to the Clio M. & M. Co. for $20,000. It is expected to start up the mine.

COLORADO.

The Colorado Mine Operators' Association has perfected its organization and elected the following officers: President, A. Winslow of Telluride; vice-president, J. H. Weddle of Leadville; secretary-treasurer, E. A. Colhurn of Colorado Springs and Denver. Thirty-eight votes were represented at the meeting from Aspen, Leadville, Lake City, Telluride, Ophir, Silverton, Central City, Cripple Creek, Georgetown and Idaho Springs. The executive committee has framed the hy-laws and named the standing committees. The members of the Association declare that the Association is demanded by the times. All other great interests are organized and it has become evident that the mining industry of Colorado required the same solidification. One of the members put it in this form saying: "This matter of hiring our labor from a lahor trust and selling out ores to a smelter trust, hy which we are hetween the upper and nether millstone, so to speak, is getting too oppressive and something must be done to relieve this or mining in Colorado will he extinct in another ten years. Matters can he conducted more advantageously, more profitably and far more satisfactorily to all concerned, and this Association will provide the means."

BOULDER COUNTY.

The Silver Lake G. M. & M. Co., at Silver Lake, near Ward, have a tunnel in

260 feet showing a well defined vein, and a shaft down 95 feet. The assays have run from $17 to $102 per ton. The ore is a copper sulphide. The company is planning on building a mill as soon as developments justify it.

CHAFFEE COUNTY.

Manager G. R. Dickey of the Tasmania Copper M. & S. Co. is to increase the working force on the Last Dollar and Dickey Boy mines at Winfield. Supt. R. Taggart has done considerable exploration work and has opened two entirely new veins in the company's territory. A tramway will be built from the mine to the smelter, 3500 feet long. The main vein is 30 fee wide and has 8 feet of quartz carrying 7% copper and good values in gold and silver.

CLEAR CREEK COUNTY.

The Narragansett tunnel at Silver Plume has cut the Alendria lode, which shows well. This is one of the lodes for which the tunnel was started. The tunnel will go through twenty-three claims that have been bought and located by E. Aldrich, tho present owner.

In the Scott tunnel at Silver Plume, which is being driven into McClelland mountain by a New York company, represented by W. S. Ross of Grand Junction, 90 feet were made in March by hand. The plant of machinery to be erected at the tunnel is expected, with electric power drills, to advance the tunnel about 200 feet a month. The contract has been let for 1400 feet.

The body of rich ore on the Wisconsin, at Silver Plume, it is stated, still continues to hold out and shows from 12 to 14 feet of mixed ore that runs from 300 to 500 ounces silver. The standard of shipments has been from $3500 to $4500 worth of ore turned out by fifteen men each week.

The Republic Con. Co., on Douglas mountain, near Idaho Springs, is drifting on the Ruby vein, opened by a 300-foot crosscut, and is shipping mill dirt of good quality taken without sorting from a 9-foot ledge. Manager Burgess is preparing for the introduction of power drills and a broad-gauge tunnel from the base of the mountain is projected.

The Sporting Times mine has resumed operations with an increased force of men. The breast of the drift is now in a large body of hard quartz in which considerable bodies of solid ore are visible.

J. Hite is completing the installing of the new hoisting plant on the Capital Prize group at Georgetown. The boiler house has been built on the dump of the main tunnel and the steam pipes will be laid in the tunnel to the shaft and carried up the shaft to the engine. The shaft house is completed. The shaft is now down from the surface to about 75 feet below the tunnel level and is to be used to explore the Griffith lode beneath the town. A pump for handling the water will be put in.

The Hidden Treasure Gold & Silver Mines & Mills Co. has been incorporated, capital $100,000. E. G. Hovey of Denver is president and J. F. Stanish of Georgetown general manager. The properties of the company are the Hidden Treasure group at Empire and the Edinburgh group near Georgetown, nine lode claims in all. The new company plans the driving of a crosscut tunnel from the base of Lincoln mountain to explore its own properties and those of other parties lying on the mountain, and also contemplates the erection of a concentrating mill for handling the low-grade ores that will be found.

EL PASO COUNTY.

The Portland Cement Co. is building 6 miles east of Florence a 1000-barrel Portland cement factory, making an investment of about $225,000. Florence and Denver people are interested. The concrete is being laid for the piers and the foundations are being built for the stationary engines. The company has bought several hundred acres of land upon which are extensive beds of cement shale. Supt. Moore of the works says the shale differs from that employed in the East, the ingredients being mixed by nature in proper proportion.

FREMONT COUNTY.

The new copper reduction plant at Parkdale, erected by the Greenhorn Mountain M. & M. Co, composed of Denver and Springfield, Ill., people, has been completed. The mill is equipped with a 100 H. P. boiler and a 75 H. P. engine to run a dynamo and air compressor, a hot air receiver, a thirty-ton crusher and pulverizer for grinding fifty tons of rock daily to 130-mesh, or seventy-five tons of rock to 60-mesh.

R. C. Vidler has bought the remaining two-thirds interest in the Argentine tunnel of C. Johnson of Georgetown and S. J. Anderson of Idaho Springs for $25,000. He has made arrangements for starting up the work in a short time. The tunnel will cut through the range at Argentine pass and will be 10,000 feet long, in which a depth will be obtained of from 1800 to 2500 feet. The tunnel is being built 10x10 in the clear.

GILPIN COUNTY.

Eastern people have leased and bonded the Charter Oak mine at Russell and have begun repairs preparatory to sinking the main shaft an additional 200 feet. W. H. Quintrall is Supt.

The Black Hawk people, operating the Fannie mine, on Cyclops hill, near Central City, are getting some high-grade silver in sinking the shaft. The Fannie has a good record as a producer of high-grade silver ore in the early days. A strike of 7 inches of silver ore has been lately made that assayed 1700 ounces silver to the ton.

The Saratoga mine at Central City, under the management of Dr. Carpenter, has been made a dividend payer by the addition of better machinery and methods of mining. The gross output for the month of March exceeded $25,000 or at the rate of $300,000 per year. Dr. Carpenter holds that a properly equipped mine can break ore as cheaply upon company account as can be done by individual lessees, so all work at the Saratoga is done upon company account. There are 105 men upon the company pay roll at present and the monthly pay day disburses about $8500 in wages, in addition to which there is about $2000 per month paid out at Central City and Black Hawk for supplies.

J. M. Shrote, secretary of the Benzie Investment Co. of Denver, has completed arrangements to buy the Elizabeth lode, situated in Lake district, from W. Smith of Central City. The property has a 90-foot shaft. A. B. Drake will be Supt. and it is anticipated that a plant of machinery will be installed.

GUNNISON COUNTY.

J. T. Quigley, representing Galveston, Texas, people, has bought the Whig group of five claims located in the Gold Brick district, between Pitkin and Ohio City, from Scott & Kienbush of Pitkin. The new owners will, it is understood, do extensive development work.

LAKE COUNTY.

F. Bartlett has opened up ore in his Mount Elbert property, near Twin Lakes, and says they have a considerable quantity of shipping and mill ore already blocked out, with which they intend to start their reduction works as soon as new machinery now needed for the enlargement of the plant can he put in.

The American Placer Mines Co. has been incorporated at Twin Lakes by A. G. Clark, E. A. Horner and A. L. Welch, with capital of $10,000, to operate the Young America group of claims, comprising about 10,000 acres near Twin Lakes. A large steam shovel will be installed.

PARK COUNTY.

Manager D. E. Rowe has started work on the Snowstorm and Beaver Park placers, at Alma, for the Snowstorm Hydraulic Co. He states that both properties will he put in operation this year, and offices, men's quarters and boarding houses will be erected at each of the properties, pipe plants and ditches supplied, and the placers systematically worked.

SAN JUAN COUNTY.

On Green mountain, at Silverton, the development of the Green Mountain M. & M. Co.'s properties, under Supt. Bielefeldt, on the great Osceola vein, shows good grade ore, carrying galena, iron and copper pyrite, with some gold and silver values. This ore body is 15 feet wide and testing shows the average value about $20 to the ton.

E. O. Buskirk and W. Haas have bonded the Crookson and Sunset claims near Silverton to the Western States G. M. Co. at $12,000. Several other properties have also been bonded to the same company.

SAN MIGUEL COUNTY.

Over 250,000 feet of lumber has been delivered to the Tom Boy Gold Mines Co., at Pandora, for the erection of the new mill, boarding and hunk house, timber shed and the other buildings that will be constructed at the Tom Boy this summer. The contracts call for over 1,000,000 feet. It is the intention of the company to have the buildings completed before snow falls next winter.

The Gold Metals M. & M. Co. incorporated to operate in Prospect Creek basin, near Telluride, is to commence operations at once. The tunnel will be advanced about 60 feet and the Gold Metal vein intersected. The average value of the ore is $20, principally gold, and is free milling with concentration. The company owns eleven claims, which can be worked through the tunnel, and has leased a 20-stamp mill, which it is repairing and getting into running order. Electric machine drills will be installed. P. M. Finnis, secretary of the company, is in charge.

SUMMIT COUNTY.

The work of repairing and overhauling the West Side concentrator, at Breckenridge, by the Puzzle M. & R. Co., has been completed and the plant is running on ore from the Puzzle Extension mine.

On April 15 the Gold Pan Co.'s pipe line at Breckenridge was filled with water and washing commenced on the Maggie placer.

The drill on the Tyra placer has bored to a depth of 330 feet—still in wash and sand. It was expected that solid formation would be encountered at not over 200 feet in depth.

TELLER COUNTY.

The Golden Cycle G. M. Co., at Cripple Creek, reports its production for March as 3400 tons, the net value of which was $39,000, this being the value of the ore after the freight has been paid the railroads and the treatment charges have been settled. The net profits to the company were $17,000.

W. S. Stratton is working two shifts in the Chicago and Cripple Creek tunnel and advancing it about 10 feet a day. The tunnel is now under Gold hill and in 3800 feet from the entrance, which starts at the Abe Lincoln mine in Poverty gulch. A crosscut has been driven 1400 feet toward the Baby Mine claim of the Temomj company. It will require another 100 feet before ore is encountered.

A strike has been made on the Gold hill property of the Colorado-Cripple Creek G. M. Co. at Cripple Creek in the main working shaft at the depth of 500 feet, where a vein 10 inches in width was encountered. The rock assayed from three ounces gold upward and forty-three ounces silver upward, with 2% of copper. Manager R. G. Mullin will cut a station at the 600-foot point and drift over to the ore, sbould the vein dip out of the shaft.

The El Paso Con. Co., on Beacon hill, at Cripple Creek, in the construction of the new ore house, has set sufficient room aside for the installation of a complete sampling works, and all ore that is shipped will first be sampled, so that when the shipment leaves the mine the company will know what will be received for the ore. Another innovation to be started at the El Paso is the use of double-tracked cages in the new working shaft, instead of the use of double-deck cages. The great advantage of the double-tracked cages over the double-decker is that both cars are rolled on to the cage, and one signal starts it up toward the surface; while with the double-decker, in use, the machinery has to be used to get the next deck to the level. That takes time. The new shaft of the El Paso is to be 5x14 feet, 8 inches in the clear, and will he sufficiently large to permit of the use of a cage that will hold two cars on one deck.

A movement is reported to he on foot to bring together into one company, under one management and one hoard of directors, with a capitalization of $60,000,000, the producing mines of the Cripple Creek district, the Colorado Springs & Cripple Creek District Railroad and the Portland mill, located at Colorado Springs. The companies to which the suggestion was made hy President Burns of the Portland and which, it is reported, have tentatively indorsed the plan as one that would result to the great advantage of all the parties to the consolidation, are: The Portland G. M. Co., Strong G. M. Co. and Ajax G. M. Co.; the new consolidation recently announced by the Woods Investment Co.: The Anchoria-Leland M. & M. Co., Midget G. M. & M. Co., Gold King M. Co., Colorado Springs & Cripple Creek District Railroad Co. and the Portland mill.

IDAHO.

BOISE COUNTY.

The lower tunnel on the Mountain Ram claim at Gamhrinus has struck the ledge, 3½ feet wide and all fine ore, some high grade showing a value of $158 a ton.

IDAHO COUNTY.

At the Goldbug group of mining claims, located near Dixie, owned by J. D. Glover and associates of St. Paul, Minn., the shaft has been sunk 100 feet and 200 feet of drifting done. The ledge is from 25 to to 30 feet wide between walls and shows ore going $15 to the ton. The company has let a contract for sinking the shaft 100 feet deeper and is making arrangements to erect a large mill this summer.

F. S. Hobbs of Lewiston, who has arrived from Thunder mountain via Dixie, says that the Dewey Co. has ordered 100 more stamps and has located another mill site on Monumental creek, 3 miles from the mine. The ore will be transported to the new mill hy a wire tramway. There are several groups of Pittsburg people now interested in the camp and one of them, he states, is planning the putting in this summer of a 250-stamp mill on Big creek, over 30 miles from the Dewey.

WASHINGTON COUNTY.

J. M. Edwards, manager of the Golden Crown G. M. & D. Co., owning a group of claims on the Idaho side of Snake river, opposite Imnaha, has started a force driving 50 feet more of the tunnel on the Golden Gate.

MICHIGAN.

HOUGHTON COUNTY.

At the Baltic and Champion mines, near Houghton, preparations are being made for increasing production. At the present time two heads of stamps are in operation at the Baltic mill and one old-fashioned head at the Atlantic mill. Later on four heads of stamps will be operated at both the Baltic and Champion mills. The Champion with its four modern shafts, it is claimed, can produce more rock daily than the Calumet & Hecla.

ONTONAGON COUNTY.

A discovery of gold has been made near Matchwood in paying quantities. Hancock parties are interested.

MONTANA.

FERGUS COUNTY.

The North Moccasin M. Co. at Kendall has decided to erect a 150-ton mill this summer.

The ore in the King-Barnes mine at Kendall is quarried from the side of a mountain, which, so far as explored, is a vast body of mineralized rock, nearly all of it carrying gold in sufficient quantities to make it profitable. Nearly all of the ore is taken from an open cut, 800 feet from the company's mill and may be approached along a car track that skirts the hill and finally penetrates it through a tunnel directly below the cut. In the tunnel are chutes from which the cars are loaded. When the ore is blasted it falls into the chutes. It is hauled out in two-ton cars drawn by a single horse, and two men are employed in loading and unloading them. It is possible for the two men to send sufficient ore to the 100-ton mill in six hours to keep it employed twenty-four hours. The breaking down of the ore in the cut is carried on hy drilling holes down from 4 to 9 feet and blasting them simultaneously. Often as much as 100 tons are hroken by one round of shots, and the remainder of the day and perhaps the whole of the following day are required to break up the rock so that it may be passed to the cars. In these hlasting operations nothing is considered waste — all the material finds its way to the mill. The King-Barnes mill has been running since last September, and as over 100 tons of ore a day are put through the cyanide tanks, it may he stated that up to date about 22,000 tons have heen treated. It requires 17 cubic feet of the ore to make a ton. At present forty miners and ten muckers are employed in the mine. Foreman McCormick states that two men in the open can furnish about 90% of the ore sent to the mill. In all of these operations from 150 to 200 pounds of powder a day is used. The ore is treated by the cyanide process and the cost of treatment is so small that $3 ore can he mined at a profit. It requires four days from the time the ore enters the crushers till it is run off into the slum pond. E. W. King is Supt.

FLATHEAD COUNTY.

The Libby placers are heing developed hy a Butte company under F. Whiteside as manager. The company is preparing for extensive work and has acquired nearly all of the ground on Libby creek south of Bear creek. It is reported that some of the company are figuring on building a railroad up the creek from Libby.

The Northern Montana M. Co. has been incorporated at Libby to operate on Fourth of July creek in West Fisher district. It is now putting up a mill.

The Beager placer mine in West Fisher district is reported turned over to Eastern men, who will equip it with a hydraulic plant with the intention of doing considerable work this season.

LEWIS AND CLARKE COUNTY.

The machinery for the 60-stamp mill which the Big Indian G. M. Co. is building on the Winscott mine, near Helena, has been received and the work of building the mill is under way. The mine is a large deposit of free-milling gold, claimed to be 480 feet in width, and, so far as developed, over 800 feet in length.

Mr. Alexander, manager of a St. Louis and Kansas City, Mo., syndicate, organized to operate the Josephine mine above Rimini, has started work on the property, which will be developed on an extensive scale preparatory to the erection of a concentrating mill.

MADISON COUNTY.

W. A. Heimbucher, assistant superintendent of the Montana C. & G. M. Co., has started operations on the Ballarat mine, which is one of a group of copper prospects owned hy the Montana Co. on Stone creek, about 12 miles northeast of Dillon. T. W. Heatherly is Supt.

SILVER BOW COUNTY.

At the Edith May mine, near Butte, the shaft is 65 feet deep and the vein 18

inches wide, carrying ore that averages 20% copper and thirty-two ounces silver. The property is being worked by J. Cummings & Co. under lease. It is owned by G. H. Casey, P. J. Brophy and C. W. Newton of Butte.

NEVADA.

LINCOLN COUNTY.

The Osborne property, near Pioche, now owned by H. Helland, of Pioche, is producing ore that yields $14 in gold to the ton, 40 ounces of silver and 45% lead. The vein is 2 feet thick. On the Amador property a bond has been taken by Roberti & Clepodina, who have started work.

NYE COUNTY.

The O'Meara-Lynch Co. has secured a contract from the Tonopah M. Co., at Tonopah, to sink Lease No. 44 shaft 500 feet from the present depth of 175 feet. The shaft is to be 4x6 in the clear, with additional manway. A large hoist engine will be installed, and an electric power plant for air compressors. The new contract, it is stated, will necessitate the employment of 150 men, as the contract calls for the extracting of ore on both sides of the shaft.

On the Halifax group at Tonopah the shaft is down 120 feet and has struck mineralized porphyry. The machinery for the whim is being put in place and the shaft will be continued down to 250 feet.

At the California shaft of the Ohio-Tonopah Co. the timbering is completed and the rig prepared for deep sinking. A. Z. Dodd is foreman under S. H. Knapp.

The Tonopah Fraction Co., which has no surface indications of a ledge on its claim at Tonopah, after sinking through 240 feet of wash lava and through the alluvium beneath, is reported to have struck in the solid formation a rich lead, resembling the Con. California and Virginia ore of the Comstock. Rhyolite lies on each side of the lead. The rock shows crystallized horn silver in large quantities and is bonanza ore.

WASHOE COUNTY.

The Ora mill at Olinghouse is being overhauled preparatory to crushing 200 tons of high-grade ore from the W. C. Williams Cabin claim.

The Denver, Colo., people who have a bond on the Slip mine have in view the extension of the main tunnel 500 feet. The Slip mill has been overhauled and put in shape to make a run on ore from the Jumper mine. The Denver people have this claim bonded.

San Francisco people have been examining properties at Olinghouse and have five claims under bond.

A discovery has been made by J. L. Wedekind near Reno and close to the V. & T. railroad track of a large deposit of a soluble mineral, believed to be alum, carrying 38% sulphuric acid. On the deposit is a spring that flows water highly impregnated with alum.

J. Burke, of Steamboat, is operating in the Great Eastern quicksilver mine, a mile and a half north of Steamboat, and is taking out considerable cinnabar ore, valuable not only for mercury, but for the gold and silver that are also carried.

NEW MEXICO.

GRANT COUNTY.

Grant county miners have appealed to the Santa Fe Railway Co. to give them lower rates on ore to the smelter at Cerrillos, in Santa Fe county. Since the smelter trust has closed the smelter at Silver City, the miners of southern and southwestern New Mexico find it unprofitable to mine their low-grade ores, and in consequence the situation in the mining districts of Grant and adjoining counties is very quiet. Siliceous ores carrying as high as 10% copper cannot be shipped and treated with profit at the trust smelter at El Paso. As a consequence, the tonnage of ore carried on the Santa Fe Railway from Silver City and the Whitewater branch is very small.

LINCOLN COUNTY.

The American G. M. Co. at Nogal has fifty men employed. A shaft is being sunk on the American mine and tunnels are being run on the other properties.

The 700-foot tunnel being run on the Turkey Creek mines by the Iowa & New Mexico M. & M. Co. is now in 300 feet and has cut one body of ore 20 feet thick which assays as high as $18 to the ton in gold. When the tunnel is completed the end will be 1500 feet under the surface. The work on the Schelerville mines belonging to the same company is to be resumed. A new hoist engine, air compressor and machine drills are being placed.

OTERO COUNTY.

J. Stone and J. K. Smith have located a fine body of onyx in Cox canyon, near the railroad.

OREGON.

BAKER COUNTY.

(Special Correspondence).—C. J. Allen, who recently bought the Monumental mine, is having the old works equipped with air pipes and is installing drills for extensive exploration work. It is a silver proposition and has been a good producer.——The Golconda mine has been taken up by J. H. Robbins and associates. The old works are being cleaned out and twenty-five miners employed opening new ground. The property is equipped with a mill.——The Eureka and Excelsior mine is to be reopened hy New York people and a new shaft will be started, going down about 300 feet below the old workings, and a crosscut run to the vein. The property has a complete silver mill.——The new hoist at the Bonanza has been completed and started up. It is the largest in the district and designed for a three-compartment shaft 2500 feet deep. The present workings are 500 feet deep.——The Buckeye mine has some rich ore on the 250-foot level, showing less zinc and better values in gold and copper than that found on the upper levels.——The Columbia mine has been started up after a sixty-day shutdown.

Sumpter, April 21.

The Old Abe G. M. Co. has been incorporated at Sumpter and development work will begin at once on its properties near Minersville. F. P. Schultz of Milwaukee, Wis., is president and R. F. Evans of Sumpter secretary.

The old Monumental mine, near Sumpter, owned by "Monumental" Miller, has been bought by C. J. Allen of Portland. He has commenced operations and proposes to install a sinking plant and will put a shaft down on the ledge for several hundred feet. The mill on the mine was one of the first brought into eastern Oregon.

GRANT COUNTY.

The Kittanning M. Co. of Seattle, operating under bond the Big Four group of claims, near Granite, has let a contract to G. J. Barrett to construct 200 feet more tunnel on the claim.

JACKSON COUNTY.

Mr. Mendenhall, owner of the Roaring Gimlet mine of the Kanes Creek district, near Gold Hill, has made another clean-up at his new property, taking out $3000.

The Bill Nye M. Co. has made a strike on their mine on Galls creek, near Gold Hill. Major Andrus, the Supt., has opened up 2 feet of quartz running from $150 to $200 per ton. The new shaft is now down 50 feet and the whole bottom of it is in ore going better than $100 per ton.

H. S. Sanford, manager of the Shorty-Hope M. Co., has received orders from the directors at New York to proceed with the development of the property at Ashland and has started work with T. W. Hill as foreman. A 750-foot tunnel is to be driven on the ledge, which will give 110 feet of stoping ground and unwater the mine. There is a 10-stamp mill and other equipment on the property.

The Last Chance G. M. Co., of Ashland, has been incorporated, capital $20,000, by O. C. Tiffany, R. P. Neil, H. L. Whited, L. L. Mulit and D. A. Applegate. It is the intention of the company to develop a quartz proposition near Gold Hill.

JOSEPHINE COUNTY.

A 40 H. P. compressor, three boilers and other mining machinery are being installed at the Oregon Bonanza mine In the Williams district, near Grants Pass. Mr. St. John, the manager, has uncovered a considerable body of ore.

A 10-stamp mill and other machinery is being installed on the Eureka mine, near Grants Pass. The Eureka, Cal., people who own it have bonded it to the Victory G. M. Co. of Chicago, Ill. This last-named company has sunk the main shaft to a depth of 400 feet, opening several levels and uncovering a ledge of high-grade ore 8 feet wide.

The placer and quartz gold yield of Josephine county for 1901 by the leading districts is as follows:

Althouse	$ 45,120
Waldo	95,000
Williams	100,070
Galice	112,100
Grants Pass	46,000
Grave Creek and Mount Reuhen	556,000
Total	$954,290

UNION COUNTY.

J. M. Ferguson & Co. of La Grande, who have leased the Camp Carson placer mines, in the upper Grande Ronde river, from Imbans & Foley for a term of years, are putting their excavating and elevating machine in readiness for starting up by May 1. This hydraulic excavator and elevator is expected to handle some 3000 cubic yards of earth per day. The machine will have a 14-inch steel pipe, and 600 inches of water through a 4-inch jet under a pressure of 300 feet is to force the gravel up into an elevator flume 30 feet high.

SOUTH DAKOTA.

There are ten stamp mills working in the Black Hills this year, treating ore by amalgamation. Six of these belong to the Homestake, the Star, Highland and Old Eighty, at Lead; the Deadwood-Terra and Caledonia at Terraville, and the De Smet at Central City—900 stamps all told. At the Uncle Sam mine, belonging to the Clover Leaf M. Co., the mill has thirty stamps; at the Holy Terror, fifteen stamps of the Keystone mill; near the Holy Terror, the new 40-stamp mill of the Elizabeth M. Co.; at the Clara Belle, near Custer, in Custer county, a 2-stamp mill. All free-milling ore carries a percentage of value in sulphides, and most of the stamp mills employ concentration. In the case of the Homestake the concentrates are shipped to a smelter and the tailings are treated by the cyanide process. At Keystone cyanide has been found impracticable, owing to the arsenic in the ores, and experiments are being made with other processes. The Clover Leaf M. Co. will enlarge its mill to sixty stamps. The Tycoon M. Co. has bought the old custom mill of Ingram & McEachron at Keystone and is replacing the worn out machinery. It has twenty stamps. The Grizzly Bear 10-stamp mill near Hull City has been repaired. The Cuttysark mill, near Mystic, has been leased by Eastern men, who have bought the Basil property of T. Tracy. The 40-stamp mill of the Ajax M. Co., at the Standby mine, is to be started. The Hidden Fortune G. M. Co. will build a 200-stamp mill, with cyanide annex, probably at Deadwood. The North Star Co. will put in a 20-stamp mill, the Cochran M. Co. twenty stamps, the Ohio-Deadwood M. Co. twenty stamps and the Castle Creek M. Co. ten stamps. It is likely that the Grantz G. M. Co. will remodel the St. Elmo 10-stamp mill and add ten stamps.

LAWRENCE COUNTY.

A tract of 313 acres of ground near Ragged Top has been bought by G. A. Dunn, of Mercer, Utah, representing an Eastern company, which has been sold by Zinc Bros., A. Hattenbach, W. L. McLaughlin, H. Hulin and associates, of Deadwood, for $45,000. Work is to be started at once exploring and developing the ore bodies.

The Dakota G. M. Co., operating a 100-ton cyanide mill in lower Deadwood, has cleaned up from an eight days' run 600 ounces of bullion, valued at $9000. The ore is said to have yielded an average of $11 per ton.

The Gustin-Minerva stamp mill in Blacktail gulch is being enlarged by the addition of twenty stamps, making it forty stamps. The mill and mine are owned by the Boston-South Dakota Co., with T. Corkhill as Supt. A cyanide plant in connection with the stamps is contemplated hy the company, to be built some time during the year.

UTAH.

BEAVER COUNTY.

F. Morehouse, manager of the Beaver G. & C. Co., near Milford, states that the company will start sinking a shaft on the Lady Curzon group.

The Bluebird group of claims, near Milford, has been bonded at $2000 by A. L. Fotheringham and E. A. Hodges. There is a 15-foot vein in the mine, showing 3% copper, besides values in gold and silver. The property will be actively developed.

A tellurium discovery has been made in the Hayseed group in the Granite range, near Milford, hy W. D. Williams, S. E. Potts and J. R. Lindsay. The property will be worked this season.

A. B. Lewis of Salt Lake City has made final payment on the O. K. property at Milford for the Majestic C. M. Co., and is arranging for an extensive increase in its development, including the construction of a smelter.

JUAB COUNTY.

The traffic managers of the Tintic railways are considering the reduction of the rate on low grade ores, and it is semi-officially announced that they are ready to reduce the present tariff from $2 50 to $1.50 on ores of a certain grade, providing the smelters will make a sufficient reduction in treatment charges. There is hardly a mine in Tintic but can quadruple its tonnage under such concessions.

KANE COUNTY.

The Copper Cliff M. & M. Co. has been incorporated at Springville, capital $20,000, with W. A. Warthen president and H. L. Cummings secretary and treasurer. The company owns the Cliff, Kruger, Iron Duke and Jim Lew claims in the Pahreah mining district.

SALT LAKE COUNTY.

The Rio Verde M. Co. has been incorporated in Salt Lake City, capital stock $100,000, with W. C. Hall president, J. H. Woodman secretary. The company do placer mining, etc.

It is reported that the Utah Con. Co. earned $700,000 net as a result of 1901 operations, notwithstanding sales of copper at low prices. The company entered the year 1902 with between 2,000,000,000 and 3,000,000,000 pounds of copper on hand. The company has paid two dividends of $1.22 per share during the year, calling for the disbursement of $732,000.

H. E. Thomas, Supt. for M. C. Fox at the Storey mine at Bingham, says the mine is now showing a large tonnage of ore, much of it of shipping value. The mine is employing ten men, and 1000 tons of copper-iron ore is to be marketed as soon as it can be handled; also a smaller quantity of galena.

The Jordan M. & M. Co., capital $5000, has been incorporated at Sandy to operate under lease the Chicago mine at Bingham. R. M. Holt is president and W. D. Kuhre secretary and treasurer.

SUMMIT COUNTY.

The Ontario M. Co.'s report for 1901 states that development work to the extent of over 2300 feet has been accomplished, almost all of it on the 1700-foot level and in the workings immediately heneath. The total receipts for the year were $514,257.51, with expenses reaching $356,952 88, leaving a net profit of $157,-304 63, and a reserve fund in the treasury of $402,828 61. Dividends to the number of 223 had been paid up to December 31, 1901, and the mine, during its entire operation, has produced 34,455 tons of tailings, 629,121 tons of ore, which have contained 37,234,663.34 ounces of silver, which have been sold for $33,155,950.51, and from this dividends have been paid, with dividend No. 224 recently declared, to the amount of $13,797,500.

The Great Western mine at Park City, D. Evans manager, holding 2500 acres of patented ground, has had three crews of men doing preliminary work through the winter, and a large force will now he employed.

The Lake Flat M. Co. of Park City has been incorporated, capital $37,500, with H. Shields president and J. P. Burns secretary. The company owns the Lake Flat claim at Park City.

TOOELE COUNTY.

At the Stockton G. M. & M. Co.'s property at Stockton, J. J. Trenam manager, the double-compartment shaft has been sunk from the 300 to the 400-foot level in thirty-three days. A station has just been completed on the 400 level 9x19 feet in extent and 7 feet high, and the sinking of the shaft another 100 feet started. With water level reached the installation of a concentrator will follow for handling the low-grade ores already blocked out.

WASATCH COUNTY.

N. Robinson has returned from Midway, where with others he is interested in a group of ococerite producing claims. Considerable development work has been accomplished. Mineral wax will be shipped at an early date.

WASHINGTON.

CHELAN COUNTY.

Davenport people have incorporated the Holden Extension G. & C. M. Co., capital $1,500,000, to operate two claims on the Holden lead. The trustees are S. Griswold and J. C. Bowen of Davenport and W. J. Bowen, A. H. Murdock and W. P. Robinson of Chelan. W. J. Bowen is secretary and general manager. The Holden ledge is about 200 feet wide. The ore runs from $5 to $30 a ton in copper, gold and silver and has, it is claimed, an average value of from $12 to $18 a ton.

FERRY COUNTY.

On the Silver Dollar mine at Republic, W. M. Crummer, manager, a two-compartment shaft has been started about 100 feet east of the old shaft. It is to be continued to a depth of 200 feet before drifting from it. A windlass is to be used until steam hoisting machinery can be brought by the railroads.

FOREIGN.

BRITISH COLUMBIA.

Arrangements are being made to erect a 50-ton capacity mill on the property of the Canadian King Con. G. M. Co.'s mine near Erie. J. M. Allen of Colorado Springs, Colo., is manager.

At the Arlington mine at Erie sixteen horses are constantly employed hauling the ore to the railway. In addition to this the company is operating its mill and paying a quarterly dividend of $10,000, the initial one having been distributed last month.

The Bayonne mine, reached from Ymir, is heing developed hy Davenport & Gilliam of Spokane, Wash., and the vein, which is of free milling ore, is clalmed to be fully 30 feet wide. It is very difficult of access, heing in the heart of a new section near Kootenay lake.

In the Black Hawk claim at Ymir, owned by N. Iverson, a crosscut tunnel is heing run ahout 80 feet to tap the vein. On the surface the vein shows about a foot of galena ore.

The Le Roi company has shipped four

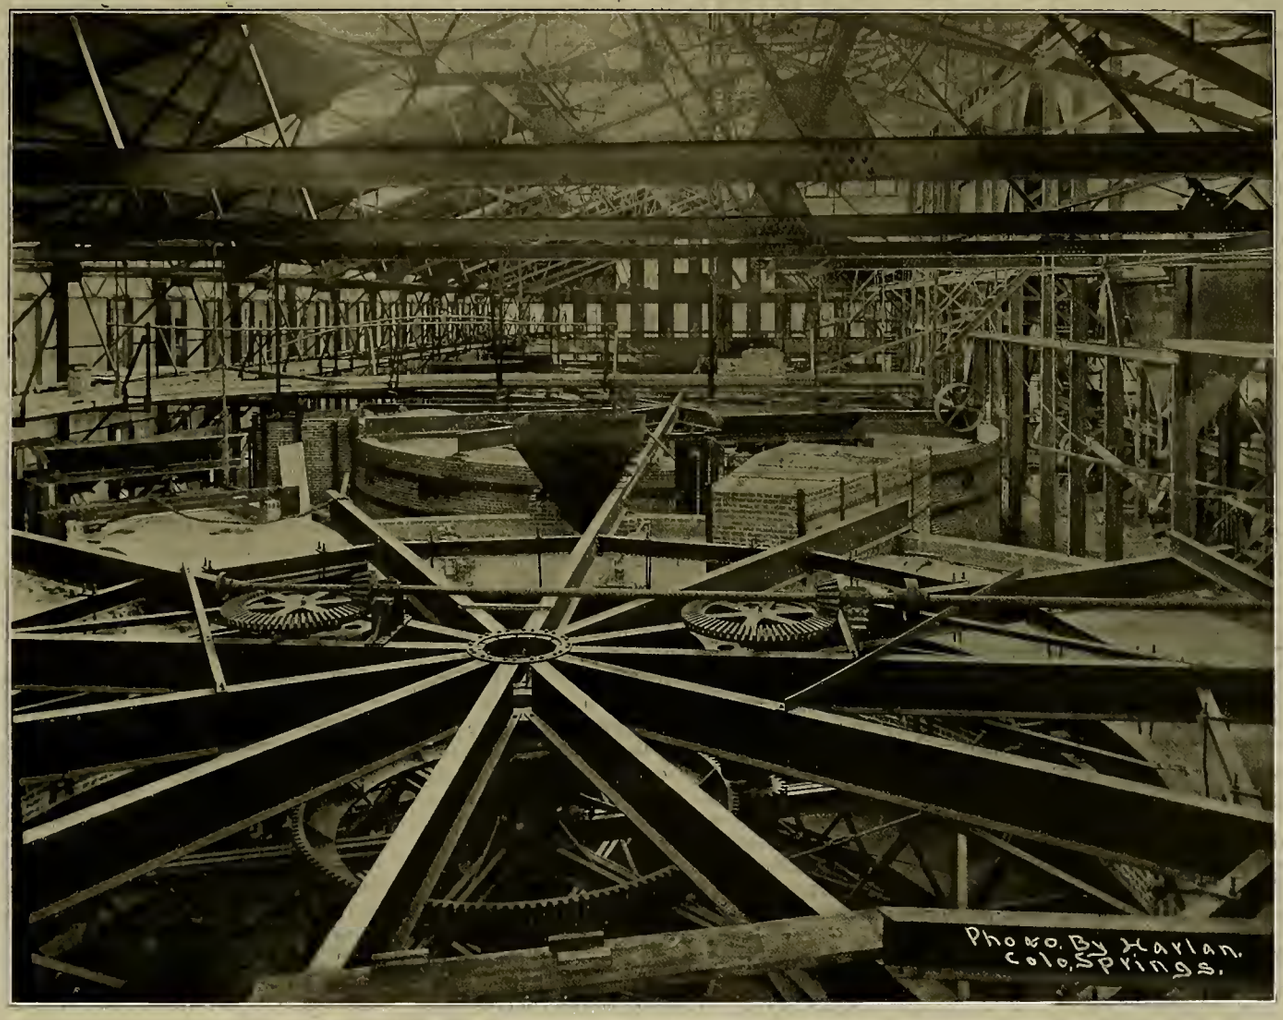
Placer Gold Under Tundra at Nome, Alaska.

It is reported that borings made with a prospecting drill in the tundra near Nome, Alaska, have proven the presence of rich placer gravels in extensive minable deposits. The reports do not give much detail, but the finding of gold in the tundra confirms the opinion advanced by this journal when the reports of the working of rich beach deposits at Nome were first announced. It seems strange that with the general knowledge of the mechanical laws of the distribution of placer gold that is available, that it should have required the time from the summer of 1899 to the winter of 1901–02 to prove the existence of payable gold deposits in the half dozen miles of tundra lying directly between beach gold deposits at Nome where the miners had no bedrock, and the Anvil creek deposits where the miners were working on bedrock. Both of these points were exceedingly productive and their physical relation so suggestive, that the inference that there was equally rich gold-bearing ground between could not be avoided by any miner who gave the matter even a moment's hard thinking as he plodded laboriously from Nome over the tundra to the Anvil creek diggings. The explanation probably is that the moment's hard thinking was not given to the matter. If it had been, the large amount of machinery that was dumped by the thousands of tons on the Nome beach in the summer of 1900 to be abandoned there, would have been put to service in the tundra. Much of it was adapted to the kind of mining necessary in the tundra and entirely unsuited for any other kind of mining, and practically all of the machinery was adaptable to the work that it could have been put to. Another interesting and valuable discovery reported, that it seems surprising should have taken three years to discover, is the peat surface to the tundra. Nome has imported fuel at exceedingly high cost when it was all but built on a fuel bed.

It is to be anticipated, now that the Nome tundra is proven to cover placer gold deposits, that the tundra between other beach deposits and gold-bearing creeks in Alaska will be investigated. It will be well to note that not all the tundra at Nome is proven to overlie gold placers, nor is it even a possibility. The most that can be hoped for is that the tundra-covered deposits will be the down-stream extension of the Anvil creek placers, and will have about the same width of pay gravel and proximately to the linear foot of channel as much gold. The same relation will be found to exist at other points on the Alaska coast. The tundra-covered deposits will be found the down-stream continuation of the creek placers, and will be about as rich. It should be possible to locate these tundra-covered deposits at comparatively little cost, and the working of them should not prove expensive, particularly if similar peat deposits are found associated with them. They promise a not inconsiderable addition to the Alaska gold production and offer an opportunity for the installation of machinery on a considerable scale. The proposed extension of the placer mining under the sea by drifting sounds big, but is of doubtful practicability.

Interior of Portland Mill, Near Colorado Springs, Colo.

The illustration on this page of the roaster plant and on page 243 of the crusher plant are views taken during construction of parts of the interior equipment of the Portland mill, near Colorado Springs, Colo., which was illustrated in the last number of this journal. The striking characteristic feature is the metal, steel-frame construction of everything shown, and the complete absence of wood. Another feature is the number and area of window openings in the roaster room.



The Roaster—Portland Mill, Near Colorado Springs, Colo.

The use of steel to the exclusion of wood for framing, and the increase in the use of glass, are typical of mill construction now as compared with ten years ago. How extreme the change is can be appreciated by comparing the illustrations with the plans and specifications that were standard ten years ago.

THE recent development of a rich ore body at Tonopah in drifting from a shaft sunk through a heavy detrital formation, the earlier discoveries of high-grade ores at Ray, 10 miles north of Tonopah, and the latest one 30 miles west of Tonopah, are conclusive evidence that Nevada is still in the early days of its mining. There are plenty of opportunities yet for prospectors and the capital that buys and works mines, and there are still possibilities of new Comstocks being developed. It is a curious and suggestive fact that the rich Tonopah ores and the bonanza Comstock ores are very much alike.

Low Grade Mines.

Successfully exploited low-grade mines are kept prominently before possible investors in new mining enterprises as examples of great mining profits from small margins over low working costs. There is something fascinating in the idea of putting a dollar into one end of a mine and having the machinery of it deliver to you a dollar and a quarter or a dollar and a half at the other end. It looks to the outsider as being simply finding money, and that anyhody could do it with a low-grade mine. The mischief in it, the indeterminate element, is, what is a low-grade mine, and how do you know it when you see it? The experience of many years of mining has taught miners that it is not easy to know the real low-grade mine off-hand, and that many failures of apparently sure winning enterprises have resulted from mistakes of estimation. The outside investor rarely knows this, and is frequently misled to his pecuniary loss, by depending on the false idea that a low-grade metal deposit must be a profitable low-grade mine, because some other well known low-grade deposit of similar metallic content is a profit-earning mine.

The metallic content of an ore body is only one of the elements that combined make a mine. With gold the metal, the elements are simpler and more certainly estimatahle in advance, than where silver, copper or lead, or a combination of them, make up the value. The facilities for low cost of mining and low costs of reduction, and the ore conditions which admit of the last, do not exist in combination with every low-grade deposit. It rarely happens that exactly the same cost outlays can he accomplished for identical work in two different low-grade mines. Even the seemingly simple matter of stamping ore cannot be assumed to be accomplished at precisely the same cost in two adjacent mines.

Every so-called low-grade mine requires an independent analysis of the working conditions and costs. Nothing should he assumed as proven by comparison with the data of some other mine. The chances of actual large-scale testing must be taken before large-scale exploitation is projected. This looks like waste, but it is not. Finally, exploitation should not he hased on narrow margins of possihle profit, even with a hydraulic placer or free-milling quarry of gold-hearing ore. There are always contingencies that increase estimates. Ultimately they may he eliminated, as they have been in many low-grade mines operating now, hut they should be allowed for in the beginning of a mine exploitation.

Where the ore deposit is a low-grade copper or lead proposition, the profit margin must be much larger than with low-grade gold mining. The variation in the market price of the output is an element that can wipe out profit margins faster than economies of mine operation can add to them. It is not safe to estimate on the permanence of any market price. It should always be estimated on as if it was certain to go down. Very small losses in market price of copper or lead will wipe out the profit margin on low-grade ores of these metals. With gold ores estimates can be made with the ton of ore as the unit basis. With copper and lead the unit hasis should be, to avoid misleading deductions, the pound of metal output. A margin of profit on the ton of mine ore output that would seem attractive will demonstrate itself to be unsafe when the margin is estimated in the difference hetween the pound cost of production and the pound selling price. Silver is to a large extent a by-product of mining the other metals. Associated with gold, its amount in low-grade propositions is so small that fluctuations of the market price are not likely to affect the profit margin. With low-grade copper and lead mines, it is often the leading value and materially affects the value of such propositions.

Consolidation of Cripple Creek, Colo., Mining Companies.

Following close on the organization of the Colorado Mine Owners' Association, the announcement is made of a projected consolidation of a number of the larger mining companies of Cripple Creek district, the declared object being to accomplish for the owners of the mines combining what the Colorado Mine Owners' Association is projected to accomplish for the mine owners of the entire State. Since the first announcement the usual number of qualified denials by parties interested have been made, nevertheless the fact that such a combination of interests is projected, and under tentative acceptance, subject to the arrangement of details, may be accepted.

Cripple Creek mine owners have found these common conditions affecting the income from their properties. The depth of the workings has been increasing, adding considerably to the expense of hoisting ore, and adding still more to the cost of pumping water, with the special condition that any mine opened much deeper than its neighbors would have to do some or all of their pumping at its own cost. The custom smelters having been combined, and the custom mills having been combined, the market costs of reducing the ores have heen increased, because the two monopolies working together had the power to increase the costs and their profits without losing the business through competition. The railroads having a monopoly of transportation from mine to mill increased the market cost of transportation, until a local railroad was built by some of the mine owners as an independent company. This brought ore transportation charges down, but the old railroad interest combining with the smelters and mill combinations is now seeking to destroy the competition by making transportation unprofitable to the independent railroad. The labor cost of the ore mined has been increased some by the increase in the wages rate, hut this increase is no more than naturally follows the increase in the cost of living. It is frequently stated that the gold content of the ore is decreasing with the increasing depth from which it is mined, but this cannot be considered as established. The fact is that the lowering of average grade is made by the increase in the quantity of low-grade ore mined. A close analysis of ore output will disclose that for equivalent areas of vein opening the tonnage of high-grade ore is as large now as when the mines were first opened.

The net resultant of these common conditions is that the average profit margin for the mine owner is a rapidly decreasing quantity. Too many are sharing in the division of the output, and those taking none of the risks of the business are getting more and more of the income from it. At the same time there is not the slightest competition in production to affect the sale price of it. The mine owners are literally coining money from the mines, but are getting less and less of what they coin.

The consolidation of mines project seems to this journal admirably contrived to make the best of these increasingly adverse conditions. Consolidated, a common scheme of tunnel opening can be planned and built, so that gravity drainage and transportation can he provided at the minimum of an equitably distrihuted flat cost to the several mines consolidated. The consolidation including the new Portland mill, its capacity doubled as planned, or trebled if needed, the ore reduction charges will be brought down to flat cost. Including the independent line of railroad, the ore transportation charge will be made cost or less than cost. The ton labor cost of ore production will be decreased hy doing less dead work. An additional economy will be effected by huying less plant in proportion to ore production, hy buying plant and all supplies cheaper, hy the less costly and superior accounting system that can he used, by owning and operating common sampling and concentrating works and assay plants.

The net result will be to increase the profit margin on ore mined to the maximum possible, and to increase the quantity that can he profitably mined, for the minimum grade that will pay then will be less than the minimum that will pay now by the sum of the profits now earned by sampling works, railroads, custom smelting works and custom mills. The common conditions that affect the income to the owners from these Cripple Creek mines will be made such that the income will he the largest possihle instead of heing as now the opposite of this.

It is not assumed in the preceding that the consolidation is going to the extent of suhstituting one ownership in the mines for the many that exist now. It is considered that each separate mine ownership will continue to win ore from its own ground and to have the profit of it, but the consolidation equally with all, in the conditions common to all, will make the ton cost charges the minimum flat costs, and the ton profits the maximum without division or deduction. There being no competition in selling production, every mine in the combination can produce ore without other restriction than the business one imposed by the total of the flat costs.

The mine owners of Cripple Creek are fortunate in being able to make so effective and independent a combination. Its success is assured, and it will he an example of trust fighting that cannot fail to he instructive. The essence of it is that the mine owners will be doing for themselves what the existing outside combinations are organized to do and will be doing it better and cheaper.

CONGRESSMAN WOODS' bill for the creating of a Department of Mines and Mining, with a Secretary of Mines, has gone the way of its predecessors since Congressman Cole, representing the same California district, introduced the first of them in 1865. The way that it has gone is to the graveyard of hills that go to Congress without going through it. The excuse given for the failure to move forward even a peg the measure which has had appearances in thirty-seven sessions of Congress, is that the hill to create the Secretary of Commerce blocked it. The latter is a young thing, just out for its first appearance with this Congress, and the hustling Congressmen who particularly want the commerce department have pushed it to the front and have, it is stated, the votes of the mining State Congressmen this session for the promise of their votes for the mining department next session. This will give the two or three conventions that meet this summer an opportunity to resolve again that there must he estahlished a Department of Mines and Mining.

THE Canadian Council has finally aholished the royalty on the placer gold production of Yukon Territory, including the Klondike, substituting for it an export duty of 2½%. The aggregate reduction is not as large as the difference hetween the 5% royalty and the 2½% export tax would suggest. The portion of the gold exempt from the royalty is suhject to the export duty, so that the Canadian Government will now receive very little, if anything at all, less than heretofore while the royalty was collected. The 2½% will, however, be collected at a less expense and will be less felt as a burden by the mine operators than the royalty. It is intimated that a government assay office might be established at Dawson. If this be done, the entire question of taxation of the Klondike gold production can be considered as finally settled and removed from controversy between the mine operators and the Government.

Concentrates.

It is stated that coal can be mined in the Crow's Nest coal fields in British Columbia at $1.25 a ton, and made into coke, the latter will cost less than $3 a ton.

FERRO-TUNGSTEN consists of about 60% iron with 40% tungsten. The principal minerals furnishing the tungsten are scheelite, wolframite and huebnerite.

A MINOR can legally locate a mining claim, but to transfer a valid title it is necessary for the court having jurisdiction where the claim is located to appoint a guardian to act for the minor.

QUARTZ has been volatilized in a furnace consuming retort carbon with a heated blast. The highest temperature commercially reached in other than electrical furnaces is at or about 2000° C. or 3600° F.

THE gold output of Siberian mines is not increasing. The new mines opened barely make up the production lost by the exhaustion of other mines. The gold placers near the Pacific coast are not being worked at all.

THE season for washing is so short in Nome district, Alaska, that stream tin diggings will have to be extra rich in mineral to make their working profitable in competition with the stream tin deposits of the Malay peninsula in Asia.

THERE is practically no difference in the fuel value of different kinds of wood comparing the heat units of equal weights. In measuring the heat value of wood by the cord the denser woods produce the greater number of heat units.

THE price of nickel from 1895 to 1898 ranged from 33 to 36 cents a pound. In 1901 the price was from 50 to 60 cents a pound. The production has largely increased in response to the higher price and an increased demand for consumption.

A GAS POWER PLANT using wood for fuel shows the same ratio of saving as with coal, from 2 to 2.25 pounds of wood being equal to 1 pound of coal in making gas. The wood is used in 2 or 3-foot lengths and of ordinary cordwood diameters.

TWO tangential water wheels to develop 3700 H. P. each under 1600 feet head of water are being made for installation in an electric power station in California. These are the largest wheels of this kind yet undertaken measured in power output.

THE pit of a gold ore quarry can be cleaned of the waste rock caved in from the walls by hydraulicking. Washing through sluice boxes set in the cut or tunnel, some gold is recovered from the ore that is unavoidably washed away with the waste.

WITH plants of 250 H. P. or more, under ordinary working conditions, 1 brake H. P. per hour is produced with from 1.25 to 1.5 pounds of bituminous or anthracite coal, or with 3 pounds of wood. The consumption of water need not exceed 2 pounds per brake H. P. hour.

THE common practice now is to use only one amalgamating plate inside of a stamp mortar and to set it in front of the stamps, beneath the screen frame. The back plate has been largely abandoned through the general use of the narrower mortars, which give increased crushing capacity.

BORAX is mined in California principally from bedded deposits resembling veins. The mineral produced is colemanite. This is treated with sodium carbonate to produce borax. Borax was some years since obtained directly by evaporation from marsh deposits in Death valley, Cal. These are not worked at present.

ON typical free-milling gold ores of grade from $4 to $7 the saving on the plates and in concentrates will be from 80% to 94%. The percentage of saving is checked by assay of the final tailings. The mine run assay is not based on as uniform sampling as the tailings assay and can not as safely be used to estimate percentages from.

A STAMP MILL built on a mill site claim to treat the ore from a group of quartz claims is an improvement that counts as assessment work on the claims. It is not required that it should be built on a quartz claim location in order to be assessment work for that claim, so long as it was built for the working of ores from the claim.

THERE is a difference of opinion as to the comparative merit of a down cast and up cast air draft in a mine shaft. In works not far distant from the surface the up cast current, the blower delivering air at the working face, is satisfactory. For deep and extended workings it is found more satisfactory to draw the fouled air out of the mine by an exhaust.

IN measuring survey lines with a steel tape, where accuracy is important, inexperienced assistants should use a spring balance to keep the tape under a uniform tension. Experienced assistants having once learned the feel of the proper tension can do without the spring balance. A difference of tension of ten pounds will make a difference of 1 inch in 100 feet.

WHERE the percentage of concentrates saved is high, a tailing loss shown directly by assay must be corrected so as to refer to the original ore when loss percentages are estimated. Thus if 30% of concentrates are saved and an assay of the final tails is $1 per ton, the loss per ton of the original ore is only 70% of this, or 70 cents a ton. The percentage of efficiency of the work based on 70 cents a ton lose is obviously higher than where the loss is estimated as $1 a ton.

THE actual power consumed in a milling and concentrating plant should not be far out from the preliminary theoretical estimation of it. In a smelting plant, however, the theoretical estimation from averages cannot be depended on so closely. There are wide variations of load which make it desirable to have an ample margin of power available over theoretical average requirements.

THE steam from a good boiler plant represents about 70% of the heat developed by the combustion of the coal, and a good steam engine delivers about 14% of the heat of the steam as power. The total net efficiency is thus about 10%. The gas from a power gas plant contains over 80% of the heat in the coal, and a gas engine delivers 25% of this as power, making the total efficiency 20%.

THE linear expansion or contraction of a 100-foot steel tape for 1° F. of temperature is .007 inch. Where the difference of temperature between a mine under ground, and the surface is small, less than 20° F., the measurements are sufficiently accurate for connecting surveys without temperature correction. Where the difference of temperature is considerable the correction should be made.

PORTLAND CEMENT is an artificially prepared substance which has the property of hardening in the air or water when mixed with the suitable proportion of water and of remaining hard when immersed in water. In its manufacture a mechanical mixture of finely pulverized limestone or marl and clay or ground shale is calcined, or burned, and the resulting clinker is ground to a fine powder.

THE United States Geological Survey undertakes to do in economic geology work for the mining industry as a whole, and not what the individual engineer or mine owner can do himself. It does not undertake, in surveys and geological examinations, what can just as well be done by the individual engineer or owner, and is so conducted as not to interfere, favorably or unfavorably, with the private mining business of individuals or corporations.

BUILDINGS are being made successfully of concrete from foundation to roof. The concrete is poured into forms, the materials being mixed with more liquid than in massive foundation work. Walls are given the same thickness as if brick was the structural material. Where special strength is required in walls, a steel framing is imbedded in the concrete. Floors and roofs have to be poured in a close webbing of binding rods of twisted steel or iron.

"CONCENTRATES" does not know of any two low-grade mines in California that produced in 1901 more gold than was produced in the entire State of Colorado. There are no such mines, however, neither high grade nor low grade. The declaration that owners could and do conceal the knowledge of such a yield from any one but themselves is an absurdity. It would be physically impossible to conceal the physical evidences of the yield or of the operations which only could produce it.

THAT the quartz boulders in a placer do not show gold does not necessarily prove that the gold came from some other rock or was "grown" chemically in the placer. As a general rule the quartz in a lode that contains gold or any other mineral is less resistant to grinding and disintegrating in the process of erosion than the quartz which is barren. The latter will remain in the placers as cobbles and boulders after the gold-bearing quartz is ground to sand and the gold liberated from its matrix.

A NEW form of coffer dam used in making excavations for construction in water is made of interlocking steel I beams, channels and bolts. Two channels are bolted together face to face, the bolts being just near enough the flange to let the flange of an I beam interlock with the flanges of the two channels. The steel sheeting making the coffer dam is extended by driving first an I beam, then two channels, and then an I beam, until the site is enclosed. A pile driver is used and the dam is made water-tight by tamping with clay the space between the two channels and the I beam flanges. After the work is completed the members are pulled out.

THE rusting of iron consists in oxidation of the metal to the condition of hydrated oxide. It does not take place at ordinary temperatures, in dry air, or in moist air free from carbonic acid. The combined action of moisture and carbonic acid is necessary. Ferrous carbonate is first formed; this is at once oxidized to ferric oxide, and the liberated carbon dioxide acts on a fresh portion of metal. Once started, the corrosion proceeds rapidly, perhaps on account of galvanic action between the oxide and the metal. Water holding carbonic action in solution, even if free from oxygen, acts as an acid, and rapidly attacks iron. In lime water or soda solution the metal remains bright.

MICA is high priced not because it is a rare mineral, like gold, silver, uranium, etc., but because of the hazards and uncertainties of mining it, and the extraordinary proportion of waste between the rough block and the finished product. Even after all this waste, the somewhat irregular sheet of good material must be further diminished in size by cutting or trimming. Electric mica is now generally "thumb-trimmed," but nearly all mica mined in the United States for glazing purposes is still cut into rectangular shape before leaving the mine; and thus nearly one-half of the good portion goes to the scrap heap. Finally, if the square plates of cut mica are again cut up into other shapes, another large fraction of the material is wasted at the point of use.

PORTLAND CEMENT is manufactured in rotary kilns by what are known respectively as the "wet" and the "dry" processes. In the wet process the finely ground limestone and clay are mixed with about 60% of water, and this "slurry" is turned into the higher end of the cylinder in a small stream. In the dry process the "slurry" is only sufficiently moistened to prevent it from being blown away as dust. As the "slurry" travels down the cylinder, it is raised to a white heat, and the resulting clinker runs from the rotary in a continuous stream of white-hot pellets, which, after cooling, are ground to a fine powder in grinding machines, producing such fineness that from 90% to 98% of the cement should pass through a sieve having 100 meshes to the inch.

IN addition to the limestone, shale and gypsum used in the making of Portland cement, the fuel generally used in upright kilns is crushed coke, and in the rotating kilns a jet of gas, of petroleum or of finely pulverized coal is forced in by means of an air blast. The rotating type of kiln now almost universally used in America consists of a steel cylinder 60 feet long and 6 or 7 feet in diameter, lined with refractory material. These cylinders are rotated rapidly in a nearly horizontal position. The fuel used, if bituminous coal, is first dried and ground to a fine dust. This dust is driven into the lower end of the kiln by means of an air blast, and, on ignition, produces a jet of flame some 15 feet long. Crude petroleum and pulverized peat have been used, but coal dust is regarded as the best fuel.

DECISIONS of the Supreme Court of the United States have established the doctrine that where an application for patent has been made and is pending for a townsite the land is at the same time open to exploration, location and purchase under the mineral act the same as any other portion of the public land even though it is the actual occupancy of persons for townsite purposes. But if a patent to the townsite has been issued, or final entry has been made, only such lands are excluded from the operation of such patent as were known to contain minerals of sufficient value to warrant exploitation and working at that time, and lands then located and possessed as mineral lands. Where a mining claim is actually located prior to the entry of the townsite for patent, the rights of the mineral claimant are protected.

THERE are two types of electric furnace, the arc and the resistant furnace. Both are used in industry. The simplest effective form of arc furnace consists of two blocks of chalk carefully dried and carved out so as to form a cavity in which a carbon crucible can be placed. Massive carbon electrodes pass into this cavity, and the arc formed between them plays over the hearth, heating the material to be treated in the manner of a common reverberatory furnace. A typical resistance furnace consists of a slender carbon rod, supported between the ends of two stout carbon rods. The small rod bridges a cavity in the furnace, which can be filled with the material to be treated. On passing a sufficient current the rod is raised to a high temperature, and the charge is heated from its center. This makes its action comparable to the blast smelting furnace.

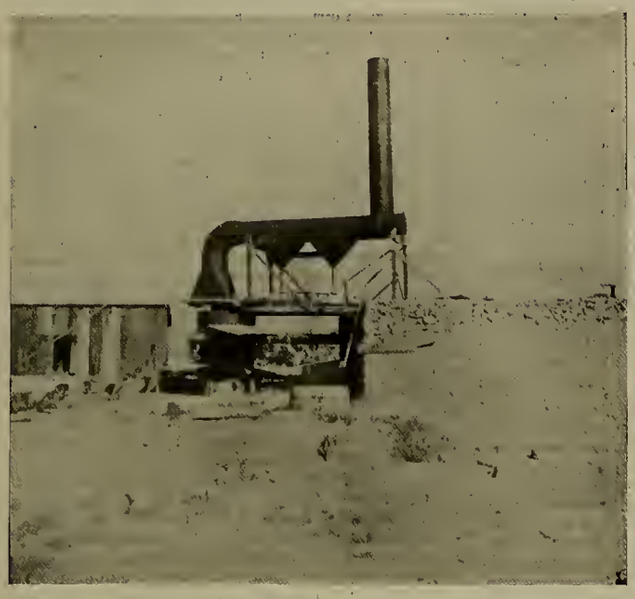
IN the case of Redding vs. Bradford et al., in which Redding was endeavoring to patent the Alabama Con. quartz mine and mill site embracing land in Tuolumne county, Cal., patented in 1875 as the Omega Table Mountain Gravel Mine, Commissioner Binger Hermann says: "It would appear that while the ground in controversy was located as a lode claim prior to the date of placer application—a location certificate having at least been filed and conveyances made thereunder—it has not been shown that a discovery of valuable mineral rock in place was made prior to that date on the land located or that the lode has since been found to exist thereon. The rule is that in a case like this in order to defeat a placer patent it must be shown positively that the known value of the mineral found in lode formation prior to the date of placer application was such as to render the land more valuable as a lode claim and to justify working and developing by the then usual methods of mining."

A MINING COMPANY, incorporated and operated in California in the early '60s, which ceased active operation before 1870, has very likely lost the mines it operated. Until 1866 there was no law under which mining claims could be patented, and while many claims went through the preliminary proceedings for a patent under that law, very few claims were carried to patent. Under the law of May 10, 1872, some of the companies which held claims they were not actively operating patented them to avoid having to do annual assessment work, as provided by that statute. Under the 1866 statute there were no requirements as to assessment work and local customs and laws controlled. These did not always require assessment work to maintain possession, and the title to a mining claim would not become forfeit by failure to work it. Companies which ceased operating in the '60s and which did not patent their claims after the law of 1872 went into effect, have very generally long since lost their claims by failure to do assessment work. In many cases they were relocated several times, and are now largely patented under the later relocations. Later operations have obliterated even the local memories, as well as the physical evidences, of the original ownership. Stock in these old companies is very likely to have only a souvenir value.

Small Smelting Works.

Written for the MINING AND SCIENTIFIC PRESS by HERBERT LANG.

Since the publication of my article, "Smelting Arsenical Ores," in your issue of March 29th, I have received several inquiries relating to the details of the furnace in which the work was done, and particularly as to the cost of plants of this kind. The accompanying illustration is of the Ivanpah copper smelter in southern California, which I built in 1898.



Small Copper Matte Smelter at Ivanpah Mine, San Bernardino County, Cal.

This is a similar plant in many respects to the Slate creek plant, but treats very different ores and produces black copper bars instead of a low-grade matte. Its production in three years has been in the neighborhood of $300,000 worth of bars from 15,000 tons of "carbonate" ores. Both plants are very simple affairs, but the character of the work carried on will sustain a comparison with that done at far more pretentious establishments. The illustration shows the Ivanpah plant during its erection, before the roof was placed over its furnace. The climate of the arid region of California and Arizona renders buildings to a certain degree superfluous. They would not be built at all if it were not for the annoying dust-laden winds which sweep over the country and make existence at times a troublesome thing. A great many, perhaps the majority of the smaller quartz mills, stand out in the open air totally without covering. In the matter of buildings the desert regions of California have somewhat of an advantage over the Sierra regions.

A gasoline engine does the blowing at the Slate Creek works, in common with a practice which has developed slowly in Arizona. It gives fair results, though not, in my opinion, equal to steam for such a continuous performance as blowers are expected to give.

The power required for carrying on the different operations around such small plants is considerable. While experience has shown that 1 H. P. applied to the work of blowing will suffice under ordinary circumstances of pressure, comminution of charge, etc., to smelt five tons of charge, I find it advisable to provide no less than 20 H. P. for the blast of each of these small furnaces, which are 36 and 40 inches in diameter respectively. The demands for power vary so widely that in order to be on the safe side and avoid the not uncommon error of depending too closely upon the theoretical requirements, it is well to install power sufficient for any reasonable emergency. Should the charge be of an infusible sort, or should the fuel be difficult to burn—a peculiarity of the Connellsville coke, for example—a greatly increased blast pressure would be required. In such cases the utility of the high blast with ample blowing power becomes evident. In addition to the blower there is, of course, other necessary machinery, such as elevators, jaw crushers, electric lighting plant, etc., for which provision must be made. It is the common practice to attach each of these to the blower engine, but this is not, in small plants, a wholly advantageous practice, inasmuch as it requires that the one engine shall run at an invariable speed—whereas it is most convenient to vary the speed to conform to the character of the charge which is being put through. I find that a very fair engine and boiler, with piping, etc., constituting a complete though necessarily simple power plant suitable in most important respects for driving a plant of this kind may be had for $1000 or thereabouts. This generally consists of a portable or semi-portable boiler and engine mounted on one base and piped permanently together. It is similar to, though rather larger, than the harvester engines used so much in agricultural regions. While the economy of its actual running is not high, this disadvantage is generally more than offset by the cheapness of first cost, the simplicity of the tout ensemble which makes it easy to understand and correct if anything goes wrong, and consequently by the comparative cheapness of the service given. Engineers in quantity can be had for these simple engines where no one can be had who understands the Corliss or more intricate engines. But the great point of superiority of the portable machines is the fact that they are arranged upon one base, engine and boiler together, which saves a great deal of time and some money in setting up, at a time, perhaps, when neither money nor time are any too abundant.

A country smelter may never require the crushing of any large amount of ore or flux, and therefore may not need a large rock breaker; but a small breaker for sampling purposes is indispensable and should be installed first of all, in order that accurate and satisfactory samples may be obtained for the analyses, upon which the entire work is based. Will it be believed that these preliminary analyses, so indispensable to real knowledge of the situation and consequent to accurate judgment, are frequently neglected, and oftentimes performed in a perfunctory manner, perhaps long after the time when they would have been most useful? A small breaker, sufficient for taking the samples, will not cost more than $250.

The furnace at Slate Creek, Ariz., cost, ready to run, $1700, or about one-fourth of the cost of the whole plant. This included the small sheet-steel dust chambers, like those shown in the cut, which are very efficient and useful, saving probably as much as four-fifths of the dust that blows over. The secret of saving dust is to allow the fumes to cool as they pass through, whereby the gases are contracted in volume and diminished in speed, giving the solid particles an increased chance to fall, and also causing the volatilized substances to condense and attach themselves to the sides of the passage. Brick chambers, which do not radiate the heat away so fast, are less effective in saving the values, while they are considerably more durable. They require to be placed on the ground, where room often cannot be made for them. For large works I invariably recommend a combination of sheet-iron or steel chambers elevated above the feed floor, with brick ones resting on the ground. For small concerns serving the usual temporary purposes of country smelters the sheet metal ones amply suffice. Recollect that not only is the dust worth saving in itself, but it requires to be caught in order to keep it out of the machinery bearings, to which it is particularly destructive.

The grading of the two plants cost, if my memory serves, about $500 in each case, and the retaining walls perhaps an equal amount more. The latter are a necessary feature when building upon a sidehill, which is an ingrained practice among smelter builders. If we wish to profit by the superior advantages of the level site, which advantages are more apparent in large and complicated works than in the simple ones that we are describing, there will be a saving of the two items mentioned; but this is offset to a considerable degree by the expense of the elevating appliances which have to be installed. Even in the case of the sidehill system there must be some means for getting the foul slags up to the feed floor, but this in the case of the small plant may be merely a horse and cart working upon a graded rise. Wheelbarrows and even hand lifts are sometimes made use of for this purpose, but are out of the question when economy is strictly aimed at.

The water system around such a works is of great importance and should be given a good deal of attention. There will commonly be required a pump, a considerable amount of piping and a tank, all of which should be well set up and arranged for continuous use. The cost of the whole system in one case cited reached considerably over $1000, owing to the necessity of digging a number of wells. Nor was it much less in the other, as a lift of over 200 feet had to be arranged for, requiring a small electric transmission, with dynamo, motor and a substantial power pump. It often happens, though, that the necessary water supply can be obtained at much less cost. Running streams may be at hand to provide a gravity supply, or town or city mains may be drawn upon. In such a case the outlay on this account may reach but a few dollars.

The assay office, which is of vital importance in all smelting enterprises, represents usually an investment of from $500 to $1000 for apparatus, and an indefinite sum for the building. A good enough structure can be put up of lumber at a cost of $200 to answer all purposes, and an outfit costing $500 is good enough for any works if the articles be well chosen. There is no economy in cutting down the appropriation for assay goods, as practical smelting men well know. It is only the tenderfoot company that tries, to its grief, to get along with less than the laws of chemistry allow. In particular must the balances, chemical and assay, be of the best construction; for it is the balance that sounds the keynote of the metallurgical symphony, if I may use so mixed a metaphor.

The wagon, car, and other ore scales around such a works are quite an item in some cases, but of small cost at other times. Thus the Ivanpah works have a twenty-ton wagon scale, which I installed at an expense of $300, this being made necessary by the fact of the company using immense wagons, drawn by a string of twenty mules, who haul two wagons carrying a total of thirty-five tons of ore at a trip. On the other hand, the Slate creek smelter, using their ore as it comes from the mine in small hand pushed cars of about one ton capacity, finds it necessary to use only an ordinary wheelbarrow scale, costing $50. This implement answers also as a charging scale, performing quite as well as the more expensive, cumbrous and complicated many-beamed charging scales so commonly used. Two, or even three wheelbarrow scales, conveniently disposed about the feed floor, furnish a more economical method of weighing in the materials of the charge, inasmuch as the barrows do not have to be conveyed to a common point, and also as all the congestion of traffic at that point is avoided.

A blacksmith shop is an indispensable concomitant of a smelting works of even the smallest capacity, the tools and appliances being in constant need of repair. The smith must be a man of approved skill and ingenuity and will infallibly have need of all these qualities at times.

A complete outfit of the carpenter, blacksmith and machinist tools required around a plant of this kind may cost as much as $300, and more money may in a particularly isolated locality be profitably expended. If to this we add the cost of the necessary slag pots, matte pots, steel bars for working the furnace, and the other necessary small articles we will probably have a total of $500 at least, and it may be good economy to purchase to the extent of $1000 in order to be fully ready for contingencies.

The setting up of a smelting plant demands skill and care, but is not necessarily an expensive matter. If the details have been well studied and the working plans prepared with care the different parts of the plant will fit together satisfactorily and the work of construction goes on smoothly. Everything that can be made in the factory should be made there and the machinery set up before it leaves the shop, for the adjustment of steel and iron work is very troublesome and costly when done at isolated points, far away in the hills. I suppose that an allowance of $500 will cover the cost of erecting such a plant as the Slate creek, which went together exceptionally easy.

I use sometimes the Sturtevant fan blower, sometimes the Baker, Root or Connersville, according to whichever is best for the purpose. There is no great room for choice between them for most purposes, but I consider that the Sturtevant performs best in pyritic smelting, where the charge is commonly coarse and shallow. For fine ores, or where the slags are hard to melt, the rotaries give the best satisfaction. As for pressure, the fans when arranged for high pressures will reach about as high as any blower is expected to go. Doubtless the fan is the cheapest to run, taking less power for a given amount of air blown than the others, and if we add to this its flexibility, by which it is adapted to the driving of any sized furnace without altering speed, and its low first cost, it makes out a pretty good case for the fan. The fan differs from the rotary as two dynamos differ from each other when they are wound differently. One dynamo is wound for constant current with variable intensity; the other is wound for constant intensity and variable current. The fan gives constant pressure (intensity) with variable current; the rotary constant current with variable intensity. Knowing this and knowing the effects you desire to produce in the furnace you take your choice. There has been much discussion about the relative merits of fans and rotaries, and much prejudice, impossible, no doubt, to remove, exists in connection with the matter. For my part I can only say that fans have served me the best so far. A small furnace like those in question requires a No. 6 Sturtevant or a No. 4½ Root, the former costing $230, the latter over twice as much. As economy in first cost is supposed to be a prime object in these small plants I have inserted the former in my list of requisites.

Excepting as to the item of freight, which is omitted from the lack of definiteness, the sum represents very fairly the expense of constructing a good, solid and substantial smelter, suitable for dealing with a great variety of ores either by the matting, metallic copper or lead process. The inquiry does not deal with experimental plants, which may be put up cheaper, nor with permanent and durable constructions, which would be out of place in the interior mining regions. Such a works is capable of smelting from thirty to sixty tons a day of suitable

mixture, depending on the chemical and physical character of the material smelted. The slags which can he made may vary in silica—the ruling constituent—from 25% to 45%, from which the reader may deduce the composition of the mixtures which may he smelted.

Assemhling the different items which enter into the cost of a smelting works of the size and character indicated, we have:

Furnace	$1,700
Steam power plant	1,000
Blower and piping	300
Grading and retaining walls	1,000
Water system (assumed)	1,000
Setting up	500
Rock breaker, foundation, etc	350
Assay office and apparatus	700
Blacksmith outfit and other tools, steel, pots, car, etc	1,000
Charging scale	50
Planking ore dumps	200
Smelter building	400
Total	$8,200

In setting about to huild a smelter the first necessity is to get a true and accurate sample of the average ore of the mine, which cannot he done except with considerable lahor and care. It is of little use to send supposed average specimens of the ore to this, that or the other "expert" for his judgment as to the smeltahility of the whole mass of ore, for these specimens never represent—or at least never in my experience—the average of the whole mine. It doesn't matter how desirous an owner may he to get the thing right, he never gets it right until a large amount of his ore has been handled over and sampled as if for sale. Then, and not till then, has he accumulated the knowledge necessary to enable him to go ahead in a proper manner. First, then, move all the movahle ore and sample it carefully, the work heing done, of course, hy disinterested parties, for the owner is hound—such is human nature—to "salt" himself. Either from carelessness or from the self-salting tendency, or from both combined, the great majority of smelting plants are projected and even started off without these preliminary analyses, which are the life and hackhone of the whole proposition.

Having procured the samples and assays upon which the engineer's preliminary report must he based, they should be suhmitted to some qualified person, who will, hefore replying definitely, propose a numher of questions hearing upon the conditions surrounding the mine, as to its water and fuel supply and other matters. These answered, the engineer is now in a position to make recommendations as to the process to he used, the capacity of the plant to be installed, etc. After these have heen canvassed—and no such matter can he settled without a great deal of cudgeling to and fro—the next step is the preparation of the working plans. Whoever is entrusted with this part of the work should visit the locality and study its peculiarities, when, if he has the experience and originality which befit his office, he will be ahle to make such suggestions and adjustments of the project to the conditions that the future plant may possess extreme advantages and even he a model of its kind. The progressive designer never stops short in the march of improvement, hut finds material to his hand in even the most obscure and out-of-the-way locality. Even the smallest smelter should he the suhject of careful and anxious consideration, and should be planned separately from any other, for the local conditions invariahly make it worth while to introduce changes in apparatus from all preceding plants. A man is a poor designer if he huilds two smelters alike, never progressing from the huilding of one to another. The last word in smelter building is not yet, and never will he, said.

The Ore Crusher, Portland Mill, Near Colorado Springs, Colo.—(See Front Page.)

THE Portland cement industry has had a large and favorahle development in Michigan in the last few years. In May, 1901, ten factories were producing cement, and six others were in process of construction. The capacity of the ten plants is ahout 2,400,000 barrels of cement per annum. The capital stock of the Michigan Portland cement companies then organized is about $25,000,000, and their estimated capacity is, approximately, 8,600,000 harrels of cement per year. The total consumption of Portland cement in the United States during the year 1900 was hetween 10,000,000 and 11,000,000 harrels, and the amount manufactured was 8,500,000 harrels.

THE Russian petroleum output for 1901 from the three Baku oil fields was 80,945,247 barrels of forty-two gallons each. In 1900 the production was 72,018,743 barrels. The production from flowing wells accounted for 12,059,332 barrels in the total for 1901. Deducting loss and oil used for fuel, the net production was 71,583,401 harrels out of the 80,945,247 harrels. The average price for the year 1901 of the crude oil at the well per barrel of forty-two gallons was 32.67 cents; of residuum at Baku, per gallon, 0.91 cent; of refined oil f. o. b. on the Caspian sea, per gallon, 0.82 cent; refined oil in tank cars at Baku, per gallon, 1.1 cent. At the close of 1901 1354 wells were classed as producing and 1003 wells stood idle.

Australian Platinum.

By JOHN PLUMBER.

Although platinum is known to be more or less plentiful in New South Wales, the quantities at present ohtained are limited, the output in 1900 heing only 530 ounces, value £1007; and the total quantity raised since the heginning of 1894, 8295 ounces, value £12,432, the great difficulty heing the scarcity of water in the districts in which the metal is found. When this ohstacle has heen overcome, prospecting operations on an extensive scale will he found possihle. It usually occurs in grains or scales, sometimes in irregular lumps or nuggets, and rarely in crystals. A cuhical crystal of platinum found at Fifield, and now in the Sydney Geological Museum, measures nearly three-sixteenths of an inch.

The New South Wales platinum is ohtained chiefly from the Fifield district, about 322 miles west of Sydney, where it is found associated with gold. Here the principal workings are at Platina, a township situated about 2 miles from that of Fifield, a deep alluvial "lead," containing platinum and gold, extending from near the former place for over a mile in length, and varying from 60 to 150 feet in width. The sinking is from 60 to 70 feet, through loam, with some hands of harren quartz drift. The platinum and gold occur in fairly coarse waterworn grains, and, as a rule, are confined to the cavities in the bedrock, and to the washdirt for a few inches above it. Occasional nuggets of platinum have heen ohtained; the largest hitherto found weighs 27 dwt., and was purchased for the Sydney Geological Museum. There are two other nuggets in the Museum weighing 11 dwt. and 8 dwt. respectively. The washdirt contains from 5 dwt. to 12 dwt. of platinum, and from 1 dwt. to 3 dwt. of gold per ton. The yield from 269 loads, taken from a numher of claims along the "lead," was at the rate of 6 dwt. 21 grs. of platinum, and 1 dwt. 23 grs. of gold per ton. Platinum has also heen found in the Broken Hill district, and in many other places, likewise on the heaches of the northern coast, where it is ohtained from the auriferous sands. Here, the gold, platinum, etc., which are concentrated on the beaches during stormy weather, are hrought down by the action of the waves, from an ancient heach deposit, which occurs at an elevation of ahout 6 feet, and which has received locally the name of "hlack rock." This consists of a layer or bed of black sand-rock, composed chiefly of small zircons, with some grains of ilmenite (titaniferous iron), quartz, garnet and tinstone, also small but variahle proportions of platinum, platinoid metals and gold.

An Adobe Reverberatory Furnace.*

By JOHN GROSS, Sombrerete, Zacatecas, Mexico.

The building of reverheratory furnaces (fortschauflugsofen) where ordinary brick, firebrick and iron are comparatively cheap is quite a different matter from the building of such furnaces in isolated camps, where proper material is only to be obtained at high cost and with long delays. Time is always a large factor in metallurgical operations, and the metallurgist may find himself in a position where it hecomes necessary to erect apparatus and have it running in less time than it would take to obtain material from outside. It is here that he must make use of makeshifts.

In Mexico one of the most important of these is the all-useful adohe. Employed from prehistoric times, it still has its sphere of application in a surprisingly large numher of instances requiring an article that can he quickly and cheaply produced.

It is quite possihle to erect serviceable reverheratory furnaces with no other materials than adohes, stone and wood.

The old Mexican smelting shaft furnace was an example of what can he done with adohe, and the large numher of ruins of this class of furnace scattered through the mining districts of Mexico are silent testimony to the genius of a people who demonstrated their capahility of adapting material at hand to their needs.

The present paper will describe briefly the construction of an adobe reverberatory furnace which is giving good results, can he quickly erected at low cost, and, if properly huilt and handled, will last a long time.

The material being sun-dried, it naturally follows that the construction must be quite heavy. The adobes should he evenly made, with just sufficient straw to hold them together, and not too large in size—9 inches wide, 18 inches long and 4 inches thick is very convenient. The binding material should he of the same clay as the adobes.

The drawings explain themselves. Fig. 1 is a ground plan through the lower hearths, Fig. 2 a longitudinal section, and Fig. 3 a cross-section.

The furnace is douhle-decked, with three hearths on each deck and an auxiliary fireplace for the upper deck. It is designed for wood firing and chloridizing roasting, and is operated entirely hy manual lahor.

The ore is charged through a hole in the roof, worked in charges of 1200 kilos, and finally drawn through the last rahhling door into wheelbarrows, to go to the cooling floor.

Naturally, different ores and conditions would suggest other modes of huilding and manipulation, hut the object of this paper is simply to show this particular furnace as it is.

The hearths are 10x10 feet in size, with 3-foot walls, making the furnace 16 feet wide and some 41 feet long. The arch springs 9 inches above the hearth floor, and has a 12-inch rise.

The foundation is of stone, well built on a solid footing, and carried up to the first set of huckstay rods. These 1-inch iron rods are placed in pipes or channels, to prevent them burning out and to permit them to be easily changed if necessary.

The outside walls of adobe are now huilt up to the top of the lower skew hack, when the floor of the hearth, which consists of a "fire stone" set in clay, is put in. Each hearth is stepped a few inches lower than the preceding one.

The center (of dirt) for the arch is now put in and curved to templates. A 10-foot span of arch should not have less than 12-inch rise. When the center has been satisfactorily placed the skew back is cut and the arch is built of "arch" adohes, placed upright, using as little mud (made from the same clay) for joints as possible, and hammering adobes in place with a hlock of wood.

After the arch has heen well keyed the middle buckstay rods of 1-inch iron are placed in pipes just over it, and the walls are carried up to the top of the skew hack of the upper arch, the upper hearth floor is put in, the center is placed as hefore, and the upper arch is huilt of the same size as the lower one. The upper rods of 1-inch iron, just over the upper arch, need not be put in pipes; however, it is convenient to do so. The top of the furnace is paved with flagstones.

The huckstays of 10x10-inch timbers are now put on, the rods are tightened thoroughly, and the centers are removed by boys getting into the furnace through the firehox after this has heen cleaned out.

A light fire is started and kept going one day in the lower firehox, and then in the auxiliary one, the lower fire being increased. After three days of gradually increased firing, during which time steam and water are likely to appear in a few cracks, and the rods are occasionally tightened, a charge of ore is put on each hearth. The sulphur, soon igniting, will in a day or two, with proper firing, hring the furnace up to a temperature sufficient to hegin operations. Some four or five days more are required, however, hefore the furnace is properly heated, owing to the enormous hody of adohe work that must he hrought up to proper temperature.

The rods must he looked after to see that they are kept tight, or, if they burn out, that they be replaced. The enormous weight of the arches will cause their gradual sinking, if not properly held, hut they sink very slowly and give ahundant notice.

Crosse's Method for Determining Oxygen in Cyanide Solutions.

A Winchester quart is completely filled with the cyanide solution, the exact capacity heing known, and five or six grammes of solid caustic potash are added to decompose the douhle cyanide of zinc and potassium.

$$K_2 Zn CN_4 + 4KOH = Zn K_2 O_2 + 4KCN + 2H_2O.$$

After this, 100 c.c. of the solution are withdrawn for a preliminary test, and are titrated with zinc sulphate solution (200 grammes of $Zn SO_4$ 7ag. per litre), using phenolphtalein as an indicator, the zinc solution being run into the cyanide until the magenta color of the latter is just destroyed. The quantity of the standard zinc solution required for the bulk of the cyanide in the large bottle is calculated from this result, and the correct amount is added, without allowing air to enter with it, the stopper of the hottle heing replaced as soon as possihle.

The mixture of cyanide and zinc sulphate is then thoroughly shaken and set aside for the resulting heavy flocculent precipitate to settle.

The following reactions occur:

$$2KCN + Zn SO_4 = K_2 SO_4 + Zn CN_2.$$

$$Zn K_2 O_2 + Zn SO_4 + 2N_2 O = K_2 SO_4 + 2Zn H_2 O_2.$$

$$2K_4 fe CN_6 + 3 Zn SO_4 = H_2 Zn_3 Fe_2 CN_{12} + 3K^2 SO_4.$$

$$2KOH + Zn SO_4 = K_2 SO_4 + Zn H_2 O_2.$$

The clear liquid is then siphoned off without undue access of air by using a bent glass tuhe passing through one hole of a douhly perforated cork fitted into the bottle; the second hole carries a short glass tuhe (arranged as in a washing hottle) through which water is hlown momentarily to start the action of the siphon. The end of the immersed limh of the siphon is covered with a small hag of lint, which filters off any floating particles of precipitate. Two or three (290 to 300 c.c.) pipettes full of the siphoned solution are drawn off and retained. These pipettes have a glass stopper ahove and a stopcock helow, with a tube 3 or 4 inches long helow the stopcock. A preliminary test of the iodine absorhing power of the solution (due to unprecipitated douhle cyanides) is then made hy adding to a quantity equal to that used in the test, 0.9 c.c. of sulphuric acid (half acid, half water) and a few drops of potassium iodide and starch. Dilute hromine water (1 hromine water, 2 water) is added until a hlue color is ohtained. Another pipette full of the liquid is now taken, 0.9 c.c. of sulphuric acid and the required amount of bromine water (found from the preliminary test) are added, and the pipette is turned over several times. One c.c. of a solution containing 20 grammes potassium iodide and 0.5 grammes of sodium nitrite to 100 c.c. of distilled water is then added, and the pipette inverted a few times and left to stand for fifteen minutes to enahle the reaction to take place.

The stopper is then placed in the wide-mouthed hottle described helow, coal gas is passed for a few minutes until it hurns at the exit tuhe, the cyanide solution is allowed to run in from the pipette, and the free iodine, freed in proportion to the oxygen in the solution, is finally determined by means of standard sodium thiosulphate solution. If this solution contains 7.75 grammes of pure crystals of thiosulphate per litre, then 1 c.c. corresponds to .25 milligram of oxygen.

The equations are:

$$2HT + 2HNO_2 = T_2 + 2H_2 O + 2NO.$$

$$2HT + O = H_2 O + T_2,$$

the nitric oxide acting as a carrier of oxygen.

The wide-mouthed bottle mentioned above is of ahout 500 c.c. capacity, and is closed with a caoutchouc stopper having four perforations. Through one the cyanide solution is run in from the pipette. Two others are for the entrance and exit of coal gas, which is used to drive out all the air. The fourth is for the passage of a glass tuhe drawn out to a point at its lower extremity and connected ahove hy means of a few inches of rubher tuhing with the hurette containing the thiosulphate.

The addition of sulphuric acid, hromine water and the solution of potassium iodide and sodium nitrite are made in the cyanide solution in the large pipette hy means of small hand pipettes, and corresponding quantities of the cyanide solution are displaced when the stopper is replaced. One c.c. of starch solution is added to the wide-mouthed hottle through the stoppered pipette when the titration is nearly finished.

The estimation is interfered with hy the presence of nitrites in these mill solutions and a correction must he applied. To make this correction, pour into a very strong 350 c.c. flask a quantity of solution equal to that used in the experiment (say 293 c.c.), add a few drops of potassium hydronide, and close the flask with a rubher stopper, having one perforation, through which is passed a glass tuhe with a glass stopcock. Boil the solution for a few minutes and close the stopcock. Cool the flask and when

cold pour the liquid into the pipette and add the bromine solution, acid and 1 c.c. of iodide and nitrite solution as before. Then let it stand for ten minutes and in the presence of coal gas, run it into the wide-mouth bottle described already, add 1 c.c. starch and titrate with thiosulphate. The quantity required gives the correction for nitrites and for the reagents, as the same amount of acid and of iodide and nitrite solution is used in each case.

The only other correction is for the oxygen dissolved in the thiosulphate solution, which corresponds to about .03 c.c. of thiosulphate per c.c. added. By this method the amount of oxygen per litre in certain cyanide solutions was found to he:

Solution pumped in leaching vat	6.3 mg.
The same solution running from vat after thirty hrs.	0.6 mg.
The same solution from end of zinc boxes	0.3 mg.

A Ship of the Desert.

Written for the MINING AND SCIENTIFIC PRESS.

The idea of a ship of the desert has heen so long a figure of speech—the weaving of romance and imagination about the dromedary and his navigator, the nomadic Arah of the Sahara—that the real thing depicted in the illustration accompanying this, though a thing of beauty, will bring to the mind a sense of regret at an illusion that must vanish. To one who knows from close association both the real ugly heast of a camel with his unpleasant master, and the graceful machine here pictured, the disillusionizing process leaves no disappointment.

Like many other unhelievable things, both natural and the development of art, this novel structure is a California production. It sails on the Mohave desert. This desert, too, is as unlike the thing created by one's imagination as are most things Californian. It has a river—the Mohave—which is heing harnessed to water wheels to make power and light—which could very appropriately be called "The Light of the Desert"—and, after making power and light, used for irrigation, makes the sands fruitful of oranges and pomegranates. This Mohave desert has a covering of snow in California's pretense for winter; a carpeting of flowers, to the vivid hloom of which distance gives the effect of a field aflame, in spring time. It is noisy at times with the twittering of hirds, and every desert hush hides a mouse or a rahhit. Still, with these desert surprises and antithesis, it has in a long dry summer of mirages, horned toads and rattlesnakes, and summer is not the season for pleasure journeys on the desert.

The Mohave desert has a wealth in mines, lightly touched as yet, and still to he found hy that mining pioneer, the prospector. The new ship of the desert is really a mining apparatus devised to he lahor-saving and more economical than the burro that it is expected to displace for transportation. The new ship of the desert has the wind for motive power, where the burro must he fed and provided with a water supply, always short and never convenient. Two tenderfoot miners, the Hoyt hrothers, of Cleveland, Ohio, brought the idea out with them—douhtless getting it from the ice boats used hack there in the winter navigation of Lake Erie—and huilt it at their new home at Rosamond, Kern county, to carry them back and forth daily to their mine, 9 miles away, a service it performs without the "bucking" that attends on continuous service from the burro.

The illustration shows the manner of construction employed. This one is 14 feet long, with 8 feet heam at the bows, tapering to a sharp run aft. The mast is 15 feet high from the front axle to the truck. The main boom is 10 feet long and the mainsail has a hoist of 10 feet in the throat. Perhaps it should he explained that, though the desert ship holds water, which it carries, it is not the throat of the mainsail which gets dry.

The first of the kind, it is, like all beginning, small and made from the materials at hand. The wheels would run easier with hall bearings; hut, even without this, the speed developed seems all that is desirahle. The winds hlow strong on the desert and lift the hoat along with the speed of a California railroad train. The vessel is a good load carrier, as the numher of passengers shown in the illustration will indicate.

Mine operators in Arizona and New Mexico, as well as in the Mohave desert, will see economic possihilities in this load-carrying feature of the desert ship. It offers a possihle solution of the mine transportation problem to them. Pack transportation by hurros, wagon transportation by horses and railroad facilities are all more costly than that afforded hy the desert ship when the desert winds blow.

Smith-Vaile Electric Triplex Truck Pump.

Triplex Pumps.

Herewith is illustrated a horizontal electric triplex mine pump, size 4x6, to pump to 350 feet, 150 pounds pressure. The plungers are single acting, outside packed and outside guided, and with water cylinders, valve chambers, gears, etc., are mounted on an iron truck, providing a compact and rigid machine. The crossheads have adjustable shoes; the connecting rods have bronze boxes at crankshaft connections, with key adjustment; the gears are machine cut and provided with guards; close and direct connection is made to motor. It is manufactured by the Stilwell-Bierce & Smith-Vaile Co., Dayton, Ohio, who will promptly furnish any detailed information desired.

THE U. S. Geological Survey reports that the production of flint in 1901 amounted to 32,740 short tons, valued at $133,298, which was a slight increase in quantity over 1900, hut a decrease in value. The feldspar production showed a decided increase, the total quantity mined being 34,742 short tons, valued at $121,422, which shows a decrease in value of $52,237. This is partly accounted for by the fact that in 1900 91% of the output was ground by the producer, while in 1901 only 7% was so treated. The production is used principally in the manufacture of pottery and chinaware, most of it being marketed in New Jersey and Pennsylvania.

Stamp Battery Block Foundation in Soft Ground.

Written for the MINING AND SCIENTIFIC PRESS by W. H. WASHBURN.

In carrying out the details of mining operations in their various branches, it sometimes becomes necessary to modify or change the methods generally in use. In this way the desired result is often reached, when a strict adherence to the usual practice might result in at least a partial failure.

We do not mean by this to belittle tried and established methods, but simply to recommend adapting the means to the desired end, where the usual practice would probably fail. As an instance of this a recent case may be quoted, in which the writer had to place a set of mortar blocks for a 25-stamp mill on what is known in Oregon as webfoot.

For the information of those of your readers who may not know what is meant by webfoot, it may be stated that it is a sort of indurated clay, probably of volcanic origin, and is readily reduced to a soft mud when wet by even walking back and forth over it. It will be seen that a wooden mortar block, set upon it in the usual way, would be most likely to soon work loose and settle, perhaps, continually, while the mill was in operation.

It was expected when the pits were begun that a porphyry dike, which from the surface appeared to dip toward them, would be found at a less depth than 20 feet. Had this expectation been realized, we should have put the mortar blocks down in the usual way on the solid foundation it would have afforded; but, after going down 20 feet and driving a steel bar still farther, it was evident that the dip of the dike had become more vertical, and something had to be done to meet the situation.

It was then decided to enlarge the bottom of the pits and lay down a platform of timbers upon which to place the mortar blocks proper.

The pits for each section of ten stamps were 3′ 2″ wide, 13′ 2″ long and 20′ deep, that for the 5-stamp section being correspondingly shorter.

Beginning about 3 feet from the bottom, each pit was undercut at an angle of about 45° to a point level with the bottom and undercut about 1 foot at the ends.

A layer of sand about 2 inches thick was spread over the bottom, and upon the sand a row of timbers 10″x12″x7′ 6″ were laid crosswise one by one and well pounded down on the bed of sand, tamping it well underneath when necessary to make them level and true. They were toe-nailed together with about six 8-inch spikes in each sill as it was laid down, and short stulls were put in from the roof of the undercut down to the ends of the timbers, to prevent the incoming water from floating them up out of place. After making sure their upper surface was level and smooth, both lengthwise and crosswise of the pit, three timbers, each 10″x12″x14′ long, were laid lengthwise upon them and well spiked and bolted down. A thin layer of mortar, made of freshly slacked lime, without sand, was laid between the two rows of sills, with the intention of preserving their adjoining surfaces from decay, as well as to keep the tamping sand from working in between them.

A series of 2-inch plank of different widths, as shown in the accompanying drawing, were then spiked lengthwise alongside the top row of timbers, as a further precaution against the sand getting between the timbers, as well as an additional binding to the whole platform. A temporary covering of boards was then laid over the top and the platform well tamped with sand up to within about 2 inches of the top.

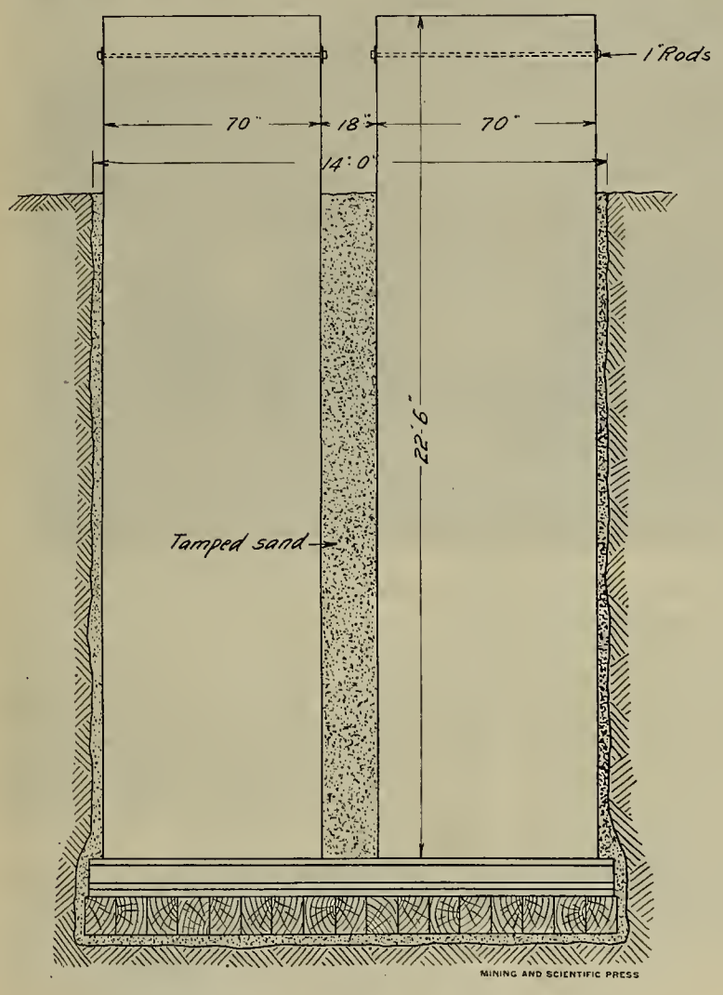
The temporary covering of boards was then removed, the upper surface of the timbers made level and smooth and the platform was ready to receive the mortar blocks. These were built of 2½-inch plank, 24 feet long, one layer being of three planks, each 10 inches wide, and the next of two planks, each 15 inches wide, in alternate layers. The planks were sized by a planer to an even thickness and width and their lower ends squared. A derrick and tackle was rigged over the pit and used to hoist and lower the plank in place. Lime mortar, the same as before, was used under their lower ends. They were well spiked together from the bottom to the top and toe-nailed to the platform with 60d spikes, care being taken not to have the spikes interfere with the space required for the anchor bolts or their pockets, as well as the binding bolts through the upper end of each block, as shown in the drawing.

The surrounding space was then thoroughly tamped with sand, the upper ends of the blocks sawed off and dressed off level, and the whole job was done, so far as the mortar blocks were concerned.

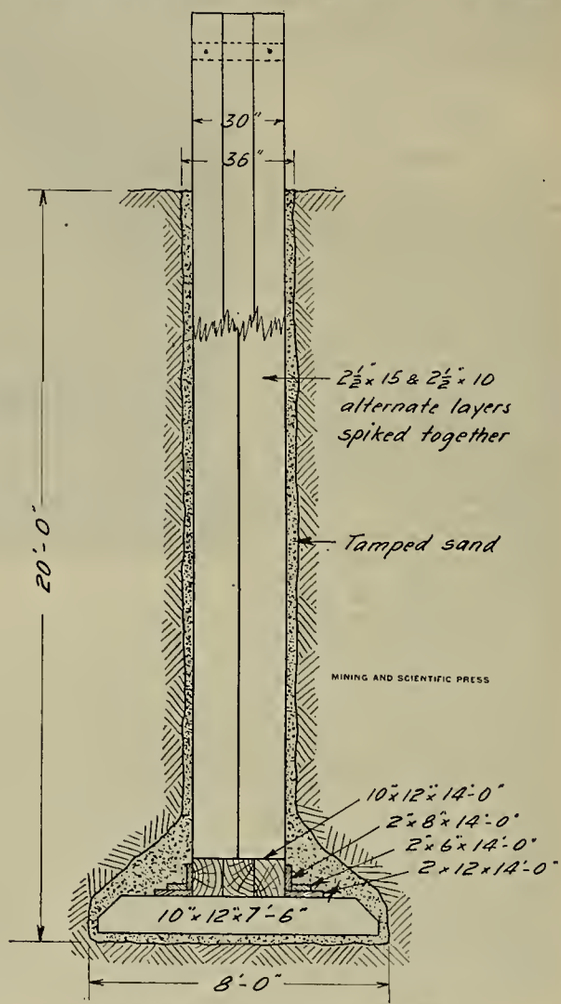
In dressing off the top of the blocks, they were made slightly concave, or about $\frac{1}{16}$-inch lower in the center than at the ends, to prevent any tendency toward rocking on the block in the future—a practice which has proven successful, so far as we have been able to observe, as when a mortar does work loose on the block it generally begins by rocking endwise.

A layer of felt about 1 inch thick was placed between the mortar and the block, which seems indispensable in order to prevent sand or dirt from working in beneath the mortar and causing a rapid wearing away of the wood, a result we have seen to follow when they were set without it.

Before the mill was started up the blocks were marked with reference to the sills around them, and, after the mill had been run three weeks, there was no sign to detect that they had settled as much as $\frac{1}{16}$ of an inch and they were perfectly solid when the mill was running. We venture the opinion that where wooden mortar blocks are used in any case, it would pay to have them not less than 20 feet long, instead of 14 feet or 16 feet, as they are often made, as the inertia of the longer block will absorb the greater part of the blow, instead of transmitting it to the ground upon which it rests.



Webfoot Foundation for Stamp Battery Blocks; Front Elevation.



Webfoot Foundation for Stamp Battery Blocks; End Elevation.

The A. C. Bates Rock Drill.

The A. C. Bates rock drill herewith illustrated is a simple, light and effective hand rock drill. In the operation of it, by turning the handle, the drill is twisted and drawn to its stroke, which is 1½ inch, and driven into the rock by means of a heavy spring. If the drill sticks in the hole, the twist is released and the drill drawn to its stroke. The manufacturers claim it will do rock drilling by hand power easier and quicker than by the old style of single or double hand drillers, and that it can be operated by a boy, laborer or miner, requiring no special skill to use it.

The Bates Rock Drill.

The spring is made adjustable for light or heavy blows. It can be quickly taken down and set up by one man. Drills used in ordinary hand work can be used in the machine. If desired it can be connected

up and run by electrical power. The machine, set up ready for work, weighs 125 pounds. It is claimed that the air cushion, automatically formed by each blow, effectively takes all jar and concussion from the machine frame and operator, and protects the machine from breakage when not properly fed.

One hundred and fifty blows are struck per minute, under average speed by hand power (two blows being made by each revolution of the handle). All parts are interchangeable, so that any part may be replaced from stock when worn out. The leather washer between the spring and adjustable cap at end of machine tends to prevent crystallization of the spring and adds to its life. Otherwise the manufacturers say there is nothing in the working parts but what a miner at his forge may repair.

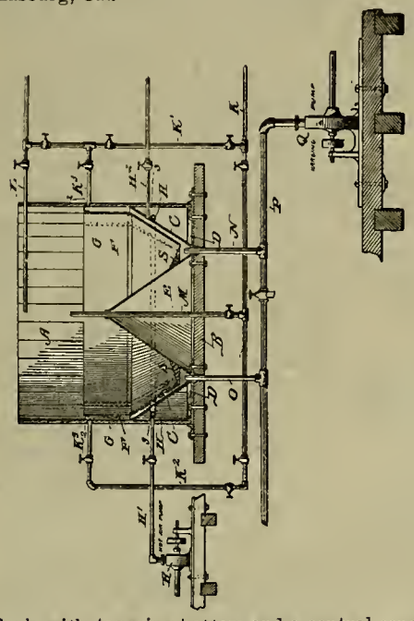
Griffitts & Howlett, 85 Fremont St., San Francisco, Cal., the manufacturers, will give further information regarding this rock drill.

Mining and Metallurgical Patents.

Patents Issued April 22, 1902.

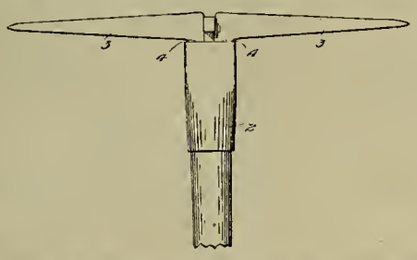
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

CYANIDE TANK. — No. 698,016; J. J. Hervey, Randsburg, Cal.



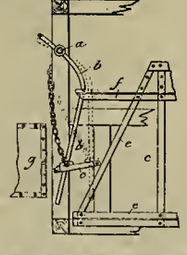
Tank with tapering bottom and a central cone arranged in connection with bottom, annular lining arranged in tank and open at lower end, filtering screen connecting the lower end of lining and central cone, air and water pipes, charging and discharging pipes, and forcing means connected with pipes.

PICK.—No. 698,147; E. A. Smith, Fowler, Colo.



A pick eye having polygonal opening and transverse ribs on interior end walls of opening, pick points having shanks polygonal in cross section adapted to opening and formed with grooves to engage ribs, and wedge driven into opening between shanks and spreading them apart and holding grooves of shanks locked to ribs of opening.

SELF-CLOSING DOOR FOR MINES.—No. 698,275; F. Gunther, Recklinghausen, Germany.

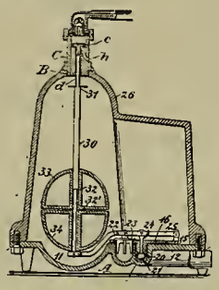


Curved inverted U-shaped bar, pivot bolts connecting it near upper end to timbers of mine level adjacent to shaft, guides on sides of level, foot bar connecting lower ends of U bar, cross rod supported upon timbers above foot bar, chains connecting rod and foot bar.

SUBMARINE GOLD SAVING DEVICE.—No. 698,105; L. D. Craig, San Francisco, Cal.

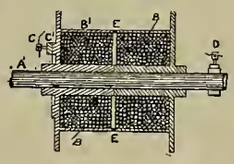
Open trough, series of riffles arranged transversely therein, rods secured within trough above riffles, cutter carried by trough for separating material during movement of trough and means by which trough is propelled.

HYDRAULIC AIR COMPRESSOR. — No. 698,236; J. Weyand, Guttenberg, N. J.



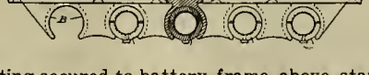
Shell provided with water inlet and outlet openings, lever pivoted within shell, valves attached to lever and controlling openings, vertical rod pivoted to one end of valve lever, and floats movable up and down upon rod in combination with valve tube provided with air delivery and air vent nipple forming continuation of delivery channel, flexible apertured jacket covering nipple nozzled cap surrounding and valve controlling air vent with hollow stem adapted to slide over float rod and capable of closing delivery outlet by contact with upper one of floats.

ORE CONCENTRATOR.—No. 698,293; C. M. Kimball, Port Huron, Mich.



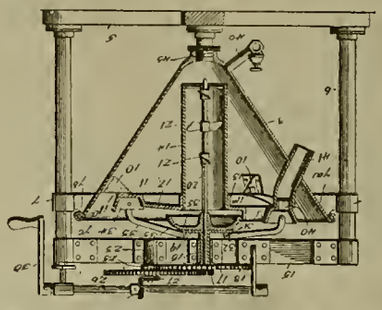
Open tank having settling trough with generally imperforate bottom located within its upper portion, means also within tank for circulating water and tailings from lower part of tank to trough, and means for moving tailings which lodge in trough along the bottom thereof, tailings outlet from trough extending through outer side of tank, whereby gold or other heavy material will remain at bottom of tank while tailings will be elevated into trough, and automatically and continuously removed therefrom while water overflows from trough into tank.

GUIDE FOR STAMP STEMS.—No. 698,378; D. C. Demarest, Angels Camp, Cal.



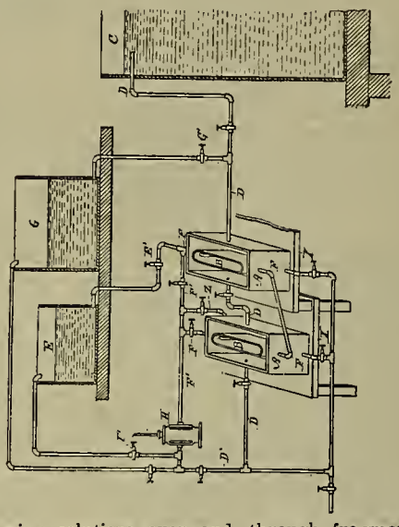
Casting secured to battery frame above stamp or line of stamps, and formed with tapering socket or opening through casting above each stamp and with passage through front wall of each socket for lateral admission or removal of stamp stem, sectional tapering sleeve or shell fitted around each stem and adapted to fit and seat itself in socket in casting, and lug on sleeve or shell adapted to project through opening in front of socket.

MAGNETIC SEPARATOR.—No. 698,311; J. H. A. McPhee, Dunedin, New Zealand.



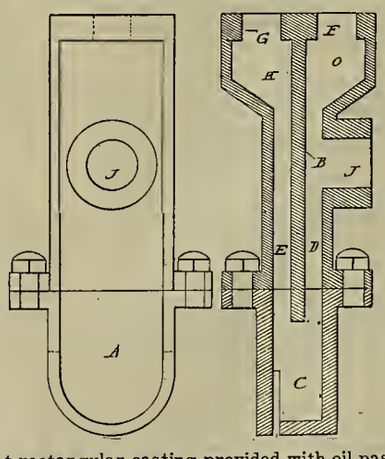
Pulley consisting of a core and shell surrounding same and integral therewith, magnetic coil wound upon core and extending to inner face of shell, shaft extending through core for supporting and rotating pulley, suitable electrical connections for coil, insulated means for dividing pulley in sections, belt operated by pulley and adapted to receive and separate material, means for supplying material to belt, and for operating pulley in rotary direction and to impart transverse movement to pulley while it is rotating.

PROCESS OF RECOVERING METALS. — No. 698,292; E. D. Kendall, New York, N. Y.



Flowing solutions over and through fragmental mass of carbon presenting large surface area, and which carbon mass serves as cathode, plate of carbon immersed in solution of potassium or sodium hydroxide serving as anode, which solution of potassium or sodium hydroxide is separated from cathode solution by porous diaphragm, whereby cyanogen set free by electric current is reconverted to alkali cyanide, subjecting flowing solution to action of electric current having electromotive force of five volts' strength or more, next stopping flow of dilute solution and flowing over and through fragmental carbon mass stronger solution of potassium cyanide and then subjecting deposited metal to action of reversed electric current not exceeding electromotive force of five volts, using carbon mass as anode and plate of metal for cathode.

OIL BURNER FOR FURNACES. — No. 698,361; W. Booth, San Francisco, Cal.



Flat rectangular casting provided with oil passage and adjacent steam passage, separated by partition; nosepiece bolted onto casting in front of partition, interior of nosepiece forming chamber, horizontal floor in chamber and slit in forward end of nosepiece in line with floor of chamber.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

COOK'S INLET.

The Big Horn M. Co., owning placer claims at Sunrise City, is preparing to do extensive hydraulic work this summer. President and General Manager A. R. Ommanney is in personal charge of operations. The line of the Alaska Central railway from Sunrise City will cross ground belonging to the Big Horn Co.

JUNEAU.

Preparatory work for the construction of the tunnel at Juneau has been completed and construction will commence about August 1st. The tunnel will be nearly 8000 feet long and will tap a series of quartz claims at a depth of 800 feet in Silver Bow basin, back of Juneau. The tunnel is being driven by the London Exploration Co.

KOYUKUK.

Busby Bros., owning Discovrey, on Hammond river, Koyukuk district, have picked up a nugget from their claim valued at $822 50, figuring at $17 an ounce. The men on No. 1 above Discovery, on Hammond river, are taking out their dump and are picking up in nuggets from $30 to $60 a day. Further up the creek, men have been trying to sink holes down to bedrock, but are unable to do so, owing to water coming in about 12 feet down.

NOME.

Since the summer of 1900, investigations of the tundra deposits near Nome bave been pursued under J. U. Picard's direction for a New York company. Picard says the company now owns eleven 160-acre tracts between Nome and Penny river, and that in 1901 and this winter he has sunk a number of prospect holes to bedrock, using a Keystone boring drill. The depth to bedrock varied from 40 to 80 feet, and the gravel, which begins about 8 feet below the surface, is not frozen. The surface deposit, about 8 feet in depth, consists mostly of peat, which can be used for fuel for the machinery necessary to work the tundra on a large scale. The gravel deposit under the peat contains gold. In one hole gravel averaging $4 87 to the cubic yard was found at a depth of 42 feet. In another hole sunk it averaged $3 64; in another, $6 10, while still another showed an average value of $5, and one reached $12 41. The lowest average to the cubic yard was $3 64. In prospecting the bottom of the sea in front of Nome, at a depth of 10 feet, Picard reports finding $7 to the cubic yard; at 30 feet, $11 25. The lowest value found was $2 to the cubic yard. The company is to work the tundra deposits on a large scale, commencing in the summer of 1902.

VALDEZ.

Development work on Latouch Island, near Valdez, has shown up a copper ore-bearing vein for a distance of 5 miles. On the Bonanza claim a slide exposes the vein for a distance of 300 feet in length and 200 feet in height.

ARIZONA.

COCHISE COUNTY.

At the Black Dismond copper mine, near Pearce, Manager N. O. Bägge states tbe company is waiting on the construction of the smelter so as to begin turning out copper bullion. A telephone system connecting the mine with Pearce has been installed. The 200-ton smelter is expected to be ready for operation by August 1st. The construction is in charge of C. C. Leary.

GILA COUNTY.

Supt. F. W. Hoar of the Old Dominion M. & S. Co., at Globe, says that while final plans are not completed, it may be stated generally that changes and additions to the present plant will be made to increase the output of copper and reduce the cost of production. The first improvement to be added will be a briquetting machine to utilize the flue dust, of which there is a large accumulation at the smelter.

The Pinto Creek M. & S. Co., operating north of Globe, has installed a gasoline hoist and is considering the putting up of a 10-stamp concentrating mill. A large body of rich ore has been opened and a depth of 330 feet reached.

GRAHAM COUNTY.

The Stevens Copper Co. are operating the Stevens group of thirty-five claims, near Metcalf. These claims lie on the western side of the mineral zone. The ore—carbonate and oxide—is found in a contact vein between porphyry and lime, capped by iron. The dyke is several hundred feet wide and shows on the surface about 6000 feet. The company is extending the main tunnel, now in 570 feet, to crosscut the veins, and will open up the property 400 feet down. It is intended to put in air drills and possibly a small smelting plant.

MARICOPA COUNTY.

The Mountain Chief group of mines in the Harqua Halas, about 40 miles west of Wickenburg, lately bought by Eastern people, is now being developed and opened up by the new owners, with W. E. Defty as Supt. A whim has been installed and one shaft is down 100 feet, with 3 feet of high-grade gold-copper ore showing in the bottom of the shaft. Another shaft is to be started.

The Oro Grande Extension M. Co. has been incorporated at Phœnix, with G. B. Upton, G. E. Sanders, D. S. Michelsen, A. Smitu and A. Childers directors—all of Wickenburg. The company is to operate the Oro Grande Extension group of eight claims adjoining the Oro Grande mine, near Wickenburg.

MOHAVE COUNTY.

P. White and associates have located several claims near Kingman, ores from which show gold, and assays over $20 a ton. The locations are about 6 miles from the Colorado river.

SANTA CRUZ COUNTY.

The Buena Vista properties of fourteen claims are 12 miles east of Nogales. The company has over 12,000 feet of development work, and bas recently installed an electric drill. The work on the Buena Vista claim shows a ledge which averages 5 feet in width, running 6% copper. F. N. Cox is Supt.

YAVAPAI COUNTY.

Switzer & Ratcliffe have sold for $55,000 their mining properties in Copper Basin, at Skull Valley Station, near Prescott, to the Oro Cobre M. Co. They consist of two groups of seven gold quartz claims. A water right hss been bought in connection with the claims and the company will soon commence development work.

A strike is reported in the Cliff mine, owned by the George A. Treadwell M. Co. at Jerome. Assays of the 22 feet of ore struck run from 8% to 25% copper.

D. Kyle, Supt. of the Oro M. Co., in the southern Bradshaws, says the Oro group was formerly known as the Boaz and was equipped with a 20-stamp mill with fifty tons daily capacity. This is being increased to 150 tons, and a cyanide plant that will treat 150 tons daily is being added.

Ten stamps are to be added to the Val Verde smelter plant at Val Verde and the number of rolls increased so as to make the capacity of the plant 100 tons a day.

The Poland M. Co. has bought the Middleton, Cash on Delivery and Independence mines, located in the vicinity of the Poland mine, near Prescott, from J. Robeson of Prescott, S. G. Miner of Phœnix and L. English of New York, for $11,000.

CALIFORNIA.

AMADOR COUNTY.

The 800 and 1400 levels at the Bunker Hill mine, near Amador, are being driven and the 200 level is being run from the shaft to connect with the Mayflower tunnel, so that the water will only need to be pumped to this point instead of to the collar of the shaft. The 1400 levels are in low-grade ore, said to be improving.

The Edinburgh G. M. Co. has been incorporated in San Francisco, capital $200,000, by D. Fisher and others to operate a quartz mine near Wieland, which is on the east belt of the mother lode. D. Fisher is Supt. A contract has been let to drive the tunnel 500 feet farther along the vein. The ore carries 3% of sulphurets, which assays $55 per ton. Drillings taken from clear across the veiu assay $7.50 per ton in free gold.

The Original Amador mine at Amador City, which has been shut down for eighteen years after it was explored to a depth of 1400 feet, is about to be reopened by Eastern peop e who have taken hold of the property.

CALAVERAS COUNTY.

S. W. Payne of San Francisco has bonded three claims at Esmeralda, on which a water power arrastra has been operated for a number of years with profit. One vein of ore developed is 4 to 6 feet wide and will go $5 to $7 to the ton; another vein 3 feet in width, it is claimed, will run $40 to $45 to tbe ton; and ore from a third vein, it is claimed, has yielded $70 to $75 to the ton in the arrastra.

The hydraulic claim on North Hill, near Jenny Lind, is to be operated with water from the reservoir in Salt Spring valley. The gold is coarse and pieces are found going as high as $40.

B. K. Mauna has sold the Sparrow Hawk and Never Thought quartz mines at Jesus Maria to Haywood & Hamilton of San Francisco.

The French Hill quartz mine at Jesus Maria has been bonded for four months at $5000 by F. O. Cortmarsh.

EL DORADO COUNTY.

The Mount Pleasant Con. G. M. Co. has been incorporated with office at San Andreas to operate the Mount Pleasant quartz mine properties at Grizzly Flat. The directors are J. Lavaggi, Plymouth; H. G. Stevenson, Menlo Park; A. M. Brown, Placerville; H. P. Morgans, Angels Camp; F. J. Solinsky, San Andreas.

KERN COUNTY.

The Mojave Copper Co. has bought thirty locations near Mojave for $10,500. The company proposes to begin active development work at once.

MONO COUNTY.

The Golden Gate M. Co., at Coleville, I. W. Geary Supt., has struck the ledge in the new workings. It is in a broken-up quartz, assaying very high.

NEVADA COUNTY.

Tbe msjority of stock in the North Bloomfield M. Co. has been sold to the W. B. Bourn Co. for, it is said, more than $300,000. It is said the new owners will erect an electric power plant and transmit power to San Francisco. The property embraces the North Bloomfield hydraulic mines, the Kate Hayes mines at Badger Hill, San Juan, Sweetland and French Corral, nearly 100 miles of ditches and canals and the Bowman and Pine Grove reservoirs. J. W. C. Maxwell continues as president of the company and G. W. Starr has been made general manager.

It is reported that the Niagara mill, at Nevada City, will soon be started up, only the tramways requiring to be finished.

PLACER COUNTY.

At Forest Hill work is being done, retimbering in the old Baltimore mine, to put it in shape to be operated. This claim is owned by Mrs. S. E. Reamer of Oakland.

The tunnel at the Red Point drift mine at Westville is now in on the channel 3½ miles. The quantity of water which flows from the mine is 70 cubic feet per minute.

SACRAMENTO COUNTY.

The Folsom Con. Co. has been incorporated, capital $100,000, in San Francisco, with D. P. Gray, A. T. Eastland, A. L. McPherson and J. A. Britton, all of Oakland. The company will operate mines at Folsom.

SAN BERNARDINO COUNTY.

It is reported that a large deposit of nitrate of sodium and potassium, located at the south end of the Slate range of mountains, is to be exploited by English people, their representative being now on the ground to make an examination of the deposit.

SAN DIEGO COUNTY.

The Noble mine, at Julian, has been bonded by Noble Bros. to J. H. Thring of London, Eng., at $30,000. There is a 10-stamp mill on the property.

The American Girl mine, near Ogilby, has been sold to the American Con. M. Co. for abnut $1,000,000 by H. H. Markham, A. R. Dodworth, G. H. Coffin, F. S. Daggett, W. Wotkins and J. W. Wood of Pasadena. The buyers are Denver, Colo., and Chicago, Ill., people.

The Ranchita group of mines, at Julian, are being put in shape for thorough development. Water is being piped in for the use of the mill and the old shaft has been cleaned out. Sinking in new ground has commenced.

The Stonewall mine, at Julian, now owned by a stock company, is having new shafts and tunnels opened, and several bodies of ore that are in sight will be worked.

SHASTA COUNTY.

W. P. Miller, owner of the Josephine mine, near Redding, has sold the stamp mill on the mine and it will be shipped to Hornbrook. The ore in the Josephine mine is refractory and the values can not be saved by milling and concentrating. The mine will be further developed and the ore shipped to the Keswick smelter.

J. J. Chambers of Redding is preparing to build a custom smelting plant at Kennet.

The Gladstone mine at French Gulch, owned by J. H. Roberts of Sacramento and I. O. Jillson and L. A. McIntosh of Chico, is to have a 500 H. P. electric plant which will be used to run the mine and mill and light the entire plant.

The Fair View M. Co., operating near French Gulch on the top of Trinity mountain, is making a wagon road to the mine. J. H. Porter is Supt.

SIERRA COUNTY.

Operations are to be resumed at the Alaska mine, at Pike City, this summer by a new company. The plan is to drive a 6500-foot tunnel from Oregon creek to tap the ledge at a depth of about 1500 feet, far beneath the old workings, which were abandoned because of an inflow of water. The power to be used will be electricity, which will be obtained from the Plumbago power house.

SISKIYOU COUNTY.

The Brokaw, Lewis & Co. mine in Hull gulch, near Oro Fino, has started up after being closed down for several weeks on account of a broken pump. The mill has been started crushing ore.

The tunnel at the Cherry Hill mine, near Fort Jones, is now in 1100 feet. A 30-inch blower has been installed to draw the gas and bad air from the works, and an air receiver placed inside the tunnel at the 1000-foot market. The 10-stamp mill is running on ore taken from the upper works.

TRINITY COUNTY.

The Bob's Farm M. Co., in which W. H. Montgomery of Trinity county and J. A. Byers of Colusa county are interested, has seven claims 45 miles northwest of Weaverville, the best developed being the Wild Denver. No. 1 tunnel is in 54 feet and has cut a ledge from 8 inches to 2 feet wide which averages $55 per ton. No. 2 tunnel runs in on the lead 130 feet and the face is about 75 feet below the apex. The vein is from 18 inches to 3 feet wide. The plant is a 2-stamp mill, ore feeder and rock crusher, capacity six to eight tons per day, and a gravity tram connecting the ore bins at the mouth of the tunnel with the mill below. R. Hicks is foreman.

TUOLUMNE COUNTY.

In the Soulsby mine at Soulsbyville the vein has widened and is richer than ever, carrying, it is claimed, over $100 in free gold and $250 in sulphurets. Tbe vein averages 15 inches in widtb.

The Anderson mine tunnel at Carters is in about 200 feet. The hard rock has been gone through and 4 feet a day are being made.

The Wbeal Perrin mine at Soulsbyville has been unwatered and is to be prospected.

An addition of ten stamps to the Republican mill at Jacksonville has been decided upon and contracts for the machinery are to be let at once. The chlorination plant will not be added at present.

The New Era, formerly the Gold Hunter mine, 16 miles east of Sonora in Buchanan district, has been bonded. It lies across a deep canyon which cuts several veins that have been worked at intervals by tunnels and have produced well. C. A. Holland, the present manager, has sunk a shaft in the canyon, and stoping out ore has paid expenses and for a complete 10-stamp mill.

At the Bedrock Blue Gravel claims on Table mountain at Sonora, owned by C. L. Lang and associates, the old Virginia tunnel is now being cleaned out to the heading supposed to be in 800 feet. Then it is proposed to make the first upraise to the gravel channel.

The App Con. G. M. Co. has transferred all of its property in Tuolumne county, excepting the New Albany mine, to the Rawhide G. M. Co. for $14,975 of fully paid capital stock of the Rawhide Co. The mines in the transfer are the Rawhide and App mines and mill sites, the Heslep and Hitchcock quartz mines and the Martin, Nevills and Ballard placer mines, and other property near Jamestown. The Guild G. M. Co. has deeded to the Rawhide M. Co. all its property.

The Horseshoe Bend mines, near Melones, controlled by a Boston, Mass., company, have erected buildings and shops for operating on a large scale.

Four feet width of $30 ore is reported encountered in the Dollie Dimple mine on Yankee h ll, operated by H. C. Kennedy of San Francisco and E. J. Gilbert of Columbia, under bond from G. W. Mapes. They will drive a tunnel to develop the vein at a depth of 300 feet below the old workings.

The Bourbon mine on Knights creek, owned by Signoretti & Capelli, has been bonded by H. C. Dodds of Oakland, who will begin operations at once.

M. E. Sanford has deeded to the Horseshoe Bend G. M. Co. eleven quartz mining claims, water rights and three mill sites, situated on the Stanislaus river, about 4 miles west of Columbia.

YUBA COUNTY.

J. O'Brien has deeded to the United States land for constructing debris barriers in the Yuba river, reserving the right to mine, for $3000. It is understood that other payments have been made for land for the barriers.

COLORADO.

BOULDER COUNTY.

The court has ordered the sale of the chlorination mill at Eldora. This is with the consent of the parties interested. It is understood that it will result in starting the mill again.

The Lucky Star mine, at Ward, has shipped a car of its mill ore as a trial test to the new concentrator recently installed in the Culbertson mill. Should the test prove a success, plans for a tramway connecting the mine with the railroad will be

taken up to provide more economical transportation.

CLEAR CREEK COUNTY.

The Mondota mine, at Silver Plume, has 3 to 4 feet of ore in the shaft that mills 60% lead and thirty-five ounces silver. The concentration mill recently bought by J. W. Olds is being rearranged and fitted up under the management of W. P. Jewell.

The Waltham M. Co. of Idaho Springs, A. Anderson, president, and R. H. Hastie, manager, have taken a lease and bond on the Waltham property at Russell, and will open it up at once. The shaft is down 50 feet in the vein about 3 feet wide, which runs about $13 a ton. A power plant will be put in and a shaft house erected.

The Gold Standard mill on Chicago creek, near Idaho Springs, is putting in stamps to crush the ores from the Black Eagle mine, rolls having been found unsatisfactory. The ores are crushed, passed to concentrating tables and the slimes are carried to vats for cyaniding. The addition will make it possible to cyanide about twenty-five tons of tailings a day. The tables will catch 60% of the concentrates.

Examination of Empire's ores, it is stated, has determined their adaptability to profitable reduction by pyritic smelting. The immediate question is how to profitably treat the grade, containing from $5 to $10 in gold values—too low in grade to pay for smelting and transportation charges and too solid for wet concentration. Large bodies of this description have been developed at Empire. It is believed these low-grade ores can be made to pay, and a pyritic smelting plant is under consideration.

J. H. Robeson, manager of the Seven-Thirty, Bismarck, Dives-Pelican, Illinois, Burleigh and other properties at Silver Plume, has let a contract for about 1300 feet of drifting and an upraise of 250 feet to connect the shaft of the Seven-Thirty with the workings of the Burleigh. This contract when completed will unwater approximately 5 miles of underground workings and will also open a large area of unexplored territory.

B. J. O'Connell has located a tunnel site on Republican mountain at Georgetown, and contemplates driving entirely through the mountain. He has bonded the Gambetta mine, the only original location within the entire route of the tunnel.

CUSTER COUNTY.

The Bull Domingo mine, at Silver Cliff, is to be operated on an extensive scale, preliminary work having been begun. E. J. Christie of Marion, Iowa, is manager. The hoist has been removed from the Geyser mine to the Bull Domingo.

GILPIN COUNTY.

The Justice Leasing Co. of Denver will operate the Justice mine in Lower Lake district, with T. A. Irvine as manager. A contract has been let to sink the shaft a further depth of 75 feet.

A new 10 H. P. gasoline hoist is being installed at the Kate and Francis mine, owned by the Wilkesbarre G. M. & M. Co., E. C. Sherman Supt., at Eureka, and an addition is being made to the shaft building. The shaft bottom at a depth of 185 feet shows lead and copper ore.

The Penobscott M. & M. Co. of Pierce, S. D., has been incorporated, capital $1,000,000, to operate near Perigo, by L. L. Stephens, Pierce, S. D., P. J. Hamble and W. Bayler, Valley Falls, Kans.

The Omaha G. M. & M. Co. of Central City has been incorporated by J. N. Drake, J. A. Smith and J. Saling, capital $1,000,000.

G. K. Kimball and associates of Idaho Springs have organized the Russell Gulch M. & Dev. Co., to operate the Warfield group of four claims. A new plant has been installed, including a steam hoist, and a new shaft house, 20x50, is being built.

GRAND COUNTY.

Mining on Gold Run at Sulphur Springs is to be resumed by the Touraine G. M. Co. of Boston, Mass., Mr. Killduff, representing the company, being on the ground to start the work. On account of a deficiency of water in Gold Run creek in the fall, the company will build a reservoir.

GUNNISON COUNTY.

The Union Park Placer M. Co. has resumed work on its placers at Tin Cup. The flume and ditch will be finished in July, when washing will commence. R. W. Spensley of Leadville is Supt.

The Galveston Co., which has bought the Whig group of claims in the Gold Brick district, near Gunnison, has let a contract to sink a deep double compartment shaft. A first-class plant of machinery will be put on, and the operators say they may sink to a depth of 1500 feet.

The Grizzly M. Co. proposes extensive operations at Tin Cup this season. Its property is located on the north side of Taylor park and has a 200-foot tunnel. The company proposes to expend $25,000 in constructing a concentrating mill and in development.——The Kentucky Gulch M. Co. will operate on a large scale this year. The property is showing a vein of ore, carrying good values in gold, silver and copper. Machinery will probably be put on.——The Iowa M. Co., owning property in the same district, has equipped it with a fine plant of machinery and will oporate extensively.——The shaft on the Star mine is 190 feet in depth and has three levels extending from it, all of which are in ore, a high grade lead carbonate. It is believed that H. B. Gillaspie and his associates will operate the Star extensively this year.

At Elko the Galena Mountain M. Co., which erected a 50-ton concentrating mill last fall, will put it in operation to handle the low-grade ores.——The East Rock M. & M. Co., owning a group, will do considerable development work.——The Brooklyn M. Co. is driving a long tunnel on the Harper group with a good plant of machinery. The veins to be cut by this tunnel will be reached at a depth of 1000 feet or more.

HINSDALE COUNTY.

Munro Bros have sold the Gold Mine claim, in Burrows park, near Lake City, for $10,000. The Gold Mine is a new location, lying about half a mile from the Iney-Hollister, where bonanza ore was recently found.

LAKE COUNTY.

On Mt. Elbert, at the timber line, near Twin Lakes, a 2300-foot tunnel has been driven by the Twin Lakes G. M. Co., cutting a vein that carries from 200 to 300 ounces silver and from ½ to 4 ounces gold. New York people are interested and J. D. Bartlett is Supt.

The Fryer Hills Mines Co., capital $3,000,000, has been incorporated by Chicago, Ill., New York and Denver people, making a combination of the Union Leasing & M. Co. group and twenty mines with an area of 150 acres on Fryer hill, Leadville. Small companies have been unable to work this territory on account of the great water flow, and it has laid idle several years. Large pumping plants will be put in and the territory drained through the El Paso mine, which will be the base of operations. It will take four months to drain the mines.

LARIMER COUNTY.

In the Coldwater and Mount Zirkel properties, at Pearl, which are being developed under L. D. Godshall, Supt., at a depth of 45 feet the Coldwater shows a 6-foot vein of copper ore, 3 feet of which is solid copper glance, while the Mount Zirkel at a depth of 75 feet shows a 12-foot vein of sulphide ore. It is stated that the Coldwater and Mount Zirkel Companies will build a smelter and both properties will install steam hoisting plants.

SAN JUAN COUNTY.

The Royal M. & Investment Co. of Florence has bought the King group of mines at Silverton. M. H. Kinney is president; C. N. Kinney, secretary-treasurer, and W. R. Pyke, of Hooper, Supt.

E. Goodwin, H. Stroebel and Conyers Bros. have been opening their group of 16 claims, near Gladstone, through a tunnel to cut the Independence vein. A shaft sunk on the Independence vein shows $40 a ton ore, principally silver.

The Bear Mountain M. Co. is preparing to resume work on its group of 5 claims, near Silverton.

SAN MIGUEL COUNTY.

It is reported that the Four Metals Co. may build a mill this summer for the Palmyra mine. New ore bodies have been opened and the continuity of the high grade streak found in the lower level has been proven. An immense dump of milling ore awaits the erection of works for its reduction.

The Nellie mine at Telluride, owned by the North American Ex. Co. of New York, has been leased by it to J. Campbell of St. Louis, Mo., and E. I. Field and L. L. Nunn of Denver. The average value of the ore taken from the mine is $11 a ton. The lessees expect to keep thirty stamps going. E. I. Field is manager.

TELLER COUNTY.

Brewster & Bradley, lease operators of Cripple Creek, have taken a two-years' lease on the Pride of Cripple Creek mine and commenced prospecting. The ore assays $45 a ton and there is reported to be a fair sized body of it. The lessees will install a steam or electric hoist.

The Free Coinage Co., at Cripple Creek, is receiving between $2000 and $2500 in royalties each month from five sets of lessees, who are operating leases and making a production altogether of about 230 tons a month.

Daniel Maclaren, the Scotch mining engineer who has been making an examination of Stratton's Independence mine at Cripple Creek, has completed his examination and says that he has gone over all workings, and has been in every nook and corner, and "it is my opinion that the Independence mine has been underestimated. I am confident that there is over $2,000,000 worth of ore in sight—that is from the surface down to the ninth level. If the mine is carefully worked and the waste separated carefully, the profit would be greater and the average per ton would be greater than it is to-day. When the tenth and eleventh levels reach the volcanic complex, there will be as large bodies of ore found as there were in the upper levels."

The Addie C. claim on Mineral hill, at Cripple Creek, has been sold for $32,000 to J. C. Farrell and J. K. Walch.

The report of the Golden Cycle G. M. Co.'s production of the mine at Cripple Creek during the past three months shows that the mine earned $48,709 05. The tonnage in January was 3552, average value $13.48, total $47,906; in February it was 3342 tons, average value $10 99, total $36,743.86; and in March 3419 tons, average value $11.30, total $38,625. The report shows: Cash on hand Jan. 1, 1902, $7587 67; profits for January, 1902, $21,355.32; profits for February, 1902, $14,479.85; profits for March, 1902, $12,873.88; received from rent of hoist, $136; cash on hand April 1, 1902, $56,432 72. The March profits were cut down by extra outlays made in that month for sinking the shaft, $4000; machinery, $2000; insurance, $500; legal expense, $700—which amounts to $7200. The average cost for mining and milling a ton of ore is but $8, that of Stratton's Independence $16 a ton, and the Portland bas been $23. The conditions are not identical in the three properties.

The Vindicator Con. G. M. Co.'s report for the first three months of 1902, as made by Manager F. J. Campbell, shows that during January, February and March the mine produced 3586 tons, which yielded a gross value of $172,743. The treatment and transportation charges were $33.730, leaving net smelter returns of $139,013. The operating expenses were $78,859, which left net profits of $60,523.

W. C. Little, manager for Helton, Tahor & Burley, Michigan people, who are leasing on the Dexter claim at Cripple Creek, have made a strike in a crosscut from the main shaft at a depth of 150 feet. A small trial shipment has given returns of four ounces gold per ton.

Childers & McLeod, who have a lease on the dump of the Doctor-Jack Pot, have received returns on a small trial shipment at $21 to the ton, showing a saving of shipping values from the dump.

Stratton's Independence M. Co. of Cripple Creek has begun suit against the Strong M. Co., charging the latter company with extracting ores from the Maggie lode mining claim, which adjoins the Strong property, and asking damages to the amount of $1,750,000.

The Theresa M. Co., at Cripple Creek, has resumed work on company account and is working on the 500 and 600-foot levels. There is a probability of the shaft being deepened down to the 800-foot level. For the past few years the property has been in the hands of lessees and they have paid royalties enough in the treasury of the company to permit of work being resumed on company account. C. Emerson is manager.

IDAHO.

CUSTER COUNTY.

The White Knob Co., at Mackay, is putting in an electric line 12 miles in length to convey the ore from the mine to the smelter, which is being built of 600 tons daily capacity.

IDAHO COUNTY.

F. Brown, manager of the Jumbo mine, at Buffalo Hump, has ordered six stamps, to add to the four stamps already installed, and also expects to install a saw mill. The Jumbo, operating four stamps since Aug. 15 last, has been producing an average of $7100 per month.

The B. B., at Buffalo Hump, is operating ten stamps on ore taken from the 65 and 200-foot levels. It employs about thirty men in mining and development.

W. E. Pierce & Co. have arranged for putting in a saw mill at the town site of Caswell, at Thunder Mountain, with a capacity of 50,000 feet per day. The logs will be secured from the town site and the surrounding country. It is expected that this machinery will he started for Thunder Mountain about May 1 and to have the mill going before June 1.

William Beals, Jr., M. E., of Beals & Whittle of Boston, who examined the Dewey mine at Thunder Mountain, says the average value of the ore is less than $5 per ton at the mill, and there are neither veins nor lodes on Thunder Mountain. It is simply a placer deposit influenced by geyser action. There are two kinds of gold, placer and geyser, the former the more valuable, the latter carrying a considerable proportion of silver. Mr. Beals states that the idea of there being $125,000,000 in the Dewey mine or even a small fraction of that amount posed is a gross misrepresentation of actual facts.

LEMHI COUNTY.

Discoveries of coal in the Salmon Lemhi valleys during the past two months have shown three or four workable deposits of a good quality of lignite, clean and hard, and from 4 to 7 feet thick in the clear. The lignite belongs to the Miocene-Tertiary formation, and the field extends up the Lemhi river about as far as Junction, and as far up the Salmon as Cronk's canyon. In this area one workable bed has been found, which with few exceptions, wherever opened, shows from 4 to 7 feet thick.

Dalo Bros. have been operating the Italian mine, near Salmon City, and have in a 75-foot tunnel cut a new vein, showing 1 to 4 feet of pay rock. The mine comprises 6 claims and is equipped with a 10-stamp mill. A. Dalo is Supt.

WASHINGTON COUNTY.

W. B. Wright, Supt. of the Denver & Chicago M. Co., operating mines on Rapid river, north of Council, states that during the winter about 100,000 feet of lumber has been cut and that mining will commence in the spring. The company will build a 10-stamp mill on their property this season.

MONTANA.

FERGUS COUNTY.

The North Moccasin M. Co. has started work on the Santiago and the Santiago Fraction at Kendall, to ascertain the dimensions of the ore body, with the intention of erecting a mill in the near future.

The development work on the north end of the King-Barnes property is reported to show results better than anticipated. A 150 foot tunnel and a 50-foot crosscut both ways from its end are in high-grade cyanide ore. A mill is being considered for the mine.

FLATHEAD COUNTY.

The 10-stamp mill erected on the Blacktail G. M. & M. Co. property, near Libby, too late last season for operation during the winter, was damaged by a snowslide. Repairs are being made and a full force of men will start up work in the mines about May 1. A. J. Moore is Supt.

GALLATIN COUNTY.

M. L. Rickman and E. V. Blankenship of Bozeman, who have been developing a deposit of corundum on Camp creek, report that they have discovered another deposit of corundum. One of the veins is stated to be about 32 inches and the other about 3 feet wide. One of the veins carries ruby crystals scattered through feldspar and the other is of corundum proper.

LEWIS AND CLARKE COUNTY.

The shaft being sunk by Iowa people on the Farmer lode on Scratch Gravel, near Helena, is down 170 feet and is in 6 feet of solid ore from the grass roots down. The ore is free milling and will average between $10 to $15 in gold. Ten tons of the ore milled have yielded $9.50 a ton in free gold, no concentrates being saved.

The works of the American S. & R. Co. at Helena have been closed down because of a strike ordered by the Mill & Smelter Men's Union because the company will not recognize the union. It is stated that there is no question of wages, hours of labor or other grievance involved. Manager C. W. Whitley says that the works would be closed down indefinitely.

MADISON COUNTY.

Late accounts from Sand creek report a stampede to the new fields. The ground for a radius of 10 miles has been staked off.

Two carloads of machinery for the tramway of the Boss Tweed mill, at Pony, have been delivered. The company has made a shipment of 100 tons of ore hauled to Anaconda for treatment to determine the kind of concentrating machinery required for its reduction.

MEAGHER COUNTY.

It is reported that work will be resumed on the North Pacific and Darling fraction mines of the Daly group at Copperopolis by W. W. McDowell of Butte, operating under a bond.

SILVER BOW COUNTY.

In the Pacific mine, at Butte, crosscutting is in progress at the 200-foot level, and arrangements are being made for the necessary pumps and boiler capacity to sink deeper.

R. Bagley of Pittsburg, Pa., has bonded the Altoona and other claims in the East Butte district and proposes to develop them. A shaft on the Altoona is nearly 400 feet deep.

The Heinze copper properties at Butte have been taken over by the United Copper Co. of New York, capital $50,000,000, of which $5,000,000 is 6% preferred stock and the balance in common shares. The Heinze properties transferred include the Montana Ore Purchasing Co., Nipper

Con. Copper Co., the Cobra and Rock Island group, the Minnie Healey mine, the Belmont and a number of others.

NEVADA.

ESMERALDA COUNTY.

A report, stated to have been confirmed, says that a great gold strike has been made at Lone Mountain, 30 miles west of Tonopah. The ore body is 40 feet wide and is said to average $100 to the ton. The discovery was made by an Indian, who took white prospectors to the place.

LYON COUNTY.

J. E. Paramore, president of the Oakland Con. M. Co., operating at Como, says a 12-foot ledge has been lately struck, the concentrates from which assay $57.85 per ton. A new tunnel has been started.

NYE COUNTY.

At the Tonopah M. Co.'s mine at Tonopah the two-compartment permanent deep shaft on the Valley View is down 140 feet. When the 150-foot mark is reached crosscuts will be run and the sinking will continue. The Brougher shaft is down 300 feet, from which point there will be a crosscut run to connect with the Valley View shaft. East and west drifts are being driven on the veins from the 300 level, and the body of ore in the east drift on the 250 level is now being cut into on the 300. The ore body in the 250 level is at the present time 7 feet thick and averages $500 per ton.——The three-compartment shaft on the Mizpah ground is down 215 feet. The first station will be at the 300 level and a crosscut to the Brougher shaft will be started from it. The company has about 150 men employed and is increasing the number. The company is completing its assay office, a four-room building built of Nevada granite, walls 2½ feet thick, corrugated iron roof, redwood ceiling. The rooms will be used as assay office, assaying room, weighing room and draughting room. The office building will be a stone structure, 30x40, containing main office, mansger's office, superintendent's office, stenographer's room and a steel-lined vault. East of the main office building a short distance, will be erected the company's buildings, consisting of quarters for the officers, spare rooms for visitors, etc., also stables, blacksmith and machine shops. Store, compressor and ore houses are already completed.

Details concerning the strike on the Fraction claim at Tonopah by A. J. Crocker, one of the owners, describe the Tonopah Fraction M. Co.'s property as adjoining the main group of the Tonopah M. Co. on the west and in direct line with the ledges of the Valley View, Silver Top and Desert Queen claims. These ledges are lost to view on the surface where they enter the lines of the Fraction Co.'s claims, dipping under a capping of porphyry of a later flow than that containing the mineral. A shaft was sunk on the Fraction property through the capping, at a depth of 140 feet entering the ore-bearing porphyry, and crosscutting when at a depth of 240 feet, 5 feet of very rich ore was struck, assays of which run between $100 and $300 a ton. The ore is very hard and contains ruby silver and sulphides, resembling the Comstock bonanza ores.

The Ray M. Co. has been incorporated in Arizona, capital $500,000, with J. L. Butler president and J. R. Duffield secretary; principal place of business, Tonopah, with mines at Ray. The company's shaft is down 175 feet in a good body of shipping ore.

STOREY COUNTY.

The $2000 bond on the Lizard mine, below Sutro, has been taken up by the California company which has been operating the property for the past year and the money paid over to the former owners, G. Midgley, S. Morgan, P. Roberts and E. Tailleur of Virginia City.

WASHOE COUNTY.

J. Sparks expects to have his new mill ready for reducing the Reno Star ore at Wedekind by May 15th. The mill is of thirty tons capacity, which will be doubled if it works satisfactorily.

WHITE PINE COUNTY.

The Smoky claim, at Ely, owned by J. Ostegard and R. J. Harmon, has developed a good body of copper sulphides in the shaft. F. Paul, representing the Giroux Syndicate, has bought Mr. Harmon's half interest.

NEW MEXICO.

COLFAX COUNTY.

The Willow Creek Placer Co. of Las Vegas has been incorporated, capital $100,000, with H. G. Coors president, J. A. Carruth secretary and F. A. Edwards superintendent. The company will operate the Willow Creek placers, near Elizabethtown.

B. F. Groomer and W. J. Murray of Trinidad, Colo., and J. E. Lowrey of Sopris have bonded at $5000 the Free Gold claim of the Chickasaw M. & D. Co., situated between Red River City and Elizabethtown, in the Morino mining district. The ore on this claim is brown hematite, carrying gold.

GRANT COUNTY.

The Lena M. Co. at Lordsburg has received returns from the first three cars of concentrates turned out at the new concentrating plant recently built at their Shakespeare mines, the amount being between $7000 and $8000. The product was the result of reducing five tons to one.

Work on the new 60-ton smelter to be constructed in the Burro mountains will soon be commenced by Cross & Laughlin of St. Louis, Mo.

A diamond drill will be installed by the Rose Copper Co. on their property near Santa Rita.

An extension of lease for two years has been secured on the Arizona mine at Pinos Altos by W. McAllister, and a new double-compartment shaft will be sunk and a new hoisting outfit will be installed.

A proposition is under consideration to organize the Mine Owners' & Ore Shippers' Association, to include all the mines of Grant county, for the purpose of assisting the miners in disposing of their product at the highest market price. A sampling works to be controlled by the ore-selling committee would be part of the scheme.

The Wilson M. Co. at Stein's Pass has bought the boiler and machinery formerly used in the Lone Mountain mill, and has had it installed in their own mill.

The Michigan-New Mexico C. Co., operating at Shakespeare, has arranged with the American Con. C. Co. to take its ore. The latter company has plans perfected for the erection of a plant of capacity to handle the output of both mines. Besides copper values, the ores carry gold and silver.

SOCORRO COUNTY.

In April, 1901, D. M. Estey, with workmen, tools, lumber, tents and provisions, started work at the town and mill site of Estey City. At this time, a year later, the reduction works, boiler and engine rooms, ore bins, two story store and office building, boarding house and bunk houses, blacksmith shop, laboratory, magazine, stables, carpenter shop and dwellings for employes and their families are complete. The reduction works have a capacity of 300 tons of ore per day. One-half of the reduction mill construction is of stone. The boiler house, engine room, laboratory and powder magazines are entirely of stone, and the foundations of all the other buildings are of the same material. The engine room and the main mill are separated by a massive stone fire wall. It requires 300 H. P. to drive the reduction and electric machinery. All the motive power, electric lighting and other machinery is installed.

OREGON.

BAKER COUNTY.

The E. & E. mine at Sumpter, once bonded to J. Bourne, C. W. Knowles and H. Knowles for $24,000, and rebonded for $1,000,000 to St. Louis people, who erected a 20-stamp mill, but only run a short time, is reported sold. Later J. H. Longmead of Montana secured a four-year lease, during which time he took out over $900,000 net, but was unable to secure an extension of his lease. There has been some 7000 feet of work done on the vein and a vertical depth of 200 feet gained, but the old works, it is stated, will have to be abandoned and a new shaft started.

JOSEPHINE COUNTY.

The St. Helens & Galice M. Co. of Portland, with A. B. Cousins as secretary, which owns the Cousins & Adkinson mines at Galice, are negotiating to buy all the placer properties along Galice. The new company proposes to combine the several mines along the creek and work them as a single property and on a large scale by erecting a large double flume in the bed of the creek.

In the Copper Stain mine, near Leland, it is stated by Supt. Dana that the ledge, where it is tapped with the long tunnel, about 300 feet down, is larger and richer than ever. The company will build 6 or 7 miles of wagon road to get the necessary machinery to the mine.

J. C. Lewis' upper mine, near Leland, is being worked night and day with a full force of men. There is 240 feet pressure at the hydraulic giant and a 100-foot bank of gravel, at the bottom of which is a heavy blue gravel lead. The bank carries coarse gold from the surface to the bedrock.

LANE COUNTY.

Contracts for construction of the Oregon & Southeastern Railroad, to be built between Cottage Grove and the Bohemia mines, have been signed, and the road is to be built this year to the border of the Cascade forest reserve, a distance of 21 miles from Cottage Grove. The work will begin as soon as the workmen can be secured. It is said, too, that the same people that have brought about the exploitation of the Bohemia mines and secured the railroad have arranged for the construction of a large smelter in Portland to treat the ores.

UTAH.

BOX ELDER COUNTY.

At the Tyche property in Park Valley, owned by P. A. Sorensen, S. P. Armstrong and others of Salt Lake City, a shaft is down 50 feet in a wide vein that shows gold values believed to average $18 to the ton. The erection of a 16-stamp mill is under consideration.

IRON COUNTY.

W. J. Halloran and F. M. Wilson of Salt Lake City, owners in the Johnny mine at Stateline, state that twenty men are blocking out ore. A drift has been run on the 100-foot level 140 feet through ore without a break. The property is equipped with a hoisting plant, and preparations are being made for the erection of a 16-stamp mill, which will be begun at once.

JUAB COUNTY.

The Melville M. & M. Co. has been incorporated at Salt Lake City, capital $30,000, with P. J. Quealy, president, and H. C. Lund, secretary. The company owns the Copper King, Copper Queen and a number of other claims in the Moss district.

SALT LAKE COUNTY.

Since Dec. 1, 1901, 600 feet of development work has been done on the mine of the Columbia Copper M. Co. at Bingham, including in this the driving of the new tunnel 375 feet. The tunnel will in a short advance cut the What Cheer ledge. A large amount of work is laid out, and it is the intention to add 3000 feet to present developments before finally considering the proposition to build a mill.

SUMMIT COUNTY.

The Lake Flat M. Co. of Park City has been incorporated, capital $38,500, to operate the Lake Flat and Jordan claims at Park City. H. Shields is president and J. P. Burns, secretary.

The Weber & Kearns concentrator, bought at Park City by the D. & M. Co., is to be moved to its mine immediately. It is understood there is ore on hand to keep the concentrator operating for some time. Samples tested have returned assays of 50% lead, 40 ounces silver and $10 70 in gold to the ton. The vein is from 1 to 2 feet thick.

The Park Gold King M. Co., owning 15 claims in Thayne's and Iron canyons, near Park City, has started work. The incorporators are G. Lindsay, Jr., H. R. Lindwall, F. C. Thompson, W. Y. Mosher, Rosa H. Lindsay, C. F. Thompson and M. Sommer of Park City.

TOOELE COUNTY.

The Black Diamond mine at Stockton is reported sold by E. P. Mitchener & Co. for $25,000. It is stated that the buyers will begin at once the development of the property and that the installation of a concentrator is quite probable.

The Ophir Queen M. Co. has been incorporated at Salt Lake City, capital $250,000, with B. T. Cannon, president, and J. B. Weimer, secretary and treasurer. The company owns the Ophir Queen group at Ophir.

Manager G. Moore of the Sunshine gold mine at Mercur reports 100 tons of ore going through the new mill that averages about $5 per ton, of which over 90% is being recovered at a profit. He says that $3.50 ore can be worked at a profit in the new mill, and expects to make $1 50 ore pay. The novel operation of the filter presses is making the present work slow; but as the men become acquainted with the work, the tonnage is expected to gradually increase.

The Calumet mine, at Stockton, is reported sold by Nuson & Niedringhaus of St. Louis, Mo., to New York people. The group consists of twenty-five or thirty claims, from which nearly $200,000 was taken from an ore shoot above water level. The reopening involves, it is stated, the control of a large flow of water by pumps.

WASHINGTON.

FERRY COUNTY.

Three cars of ore shipped from the California mine at Ophir to the Grand Forks smelter have netted $10,000.

At the Tom Thumb mine, at Republic, in March, 90 feet depth was gained in the 400-foot working shaft at a cost of $33 per foot. The shaft has just been completed to the 400-foot level and a station cut.

STEVENS COUNTY.

The Waukegan - Washington M. Co., operating near Bossburg, is planning extensive improvements and has bought a $10,000 machinery plant including Corliss engines and a ten-drill compressor plant, which will be installed at once. A concentrator is being secured to reduce the bulk of the gold-copper ore before shipment.

WYOMING.

CARBON COUNTY.

The New Rambler copper mine, near Grand Encampment, is to have its own smelter. The erection of the building will soon be commenced and it is expected that within two months the smelter will be in operation.

FOREIGN.

BRITISH COLUMBIA.

The Mines Exchange, Ltd., of Nelson, reports that the Mollie Gibson mine, in the Slocan, has shipped 1000 tons and the Rambler-Cariboo 1260 tons since Jan. 1. The latter property steadily employs 100 men.——The Byron N. White Co. of Sandon has made application for 1000 inches of water near New Denver and has already began the preliminary work of installing a power plant to supply the mines and towns in the Slocan with power and light. According to the plans, the water will be delivered at the plant under 350-foot head. ——At the Silversmith, one of the claims of the Byron N. White Co., the latest report is that there is exposed in the drift face 4½ feet of steel galena, running 500 ounces silver and 70% lead, with a high-grade concentrating ore of considerable thickness between this body and either wall of the vein. Five cars of high-grade ore have been shipped, taken out in development work only.——The Sunset mine, at Cody, paid its regular monthly dividend of $6000 on April 17. The Sunset is an individual enterprise and is worked on a very small scale. A specimen of solid galena, weighing 125 pounds and containing 185 ounces silver and 82% lead, was recently taken from the vein on this property.

The Anglo-Slocan Syndicate, with a capital of £5000 in £1 shares, with registered office in London, Eng., has been incorporated to operate the Wakefield mine.

M. Gilliam, foreman of the Bayonne group at Nelson, reports that the tunnel has been driven 260 feet, showing the vein to be 30 feet in width of ore of fair milling grade.

The Ollala Copper M. & S. Co., capital $8,000,000, is developing its holdings in the Similkameen valley, consisting in part of sixty mineral claims, the town site of Ollala, together with a charter for the Similkameen & Keremeos Railroad and telegraph and telephone franchises.

The Black Warrior group of claims near Trout lake has been bonded by B. Coursier of Revelstoke to W. B. Webber of Winona, Minn., at $37,500, until Nov. 1, 1903

Nelson, April 23.

A strike is reported made on the Hideway group at Salmo of a vein of free-milling ore 10 feet wide, sampling an average of $61 per ton. The owners, McArthur, Waldbeser & Broadfoot, are preparing to ship to the Nelson smelter.

The discovery of gold in a beach deposit of black sand is reported at Cape Scott at the northwest end of Vancouver island.

The use of electricity from water power as power for dredgers on the Fraser river is projected. Mr. Amos, representing Pittsburg, Pa., people, is superintending the construction of a dredger at Cayoose creek which is to be operated by electricity. It is proposed to dam the creek and secure water power to operate dredgers between that point and Lytton, a distance of 30 miles.

MEXICO.

At Minas Prietas, Sonora, the Creston-Colorada M. Co. are rebuilding the machine shops destroyed by fire in March. A plant of the latest improved machinery, including heavy lathes, drill presses, etc., will be installed.

A. McNeil of New York has bought the Dewey mine, near Willard station, between Hermosillo and Torres, Sonora, and is making preparations for development on an extensive scale. C. L. Fisher is Supt.

The new owners of the Carrera mines, near Minaca, Chihuahua, propose to erect near that town a 200-ton concentrating plant. The ore runs high in zinc and lead.

J. R. Hooper, Z. O. Stocker and R. McCalmont are doing development work on the Guijosa Grande group of five claims, including some forty pertenencias, near Arevechi, Sonora. A ledge of high-grade petanke ores, running from 400 to 600 ounces silver per ton, is being opened.

YUKON TERRITORY.

The Dominion Government has abolished the royalty on gold mined in the Yukon district and has made an export tax of 2½%.

"Arkansaw Jim" Hall has sold his famous No. 17 El Dorado claim to C. Helnhurger for $25,000, the sale to take effect after the present clean-up. It is estimated that Hall has at least $150,000 in the present dumps to wash up.

Personal.

G. H. ROBINSON of Butte, Mont., is in Salt Lake City, Utah.

R. GUENTHER of Salt Lake City, Utah, is in Los Angeles, Cal.

D. M. MAUNA is Supt. Mauna Bros. mine near Jesus Maria, Cal.

H. FRANKLIN has resigned as Supt. of the smelter at Deadwood, S. D.

G. MCDONALD has been appointed foreman at the Bouden mine, Gold Hill, Or.

W. W. GODSMARK is Supt. of the Ratcliffe mine at Ballaret, Inyo county, Cal.

E. I. FIELD, manager Nellie mine, Telluride, Colo., has returned from New York.

W. H. MERCER, Supt. Mercer Tunnel, near Globe, Ariz., has returned from New York.

G. H. LEIGHTON of Denver, Colo., was at Stockton, Utah, last week examining mines.

A. BUCKBEE, manager Con. Virtue mine, Baker City, Or., is in Salt Lake City, Utah.

M. MCLEISH of Denver, Colo., is examining a mining proposition near El Dorado, Cal.

C. L. FISHER has been appointed Supt. of the Dewey mine near Hermosillo, Sonora, Mexico.

W. E. SHEPMAN, manager of the Maple Creek M. Co. at Junction City, Cal., is in San Francisco.

H. A. COHEN, general manager DeLamar properties in California, Utah and Nevada, is in New York.

F. STEWART of Stockton, Cal., has been appointed Supt. of the Sugar Pine mine near San Andreas, Cal.

M. MCLEAN, Supt. of mines of the Detroit Copper Co. at Morenci, Ariz., has returned from California.

T. MENNIE, late mill Supt. Rock Lake M. Co. at the Bruce mines, Ontario, has returned to Butte, Mont.

L. S. BUTLER of Vera Cruz, Mexico, consulting engineer Summit Placer M. Co., is in Salt Lake City, Utah.

R. WILLIAMS has resigned as Supt. Anchor mine, Park City, Utah, and will shortly go to England for a visit.

T. D. HARRIS of Breckenridge, Colo., has been appointed Supt. of the Oro Grande P. M. Co. at Dillon, Colo.

H. E. T. HAULTIM, consulting engineer to the Hastings Exploration Co. at Nelson, B. C., has resigned his position.

W. R. ARTHUR has been appointed Supt. of the Placer county division of the South Yuba W. & M. Co. at Auburn, Cal.

BERTRAM HUNT has returned to San Francisco from San Diego Co., Cal., where he has been engaged in projecting a cyanide plant.

J. E. BOWERS of La Colorada, Sonora, has been appointed foreman for the American-Mexican Anthracite M. Co. at San Marcial, Sonora, Mexico.

M. M. DYER of Boston, Mass., has been appointed manager of the American Dredging Co. operating the Swan placer mine at Breckenridge, Colo.

FRANK MONAGHAN of Needles, Cal., has been appointed a member of the board of trustees of the State Mining Bureau, vice W. S. Keyes, resigned.

R. K. COLCORD, Supt. U. S. Assay office at Carson, Nev., has been appointed Supt. Con. Esmeralda Mines Co., which is starting operations near Hawthorne, Nev.

A. J. MOORE, formerly Supt. Michigan & Montana C. M. & S. Co. at Butte, Mont., has been appointed Supt. Blacktail G. M. & M. Co. at Fisher creek, near Libby, Mont.

W. B. WASHINGTON of La Colorada, Sonora, Mexico, is at Santa Rosa, San Salvador, engaged in the construction of a cyanide plant for the Minas Pretas syndicate.

JOHN W. DUDLEY of Washington, D. C., and P. M. Mullan of Nebraska have been appointed, respectively, register and receiver of the U. S. Land Office at Juneau, Alaska.

GEO. W. STARR, Supt. of the Empire mine at Grass Valley, Cal., has received the additional appointment of general manager of the North Bloomfield M. Co. at North Bloomfield, Cal.

Books Received.

"Report on Forest Reserves and Adjacent Timber Regions for 1899," by Henry Garnett, has been issued as Part V of the XXI annual report of the U. S. Geological Survey. Royal, 8mo, 711 pages, 143 plates and maps. The report includes reports on the Olympic mountains in Washington, Cascade Range in Oregon and Washington, Stanislaus and Lake Tahoe timber reserves in California, Lewis & Clarke reserve in Montana, and others. The volume can be obtained by application to the Director, U. S. Geological Survey, Washington, D. C.

Catalogues Received.

The Link-Belt Machinery Co. of Chicago, Ill., have issued catalogue No. 30 on "Modern Methods, Gold Dredging and Placer Mining Machinery." By engineers and operators of placer mines the catalogue will be found useful for reference and as a source of suggestion for operative practice, besides presenting clearly the special machinery made by the manufacturers. The Link-Belt Machinery Co., on application to their office, Twenty-ninth St. and Stewart Ave., Chicago, Ill., will mail the catalogue.

The Tracy Engineering Co. has issued a catalogue descriptive of, and illustrating the Fred G. King pocket reconnaissance instrument, a new surveying instrument, particularly designed for the use of miners and prospectors, and for surveyors needing for rapid reconnaissance work a single instrument adaptable to all the varied conditions and requirements of such work. The Tracy Engineering Co. will be pleased to mail the catalogue to those interested on application to its office at 151 Fremont St., San Francisco, Cal.

Standard Diamond Drill Co. of Chicago, Ill., has issued a catalogue on its diamond prospecting core drills. The company continues the manufacture of the Bullock diamond drills with the improvements that have been developed from experience with their use. The catalogue, as well as being descriptive of the machinery, is an up-to-date text book on diamond drill prospecting, which is coming more and more into every-day use about mines. The Standard Diamond Drill Co. will be pleased to mail their catalogue on application being made to its office at Chicago, Ill.

Pawling & Harnischfeger of Milwaukee, Wis., have issued Bulletin No. 7, a catalogue on the traveling electric hoists manufactured by them. The feature of these machines, of which the catalogue is particularly descriptive, is they have self-contained the full hoisting capacity as well as the full traveling power. Another novelty to many will be the type of the machine itself, which reverses the system of moving bodies about shops and yards, using overhead runways instead of floor trackage. The catalogue will be mailed on application to the Pawling & Harnischfeger Co. at Milwaukee, Wis.

The Trenton Iron Co., of Trenton, N. J., has issued its 1902 catalogue on the application of wire rope to haulage, shafts and inclined planes. It is illustrated with cuts of several types of engines and hoisting drums, and diagrams showing the details of application and subsidiary devices as modified by the varying conditions presented by practical mining. The sixty-four pages of this handy little catalogue contain a great deal of suggestive information on mine transportation, for mine managers and superintendents, and it will be found a useful addition to their pocket libraries of reference books. It can be had on application to the Trenton Iron Co., at Trenton, N. J.

Commercial Paragraphs.

F. M. DRESCHER and G. H. MacGregor, mining engineers and assayers, have located at Central City, Colo., buying out the business of the Cyclops Assay Office at that place.

THE Denver Engineering Works Co. reports a growing demand for electric hoists to displace steam hoists in the Utah and Colorado coal fields. It has recently shipped two 135 H. P. single-drum electric hoists, equipped with railway motors and controllers for a 500-volt circuit, to Castle Gate, Utah, for the Utah Fuel Co., which now has in successful operation a number of electric hoists built by this company, one of which, of the double-drum type, 135 H. P. capacity, is operating on an incline, hauling cars at a high rate of speed for a distance of over a mile.

THE Crocker-Wheeler Co. of Ampere, N. J., reports a large increase in the demand for its Crane motors and equipments of from 1 to 60 H. P. and in the various types designed to fulfill the several applications of cranes to trolley, bridge and hoist work. In motors the following are recent shipments on orders received in the past few weeks: Four motors, size 45, 50 H. P. output; eleven motors, size 22, 30 H. P. output; twenty-five motors, size 14, 15 H. P. output; four motors, size 6, 10 H. P. output; eleven motors, size 6, 7½ H. P. output; fourteen motors, size 2½, 2½ H. P. output.

THE Westinghouse Electric & Mfg. Co. of Pittsburg, Pa., reports the sale of two rotary converters of 300 K. W. each to the Manchester, N. H., Traction, Light & Power Co., to be located at Hooksett, N. H. They will deliver power for the operation of the Concord & Manchester branch of the Boston & Maine Railroad. The machines are to be supplied with a three-phase alternating current and will deliver direct current at 600 volts. Also, the sale of two rotary converters to the South Covington & Cincinnati Street Railway Co., Cincinnati, O., one being of 200 K. W. capacity and the other of 400 K. W. capacity.

Latest Market Reports.

SAN FRANCISCO, April 30, 1902.

METALS.

SILVER.—Per oz., Troy: London, 23½d (standard ounce, 925 fine); New York, bar silver, 51c, refined (1000 fine); San Francisco, 51c; Mexican dollars, 44½c San Francisco, 41c New York.

COPPER.—New York: Standard, $11.00@11.15; Lake, 1 to 3 casks, $12.00; carload lots, $11.75; Electrolytic, 1 to 3 casks, $12.00; carload lots, $11.62½; Casting, 1 to 3 casks, $12.62½; carload lots, $11.37½. San Francisco: $14.00. Mill copper plates, $17.00; bars, 18@24c. London: £52 5s per ton.

LEAD.—New York, $4.12½; Salt Lake City, $3.60; St. Louis, $4.00; San Francisco $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; plg, $4.75. London, £11 15s per ton.

SPELTER.—New York, $4.42½; St. Louis, $4.00; London, £18 2s 6d per ton; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, $28.25; San Francisco, ton lots, 30c; 1000 lbs., 30½c; 500 lbs., 30¼c; 200 lbs., 30½c; less, 31c; bar tin, ℔ lb, 35c.

PLATINUM.—San Francisco, crude, $17 ℔ oz.; New York, $18 per Troy oz

QUICKSILVER.—New York, $50.00 large lots; London, £8 15s; San Francisco, local, $47.50 ℔ flask of 76½ lbs.; Denver, $51.00. Export, $45.00.

BABBITT METAL.—San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER.—Half-and-half, 100-lb. lots, 19.30c; San Francisco, Plumbers', 100-lb. lots, 16c.

NICKEL.—New York, 50@60c ℔ lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $17.25; gray forge, $17.75; San Francisco, bar, 2.75 ℔ lb.,3c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $31.75; open hearth billets, $32.25; San Francisco, bar, 7c to 12c per lb.

CEMENT.—Germania, $2.65; K. B. & S., $2.65; Hewmoor, $2.50; Trowell, $2.50 per bbl.

LIME.—Santa Cruz, $1.60; Roche Harbor, $1.60 per bbl.

LUMBER.—(Retail): Pine, ordinary sizes, $18.00@19 50; extra sizes higher; redwood, $19.00@20.00; lath, 4 feet, $3.90 @4.00; pickets, $19 00; shingles, $2.00 for No. 1 and $1.75 for No. 2; shakes, $13.00 for split and $14.00 for sawed; rustic, $25.00 @31.00.

GENERAL SUPPLIES.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.50; Cut, $3.50; 10d to 16d, Wire, $3.55; Cut, $3.55; 8d, Wire, $3.60; Cut, $3.60; 6d and 7d, Wire, $3.70; Cut, $3.70; 4d and 5d, Wire, $3.80; Cut, $3.80; 3d, Wire, $3.95; Cut, $3.95; 2d, Wire, $4.20; Cut, $4.20. Special rates for carload lots.

POWDER.—F. o. h. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one toss 15½c. No. 1** 50%, carload lots, 11½c; led, than one ton, 13½c. No. 2, 40%, carloan lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ℔ set; 14 oz., 40s., 9c.

COAL.—San Francisco, coast, yard prices: Wellington, $9; Seattle, $6.50; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $9.56, long ton; Colorado Anthracite, $14.00. Coke, $15 per ton in bulk, $17 in sacks; Sunnyside, $11 75, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 29@30c ℔ lb.; carloads, 27@28c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c ℔ lb.; soda ash, $1.90 ℔ 100 lbs.; hyposulphite of soda, 2½@3c ℔ lb.; blue vitriol, 5½@6½c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 5c; alum, $1.90@2.00; flour sulphur, French, 2½@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.25 @1.50 ℔ 100 lbs.; sks, $1.05; chloride of lime, spot, $2.50@2.60; nitrate of potash, in bbls, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, boiled, bbl., 76c; cs., 81c; raw, bbl., 74c; cs., 79c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 66c; cs, 71c; raw, bbl., 64c; cs, 69c. Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bbls, 19c; wooden bbls., 22½c; cs, 25c; Mineral Sperm, cs, 26½c; Deodorized Stove Gasoline, bulk, 15½c; do., cs., 21½c; 86° Gasoline, bulk, 20c; do., cs., 26½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14c; do., in cs., 20½c; Lard Oil, No. 1 bbl., 60c: cs., 65c; Neatsfoot Oil, bbl., 70c; cs., 72½c; No. 1 bbl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6¾c; 1 ton and less than 5 tons, per lb., 7c; 500 lbs. and less than 1 ton, per lb, 7¼c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6¾c; do. in kegs, 7¼c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7¼c; less than 500 lbs., 7½c.

ASSAY LITHARGE.—Per lb., 9c.

BISMUTH.—Subnitrate, per lb., $1.60.

BONE ASH.—3c ℔ lb.

BORAX.—Crystal, 7c; calcined, 20c.

CHROMIUM.—(90% and over) per lb., $1.25.

COPPER.—Carbonate, 20c; Red oxide, ℔ lb., 60c.

MAGNESIUM.—Per lb., $3.00.

MANGANESE.—(90% and over) ℔ lb., $1.25.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—25c. ℔ gramme; 1000 grammes=2¼ lbs.

PHOSPHORUS.—(American) ℔ lb., 80c.

SILVER.—Chloride, ℔ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ℔ lb., $1.00

URANIUM.—Oxide, ℔ lb., $3.50.

ZINC.—Metallic, chemically pure, ℔ lb., 50c.

ZINC.—Dust, ℔ lb., 10c.

ZINC.—Sulphate, ℔ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING APRIL 22, 1902.

698,386.—TELEPHONE SYSTEM—A. K. Andriano, S. F.

698,188.—WINDOW SASH—P. Barnum, S. F.

698,244.—COMPENSATING MOTORS—F. G. Baum, Stanford University, Cal.

698,245.—COMPENSATING MOTORS—F. G. Baum, Stanford University, Cal.

698,359.—PULLEY HANGER—J. W. Berry, Tacoma, Wash.

698,250.—RAIL BOND—G. B. Blanchard, Tacoma, Wash.

698,251.—RAIL BOND—G. B. Blanchard, Tacoma, Wash.

698,361.—OIL BURNER—W. Booth, S. F.

698,253.—MOVING BOULDERS—P. Bowery, Weaverville, Cal.

698,105.—GOLD SAVING DEVICE—L. D. Craig, S. F.

698,378.—STAMP STEM GUIDE—D. C. Demarest, Angels Camp, Cal.

698,278.—LAMP HANGER—H. J. Harrison, Juneau, Alaska.

698,016.—CYANIDE TANK—J. J. Hervey, Randsburg, Cal.

698,280.—MATRIX BAND RETAINER—A. J. Hiniker, S. F.

698,288.—WRENCH—L. W. Johnson, Jerome, Ariz.

698,312.—STOVE FIRE BOX—J. P. Neeley, Centralia, Wash.

698,134.—DRYING LUMBER—H. B. Phillips, Berkeley, Cal.

698,052.—DOOR GUIDE—W. N. G. Place, Seattle, Wash.

698,142.—BUTTONHOLE CUTTER—C. L. Rogers, Seattle, Wash.

698,227.—SHELF HOOK—C. A. Schrader, San Diego, Cal.

698,067.—BASKET PACKER—F. H. Smith, Wrights, Cal.

698,081.—PLOW—W. Turner, Paso Robles, Cal.

Recently Declared Mining Dividends.

Boston & Montana Con. C. & S. M. Co., quarterly $2 per share	April 17

SITUATIONS WANTED.

POSITION WANTED BY YOUNG ASSAYER. Understands analysis and working tests of ores. Address H. W., care this office.

SKILLED MILLMAN, ASSAYER, etc., wants work. Experience gained in camps of five States. Reference letters on addressing "1902," this office.

Thoroughly experienced and reliable Chemist, Assayer and Millman open for engagement. Ten years' Western States, Canada and Central American experience. Address "Oriand," care of Mining and Scientific Press.

CHEMIST AND ASSAYER, with experience in mining, at present employed with large copper and lead smelting company in Mexico, seeks position as chief chemist or assistant superintendent. Has practical furnace work experience Address "Furnace," care of Mining and Scientific Press.

WANTED.—By a young School of Mines graduate, a position with reliable mining company as assayer, chemist and surveyor. Considerable surveying practice, besides one season with U. S. Geo. survey. Can handle both and more, if necessary, for small company. State salary Have had practical mining experience. Good references. Address "Worker," care of this office.

WANTED.—Position by an experienced and reliable assayer of all metals, and Bookkeeper. Has also had five years' experience in general merchandise business. Will give references from one of the best gold-producing quartz mines in California. Wire or write E. C. M. W., care of Mining and Scientific Press.

MINING ENGINEER, practical miner and mill man, assayer, etc., desires position of superintendent or assistant manager of a big property. Eleven years' experience. Best references. Now working in southern California. Address A. M. P., care of Mining and Scientific Press.

WANTED.—SITUATION AFTER MARCH 15, 1902, as Manager or Superintendent of mine. Have had five years' experience in manufacturing and constructing mining machinery and plants. Three years' experience in underground work Four years' experience as manager and superintendent. Treatment of low grade ores a specialty. Practical in every detail. State location of mine and salary. Best of references. Address X. Y. Z., this office

WANTED.

WANTED.—A PRACTICAL CONCENTRATOR man, one who has had considerable experience with bornites and copper glance ores. State references and salary. Address "ETHEL" Copper Mining Co., Index, Wash.

WANTED TO BUY:

Interest in or all of a going Sampling Works, Ore Business, or Smelting Works. Address with particulars, L. X. D., Mining and Scientific Press, 330 Market St., San Francisco, Cal.

WANTED, for a developed mine in California, a competent mining engineer to look after development and exploration. Must be a full graduate of a recognized mining college and have had several years' practical experience in large iron, coal or copper mines, and be fully skilled in the engineering problems pertaining to extraction, haulage, ventilation, etc. Give full particulars of career, experience, age, etc., to "Vulcan," care of this paper.

WANTED.—A FIRST-CLASS MILL FOREman for 30-stamp mill with concentrators and cyanide tailing plant. Middle-aged or young man of education and extensive experience in above line preferred; must be thoroughly sober and furnish good references as to experience and character, give comp ete information as to experience, age, salary wanted, etc Address "Mill Foreman," care of Mining and Scientific Press.

WANTED.

Consulting Mining Engineer,

familiar with making examinations of mines, prospects and mineral lands. Address stating experience and references. Moderate salary to start, with advancement to competent man. Position permanent if found satisfactory. Address A., care of Mining and Scientific Press.

STAMP MILL WANTED,

either ten or twenty stamps, second hand, as near Amador County, California, as possible. Must be in good condition, and low as to price—advertiser has himself built mills and then tried to sell, so don't quote fancy figures Water-power mill preferred; steam no objection, however. Give full details, price, location, condition. Concentrators acceptable if with plant. Will also buy small hoist and any good second hand mine equipment. Address E. N. DARLING, 9 Pine St., New York.

WANT TO INTEREST PARTIES

in group of mines (70 acres) working under bond and lease, profitably shipping 160 tons per month of lead ores. Have developed large reserves of excellent carbonate and sulphide ores of the best of concentrating material Mill and lead smelter near mine. Will stand a rigid examination.

Address DAN C. TOBIN,
White Pine, Gunnison Co., Colo

Wanted, Capital

to develop a group of mining claims recently discovered in northern California Six lode locations from 10 to 30 feet in width, carrying gold, silver and copper.

For further particulars, apply to

AUGUST QUITZOW,
CRESCENT CITY, CAL.

FOR SALE.

FOR SALE.—Controlling interest in an option on 1700 acres of ground, patented, carrying large bodies of gold, silver and copper ores, with ample wood and water, in Sonora, Mexico Money to be used to secure title, develop, and erect plant. For coin guaranteed report, address Lock Box 35, Redwood, Cal.

QUARTZ AND PLACER PROPERTIES in Siskiyou Co., Cal., for Sale.

Collections attended to. B. K. COLLIER, Attorney-at-Law, Etna Mills, Cal.

The Mines Exchange, Ltd.

Mines and prospects in British Columbia, the Western States, and Mexico, for sale.
Free milling gold properties a specialty.
Write us for reports and information.
Bank references given.
Address THE MINES EXCHANGE, LTD.,
P. O. Box 700, Nelson, B. C.
Branch Office: P. O. Box 594, Salmon City, Idaho.

158 42/100 Acres of Dredging Property for Sale.

Best location for dredger. Two power lines within ¼ mile. Blueprints furnished to reliable parties, so no agents need apply. Nearest working dredge 1 mile. One building within ¼ mile.

For particulars, address J. H. G. H., Charden, Butte Co., Cal.

FOR SALE.

Gold Mine near Jamestown, Tuolumne Co., Cal., developed and ready for a mill; ore milled $20 per ton; price, $10,000 on hand. Also eight patented Mother Lode claims, all connected and well located, for $75,000. Call or write.

MINING BUREAU & REAL ESTATE CO.,
189-190 Crocker Building, San Francisco.

FOR SALE.

Three patented and joining placer claims with seven (7000) thousand tons or more of tailings, having an average assay value of five ($5.00) dollars per ton in gold.

Price, five thousand ($5,000.00) dollars.

For particulars, address

JOHN P. SCHMIT,
Helena, Montana.

FOR SALE.

On White's Gulch, Liberty Mining District, Salmon River Country. P. O. Sawyers Bar, Box 93, Siskiyou Co., Cal.

Group of mines, 7 in all. Large low-grade proposition. Gold and sulphurets—a No. 1 free-milling proposition. To be worked on large scale Thousands of tons of $5 and $6 ore in sight. Developed for over 3000 feet by tunnels and cuts. Timber and water. Close to wagon road, and out of deep snow.

Cash sale, or bond and lease with amount down on stated sum per month. Address owner,
HENRY H. MERRIAM.

Gold Mine for Sale,

Three Miles from Sierra City, Cal.

20-Stamp Mill complete; two Hoisting Works, with ore and water skips; wire rope, with 1500 feet of No. 12 sheet iron pipe, 18 in. diameter, connected to mill and hoisting works; blacksmith shop; boarding house; miners' cabins. For information and price, apply to

KNIGHT & CO.,
SUTTER CREEK, CAL.

Lallie's U. S. Standard narrow steel tapes with Patented SELF-ACTING METAL Reels, for long lengths, are the favorites with the Civil and Mining Engineers throughout the Rocky Mountain region. Catalog and prices upon application. Lallie Instrument Co., 1622 Arapahoe St., Denver, Colo.

Molybdenum Ores.

PACIFIC MOLYBDENITE MINING & REDUCTION CO.
594 Parrott Bldg., San Francisco, Cal.
BUYERS OF HIGH-GRADE ORES, CONCENTRATES OR INGOTS.

BEGEER'S
IMPROVEMENT OF
Cyanide Process.

Insures highest and quickest possible extraction. Does not increase working cost; can be attached to any cyanide plant at small expense. Does not present any mechanical difficulties and does not foul solutions. Has doubled leaching capacity in practical mill operation and thereby greatly reduced working expenses.

Write for particulars to

G. E. ALEXANDER,
McPhee Building,
DENVER, COLO.

ASSESSMENT NOTICES.

SILVER KING MINING COMPANY.—Location of principal place of business, San Francisco. California; location of works, Pioneer Mining District, Pinal County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of April, 1902, an assessment (No. 24) of one ($1) dollar per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 310 Pine street, Room 36, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of May, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 24th day of June, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors
J. W. PEW, Secretary.
Office—310 Pine street, Room 36, San Francisco, California.

VIRGINIA CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of April, 1902, an assessment (No. 12) of two cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, No. 147 Larkin street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of May, 1902, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 26th day of May, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
B. A. BENARD, Secretary.
Office—147 Larkin street, San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of April, 1902, an assessment (No. 29) of seven (7) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of June, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 18th day of July, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CHAS. BOVONE, Secretary.
Office—217 Sacramento street, San Francisco, California.

DELINQUENT SALE NOTICE.

LARKIN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Placerville, El Dorado County, Cal if rnia.

Notice.—There are delinquent upon the following described stock on account of assessment (No. 12) levied on the 5th day of March, 1902, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
W. E. Lutz	10	100	2 00
J. B. Quigley	291	250	5 00
J. B. Quigley	314	500	10 00
J. B Quigley, Trustee	316	500	10 00
Dr. Owen Buck and	324	200	4 00
Dr. Owen Buckland	325	200	4 00
Dr. Owen Buckland	326	100	2 00
W J Likens	336	200	4 00
Chas. Downing	344	1,334	26 68
H. M. Holbrook	362	1,000	20 00
Dr. Owen Buckland	369	500	10 00
J. B Quigley	375	250	5 00
W. O. Johnson	397	75	1 50
Ella Kirkham	404	200	4 00
W. T Lally	414	300	6 00
W. T. Lally	415	200	4 00

And in accordance with law, and an order of the Board of Directors, made on the 5th day of March, 1902, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 112 Main street, San Francisco, California, on MONDAY, the 5th day of May, 1902, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. F. REMINGTON, Secretary.
Office—112 Main street, San Francisco, California.

Notice of Removal of Principal Place of Business of Corporation.

WHEREAS, at a special meeting duly called and noticed, of the Directors of the HASKELL GOLD MINING COMPANY, held at the office of Company in San Francisco, the 24th day of April, 1902, a resolution was duly adopted that the principal place of business of the Company be changed and removed from San Francisco, California, to the City of Auburn, County of Placer, State aforesaid, and that notice thereof be published at least once a week for three successive weeks in some newspaper published in the City and County of San Francisco; and

WHEREAS, at said meeting the consent in writing to said change and removal of Stockholders holding more than two-thirds of the capital stock of the company was obtained and filed in the office of the Company,

NOW THEREFORE, notice is hereby given that the HASKELL GOLD MINING COMPANY (a corporation organized and existing under and by virtue of the laws of the State of California) which has heretofore had its principal place of business at San Francisco, State of California, intends to change and remove its said principal place of business from the said City and County of San Francisco, State of California, to the City of Auburn, County of Placer, State of California.

HASKELL GOLD MINING COMPANY,
By HAROLD T POWERS, President.
By order of the Board of Directors.

NOTICE OF ANNUAL MEETING OF STOCKHOLDERS.

In accordance with the By-Laws of that Company the regular Annual Meeting of the Stockholders of the Jamison Mining Company, for the purpose of electing Directors for the ensuing year and transacting such other business as may properly come before it, will be held at the office of the Company, Room 620 Hayward Building, northeast corner of California and Montgomery Streets, San Francisco, California, at 2 o'clock P. M. on Monday, the 19th day of May, 1902.

By order of the Board of Directors.
SAM W. CHEYNEY, Secretary.

To Stockholders of the Jamison Mining Company:

REMOVAL OF THE SAN FRANCISCO OFFICES OF THE COMPANY.

By order of the Board of Directors, made at a meeting of Tuesday, April 29th, 1902, the San Francisco offices of the Company were changed from 120 Sutter Street to Room 620 Hayward Building, northeast corner of California and Montgomery Streets, San Francisco, California.

SAM. W. CHEYNEY, Secretary.

Whole No. 2181.—VOLUME LXXXIV. Number 19. SAN FRANCISCO, CAL., SATURDAY, MAY 10, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Economic Tendency in Metal Mining.

The Amalgamated Copper Co. is reported as arranging to buy a coal mine in Montana to supply fuel to its mining and smelting plants at Butte and Anaconda. The transaction as an instance would not have any special significance. It is, however, more than an instance. It is one of the steps of development in the commercial operation of copper production, which in the beginning increasing the profit margin on production by adding another profit to it, in the end lowers the market sale price of the metal. The profit on the coke consumed in producing copper, which was a cost charge against the copper produced, becomes by the change in ownership an additional profit on the copper production. It is only a fraction of a cent on each pound of copper produced, but to that extent gives the producer, the Amalgamated Copper Co., a commercial advantage in the consuming market against other producers who pay a cost charge for coke consumed instead of receiving double the sum as a profit on copper produced. In the end the competing copper producers will be forced to do just what the Amalgamated Copper Co. is reported as doing. They will own their own coal mines and by doing so restore the equality of competitive conditions. When this happens the market sale price is certain to take a lower permanent level, for a survival of producers will then depend on which ones can then stand with the least possible profit.

The economic meaning of the incident can best be expressed in a very broad generalization. The tendency is to make producing industries self-contained. The producer under the spur of competition finds that he can most successfully protect the profit of his production by eliminating other producers' profits as cost charges. This is effected by making their production subsidiary to his. It is this economic tendency which has developed the steel making business until it embraces as details the mining of all the raw material, iron ore, flux, coal, ores used to make alloys, the transportation of these ores, the manufacture of steel into directly consumable finished forms, and the transportation of the finished production to the consuming point. The last may seem a surprising statement, but it is declared that the substantial consolidation of Trans-Atlantic steamship lines had as one of the business motives inspiring it, the transportation of the steel production of the United States Steel Co. to European markets. Within the last few days the transportation of 1,500,000 tons of steel rails for a railroad in China is stated to be the incentive to the establishment of a new Trans-Pacific steamship line from San Francisco.

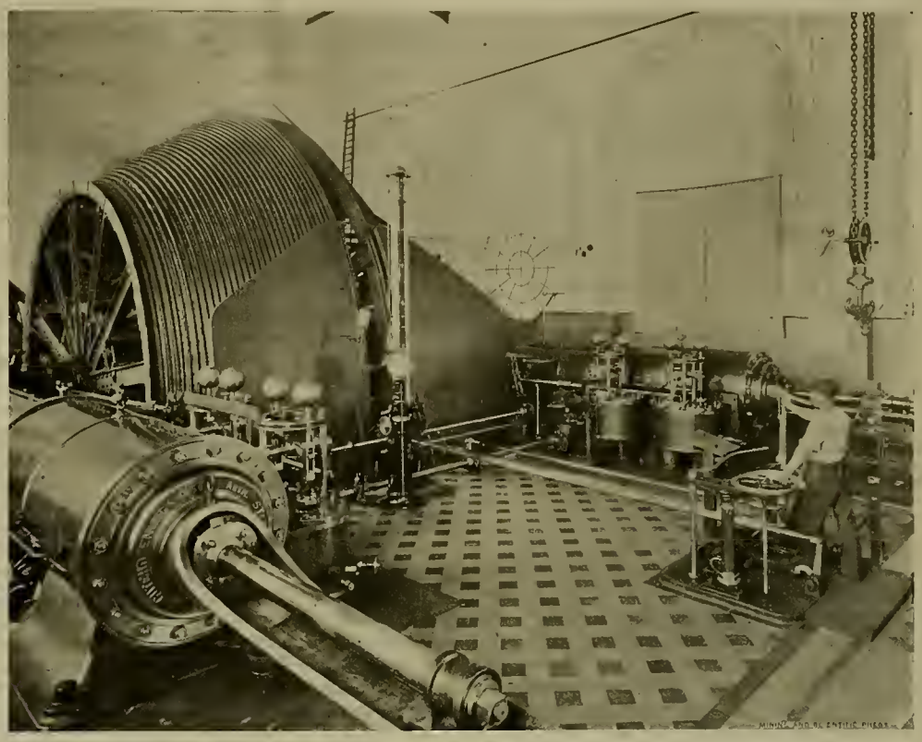

Fig. 1.—Main Steam Hoist at Gewerkschaft Glueckauf at Sonderhausen, Germany.—(See Page 259.)

What has happened in the steel production industry is happening in the copper producing industry, as a result of the operation of precisely the same causes. The consumption of copper has increased enormously, despite the high prices that attended it. The production has been increased even more and competition of producers is compelling the enlargement of the operations of producers to protect profits. The process is proceeding by steps, not all of them at once, not the same steps everywhere, but all enlarging operations, and each one as made proving for that particular producer, not the end, but merely the place for another step.

The Amalgamated Copper Co. has bought coal mines and operates smelters and refineries as details of its business. The controlling interests in it are the controlling interests in the large copper manufacturing industries. It is but a step into New Jersey to combine the two. Another great copper producer refines and manufactures, but does not transport it to market. Another producer owns coal mines and has built its own railroads for transportation in Arizona. Another cuts down transportation by devising and putting in operation a plant which is self-contained in that it mines the ore, reduces and refines it, entirely independent of transportation to it of fuel or reagents.

The point is that copper production does not as it once did, begin and end with copper ore mining, but is a complex commercial business in which the mining is a detail. Ultimately the mine will again become the determining detail, but in this transition stage there are many more important details to be first considered in determining the commercial availability of the mine. Great industrial movements are a succession of steps. At present the tendency is to make the steps rapidly, and even to short cut them to an apparent end as has been done in steel manufacture. It is well for copper producers and copper mine owners to realize that the same movement is in progress in their industry.

Fig. 2.—Underground Station at Gewerkschaft Glueckauf at Sonderhausen, Germany.—(See Page 259.)

Mining and Metallurgical Patents; Sinking a Shaft by the Freezing Process at Ronnenberg, Germany; The Simplon Tunnel, 260. Personal; Commercial Paragraphs; New Patents; Notices of Recent Patents; Recently Declared Mining Dividends; Obituary, 264.

In this number is the beginning of a paper on "Costs and Profits in Pyritic Smelting of Low Grade Copper Ores," by F. H. Prentiss, which should particularly receive the attention of our readers who are interested in pyritic smelting propositions. It is the process of concentration by fire offering the largest possibilities of profits from low-grade pyritic ores. Mr. Prentiss has made an analysis of the process from the commercial standpoint with a view to its utilization under some particularly common adverse conditions which exist in the Pacific Coast States and Alaska. Low percentages of copper and small values in gold and silver with highly siliceous gangues are a common type of this hard pyritic ore. High costs of coke, absence of limestone, and impossible transportation for low value ore are equally common conditions. The determination of the most economic scheme of treatment where the end sought, profit, is a function of several variables, is not a simple matter. The analysis made by Mr. Prentiss simplifies it nevertheless. It is quite possible, making use of the data so fully and clearly presented in his tables, to arrive at possible solutions of some problems in pyritic smelting, more surely, and with much less labor, than if their use was not available. One fact made quite prominent in the discussion, which promoters of pyritic smelting propositions seem to avoid, is the difference between the assay value of an ore and what the writer terms its matting value, the latter being its important commercial value, while the former is chiefly interesting to the entbusiastic company promoter.

Mistakes in mining that can be avoided should not happen. They would not happen but that the cost of the investigation that would avoid them is deemed a waste of good money by many people who mine. It is with difficulty realized that the mistake is quite sure, if made, to prove more costly than the expense of avoiding the mistake. A characteristic attitude on this proposition is disclosed in the self-confidence of a mine operator, who, on being asked by a manufacturer to describe the conditions under which he would have to operate the gold dredger, the construction of which he was negotiating for, replied: "What differences do the conditions make? A dredger is a dredger, is it not? Give me the cost of one." The operator was bidding for a mining failure that could be avoided. What may be termed the mechanics of mining is a science pretty well understood by men who make it serious business. The problems of mining that are purely mechanical can be eliminated of avoidable mistakes by investigating them in advance of trying to do them. It costs something, but the investment in knowledge pays. Surveys and assays cost much less than breaking hard rock. Comparatively a few tons of rock left unbroken in place will pay for the surveys and assays that leave it undisturbed. The same considerations apply in buying metallurgical machinery. The facilities exist for testing in advance its capability. The cost of this is under no conditions a waste, and, no matter how high it may seem, should be paid for the knowledge given in exchange. The avoidance of a mistake by this investigation is sure to prove less expensive than rectifying it.

Cripple Creek, Colo., Mine Drainage.

The Chamber of Commerce at Cripple Creek, Colo., has taken up the question of deep drainage of the Cripple Creek mines with a view to securing a joining of the interests affected in starting actual work without unnecessary delay. It has been suggested that the plan of action be modeled on the irrigation district organizations of California. Experience with this form of organization has not been particularly successful. The conditions of the problem are different in degree, if not in kind, between taking water out of Cripple Creek wet mines and putting water on dry lands in California.

Leaving out of consideration the practical difference between the political organization of irrigation districts, and the private corporate organization which it is assumed it is the intention to provide at Cripple Creek, the system of assessment or taxation of the irrigation districts would be entirely unsuited to a mine drainage problem. In this last there must be an equating between costs and services rendered. The location of the drainage works cannot be so made as to make the cost a matter of flat division based on superficial area of claims. The depth of drainage is an element that must be computed with the surface. The difference in the times that the drainage will become effective as the works advance is also a most important element affecting the incidence of the cost of the works. It is essential, also, that as between proved claims and unknown undeveloped ground there should be such a difference in the incidence of the assessment of cost that unknown undeveloped ground will be neither confiscated nor compelled to advance costs that may never be repaid. It is possible to adjust even this question satisfactorily in advance.

The fact can be conceded without argument that the construction of a drainage system to great depth will be profitable to the developed mines alone, leaving unproved and unknown ground entirely out of account. The latter should not receive the benefit of drainage, provided the drainage should prove a benefit, without contributing on precisely the same basis as the developed mines. This can be by agreement made a deferred payment for which the production of the ground can be obligated.

It is to be hoped that the owners of mines and mining ground in Cripple Creek district will unite without exception to accomplish this scheme of common drainage. There should be a public sentiment on the matter so strong that the rights of way should be granted without cost or difficulty. The mine owners should so organize that the work would be accomplished and maintained at cost. All possibilities of the kind of opposition which delayed the completion of the Sutro tunnel should be avoided from the start. It should be a pull together on the part of the mine operators and people of Cripple Creek and everybody should be pulling.

Time is a vital element in such an undertaking. Deferring it lessens the values in the ground that make it desirable. Primarily it is the mines above drainage level that the drainage facilities are provided for. The Comstock lode at Virginia City, Nev., furnishes an object lesson in mine drainage that Cripple Creek can study with benefit. Does any one suppose that if its building had been delayed to the '80s that it would ever have been built? Does any one suppose that if it was not built there would be any mining in the Comstock lode now or that there would now be any Virginia City? On the other hand, if the tunnel had been completed ten years earlier, an enormous saving of cost of pumping and hoisting would have resulted during the period of mining of the bonanza ores, increasing the dividends from them and increasing the deep working of the mines while they were making the output to pay the costs.

The Mother Lode in California.

The mother lode in California does not lose its productiveness in gold with increasing years. If changing at all it is increasing its output. Twenty years ago there was just one mine on the mother lode in Amador county operating, and in Calaveras and Tuolumne counties not more than two or three in each. In El Dorado and Mariposa counties none at all were in operation. The change from then is striking. In Amador county, at Plymouth, a dozen mines, unknown or little known twenty years ago, are developing into the producing stage. Going south along the lode the Gover and Fremont mines on the 800-foot level have 120 feet width of pay ore milling up to $7 a ton. The old Keystone mine, at Amador, has a pay lode from 90 to 200 feet wide, on which mining is just commencing. The Spring Hill mine, at the same place, has also a great body of pay ore. At Sutter Creek the Kennedy, Argonaut, Central Eureka, South Eureka and Wildman-Mahoney are all producing from ore bodies — some near the surface, in ground missed in the early exploitation of these mines, others at depths far below what it was considered was the bottom of pay ore two decades since.

In Calaveras county the Gwin mine is increasing its already large output; the Melones has just started up with an enormous body of proved ore blocked out, ready for breaking for the mill. The Sheep Ranch mine, on the east belt of the lode, is proving the beginning of a new mine where the bottom of an old one was supposed to be. All of these in the '80s were considered worked out and were abandoned by the owners; yet they are greater mines to-day than ever before. Another mine, the Royal, is working in a 60-foot wide ore body and considering a 200-stamp mill. In Tuolumne county there is observable the same change from abandoned mines and silent mills to active going concerns more productive than ever before, and more firmly established as to permanence of operation. The preceding records but a small part of the active and successful gold mining of the mother lode. It is not an activity that attracts much outside attention. It is accepted as a matter of course by those who best know it. It is not at all spectacular. No great combinations of outside capital play with it as if it were a pawn in a bankers' game of high finance. It is simply a free, self-contained mining industry, the opportunities of which are not monopolized, simply because monopoly of them is impossible.

Reports are being made of finds of gold-bearing quartz ledges in the vicinity of Happy Camp, Siskiyou county, Cal. The locality is a new one for gold quartz discoveries, though the district was noted between thirty and forty years ago as a good placer mining camp. This late discovery is simply another illustration of the conservatism of the old '49 miner of California, and the persistence of the repute of a mining district. The old California placer miner has always clung to the idea that where there were good placer diggings there could be no good quartz ledges. Consequently, he would not look for or prospect them. Happy Camp, once aquiring the distinction of being a good placer camp, at the same time gained the repute of having no quartz ledges of value. Being far from a railroad, and until quite recently without even a wagon road, the district was passing out of sight entirely until discoveries of copper ores in the Waldo district of Josephine county, Or., attracted prospectors who knew nothing of the old repute of the district. It is these new prospectors who are finding the ledges that are gold bearing. It is too soon to call them anything more than prospects, but there is every reason to anticipate that, developed, some of them will prove to be mines, and give a new lease of life—and a new kind of life—to one of the last of the placer mining camps of the early days of California.

The southern part of California is like the central and northern sections, proving that after a half century's mining there are both new mines to be discovered and old ones to be reopened. From Kern county a report comes of a discovery of lode outcroppings identical, physically and in gold and silver values, with the lodes of Tonopah, Nev.

Concentrates.

SAN JUAN COUNTY, COLO., mines have nearly 20 miles of areal tramway line in use or projected for immediate construction.

A NICKEL-STEEL ALLOY containing 36% of nickel has the lowest coefficient of expansion of any metal known, being 0.0000005 for 1° F.

FRESHLY CUT zinc shavings give better results in the cyanide process than where they have been cut a considerable period of time before use.

THE singing of telegraph poles is really the note of vibration of the wires conducted through the pole to the ear so that sound seems to come from it.

SECRETARY MAHONE has issued the official call for the convention of the International Mining Congress at Butte, Mont., to meet on September 1.

MANGANESE ORE deposits in California are not commercially available at present, owing to the absence of steel-making works on the Pacific coast.

THE mineral in which platinum is found in place as a lode deposit is sperrylite. It is found associated with the sulphide and arsenical ores of copper and nickel.

MANCHURIA, in northern China, has an area of about 400,000 square miles, being about twice as large as France or the State of Texas. It has never been accurately mapped.

SCRAP STEEL is used in making steel by the open-hearth process. The demand for it is increasing with the cleaning up of old accumulations at points near the furnaces.

CONCENTRATES should be briquetted for feeding to a blast furnace to avoid the loss resulting from the blast carrying the finely divided material out through the furnace stack.

THE repeal of the war tax by Congress will make it unnecessary after July 1 of this year to stamp mining stock certificates. All stock transferred before that date is subject to the tax.

A SAVING of a few cents a ton in the costs of a large mine output, where quantity counts, will pay high salaries to the brains that accomplish it, and a profit to the mine operator as well.

COLEMANITE is found in veins or beds on Furnace creek in Death valley, Inyo county, Cal. The deposits are identical with those mined at Calico, Cal., about 160 miles south of Furnace creek.

A VERY small percentage difference in the carbon of coke will account for a noticeable difference in its melting power in a blast furnace. Coke should be bought on assay and the carbon should be at least 86.5%.

SPECULAR IRON is a variety of hematite. It is foliated and micaceous in occurrence and has a high metallic luster. It is a common variety of what is known as hard iron ore in the Lake Michigan iron districts.

EXPERIMENT has disclosed that copper is reduced in strength by being heated, and by being chilled is rendered brittle. Alternate heating and cooling produces molecular changes which deteriorate it for some uses.

THE cost of opening and equipping a zinc mine in the Joplin district of Missouri runs from $5000 to $15,000. The cost of mining and milling is low; great quantities have been mined at 60 cents a ton and milled at 20 to 30 cents a ton.

A GAS-POWER PLANT has been in successful operation for two years at a Nacosari, Sonora, Mexico, mine. All the power is generated at a central station and transmitted electrically. The gas used is a mixture of water gas and producer gas.

THE depth of oxidization in mineral veins varies considerably. In arid regions, as a rule, the minerals are oxidized to much greater depths than in wet regions. A common depth is 50 to 100 feet. In the Anaconda mine at Butte, Mont., the oxidization extended down about 400 feet.

THE drop of stamps in Gilpin county, Colo., stamp mills is from 12 inches up to 16 inches, and in extreme practice up to 24 inches. The speed is from 28 to 30 drops to a minute. The California stamp mill drop is from 4½ to 7 inches and the speed 94 to 120 drops per minute.

IF two shafts are parallel, and there is a high place on the pulley, then a belt will run to the high place; but if the shafts are out of line, and the face of the pulley straight, then the belt will run to the low side, or that closest to the driving shaft. The remedy is to line up the shafting.

A HIGH HEAD OF WATER using a small quantity, as compared with a low head and large quantity, for the same output of power, is usually found to be the least costly installation per horse power. The cost per horse power of the hydraulic end of hydro-electrical power plants in California ranges from $20 to $100.

THE Commissioner of the General Land Office in a letter to the supervisors of the forest reserves says that a person having more than one mining claim on a forest reserve, with timber upon one and not upon another, can remove sufficient timber to the barren claim to do actual development work, and no more.

IN the absence of local regulation, custom, or statute, no record of a location is necessary as a part of the act of location. It is always the best plan to make such a record. One of the essentials of a valid location is public notice that the appropriation has been made. A record of the notice is legal publicity.

THE locating of a valid mining claim which has been interrupted by the ejectment of the intending locator from the ground is not thereby defeated. The intending locator is entitled to the right to complete his acts of location as of the date when they were interrupted, and can take as his own any work done by the ejecting party.

THE width of the proved oil sands in the Bakersfield, Cal., petroleum field is exceptional. The geological conditions are exceptional there. It would seem the more advisable to sink wells near the discovery well of a new field on what would be the strike of the oil sand beds rather than on the dip either above or below the discovered well.

THE cost of cyanide treatment in a typical southwestern Colorado plant, where about 125 tons are handled daily, is stated to be 70 cents a ton—20.5 cents for labor, 3.5 cents for power and fuel and 46 cents for material. Of the latter, 35 cents was for cyanide and 4.5 cents for zinc. The final tailing loss was about 85 cents a ton, divided in value about equally between gold and silver.

IRON RAILS are preferable to steel rails for the underground trackage of mines. They are easier to bend and cut, the extra time that has to be paid for when steel rail is used making it the most costly of installation, even if the flat cost of the steel is somewhat less than iron. The oftener rail has to be taken up and changed, the greater the money difference in favor of the iron rail.

A STANDARD TYPE of electric transformer oil has a paraffine base, is lighter than ordinary cylinder oil and heavier than ordinary machine oil. About 30° Baume is a standard specific gravity. It must have a high flash and fire temperature, low evaporation and be a good insulator. A standard flash test would be about 336° F., fire test 400° F. Such an oil is not at all like kerosene.

IT has been noted in California drift placer mines where close records are kept of the yield of gold that there is little difference in the amount produced per linear foot of channel whether the channel is wide or narrow. Where pay lead is very wide it contains no more gold than where narrow, the latter being, as miners would say, much the richest pay. The same condition can generally be anticipated in living river beds.

CINNABAR can be recovered from a low grade ore by crushing and concentration. The loss of mineral in a properly designed crushing and concentrating plant should be very small. Cinnabar does not slime readily and its great weight aids in concentrating it. Very fine crushing of the ore is not required. Ore containing as low as two-tenths of a per cent of quicksilver has been commercially treated by concentration at a profit.

WHAT is known as the Coolgardie, West Australia, water supply scheme is a pipe line through which 5,000,000 gallons of water is to be pumped daily to a distance of 325 miles through a total lift of 2632 feet from a storage reservoir near Perth to the Coolgardie gold fields. It is estimated that two years more time will be required to complete the construction. The cost of the work which is undertaken by the Government is stated to be $15,000,000.

THE observed velocities of travel of earthquake shocks are not uniform. The differences are probably due to the differences in depth below the surface of the starting points of the shocks compared, and the areal relation of the two points between which the measurement of velocity is made to the areal center of disturbance. A late observation on an earthquake shock in Russia showed a rate of velocity of travel between the two points making records of 40 miles a minute.

IT is a good idea to have a compressed air receiver close to the point of use of the air. Leaving the compressor the air is heated and holds its heat in a receiver close to the compressor. The water in the compressed air is thus not condensed and goes entrained to the air drills, tending to accumulate ice at the exhaust ports. With a receiver well away from the compressor, the air has a chance to cool and condense its water in the receiver, supplying drier air to the drills and forming less ice.

WHAT is commonly called a claim in Mexico is 100 meters square, and any person can locate as many claims in one location as he pleases. It takes about eight claims to correspond with the claims in the United States in superficial area. The bounding planes of a claim extend down perpendicularly on sides and ends. Ten claims make a fair location. Thus two claims wide and five long make a location 660 feet wide and 1650 feet long. The taxes would be $200 a year, Mexican, on such a location. Foreigners can make locations on the same terms and conditions as citizens.

THE General Land Office says that under the provisions of an amendment to section 2294 of the Revised Statutes all affidavits, proofs and oaths of any kind thereafter made by applicants and entrymen under the homestead, pre-emption, timber culture, desert land and timber and stone Acts may, in addition to those now authorized to take such affidavits, proofs and oaths, be made before any United States commissioner or commissioner of the court exercising federal jurisdiction in the territory, or before the judge or clerk of any court of record in the land district in which the lands are situated. In case they be taken out of the county in which the land is located, the applicant must show by affidavit that it was taken before the nearest or most accessible qualified officer.

IN considering the establishment of mining and metallurgical industry based on the production of a metal or mineral, the market consumption of which is limited, the effect of the new supply, particularly if it be a large one, on the market price must be taken into account in advance. It is not safe to assume that the price will be maintained with the new supply in the market. This applies particularly to the high-priced but little used metals. Doubling the supply on the market is certain to break the price and anticipations of profit based on it.

IN installing a slip joint pipe line for a hydraulic mine or for the water delivery to a water wheel the construction is begun at the lower end, each successive length of pipe being slipped into the one in place. The practice is to have the fit of the slip tight. In joining lengths in the line a common practice now is to surround the large end of the length in place with a strip of burlap saturated with kerosene or coal tar. This is fired and heats the end of the pipe, expanding it so that the small end of the next length slips in easily. The pipe cooling, the joint shrinks tight.

A CO-OWNER in a mining claim cannot by relocation succeed to the interest of his co-owners who do not join in the relocation, even though through failure to perform the assessment work the claim is forfeit. His relocation inures to the benefit of all his co-owners. If he procures the location to be made by a third party and then takes title by deed the essence of the act is not changed. His act must still inure to the benefit of his co-owners. The Supreme Court of Utah ruled that the proper course of proceeding by which the co-owner could divest his associates of title is to do the assessment work and then advertise his co-owners out in the manner provided by the statute.

A SIPHON can be used to drain a shallow shaft, one not more than 25 feet depth near sea level, and of lesser depth, dependent on altitude above sea level. The length of the discharge arm is of no consequence if its outlet end be lower than the inlet end of the siphon in the shaft. A hose would do as well as a pipe, the size depending on the quantity of water that would be coming into the shaft sump after the accumulated water had been discharged. If the depth of the shaft exceed the limits noted, the siphon apparatus could be used with a stream of water turned into it as a jet, creating a suction and providing a driving or lifting force additional. The apparatus then, while commonly termed a siphon by miners, would really be a simple form of hydraulic lift pump.

GIVEN the pressure per square inch of water at a circular nozzle or tip, and the diameter of the nozzle orifice, the quantity of water in cubic feet that would be discharged per minute is a calculation from the formula: discharge $= d \times .7854 \times v \times 60$, in which d is the diameter of the nozzle in decimals of a foot, and v the velocity of the stream in feet per second. To determine v, divide the given pressure per square inch by .434; the quotient will be the effective head h. Then $v = \sqrt{64.4 \times h}$, or from a table of spouting velocities under different heads the velocity can be read directly. The point is to get the pressure at the nozzle accurately. It should be read from the pressure gauge, with the water discharging through the nozzle. Also it should be determined anew for each diameter of nozzle.

CURRENT WHEELS mounted on anchored scows are in successful use for developing some of the power of swift-flowing rivers. The velocity of the current of such a river is made by the fall—that is to say, it is the effect of the head or height of fall of the water. The work done by a stream current is measured just as if it was falling water, and is the weight of water striking against the buckets of a water wheel in a given time multiplied by the height of fall required to produce the velocity. Determining by experiment the velocity of the stream flow in feet per second, the corresponding head or height of the fall can be taken from a table giving theoretical velocities for different heads, or it can be calculated by the formula: $h = \frac{V^2}{64.4}$. The wetted or submerged area of a bucket or paddle of the water wheel in square feet, multiplied by the second velocity in feet, multiplied by 62.25 pounds, multiplied by the head in feet, and multiplied by 60, gives as the product the theoretical foot pounds of work per minute. Dividing this by 33,000, the quotient is the theoretical H. P. The effective H. P. developed in the wheel shaft is from 30% to 40% of the theoretical. In estimating to plan the building of a current water wheel, it is safe to assume a third of the theoretical power as effective power. The rim speed of the wheel when working under full load will be one-half the current velocity. Requiring a known H. P. and being given the velocity of stream flow, the depth and length of the water wheel paddles required to produce the power, and the diameter of the wheel to give a desired number of revolutions per minute, can be calculated. The fixed straight paddle wheel is a satisfactory type of current water wheel. A type used in steamer paddle wheels, in which the paddle enters the water vertically, has been devised. There is also a type patented in which the wheel is set in the current with the shaft vertical, the paddles feathering and turning the edges, instead of the faces, as they are revolved against the current.

Costs and Profits in Pyritic Smelting of Low-Grade Copper Ores.

Written for the MINING AND SCIENTIFIC PRESS by F. H. PRENTISS, E. M.

A mine examination recently made hy the writer showed a wide hody of ore of fair assay value, low in copper and high in silica. With expensive coke and no available fluxes other than harren limestone the profit of smelting would he unsatisfactory, and as it would also he out of the question to concentrate the ore for shipment, the only suitahle method seemed to be to use the concentrates of the lower grade and more siliceous ore in fluxing the higher grade and less siliceous ore, and hy utilizing their heat values to also reduce coke expense. The first calculations are hased upon a slag carrying 50% silica, hut are afterwards extended to slags running from 30% to 60% silica, and in like manner concentrating losses are taken up between 10% and 40%, as well as variations in blast temperature from that of the atmosphere to 1000° Fahr. ahove. Ores are assumed to vary from nearly pure quartz to nearly pure pyrites. Allowance is made for the effect of these variahles upon the various items affecting costs, losses and profit.

EXPLANATION OF TABLES.—Calculations are hased on the following data:

Matte is to carry 50% copper.
Slag is to carry 50% silica.
Hot hlast is to be heated 1000° F.
Price of coke is taken at $15 per ton (2000 pounds) delivered at the smelter.
Limestone at $2.50 per ton delivered.
Wood at $3 per cord delivered.

The cost of mining ore (including delivery) is taken at $2.25 per ton.

The cost of concentrating ore is allowed at 50 cents per ton, and the cost of hriquetting concentrates at $2 per ton.

The loss of copper in smelting is allowed as heing one-half per cent of the slag, and the silver loss is supposed to vary from 20 cents to 30 cents per ton of ore in proportion to hlast and slag.

As the hriquetted sulphurets take the place of limestone in the change they add nothing to the cost of smelting, and on the contrary have a credit value due to what they save in coke and limestone. In fact, on account of the very high per cent of silica carried hy the ore and the high cost of coke and limestone, the prohlem hecomes one of eliminating a part of the silica by concentration and of using the concentrates to flux the remaining silica so as to avoid the use of barren limestone flux, and to reduce the coke requirement to a minimum.

Estimates of costs and profits of smelting are all hased upon a daily capacity of 100 tons of ore—not counting fluxes or ore that has heen concentrated and hriquetted.

For general and office expenses and taxes an allowance is made of 17 cents per ton of ore mined. This hecomes a minimum of ahout $5600 a year (counting eleven working months) when the quantity mined does not exceed 100 tons per day. When less than 100 tons of ore is smelted (not counting fluxes or concentrates), or when less than 100 tons is mined per day corrections must he applied as given in the tahles.

To use the tahles, first ascertain from the analysis of the ore, the amount of silica in excess of the quantity that is neutralized by the FeO, CaO and other hases in the ore (for a 50% silica slag). This gives the types (A, B, C, etc.), in following tahle.

In case the percentage of FeS_2 does not tally with the percentage given in the table, an allowance may he made hy adding to or suhtracting from the profits (per ton) 5.7 cents per unit difference of FeS_2.

The assay value of the ore is not to be used, hut the matting value, that is, the selling value of the gold, silver and copper in the matte at the mine, gold ahout $19.50 per ounce; silver, 95% of New York quotation, and copper New York quotations less the freight and treatment charges which (on 50% matte) are ahout 5 cents per pound of copper. Hence with copper in New York at 15 cents its value in matte at the mines would he about 10 cents.

The numhers at the hottoms of the columns in the following tahles are to facilitate reference.

Analysis of Ores.

Type.	SiO_2.	Fe.	S.	Al_2O_3 MgO FeO CaO.	Cu.	Excess of Silica.
A	36%	22%	25%	10%	3%	0%

(TO BE CONTINUED.)

Interactions of Gold and Zinc.

TO THE EDITOR:—In some investigations of the radiant energy of metals, and their interrelations, I found certain relations between gold and zinc, that I did not find between any of the other metals then tried. This relation was of such a character that I thought it probable that wherever these two metals were together, and free to act, there might he some freak action—hy that term I mean, unexpected results from unknown causes. Precipitation of gold from cyanide solutions hy zinc is noted as attended hy wide variations in results; this recalled to my mind the ahove observations, and I determined to investigate the suhject.

I found four distinctly different forms of precipitation of gold, and one form of some other metal on the gold. There may he others. As they are all important to cyaniders, and suggest where to look for losses, I note them for consideration as:

No. 1. The gold is precipitated in a dark colored flocculent form, which rises readily if the solution be agitated, hut sinks readily in still water. It is easily washed clean from the zinc.

No. 2. This is, at first sight, the same as No. 1, but some of the precipitate adheres to the zinc in spots; on trying to remove these spots with a knife, they hrighten, and show metallic gold strongly adhering to the zinc.

No. 3. There is no flocculent precipitate formed, hut the gold is precipitated on the zinc in a fine granular metallic form; it is easily washed off the zinc, and sinks at once.

No. 4. The gold is deposited on the zinc as a metallic plating.

No. 5. This has only heen ohserved once. I wished to know if an often used solution acted in any way different to a new solution. An often used solution of cyanide was poured on gold filings; for a time all went apparently as usual, the finest particles disappeared, the larger were heing reduced in size, when the largest hecame covered with a white film, somewhat as if mercury was present, hut the usual adhesion of amalgam was ahsent. The whitened grains grew larger and all the remaining gold took on the same appearance. Whether the gold was all displaced, or plated with some metal, was an important question; a visual examination gave no information; the grains were put in a lead cornet, melted, scorified and cupelled, resulting in a gold head of ahout the size due to the gold at the last ohservation before whitening.

Some time later it occurred to me that the cyanide solution was charged with zinc, and the zinc may have heen plated on the gold; zinc was shown to he present in the fusing. If this was zinc on gold, and gold does precipitate on zinc, then a huilding up of one on the other, either way, is shown to he possible.

These five items show the possihilities of shortages, and increase in gold recovery from cyanide solutions where zinc alone is used for precipitation.

Further experiments for a remedy show that a fresh strong solution of cyanide will rapidly dissolve the metallic gold from the zinc, and precipitate it in another form at the same time; suggesting, that after washing away the free precipitate from the zinc, a fresh solution of cyanide he turned on the washed zinc and left for a short time, and the zinc he again washed to recover any fresh precipitated gold.

Jacksonville, Or., April 24. JOSEPH VOYLE.

IN carrying out a new process of treating steel with hydrogen, Bessemer or open-hearth hars or hillets are first heated in an ordinary closed-air furnace, subjecting them to a heat sufficient to appreciahly open the pores or grain of the metal and slightly greater than that of the recalescent point. The hillets, when at a hright red heat, are quickly withdrawn, laid on a suitable support on a sand floor, and at once covered with a suitahle honnet, into which is injected a jet of pure hydrogen. By contact with the metal the gas will be ignited, serving to effect the exhaustion of what air is initially inclosed in the honnet with the hillets. When the air is completely exhausted, the metal remains in a hath of pure hydrogen gas, which it freely ahsorbs. The metal remains exposed to the gas for fifteen minutes, or longer, if desired. When the metal cools, the hydrogen is retained, both mechanically and chemically, the hydrogen comhining with the carhon.

NATURAL GRAPHITE is a gritty and inferior material. A hard-cutting siliceous ash will make graphite useless as a luhricant, and the merit of some natural graphite esteemed for this purpose rests on its mineral contents chancing to he soft or even luhricative. With artificial graphite this good property is procured hy design instead of by accident. All forms of carhon, crystalline or amorphous, are converted in graphite at a temperature sufficiently high. Artificial graphite is manufactured hy heating directly any kind of carhon sensihly free from mineral matter. A method, differing from this in principle, consists in dissolving carbon in a fused metal until it is saturated at a high temperature; on cooling, a portion of the carbon is thrown out of solution as graphite.

Automatic Regulation of Discharge From a Reservoir.

Written for the MINING AND SCIENTIFIC PRESS by F. RIGAUD.

I assume for this discussion the outlet wall of the reservoir to be vertical with a discharge opening of rectangular form at the foot of the wall. The fixed height of this opening I call "2a" and the variable length "C." Across this opening is a gate horizontally sliding, by which the length of the opening is adjusted. From the middle point of the opening the height or pressure of water, "h," is measured. The regulation of the discharge is affected by moving the gate, shortening or increasing the length of the opening, so that the discharge, "G," is kept constant, when the pressure under which the flow takes place varies from "H," its maximum, down to "a," half the height of the opening. With a less pressure the opening is not full of water and the formula does not apply. The discharge is assumed to be free in order that the coefficient of discharge, "K," about 0.62, shall be constant. All quantities are estimated in feet, square feet and cubic feet per second. Value of "g," gravity, is 32.16 per second.

The formula of discharge is

$$G = 2KaC\sqrt{2gh}.$$

At starting point, when h has its maximum value H, for a given value of G we may calculate

$$2Ac = \frac{G}{K\sqrt{2gH}}$$

and then choose at will the form of the opening; this being possible because 2a and g are constant. We have from formula

$$C\sqrt{h} = \frac{G}{2Ka\sqrt{2g}} = \text{constant}.$$

It is easy to draw the curve $C\sqrt{h} = C^1$, taking h for ordinate and C for abscis, a kind of hyperhola of third degree, and if we make this curve of metal running between two buoys directed by vertical poles carrying and moving the gate as shown in Fig. 1, the opening will make a constant discharge.

This condition is realizable in practice, if not directly because of heavy friction, at least by a combination of mechanical devices, as indicated in Fig. 1.

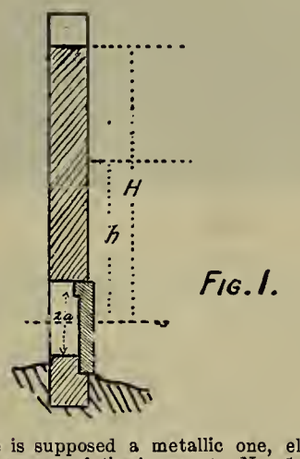

FIG. 1.

The curve is supposed a metallic one, electrically connected to one of the buoys, to No. 1 if water rises, to No. 2 if water lowers, and to a system of electric reversible motors. When there is no contact, the current does not pass through, and there is no motion. When there is contact, the motor runs, and by a crane carries the gate to right or left hand, diminishing or enlarging the opening until the contact is lost by the metallic curve, at such distance that the discharge is exactly constant.

The preceding solution of the question is the most easy to explain and to calculate, but the mechanical apparatus is rather complicated. Other arrangements may be adopted. One, which I consider the preferable, necessitates the use of the higher mathematics for the development of the formula.

Let us suppose a buoy fixed to the longest branch of a lever MN (Fig. 2), with a fixed point at N; and at point O the gate sliding vertically over an opening having the marked form a b c p. When water is at its highest level, only the square or rectangle a b c d is opened; when water lowers, the area of opening increases by a curvilinear triangle a e f, when water arrives at level a the gate must be at level c d p and the opening is at its maximum.

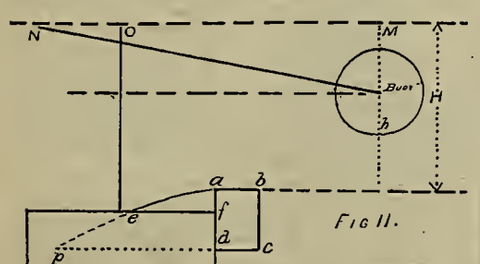

FIG II.

MINING AND SCIENTIFIC PRESS

The problem is to calculate the curve a e p in such manner that the discharge is constant.

I call a h = B, a d = A, H the height of water level above a h and G the given discharge. At starting point we have

$$G = KAB\sqrt{2g(H+\frac{A}{2})} \qquad (1)$$

wherefrom we calculate B if we fix at will the height A.

Then, from the position of the lever, the proportion

$$\frac{NO}{NM} = \frac{a\,d}{H} = \frac{A}{H} \qquad (2)$$

and if water lowers from H to h, the gate falls to f, and calling y this fall, a f, we have

$$y = (H-h)\frac{A}{H} \qquad (3)$$

and we will call x the length f e.

At this moment the discharge through a b c d is $KAB\sqrt{2g\left(h+\frac{A}{2}\right)}$ and the discharge through the triangle a e f is $K\sqrt{2g}\int_0^y x\,dy\sqrt{h+y}$. The sum of these two discharges must be equal to the given quantity G; and suppressing the common factors $K\sqrt{2g}$, we have

$$AB\sqrt{h+\frac{A}{2}} + \int_0^y x\,dy\sqrt{h+y} = AB\sqrt{H+\frac{A}{2}}.$$

The integration is possible by parts

$$\int_0^y x\,dy\sqrt{h+y} = \frac{2}{3}x(h+y)^{\frac{3}{2}} - \int\frac{2}{3}(h+y)^{\frac{3}{2}}dy = \frac{2}{3}x(h+y)^{\frac{3}{2}} - \frac{2}{3}\frac{2}{5}(h+y)^{\frac{5}{2}}$$

and because the integration is taken from 0 to y, and for x=0 y=0 we have $-\frac{4}{15}h^{\frac{5}{2}}$ the equation of the curve is, after replacing h by its value given above (3)

$$AB\left(H+\frac{A}{2}-y\frac{H}{A}\right)^{\frac{1}{2}} + \frac{2}{3}x\left(H+y\frac{A+H}{A}\right)^{\frac{3}{2}} - \frac{4}{15}\left(H+y\frac{A+H}{A}\right)^{\frac{5}{2}} + \frac{4}{15}\left(H+y\frac{H}{A}\right)^{\frac{5}{2}} = AB\left(H+\frac{A}{2}\right)^{\frac{1}{2}}$$

wherefrom

$$x = \frac{3}{2}AB\left[\frac{\left(H+\frac{A}{2}\right)^{\frac{1}{2}} - \left(H+\frac{A}{2}-y\frac{H}{A}\right)^{\frac{1}{2}}}{\left(H+y\frac{A+H}{A}\right)^{\frac{3}{2}}}\right] + \frac{2}{5}\left(H+y\frac{A+H}{A}\right) - \frac{2}{5}\frac{\left(H-y\frac{H}{A}\right)^{\frac{5}{2}}}{\left(H+y\frac{A+H}{A}\right)^{\frac{5}{2}}}$$

This equation is complex, but it is sufficient to calculate the value of x for three or four values of y.

Calculating this for a special case, I assume in the reservoir 12 feet of variation of level, and a constant discharge of 100 miner's inches, or 10,000 cubic feet, per hour, or $\frac{100}{36}$ cubic feet per second. g=32.16; k is about 0.62. The formula gives $\frac{100}{36} = 0.62\,AB\sqrt{2}\times 32.16\times 12$, or AB = 0.16 square foot. And I take A = 0.50, B = 0.32, when I make the calculation of x for five values of y; but I must observe the fifth value is not attainable, because when h is $\frac{A}{2}$ the opening is no longer full and works as a weir.

$y_1 = 0.10$	$x_1 = 3.73$
$y_2 = 0.20$	$x_2 = 6.01$
$y_3 = 0.30$	$x_3 = 7.53$
$y_4 = 0.40$	$x_4 = 8.78$
$y_5 = 0.50$	$x_5 = 9.85$

These figures show the curve convex as in Fig. 3.

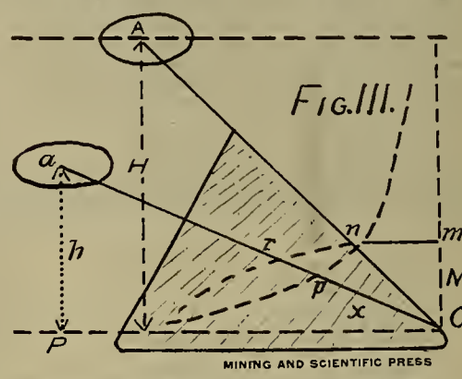

FIG. III.

MINING AND SCIENTIFIC PRESS

If the variation of level does not exceed 5 feet, the following scheme would answer. The gate is revolvable around a point of the opening, and connected to a buoy A. On Fig. 3 I take the buoy when water is at its maximum, and in an intermediary position. I assume the starting angle A O P, when water is at height H, is 45° or $\frac{\pi}{4}$, M being the heigh tof the opening, g the discharge. We have at this moment

$$G = K\sqrt{2g}\,\frac{M^2}{2}\sqrt{H-\frac{2}{3}M}.$$

When water is down to h we have $G = K\sqrt{2g}\,\frac{M}{2}$

$$\sqrt{h-\frac{2}{3}M} + K\sqrt{2g}\int_x^{\frac{\pi}{4}} r\,dx\sqrt{h-\frac{2}{3}r\sin x},$$

and from the figure the conditions $\frac{h}{H} = \frac{\sin x}{\sin\frac{\pi}{4}}$, thence the differential equation of the curve

$$\frac{M}{2}\sqrt{H-\frac{2}{3}M} = \frac{M^2}{2}\sqrt{\frac{H\sin x}{\sin\frac{\pi}{4}}-\frac{2}{3}M} + \frac{1}{2}\int_x^{\frac{\pi}{4}} r^2dx\sqrt{\frac{H\sin x}{\sin\frac{\pi}{4}}-\frac{2}{3}r\sin x}$$

This equation is resoluble, but gives an equation of seventh degree between r and x, by calculations too long to be given place here; but the equation is very near the equilateral hyperhola

$$r = M\sqrt{\frac{1}{\sin x\cos x}}$$

very easy to draw and disposed as marked on Fig. 3. M is calculated by the first formula.

As an example, suppose we assume 6 feet variation of level and we have 100 miner's inches. K = 0.62, g = 32.16. Then we have $\frac{100}{36} = 0.62\times\sqrt{64.32}\times\frac{M^2}{2}\sqrt{6-\frac{2}{3}M}$; therefrom M = 0.69 foot, and length O B = r = $M\sqrt{2}$ = 0.97 foot.

A HYDRO-ELECTRIC PLANT has just been completed at Vouvry, on Lake Geneva, Switzerland, by La Societe de la Grande Eau, in which the tangential wheels, of which at the present moment there are four of 500 H. P. installed, work under a head of no less than 3150 feet. The principal conduit consists, in the first place, of a pipe 31½ inches in diameter, which is later subdivided into three of 19.7 inches as the pressure increases nearer the bottom of the fall. Each of these branches ends finally in two pipes, each 13.4 inches in diameter. For the laying of this conduit an aerial tramway was installed, having a length in plan of 5609 feet, the rise in this distance being 2985 feet. The pipes forming the conduit varied in length from 16.4 feet up to 26.25 feet, the heaviest weighing just one ton. The cable standards were built of timber, the longest span measuring 1970 feet in plan. The cables used were of cast-steel wire, having a breaking strength of 220,000 pounds per square inch. They were 0.78 inch in diameter, their total strength being twenty tons. The factor of safety was accordingly only about 2½; but in view of the temporary character of the installations, this was deemed quite sufficient by the contractors for the work. For working the line an electromotor of 20 H. P. was employed.—London Engineering.

The Portland Cyanide Mill.*

Tbis mill is located at Gayville, at tbe mouth of Blacktail gulch, a short distance from Central. It was originally a stamp amalgamation mill; hut, as this process could not treat the ores from Portland successfully, cyaniding was installed. The mill is a wet-crushing one, crushing with cyanide solution in the battery, separating the resultant slimes and sands and treating each separately. Tbe mill bas been in operation as a cyanide plant since about October, 1900, at that time having a capacity of thirty tons per day, tbis heing tbe limit, due to the lack of facilities for handling more slimes. More tankage was tben provided for and the capacity of the mill is now sixty tons of ore per day. Tbe ore treated comes from tbe Portland district.

THE NATURE OF THE ORE TREATED.—Tbe ore is from the Potsdam and is very siliceous. Tbe gold is very finely disseminated and fine crushing is required to liberate it. Most of the ore treated is well oxidized.

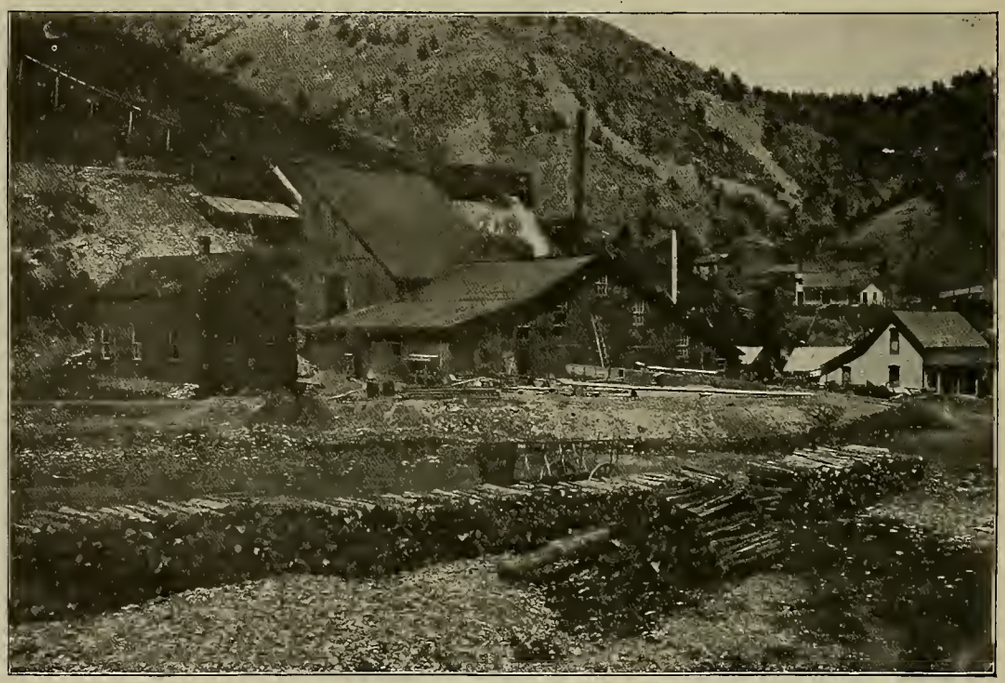
THE WORKING SCHEME OF THE PORTLAND MILL.—

Ore from R. R. cars.
By Chute to Bins.
By Cars to Crusher Floor.
Grizzley. 4 ft. x 4 ft. 1½ inch space between bars.
oversize | undersize.
Blake Jaw Crusher
20x12 in. jaw opening, crushes to 1 in. cubes.
Main Storage Bins.
Challenge Feeds. | Cyanide Solution from standardizing tanks.
Four 5 Stamp Batteries, 16 mesh screen.
By Launder to Sump.
Sand Pump.
Distributing Box, 2x2 feet cross section, 1½ feet deep.
4 Radiating Pipe Lines, 5 inch iron pipe.
Each to a Separate Box, 3x6 feet cross section, 5 feet deep (2 compartments).
Slimes (overflow) | Sands (settlings)
Overflow Launder (covered) 12x14 inches cross section. | Leached with Weak and Strong Solution and Wash Water.
Main Central Launder. | Tailings, sluiced out. | Solution.
8 inch Forked Galvanized Iron Pipe. | Zinc Boxes.
Slimes Settling, Vat No. 1 or No. 2 (alternately). | Solution. Product.
Settled Slimes, plus Barren Solution from Sump Tank X. | Syphoned Solution. | To Sump and Standardizing Tanks.
Sump Tank B.
Slimes Pump.
Storage Tank C (by pump).
Slimes Settling Vat No. 3, plus some water to fill. | Filter Tank K (sand filter).
Settled Slimes, plus barren solution from Tank X. | Syphoned Solution, (same as before). | Filtered Solution. | Overflow.
Slimes Pump. | Zinc Boxes. | To Sand Tanks for leaching and clearing.
Slimes Settling Vat No. 4. | Precipitate. | Solution.
Settled Slimes, plus barren solution from Tank X. | Syphoned Solutions (same as before). | To Sump Tank X.
Slimes Pump.
Slimes Settling Vat No. 5.
Settled Slimes and Wash Water. | Syphoned Solution (same as before.)
Slimes Pump.
Slimes Settling Vat No. 6.
Settled Slimes Sluiced Out. | Syphoned Solution (same as before).

THE CRUSHING MACHINERY.—The grizzly is a sbort one, 4 feet long and 4 feet wide, just above tbe jaw crusher. The spaces are 1½ inch wide. The rough crushing is done in a Blake jaw crusher, having a jaw opening 20x12 inches, and bence the ore requires very little sledging, and for this reason the crusher possesses a decided advantage over the smaller size gyratory crushers. Tbis crusher crushes the sixty tons that pass through the mill in seven to eight hours, avoiding a night-crusher shift. The ore is taken from the main storage bins, which are fed by tbe crusher, hy four cballenge feeders and fed to the four batteries of five stamps each. Tbe stamps are 900-pound stamps, 100 drops per minute, crushing through a 16-mesh screen with a 2 to 2½-pound cyanide solution. The amount of solution is about four tons per ton of ore crushed. Tbe screens are covered with canvas to avoid splash, the solution being caugbt in a longitudinal launder, which carries it to the Frenier sand pump, which elevates it above the tanks. (See the working scheme.)

THE SEPARATION OF THE SANDS FROM THE SLIMES.—The Frenier sand pump sends tbe pulp to tbe distributing tank, a water-tight wooden box, 2x2 feet in cross-section, from which radiate four 5-inch iron pipes, each of which can he cut out as desired, one going to the separator box suspended over each sand vat. The separator boxes are 3 feet wide by 6 feet long and 5 feet deep, made water-tight by a double lining and divided into two compartments, so tbat each compartment is 3x3 feet in cross-section and 5 feet deep. Each compartment has a 12-inch circular discharge gate in the bottom, which is closed tight against its frame by a rubber gasket. This gate is similar to a type of bottom-discharge gates for cyanide vats. Tbe pulp is led into one compartment, the sands settling out, while the slimes overflow hy a side gate into a covered launder, 12 inches wide and 4 inches deep, which in turn discharges into the main central launder, taking the slimes from all four of tbe separator boxes. Only one hox, however, is in use at a time. Tbis main central launder ends in a forked 8-incb galvanized iron pipe, so that the pulp can be discharged either into slime vat No. 1 or No. 2, according to which one is empty and ready for tbe cbarge. Wbenever one compartment of a separator box is full, the pulp is deflected to the otber compartment, while the accumulated sands are discharged into the sand vat below by means of the hottom-discharge gate. When crushing througb a 16-mesh screen the amount of slimes is about 40% to 50% of the ore crusbed.

THE TANK CAPACITY OF THE MILL (see plan of tanks).—Tbere are four sand leaching vats, of cedar, 16 feet in diameter and 6 feet deep. In all there are six slime vats, three of which are 16 feet in diameter and 8 feet deep, two are 12 feet in diameter and 8 feet deep and one is 10 feet in diameter and 8 feet deep. Tbere are four tanks for the storage of solution, two of whicb are standardizing tanks and two are tanks which hold the syphoned solution from the slime vats before it goes to the filter tanks. They are, approximately, tbe size of the smaller slime vats. Tbere are also two sump tanks, or barren solution storage tanks. "Barren solution" is the solution as it issues from the extractor hoxes, low in free cyanide. Tbis is the solution with which tbe slimes are treated after tbeir first settling. These sump tanks are 16 feet in diameter and 8 feet deep. The filter tanks are two in numher, about 6 feet in diameter and shallow, provided with a sand and gravel filter. Tbe filtered solution goes to the zinc boxes, while the overflow (wben there is any) goes to the sand vats as weak solution.



Cyanide Mill of the Portland Mining Co., Gayville, S. D.

TREATMENT OF THE SANDS.—It takes about thirty-six hours to charge a tank by means of the separator boxes. Tbe tank is then allowed to drain for about six hours, after wbicb a strong solution, about three pounds of cyanide per ton, is run on and allowed to stand for eight hours. Tben battery or syphoned solution is circulated for a varying lengtb of time, to be finally replaced by about four tons of wash water. Tbe tailings are sluiced out in about 2 to 2½ hours. The total time of treatment is in the neighborhood of eight days. Tbe capacity of the sand vats is sixty-five tons.

TREATMENT OF SLIMES.—The slimes as they come from the separator boxes are discharged eitber into slimes vat No. 1 or No. 2, whichever happens to be free, and when this is filled the slimes are deflected to the other one. About five pounds of lime per ton of ore is added at tbe stamps and greatly aids in the settling of the slimes. It takes about ten to twelve hours for a vat of slimes to settle. Then the supernatant solution is syphoned off, the solution running by gravity to either one of the storage tanks. The syphon is a 2½-inch iron pipe with a T fitting at the end, supported on a wooden float. Tbe 2½-inch pipe joins tbe discharge pipe, going out at the center of the bottom of tbe tank, hy an elbow and a tee, so that it can turn on the thread and rise or fall with tbe solution. (See drawing of syphon arrangement.) After the solution has been syphoned off as closely as possible, "barren" or sump solution is pumped into the vat, and, when filled, the resultant mixture is transferred hy the slimes pump to slimes vat No. 3. Tbe pulp is discharged from the vat by means of two 3-inch pipes in the bottom, wbich lead to the pump.

In tbe third slime vat the process is practically repeated, the slimes settling and the solution being syphoned off. In this and succeeding vats tbe method of running on harren solution or water after the first solution has been syphoned off, varies. The harren solution, or water, is introduced by pipes wbich run to the bottom of the vat, the ends heing provided with nozzles, so that the velocity of tbe discharge will serve to agitate the pulp wbile the solution is being run on. Two of the cbarging pipes descend on the sides of the vat, while one descends at the center.

This last is joined to horizontal pipes at right angles to it by a union, so that it can revolve, the whole similar to a garden sprinkler. Tbis device serves to agitate the pulp while solution is being run on. Tbe system of pipes is also connected with a ½-inch steam pipe, so that steam can be introduced to raise the temperature of the mixture. (See drawing of agitating device.)

In this way the slimes are made to pass through five vats, wash water being added in the fifth vat instead of barren solution. Tbe resultant material is then pumped to the sixth vat, where the slimes are settled and the solution sypboned off again. Tbe slimes are tben discbarged by sluicing. Tbe slimes retain about 100% moisture, it not being possible to syphon off closer than tbat.

A Frenier spiral sand pump is used to circulate the slimes pulp from one vat to another. Two of tbese pumps are used, one for the slimes alone and one for raising the pulp from the batteries to the separator boxes. No information is available as regards tbe extraction made on slimes or sands. It is bigher on slimes than on sands, hut questionable whether as much is saved.

PRECIPITATION OF THE GOLD CYANIDE SOLUTIONS.—Tbere are two zinc boxes, and, on account of tbe large volume of the solution from tbe slimes treatment, hoth are used indiscriminately for both weak and strong solutions. Tbe boxes contain eight compartments, whicb are filled with zinc and are 2x2 feet in cross-section and 20 inches deep. Tbey are provided with side launders for clean-up facilities. Lately these zinc boxes have been replaced in part by ordinary whiskey harrels, similar to the plan described for the Wasp No. 2. Tbe precipitation is good, as usual in the district, only that the boxes contain considerable fine sediment from tbe slimes treatment, whicb, however, does not seem to affect the precipitation any. The precipitates often contain considerable silver.

The clean-up is carried on bi-monthly. Tbe slimes are transferred to a small filter tank of the general pattern and washed thorougbly, then transferred to a rectangular sheet iron drying pan and steam dried. The steam-drying device is of galvanized iron, in which the exhaust steam from the mill engine is used. Tbe precipitates, after drying, are treated with dilute sulphuric acid in the usual way and smelted. Before this method was installed the dried precipitates were sold to the Omaha smelters.

METHOD OF SAMPLING THE SLIMES.—The first sample of the slimes is taken at the overflow of the separator boxes by taking a dipperful out at intervals of a half hour. The material thus taken out is collected in a large pail. Wben tbe sample is ready to go to the assay office the pail is half emptied, after thorougb stirring, the remaining half heing the assay

*From Bulletin No. 5, South Dakota School of Mines.

sample. A second sample is taken from the last slimes vat before the slimes are finally sluiced out.

POWER PLANT OF THE MILL.—The steam is furnished by a return tubular boiler, burning mine-run coal, forced draft being employed. The engine is an Erie mill engine, slide-valve pattern, built by Fraser & Chalmers, Chicago, Ill., 60 H. P., cylinder 10x18 inches, 150 revolutions per minute, steam at boiler, usually at eighty pouuds.

NUMBER OF MEN EMPLOYED IN THE MILL.—Day shift: 1 crusher man, 1 battery man, 1 solution man, 1 engineer, 1 slimes man, 1 assayer, 1 assayer's helper, 1 foreman; a total of 11 men. Night shift: 1 battery man, 1 solution man, 1 engineer.

The exact figures for cost at this mill are not available, but the total is probably in the neighborhood of $1.50 to $2 per ton.

SIPHON AND AGITATING DEVICE.

Electric Powder Thawer.

The electric powder-thawing device illustrated has been made under the direction of Chief Engineer E. F. Stuart of the Trade Dollar Con. M. Co., at Silver City, Idaho, who has heen aided by a number of employes at the mine with practical suggestions, etc., and it seems as though the thawer embodies all the good points of a number of devices, is safe, economical and practical. It has been installed at the mine.

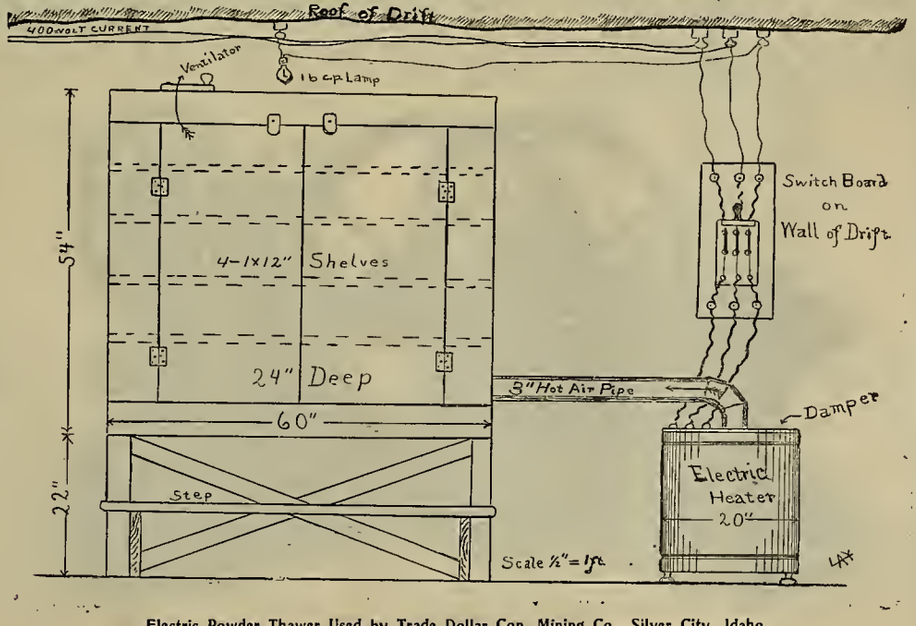
Referring to the diagram, the magazine is 5 feet long, 4½ feet high and 2 feet deep, and is set on a stand 22 inches above the floor of the drift underground. It has four 1x12-inch shelves and two doors. The magazine is lined throughout with galvanized iron. Eight galvanized iron trays, each 12x29 inches, are provided for holding the powder. There are two trays for each shelf. The trays are partially filled with sand. The magazine has a capacity of ahout three boxes of powder. Two thermometers hang inside the magazine, one to check the other, and the temperature is maintained at from 70° to 75° F. A ventilator is provided at the top of the magazine for regulating the air current. This ventilator is so arranged that it can not he entirely closed, therehy giving any gases formed a chance to escape.

The heater is made of thirty coils of No. 22 tinned steel wire, zig-zagged hetween the circular top and bottom plates of the "stove." German silver wire is preferable for this purpose, on account of its greater resistance and less tendency to oxidize; but the tinned steel answers very well. The coils are enclosed with a drum of galvanized iron, several inches larger than the coil frame, and attached to the same with three hent "legs" of strap iron. This drum is open at the bottom. The top is made closed, with openings for the hot air pipe leading to the magazine and also for a regulating damper. The heater stands on porcelain knobs, and the connections with the magazine are thoroughly insulated.

The electric current used throughout the mine is of 400 volts, and this voltage is employed in the heater. An ingenious method is employed to illuminate the magazine with a 110-volt 16 C. P. lamp. One wire of the lamp is attached to the main 400-volt line, while the other is carried through the switchboard to the heater and attached to one of the resistance coils—a sufficient numher of coils being cut in to equalize the higher voltage of the first wire. The lamp hangs in front and just ahove the magazine, giving plenty of light for the man in charge of the thawer.

In operation, from two to three hours are required to thaw the powder, when it is taken out of the trays and repacked in the powder boxes, to he used as required. By covering the boxes with gunny sacks, etc., the powder will remain thawed and in proper condition for use for several days.

The company has placed this thawing magazine in a "stub drift" from one of the main crosscuts. A hranch from the compressed air pipe line is run into this drift and the air is "blown out" twice daily, for the purpose of removing gases or fumes arising from the thawer. While close watch is maintained to keep the magazine at uniform temperature of about 70°, it has heen demonstrated that the maximum heat—with damper closed and heater at full capacity—does not exceed 80°, which is below the danger point. The company has put in three additional thawers of the same description—one at the Dewey mine and two at the Black Jack.—The Owyhee Avalanche.



Electric Powder Thawer Used by Trade Dollar Con. Mining Co., Silver City, Idaho.

Gold Mine Hunting in Arizona.

TO THE EDITOR:—It is now rather slow work endeavoring to sell "copper prospects," or even copper mines. Just three years ago we were hunting good gold prospects in Arizona: even spending considerahle money in development machinery and labor. Gold was then the only thing worth considering, and many a weary mile we rode to look at glitteringly described prospects. Copper, for the moment, had no charms for the Eastern investor with ambitious mining views.

A sudden change came. The copper prices took a jump and would-he mine owners jumped with it. Before the middle of 1899 we were as "hot" after cop-

per prospects as before we had heen keen after gold. A little prospect in Arizona, showing a narrow streak of copper ore, we hought for $5000 and sold it in a short time for $20,000.

What is the condition again to-day? Just about as it was three years ago: copper down and rather out of favor, while gold regains first place in mine hunting.

Having heen on the hunt in Arizona so long ourselves for gold, with hut poor success, we feel competent to discuss gold mine hunting there. There are good prospects to he had, hut unfortunately they are frequently adversely situated. For instance, we made a 60-mile drive across the desert at one point, carrying a heavy load of water for the horses as well as ourselves. On this dreary stretch of hot, extremely dusty road, there is hut one watering place. Arriving at the destination we found huge ledges of gold hearing rock, carrying values which would make mining profitahle if the desert did not intervene hetween rock and railroad.

Another fine prospect calls for the construction of a long pipe line, with pumping plant. One has plenty of nice ore, reasonahly near water and railway, hut is within the houndary lines of an Indian reservation. And so we have to go from one point to another in a continual search for a really attractive gold mine.

Another great hindrance to expansion of gold production here is the almost total lack of accessihle customs smelters. This absence of local smelters, making necessary a long haul to El Paso or elsewhere, prevents operations of what is termed "low-grade" properties. There are plenty of veins carrying low-grade sulphide ore, that cannot he made to yield a profit after paying the long-haul freight charges. Properties equally as good as many that are worked at a profit in States where customs smelters are convenient, cannot at this time he worked at a profit in Arizona hecause the ores and concentrates must be shipped a long distance for treatment.

Nogales, Ariz., April 28.

Electrically Driven European Mining Plants.*

Written for the MINING AND SCIENTIFIC PRESS by FRANK C. PERKINS.

It has heen demonstrated that electrically operated hoists for use especially in the lower parts of deep mines, and electric motors for haulage in those sections, are far more economical in every way than steam driven machines. This is true largely on account of steam condensation and loss in the pipes carrying the steam to the engines.

Main hoists at the surface, however, are very economically driven hy steam engines, as they are usually placed near the top of the shaft and the steam is not required to he carried any great distance. Such an installation is shown in Fig. 1 at the "Gewerkschaft," Gluckauf Zu Sondershausen, while Fig. 2 shows the loaded cars on the tracks in the mine below near the entrance to the shaft; which is illustrated further in Fig. 3, giving a good idea of

Fig. 3.—Signal Station in Main Shaft Station.

the entrance to the cage and the special signalling apparatus, for advising the operator above when to raise the load. This apparatus was installed by Siemens & Halske of Berlin.

Not only are electrically operated hoists especially convenient and economical, but they are peculiarly adapted to this kind of work on account of the flexibility and safety, permitting also ready extension or change, as mining conditions frequently require.

During recent years the polyphase power transmission system has heen introduced extensively and has found its way into mining plants, proving a valuable means of supplying the necessary power. While direct current is considered hy many as most desirahle and practical for mining locomotives, polyphase machines are coming into extensive use for operating not only electric hoists, hut mining pumps, drills, ventilators and many other types of mining machines. The necessity of having direct current at hand for use for certain classes of electrically driven machines, as at present considered hy some engineers, is met hy the use of rotary converters in substations and changing the alternating current to a direct current of any voltage desired at any place required.

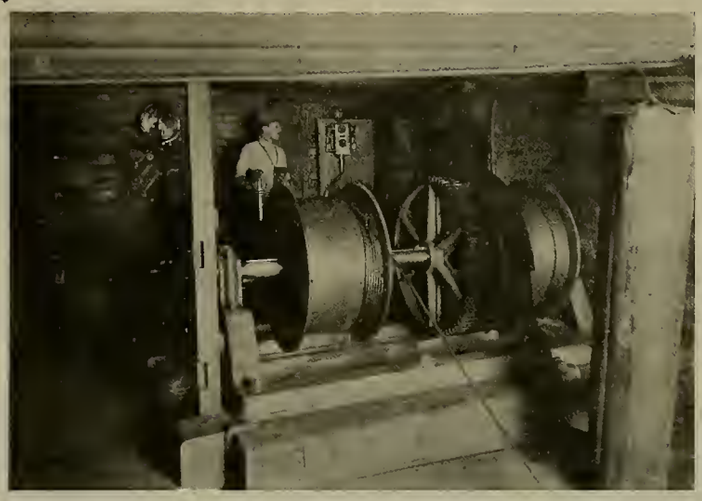

Fig. 4.—Underground Telephone Station and Electrically Operated Hoist.

The latest European practice, where several shafts of a mine are located from 1 to 5 miles apart, is to estahlish a main generating station at one of the main shafts, and at this power house sufficient energy is developed to supply the entire mine, including all of the shafts, with electric power. Polyphase generators are directly coupled to high power compound or triple expansion engines, and the current supplied is raised in potential or generated direct at from 2000 to 10,000 volts and carried over the transmission lines to the various shafts. Frequently an availahle water power makes this development particularly economical, and suhstations or static transformers are located at the various shafts and, after reducing the potential from the transmission line to a moderate pressure, is conducted to the electrically operated hoists, pumps, cutters, ventilators, drills and other mining machinery. Such a plant is in operation at the Erzherzogl. Bergantes at Karwin, Austrian Schlesweig. There are three main shafts, the generating central power station being located at the Hohenegger shaft at Karwin, where a large ventilator is electrically driven hy Drehstrom motors, and an enormous certrifugal pump, as well as the main hoisting apparatus, are driven by polyphase motors. At this power station the potential of the alternating current is raised to 10,000 volts and transmitted hy an overhead line 8750 meters to step-down transformers located at the Albrechtschaft at Petersburg, where a large Drehstrom motor operates the main hoisting machinery and three electric windlasses are also used underground, each driven hy a 35 H. P. motor from a 500-volt polyphase circuit.

Direct current motors are also extensively employed ahroad for operating hoists located hoth above ground and underground, as noted in the accompanying illustration, Fig. 4, the electrical signalling apparatus heing shown at the right of the operator, metallic tubing carrying the conductors to the shaft entrances.

A direct current motor of 50 H. P. capacity is used for mine haulage at the Gewerkschaft Ludwig II at Strassfurt; and a particularly interesting plant using direct current motors for the mine hoisting is the Thiederhall mine at Theide, near Braunschweig, Germany. The central power station of this last plant was illustrated and described in the MINING AND SCIENTIFIC PRESS, March 29, pages 169 and 176.

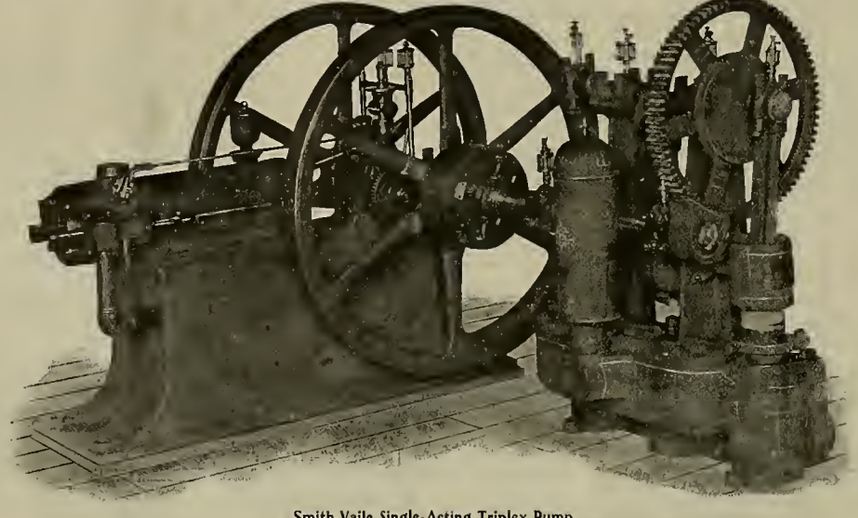
A Commercial Source of Hydrogen.

Of ordinary coal gas, hydrogen constitutes usually about 50%, the remainder heing methane with small quantities of other gases and volatile suhstances. By the use of liquid air the methane and other ingredients were first successfully condensed, leaving the hydrogen quite pure. In recent experiments the use of liquid air has heen dispensed with, and coal gas, previously cooled to 80° helow zero C., has heen passed through a Linde liquid air machine. In this way 3500 cuhic feet of hydrogen per hour was ohtained at an expenditure of from 12 to 15 H. P. By a modification of the process pure methane can also he furnished. This is accomplished hy dividing the process into two stages. In the first the gas is cooled to the temperature of solid carbonic acid, causing the condensation of carhonic acid, henzine and similar hydrocarbon matters.

A SUBSTANCE which may soon he made in quantity and put into use is fused silica. Quartz fused before the oxyhydrogen hlowpipe is in all ways superior to glass as a transparent and refractory material for the construction of apparatus. At present tanks of glass of moderate size only can he cast, hecause of the hrittleness due to its internal tensions. With quartz fused hy the ton, and similarly cast, it should be possible to prepare great vessels indifferent to sudden changes of temperature and practically permanent under the most severe conditions. Investigations in this direction are heing prosecuted.

Triplex Pumps.

Herewith is illustrated a single-acting triplex mine pump, which is an efficient device in connection with the use of gas or gasoline pumping machinery, and such a pump can be started almost instantly and run at high speed. The illustration is of a style of single acting triplex pump that is of suitahle service in mines, manufacturing plants, railway tanks, or similar places, where speed, compactness or economy are desired. It is manufactured hy the Stilwell–Bierce & Smith–Vaile Co., Davton, Ohio, who will promptly furnish any detailed information desired.



Smith-Vaile Single-Acting Triplex Pump.

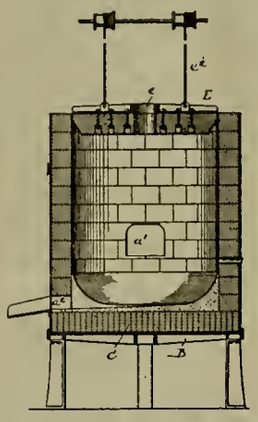
*See illustrations on front page.

Mining and Metallurgical Patents.

Patents Issued April 29, 1902.

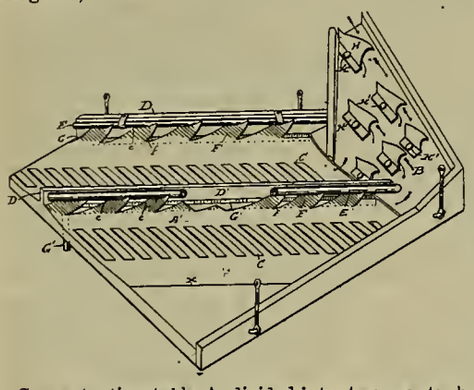
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

FURNACE FOR HEATING OR SMELTING METALS.—No. 698,495; H. H. Hewitt, Buffalo, N. Y.



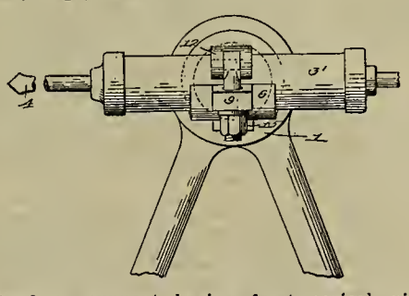
Combustion chamber perforated to admit fuel supply and vertically adjustable cover or diaphragm extending over and serving to define effective volume of combustion chamber, cover or diaphragm being of somewhat smaller diameter than interior diameter of combustion chamber, whereby cover or diaphragm can be adjusted to any desired point within combustion chamber and means for raising and lowering cover or diaphragm.

CONCENTRATOR.—No. 698,737; M. D. Rochford, Kingman, Ariz.



Concentrating table A, divided into two parts by partition rib D, extending centrally from head to tail, row of transversely placed riffles on either side of partition rib extending from head to tail, thin at ends and thick in middle; deflectors F extending from head to tail, and rising above table in gradual curved lines; water supply pipes D, disposed above deflectors and having discharge apertures spaced apart, adapted to direct jet of water onto deflectors, troughs G below surface of table, and adapted to receive and carry off concentrates; and inclined portion B at head of table and connecting therewith, extension being provided with plurality of deflectors H, arranged to spread pulp over concentrating table.

CLAMP FOR ROCK DRILLS.—No. 698,900; F. R. Brown, Unga, Alaska.

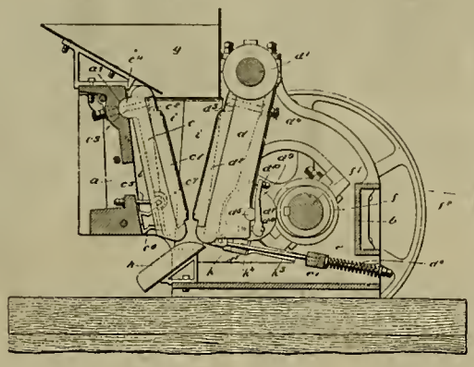


Stand or support having frusto-conical pivot, clamp comprising two oppositely disposed semicylindrical jaws adapted to embrace barrel of drill rod, one jaw being provided with substantially U-shaped base and other jaw being provided with base arranged to slide between sides of U-shaped base, each base on its inner edges being provided with arc-shaped dovetailed grooves, bases embracing pivot on stand, and means carried by ends of jaws for adjustably drawing latter and bases together.

METHOD OF EXTRACTING METALS FROM THEIR OXIDE ORES.—No. 698,739; J. Rudolphs and J. Landin, Stockholm, Sweden.

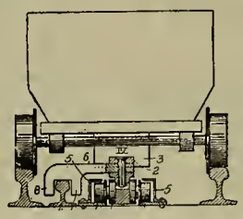
Process for producing briquettes which do not fall into pieces at high temperature and are suitable for reduction, consisting in mixing pulverized oxide ores, carbon, hydrocarbon and organic nitrogen compound or compounds, pressing mixture to bodies of suitable shape and finally heating bodies to 300° to 500° C.

CRUSHER.—No. 698,990; A. G. Morris, Tyrone, Pa.



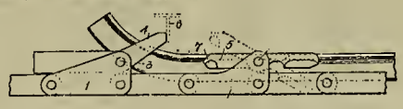
Frame, stationary jaw provided at its upper portion with lateral projection set into cavity in frame, bolt passing through projection of jaw and engaging jaw and frame to hold former in position, bolt being capable of slight sidewise movement in frame to allow jaw to swing, and fracturable spacer set against lower portion of jaw.

BRAKE FOR UPHAULS FOR MINES.—No. 699,024; C. L. E. Schenk, Walkers Mills, Pa.



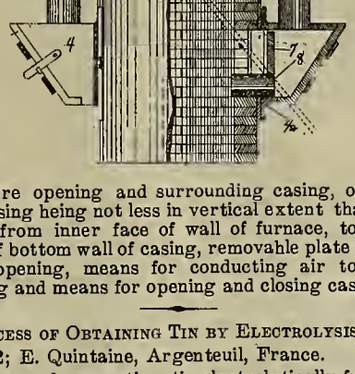
Chain, rail parallel with line of movement of chain, arm pivotally mounted on chain and provided at outer end with fingers projecting down on opposite sides of rail, and means for holding fingers from engagement with rail during forward movement of chain.

DOWNHAUL FOR MINES.—No. 699,023; C. L. E. Schenk, Walkers Mills, Pa.



Chain pairs of oppositely swinging dogs pivotally mounted on chain and provided with weights for holding adjacent or inner ends of each in operative position, depressing plate arranged parallel with line of movement of chain, and lateral extension from front dog of each pair adapted to engage and be shifted by plate.

TUYERE FOR FURNACES.—No. 698,485; W. B. Foster, Utica, N. Y.



Tuyere opening and surrounding casing, opening and casing being not less in vertical extent than distance from inner face of wall of furnace, to outer edge of bottom wall of casing, removable plate having blast opening, means for conducting air to blast opening and means for opening and closing casing.

PROCESS OF OBTAINING TIN BY ELECTROLYSIS.—No. 699,012; E. Quintaine, Argenteuil, France.

Process of separating tin electrolytically from tin scrap, which consists in suspending scrap, as anode, in bath composed of aqueous solution of nitrate of tin to which have been added chloride of ammonia and chloride of tin, suspending suitable cathode in bath, and finally passing electric current through anode, bath and cathode.

Sinking a Shaft by the Freezing Process at Ronnenberg, Germany.

A shaft has recently been sunk by the freezing process at an alkali works at Ronnenberg, near Hanover, Germany. The work was done by the Societe Francaise d'Enterprises, and is described in Le Genie Civil for February 1, 1902.

Soundings made by the Alkali Society of Ronnenberg showed that the bed of salts of potash lay at a depth of about 459 feet. To the depth of 407 feet the ground was largely composed of gypsum, very much fissured and very irregular, but immediately overlying the salt formation was a 50-foot stratum of hard and compact gypsum.

An attempt was first made to cut out the gypsum by a truss armed with cutting tools, and to lift out the water. The shaft was designed to have a clear diameter of 19.68 feet, but for the first 46 feet this diameter was enlarged to 26.56 feet, and it was lined with masonry 2.62 feet thick. Inside the 21.32 feet diameter thus left the cutting truss was operated, and an annular cast iron ring, 19.68 feet diameter, was forced down by powerful hydraulic presses. The water met with down to a depth of 23 feet was lifted by eight pulsometer pumps having a total capacity of 1553 cubic feet per minute.

But during the sinking operation both the masonry and the iron lining began to move under the pressure of the very treacherous soil traversed, and in its total height the masonry showed a divergence of 3½ inches from the vertical. All attempts to straighten the masonry failed, and at a depth of 105 feet the divergence was about 4 inches. Finally, after using sheet piling to reinforce the iron ring, the soil rushed into the shaft from the bottom and filled it to a height of over 26 feet. The water also began to increase in quantity until it amounted to 1412 cubic feet per minute, or almost the capacity of the pulsometers. Under these conditions it was impossible to continue with the method at first adopted, and the company determined to use the freezing process.

The two points to be determined were whether freezing would give good results in this fissured soil, and as the water at Ronnenberg was saline, with 3% salt at a depth of 105 feet, it was uncertain whether the freezing process would be successful under this condition. The first point was decided in the affirmative. And as to the second, experiments were made with different saline solutions of 4%, 8%, 10% and 12% NaCl. These solutions were submitted for twenty-four hours to a temperature of — 12° C. At the end of this time it was found that the 4% solution was almost solidly frozen; the others were less so, and the one of 12% was very little affected at the end of forty-eight hours. As a result it was concluded that while saline solution rendered the application of the freezing process longer in time, it was still practicable by increasing the number of freezing tubes, prolonging the time, and by using more powerful machinery.

The installation included thirty tubes sunk to a depth of 413 feet, on a circle 29 5 feet in diameter. This work was commenced in July, 1899, and meanwhile freezing machines of the Fixary system were installed, double in capacity to those that would have been used for a non-saline soil. In sinking these tubes it was found that the soil penetrated was very irregular. It was unstratified and nodules of gypsum seemed to be embedded in the masses of clay. This formation afforded little chance for water-bearing seams, and this danger was removed. The last tube was sunk on December 10, 1900. On December 5 a beginning was made in sinking the central tubes and in uniting the tubes by a series of circulating pipes.

The actual freezing operation was commenced on January 19, 1901, and by March 27 the temperature at the bottom of the shaft was — 4° C. The actual sinking was commenced on April 18, using the two compressors; but after July 1 only one compressor was employed. To avoid disturbing the surrounding ground, all of the material near the walls of the shaft was removed by hand, explosives being used in the central core only. On July 15 the excavation had reached a depth of 226.3 feet without any accident. It should have been said before that the outside diameter of the new shaft had been fixed at 26.5 feet, with a diameter of 18 feet inside the masonry portion. When the cast iron lining, sunk in the original attempt, was met with, it was removed entirely by thawing out about 3 or 4 inches of the circumference by a current of warm air. A segment was then broken from the ring, and the rest was easily taken out. Each ring taken out was replaced at once by a ring of the new shaft. The shaft was successfully completed some time in August, 1901.

THE Simplon tunnel, according to the progress report for March, now shows an excavation of 22,602 feet on the north side and 14,577 feet on the south side, measured from portals. In that month 2844 men were employed, 2037 working in the tunnel itself. The north heading is in shaly gneiss and micaceous schists, and a mean daily advance of 19.9 feet was made; on the south side the advance is through contorted schist seamed with limestone and veins of quartz. Water on the south side averages a flow of 179 gallons per second and the tunnel is given an iron lining in bad ground.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

JUNEAU.

Manager Pearce, of the Alaska-Perseverance mine, who represents the W. J. Sutherland interests at Juneau, has started work on the Greek group on Berner's river, next to the Jualin. The mine is being operated under bond from G. Kyrage of Juneau.

VALDEZ.

A. K. Beatson and A. Robertson of New York are reported to have sold the Big Bonanza group of copper mines on Latouche island, 80 miles from Valdez, to H. Gillette of New York and associates. The property is claimed to be a mountain of ore containing 9% to 30% copper.

ARIZONA.

COCHISE COUNTY.

N. H. A. Mason of San Francisco and associates have bought the Gold Farm group of mines, near Wilcox, from E. Braun and others. Development work has been commenced.

The old Terrible 10-stamp mill at Cochise has been taken down and removed to Manzora, to be operated in connection with the 20-stamp mill now under construction. In addition the 50-ton smelter is being pushed to completion.

COCONINO COUNTY.

A three-eighths interest in the Last Chance mine, in the Grand canyon, near Flagstaff, has been bought by R. Foster of Chicago, Ill., for $50,000. A large body of high-grade copper ore is said to be exposed in the developments.

GILA COUNTY.

F. W. Force, of the Bobtail Co.'s gold mine, near Globe, reports the mill as making a satisfactory run, and the mine is improving with development. It is, he states, the intention of the company to add to the battery of stamps, in order to work custom ores.

G. Lohb has bonded his mine, near Silver King, to A. C. Siehoth of Globe. It is a gold property, on which 2500 feet of development work has been done.

The Williams & Blake Ore Leaching Co. has been incorporated at Globe, capital $75,000, by J. Williams, J. Blake, G. A. Olney, P. Andarsen and Z. C. Prina. The company has an ore leaching plant already in operation.

GRAHAM COUNTY.

The Bueno Vista M. Co. of Solomonsville has been incorporated by J. S. Blake and associates, capital $1,000,000, to operate claims in the Lone Star district.

MARICOPA COUNTY.

The Leviathan G. M. Co., operating near Congress, D. M. Purman, manager, has decided to erect a 40-stamp mill, so as to have it in operation by Jan. 1st next.

MOHAVE COUNTY.

H. P. Ewing has bonded the Roosevelt group in the Boundary Cone country, near Kingman, and has let a contract to W. A. Brooks to sink a shaft 50 feet.

PIMA COUNTY.

B. Hamilton has located claims on a ledge showing native copper 30 miles southwest of Tucson.

SANTA CRUZ COUNTY.

At Washington, on the Pool mine, E. M. Ray manager, the ore body has been reached by the shaft.

W. Powers of Patagonia and E. Heck, owners of the Bland mine in the Tyndall district, are negotiating the sale of an interest in the property to a Mr. Barker of Los Angeles, Cal., to secure a concentrating plant.

A rich gold find is reported in a mine owned by W. Woods, G. Morris, A. Moody and C. Wilson of Nogales. It is reported to be a 10-foot ledge of free milling ore.

YAVAPAI COUNTY.

The Poland mill is producing twenty tons of concentrates daily, with twenty stamps in operation. Some gold values are secured on the plates also.

H. Simington has organized the Grand View M. & M. Co. to operate a group of five quartz claims in Cherry Creek district, near Prescott.

A rich strike is reported made on the properties of the Bigbug G. & C. Co., near Mayer, of which J. H. Canavan is manager. The shaft is down 180 feet, and is said to be all in high-grade sulphuret ore, carrying copper, gold and silver.

E. A. Franke has bonded the Golden Belt, Gold Standard, Mari and Mars claims, near Cordes, and has started development work on them. It is claimed that several hundred tons of float ore can be picked up that averages $15 per ton in free gold, besides lead and silver. A five-stamp mill, with concentrator, will be erected on the property at once.

The Lincoln M. & M. Co. is developing water for its mill. A tunnel is now being run 100 feet below the old water tunnel which supplies the present mill, which is also expected to cut the main ledge in 400 feet. The ore is free milling. The company is putting up a sawmill.

The extension of the Congress mine, at Congress, has been sold to O. F. Woodward, W. H. Hooker and associates of New York. A 130-foot incline shaft has been sunk, showing over 10 feet of ore in the bottom.

The Century Mines Co., in which E. M. Sanford of Prescott is interested, is sinking a double-compartment shaft on their property, near Kelly's station. The vein is reported to he 18 feet between walls, and the shaft entirely in ore.

YUMA COUNTY.

Engineers have begun the final survey for the dam to be built on Bill Williams Fork. It is proposed to build a dam 125 feet in height. From this reservoir the water will he conducted into the Plomosa desert, where have been found many rich placer gold deposits.

J. Roseborough of Denver, Colo., has bonded his Copper King mine, near Bill Williams fork, to Los Angeles, Cal., people. It is a low grade proposition, carrying 7% to 8% copper and some values in gold and silver.

CALIFORNIA.

AMADOR COUNTY.

The Amador & Calaveras Red. & M. Co. has been incorporated at Stockton, capital $200,000, with Directors T. A. Nelson, E. H. Cary, F. H. Cordway, N. W. Mahaffay and J. Marshall, to operate in Amador county.

At the Ballard & Martin mine, near Plymouth, Hayward & Lane, who have a bond on it, have commenced prospecting ledges which run through the property, testing them preparatory to sinking. Mr. Smart has charge of the work.

The Connelsville, Pa., people who recently bought the Ivanhoe mine at Plymouth of S. C. Wheeler, intend to open it up very shortly.

The vertical shaft on the F. Allyne Orr ground on Indian creek, near Plymouth, is now down 25 feet and requires a larger pump to handle the increasing water.

At the Hercules, at Plymouth, owned by C. H. Shields, three men are sinking on a lately discovered ledge that shows a good prospect in gold.

The plans for the erection of a new hoist at the east shaft of the Kennedy mine, at Sutter Creek, are under consideration by the directors. The construction of the hoist and the erection of the additional mill have been definitely decided upon.

The additional twenty stamps at the Central Eureka mine at Sutter Creek have been started. The mine has rock in sight sufficient to keep the forty stamps running constantly. W. R. Thomas is Supt.

CALAVERAS COUNTY.

At the Continental mine, near West Point, owned by Kline & Graves, a new 5-stamp mill will be erected. The millsite has been graded and building materials are on the property.

The Sultana Co., at Angels, will put up a new double hoist, capable of sinking their vertical shaft 1600 feet.

F. Cuneo, Jr., is erecting an arrastra on his quartz mine near Fricot. Considerable work has been done on the mine, a tunnel in 140 feet showing up a good vein.

It is reported that the Fort Wayne M. Co. will soon start up the Marshall gravel mine at San Andreas.

E. L. Burns and F. Treat, Jr., have bonded the Pajaro, Alpine, Clincher and Winchester claims, near Jesus Maria.

The old Duryea property on Central hill, near Jackson, recently bought by W. M. Nuner, Jr., and D. A. Nuner, is showing a good ledge between slate walls, with rich ore coming from kidneys and stringers. A shaft and tunnel are on the property.

EL DORADO COUNTY.

At the Columbia mine at Spanish Dry Diggings the shaft is down 40 feet in ore that prospects from $10 to $15 per ton. At the bottom of the shaft the ledge is from 4 to 5 feet wide. Mr. Holden is the Supt.

The Summit Hill mine at Spanish Dry Diggings has been sold to an Oakland company.

W. B. McKenney of Saoramento, one of the owners of the Stuckslager mine at Lotus, has started up mining in it.

The Mines Exploration & Development Co. of Los Angeles has bonded the Atlantic mine at Placerville and proposes to commence reopening the property at once.

INYO COUNTY.

What was known as the Millspaugh 2-stamp mill at Junction has been destroyed by fire.

KERN COUNTY.

The Josephine T. G. mine, near Randsburg, has been bought by J. P. Howe, A. Kane and R. T. Brackney, for $500, from J. Kelly and Price Bros. Kane & Brackney have bonded their interest to the Culbert Bros.

Supt. C. H. Wynn of the Baltic M. Co. says a new 10-stamp mill will be erected at once at the Baltic mine in the Stringer district, near Randshurg. The Baltic, mined in a small way, has produced in bullion about $40,000, and there are about 2000 linear feet of shafts and drifts opened. It is a large body of low-grade ore, with occasional shoots of rich ore, making an average that pays. The stamps will be of 850 pounds weight, and the engines will have a capacity of 40 H. P., the boilers using oil as fuel.

MONO COUNTY.

Work has been commenced on a cut to lower Lundy lake to provide water for irrigation and power uses and to recover the tailings from the Lundy quartz mills that are now submerged.

At the Sweetwater mine, near Bridgeport, the main crosscut tunnel is now in about 290 feet. It is expected that the east ledge will he reached in about 30 feet more, when an upraise will be made large enough to be used for letting timber down to the tunnel level. A track will be laid from mouth of tunnel to top of mill. J. J. Phelan of Bridgeport, Conn., is president of the company.

At the Golden Gate mine, Antelope valley, in grading a place to pile the ore that was being taken from the tunnel, a 3-foot ledge of milling ore has been discovered. The mill will be started about June 1.

NEVADA COUNTY.

W. W. Turney, Supt. of the mines of the Gold Deposit M. Co., below Montezuma hill, near Nevada City, reports that his company has started the tunnel to tap the Keiffer ledge at a depth of about 150 feet.

I. Haas and I. Stein have sold the control of the Alta California gravel mine to Haub Bros. of San Francisco and G. R. Tuttle of Grass Valley. The mine adjoins the Holbrook mine, about 2½ miles west of Grass Valley, and has been worked in a primitive way for the past fifteen years. Several shafts have been sunk at different points by the buyers, and they intend to open up and develop the mine on an extensive scale, installing machinery.

The New Hope quartz mine on Rock creek, near Nevada City, has been sold to F. Zeitler and J. J. Jackson by G. Johnston, S. Erskine and others.

The Syracuse & California M. Co., represented by A. H. Tickell, has made the first payment on the Culbertson mine, near Graniteville. The company is working the Culhertson and National group of mines, and when they are connected it is thought that fully thirty stamps can be kept running continually.

Mr. Priestly, who has been operating a dredger at Smartsville for some time, is going to construct a dredger for the purpose of working the bed of Deer creek, a few miles east of Smartsville.

Good ore has been uncovered in the winze which is being run from the Central mine shaft in the direction of the old workings of the North Star at Grass Valley.

At the North Star at Grass Valley it is reported that a rich find has been made in a lower drift and that further development work will he prosecuted.

PLACER COUNTY.

It is reported that a rich strike has been made in the Morning Star drift mine at Iowa Hill. The controlling interest in the property is now owned by Harold Power of Auburn.

SAN DIEGO COUNTY.

At the California Gold King mine, at Picacho, the railroad is nearly completed and the reduction works will he turned over to the company about July 1. The present payroll of the company is about $18,000 per month for 400 men. When completed, the company will have the largest cyanide plant in operation in the world. Its capacity will he 1800 tons per day. E. Gee, general manager, is at present in direct charge of the works.

A rich strike of free-milling gold ore is reported made on the old Government road running from Soda Springs to Manvel. The ledges are large and extensive and are in a formation of quartzite and porphyry. The ore is free milling and high grade.

The Nohles-Eureka group of claims, 65 miles northeast of San Diego, a free milling gold property, developed to some extent, and with a 5-stamp mill, has been sold to an English company for $3000. The pay shoot, it is stated, has been uncovered for 3000 feet and varies in width from 6 inches to 3 feet.

SHASTA COUNTY.

On the Shasta G. & C. Co.'s claims, between Pit river and Squaw creek, near Delamar, W. F. Mitchell, manager, has established a camp and started a tunnel under a capping of gossan. In this tunnel a rich ledge of black copper sulphides has been struck and crosscut 10 feet without disclosing the other wall of the ledge. The ore carries good values in silver.

A. Alexander, E. C. Allen, J. Drennan and W. Sweitzer, owners of the Tamarack mine, near Copper City, have struck the ledge in the tunnel 80 feet in from the entrance. The ore shows free gold values and indications of copper sulphides.

Supt. Sletcher of the Arps group of mines at Copper City has increased the force at work on the claims. It is reported that some fine gold-bearing rock has been taken out lately.

It is reported that the Bully Hill Co. has struck a very rich body of native copper in the mine at De Lamar.

Early Bros., at Shasta, at a depth of 50 feet have encountered a 9-foot ledge of free milling ore that assays an average of $62 a ton.

The Great Western G. Co. of St. Louis, Mo., has bought the Liberty group of mines in Flat Creek district. E. F. Adams is in charge of operations. A smelter is to be built near Copley. The group of mines consists of 900 acres, of which 640 are patented. Twenty-five men have been employed for some time under H. McCurry.

The Oro Fino mine on Clear creek, near Shasta, has been bonded to W. Moran, who has transferred the bond to the Sonoma G. M. & M. Co., who will start work at once prospecting the property.

The Niagara mine, near French Gulch, is to be reopened on an extensive scale after having been idle for several years. The Niagara-Summit M. Co. has been formed in New York, with W. T. St. Auburn, former manager, as president and general manager.

SIERRA COUNTY.

At the Last Chance mine, on the ridge between Forest City and Goodyear Bar, the main tunnel is being advanced by Miller Bros. and C. Scheffer.

J. M. Harper of San Francisco will shortly commence the extension of the tunnel into the Columbia gravel channel near American hill, above Forest City. This tunnel is already over 500 feet long.

Good progress is being made in the tunnel at the Bellevue mine at Gibsonville. It is now in about 3000 feet, one-half the distance in to pay gravel. About forty men are employed, and the tunnel is being advanced at an average rate of about 70 feet a week.

The King G. M. Co., which owns four quartz claims near Sierra City, has recently struck the ledge in the lower tunnel, where it is from 5 to 7 feet in thickness and of excellent grade.

SISKIYOU COUNTY.

G. W. Whip has bought the quartz mines on Cherry creek from J. Ironsides of Yreka, which the latter has been prospecting for several years. In the lower tunnel a 20-inch vein of ribbon quartz has been discovered, which, it is claimed, pays about $200 a ton. The tunnel is in about 75 feet and has yielded fifteen tons of ore. It is the intention of the new owner to put up a quartz mill at the head of Greenhorn creek.

Supt. Whitney of the Pine Grove placer at Oak Bar says the company will install an engine at the mine and pump water from Klamath river to operate the elevator with.

The miners along the Klamath river, in the Seiad Valley, Hamburg, Scott River and Happy Camp districts, are all busy with their giants and elevators, besides ground sluicing, while water is plentiful, and will take out considerable gold this season. Quartz ledges are being found in the Happy Camp section, which prospect rich.

The King Solomon mine, near Cecilville, has been closed down temporarily, owing to the breaking of the shaft of the mill engine.

The Consolidated M. & Dredging Co., at Callahans, have been operating the dredger about a month. The gold-saving device is pronounced the most satisfactory of any yet tested in that section. It is estimated that not more than half of 1% of the gold is lost in the tailings.

The Siskiyou M. & Dev. Association of Etna has taken a two years' bond on the coal vein near Ager, owned by A. Wise. A 3-foot vein has been developed in the bottom of a 50-foot shaft.

TUOLUMNE COUNTY.

P. Capella and partners have bonded the Bourbon mine, near Columbia, to H. C. Dodds of Oakland, who will immediately commence sinking a new shaft.

J. Oldman has discovered asbestos on his ranch, near Columbia. He is sinking on a ledge about a foot wide, being down nearly 14 feet. The mineral is green-grey in color and breaks in long slender fibers.

At the Woodside gravel mine on Table

Mt., near Springfield, tho incline shaft is down 150 feet and the face of tho workings is in gravol. A whim is used for hoisting. No water has yet heen struck.

Stanford & Estee, at Tahle Mt., on the Doyle ranch, near Sonora, have installed an 8 H. P. steam engine to run the hoist. Tbe sbaft is down 75 feet.

W. J. Wait, secretary of the Mack quartz mine, at Big Oak Flat, is making arrangements iooking toward the reorganization of the company and resumption of work at the mine.

J. M. Merrell of San Francisco has bonded until Jan. 15, 1903, the Cosmopolite quartz mine, near Groveland, at $10,000, from W. Pool, W. Schmidt, D. B. Gilliam and J. T. Poll.

S. Additon is at the Confidence mine, near Carters, making tests preparatory to putting in a cyanide plant, and has constructed a small sampling works to determine the character of the plant to be installed.

At the Sunnyside mine, at Carters, preparation is being made for operations on a large scale. A tramway is being bullt from the mine down to the river, where the mill will be located.

Work will be started up on the Bluebell mine, at Carters. The development work so far consists of a shaft 55 feet deep and a drift of 25 feet on the vein. The vein is 8 feet wide and the ore contains a high percentage of lead with free gold.

The New Aibany mine, at Carters, owned by Ballard & Martin, it is reported, is to he started up. When closed down on account of litigation, it is said it was very rich.

The Yellow Rock, a recently discovered mine on Knight's creek, near Columbia, owned by Lane & Martin, has been bonded to J. T. Newcomer. It has a vein from 10 inches to 2 feet in thickness and a mill test returned $25 to the ton. The property is being developed by a tunnel.

The Monterey Co., owner of the Longfellow mine at Big Oak Flat, has men at work cleaning the property and preparing to operate it on an extensive scale.

At the Two Brothers mine at Groveland, R. O'Brien, Supt., the gallows frame is up and the boller in place, and work will be resumed in the shaft, which has been enlarged and retimbered.

COLORADO.

CLEAR CREEK COUNTY.

A carioad of concentrates has been shipped from the '94 mill at Yankee, the first consignment out since it was completed. The '94 mill is using the Waugh dry concentration process.

The Santa Fe mine, near Idaho Springs, has 3 feet of pay ore opened in the second ievel at a depth of 200 feet. The company has plans on foot for extended work.

A. L. Preston and T. Brinkerhoff have bought the old stamp mill at Alice, are overhauling the machinery and will add new machinery, inciuding concentrating tables. They propose to make it a mill of forty tons capacity and will use both plates and concentration for the saving of values. Later they anticipate adding either a cyanide or chiorination plant.

About 110 feet were driven at the Empire tunnel at Empire in April in twenty-two rounds, making an average of 5 feet per round. Extremely hard rock kept the daily average down to 4 feet early in the month, later a change for the better made the average.

J. Frazer has leased the Robeson iode from Maxwell & Davis at Silver Piume and has made a strike of a solid high-grade ore shoot of from 5 to 8 feet width.

FREMONT COUNTY.

The Rocky Mountain Smelter Co. has closed down the piant at Florence in order that lead furnaces may be added and alterations necessary to make it a combination smelter, capable of treating all kinds of ores, may he made. Two or three months will probably be consumed in making these changes.

GILPIN COUNTY.

A company has been formed with a capital of $50,000 to build an independent sampling works at Black Hawk. The stockholders are largely local mine owners. It will be of 100 tons capacity, automatic throughout. Plans are being drawn and contracts will soon be let, as the company propose to have the works ready for business by the first of June. D. H. Allen is secretary and manager.

April shipments of ore and tailings from Black Hawk to the smelters and outside points of treatment were 405 cars, or 7495 tons, the biggest month's shipment in the history of the county, and an increase of 148 cars, or 2740 tons, over April, 1901, a gain of over 60%.

GUNNISON COUNTY.

J. T. Quigley, representing Galveston, Texas, people, has bought of Scott & Kimbush for $20,000 the Whig group of five claims near Pitkin. The workings consist of a tunnel and shafts, showing an ore shoot 56 feet in length and 4 feet wide, lying between walls of granite. The shoot will be developed hy a new 200-foot shaft.

HINSDALE COUNTY.

The Red Rover Co., operating near Lake City, D. A. Farrell, manager, has let a contract for a mill which at the start will have 100 tons capacity, arranged to be enlarged as necessity demands.

Contractors have begun work on the Tohasco power house, near Lake City, and the construction of the mill is to hegin in a short time. The building of the tram from the mine to the mill has also been started.

A contract has been let to J. Gavin to drive a tunnel on the I X L property at Lake City for the Texas owners.

Munro Bros. have bonded their gold hearing claim in Burrows Park to Lake City people for $10,000, and received a payment of $500 down.

A strike bas been made in the Lillie mine, on Henson creek, near Lake City, of a 2-foot vein of gray copper ore that mills $270 per ton. D. A. Farrell is manager.

LA PLATA COUNTY.

Prospectors in La Piata are giving attention to the Oro Fino section, with Lady Alice section west and Trimble section on the east. The three sections lie in a string between the Animas river and the backbone of the La Piata group of mountains. In the Trimble section the contact along the basaltic dikes, as far as exposed, is located, and surface work done shows materiai containing free gold.

OURAY COUNTY.

A rich strike of silver ore is reported from the Jonathan mine at Ouray. Assays give the ore a value of 300 ounces to the ton.

A strike has been reported in the tunnel of the Brooklyn mine, near Red mountain. A small streak of gold ore has been encountered in the breast of the tunnel which runs thousands of doliars to the ton. The main ore body is 12 feet wide and the average value across the entire width runs from four to six ounces in gold. The property is owned by Manion Bros. of Ouray.

SAN JUAN COUNTY.

W. H. Kearns of Silverton claims he has the extension of the recently discovered rich vein of the Isolde, or Inez-Hollister, of Burrows Park, Hinsdale county, in San Juan county. The vein in places stands out boid and bare, alongside of a well-traveled trail.

SAN MIGUEL COUNTY.

The 10-stamp mili of the Turkey creek group, near Telluride, has been destroyed hy fire, loss $15,000, with no insurance. W. H. Piper of Philadelphia, Pa., is the owner. A tunnel for the opening of the vein is now in 2500 feet, and the mill building has been utilized as a motor and converter house during its construction. Manager J. H. Shockley says the tunnel is nearly in to the vein, which will he cut at a depth of over a thousand feet, when it was expected to start the mill.

W. S. Buckley, manager of the Silver Bell and Butler mines at Ophir, is arranging for the construction of a new mill to be bullt at the mine this summer.

At the Alta mine in Gold King basin, near Telluride, it is the intention of the company to do considerabie development work this summer, and a canvas table plant will be constructed to treat the tailings after the pulp leaves the concentrators. A recent test made on a small table shows that the slimes in the tailings carry a high percentage of gold, silver and lead. The value determined was: Goid, 1.61 ounces, silver, 42 9 ounces, and 24.16% lead per ton. A. C. Koch expects to have a complete piant in operation before July 1.

A contract has been let hy the Japan Mines Co., at Telluride, to W. Treais and J. Lundstrom for the driving of a 3000-foot tunnel, and the work is now actively under way. Machine drills will be used and three shifts employed. The tunnel is in ahout 500 feet. The tunnel will drain the mine and greatly improve the facilities for creating an output.

TELLER COUNTY.

R. Bianchard, Supt. of the Bimetallic Tunnel Co., working on Copper mountain, has encountered a large vein of ore. A mili run is claimed to have given returns of $32 a ton. The tunnei is in 400 feet, where a winze 100 feet deep was sunk. From the hottom of the winze a crosscut, in 65 feet, has struck a vein known to be over 42 feet wide. The mill test was taken across this vein.

The Chamber of Commerce of Crippie Creek is to consider the matter of mine drainage of Cripple Creek district mines and to start definite action toward securing it. As planned hy the Chamher of Commerce, the money necessary to drive the hore is to be ohtained through a system of taxation, similar in operation to that prevalling in the irrigation districts of California. The estimated cost of the tunnel is $2,000,000 and the work would extend over a period of seven or eight years. The hore will out Bull hill at a depth of 3000 feet, and, if the work is carried forward through assessment, the individual amounts paid would he small, and in the case of the mining companies would be much iess eventually than the enormous monthly outlay for pumping machinery and its operation.

A production of twenty-five tons a day is being made from the Deerhorn mine at Cripple Creek, owned by W. S. Stratton, and the ore averages ahout one ounce to the ton. The ore is being mined from the 200 and 400-foot ievels of the mine from ground so soft that it permits of operations being carried on without much powder.

The production of Crippie Creek district by plants for April was as follows:

	Tons.	Average Value.	Gross Value.
Colorado City piants	24,000	$30	$720,000
Union	9,500	30	285,000
Metallic (tailings)	9,000	..	15,000
Economic	4,500	35	157,000
Smelters	11,000	60	660,000
Miscellaneous	....	..	20,000
Total	58,000		$1,857,000

The Addie C. claim, located adjoining the Laura Lee at Cripple Creek, has heen sold to J. K. Walch and J. H. Farrell, of Chicago, Ill., for $22,000, by the Addie C. M. Co. The claim has an area of ten and one-third acres. The greatest depth that has been obtained on the property is 235 feet, with about 100 feet of drifts and crosscuts. Weyand & McDaniels have a iease on the property, which has fifteen months to run yet.

There is said to be a strong probahility that a small concentrating plant will be erected at Crippie Creek hy W. Christen, who owns the Gush Pop ciaim, which has a vein that assays $5 to the ton in gold. He considers that with a concentration plant he can save enough to make it a paying proposition.

The sale of the Laura Lee ciaim, located on Minerai hill, Cripple Creek, for $50,000, $10,000 down, is announced. The property was sold by F. J. Campbeii and G. S. Wood to J. K. Waish and J. H. Farrell of Chicago, Ill., who iately hought the Addie C., an adjoining property, for $30,000.

J. Stoveken has contracted to sell to the Teller County M. & Ex. Co. the Gold Vaiiey placer at Crippie Creek, consisting of 127,823 acres.

With 300 feet advance a connection will he made from the Chicago-Crippie Creek tunnel with the Plymouth Rock shaft on Globe hill. The work is being done hy W. S. Stratton and the tunnel will cut the Plymouth Rock at the depth of 1000 feet. The tunnei, when completed, will be a mile in length and explores one portion of Gold hill and a portion of Globe hill.

IDAHO.

BOISE COUNTY.

A strike has heen made in the Lucky Boy mine, at Idado City, G. W. Thomas Supt., of ore averaging $20 a ton at a depth of 210 feet.

IDAHO COUNTY.

(Speciai Correspondence).—The spring weather is cold, making a iate start in spring water for mining. The Moose creek placers, C. P. Richardson manager, started piping on Aprll 17th with a half time water suppiy. The Newsome & Leggett Creek Placer M. Co. has heen enjoined from operation by parties who have iocated its dumps.

Newsome, April 29.

In starting a raise from the No. 1 ievel to the surface of the Jumho mine at Hump the miners encountered 4 feet of ore that has been miliing $180 free to the ton. It is claimed to he the richest ore ever struck in the camp, considering the quantity of it.

The Delta G. M. Co. has been incorporated at Wallace, capital $600,000, with directors C. S. Crysler, J. M. Savage, B. M. Crysler, H. E. Chaney and G. H. Keep. The company will put in a dredger on Beaver creek below Delta.

SHOSHONE COUNTY.

At the Cœur d'Aiene M. Co.'s plant, Manager Brown is moving the hydraulic elevator preparatory to starting the washing of gravel.

LEMHI COUNTY.

A 10-stamp mill is to he installed at the Kittie Burton mine, near Salmon City. R. L. Edwards is manager. The mill will be 3300 feet from the mine. An aerial tramway will connect the mine and mill, operating hy gravity. The new mill will be provided with hoth steam and water power piants.

F. C. Hagel, owner of the Riverside group of claims, on Salmon river, near Saimon City, reports a new strike of 4 feet of hrown hematite carrying $20 a ton in free milling gold.

MICHIGAN.

HOUGHTON COUNTY.

The Victoria C. Co. will commence at once on tbe construction of the quarter-mile railroad connecting the mine and the proposed millsite on the Ontonagon river. One head of stamps will be huilt this summer. It is planned to have two heads ultimately. The mill will differ from any other at the iake, as it will be operated by compressed air instead of steam. The ore road will probahly be operated by electricity to he generated by a water power. The compressors will also be run by electricity, making the Victoria independent of coal as fuel.

Rock breakers are now being installed in Nos. 1 and 3 rock houses at the Adventure mine, near Houghton. The rock will he conveyed from the Butler tunnel hy electric tram cars from the various iodes direct to the rock houses, without rehandling. By July 1, when the first head of stamps goes into commission, the Adventure will have 4 miles of underground openings, with three shafts in commission and the Butler tunnel opening up various iodes. The water tunnel which is now out 340 feet under Lake Superior will he extended to the full distance of 1400 feet, where it will strike 40 feet of water. The work is progressing at the rate of 160 feet per month.

The mining equipment and materiai of the Arcadian mine, near Houghton, is being taken from the abandoned Arcadian shaft, even to the brick.

MARQUETTE COUNTY.

The striking of a big vein of copper ore near Sanks Head is reported. It is claimed that the ore runs nearly 30% copper, with some gold and silver values. The vein is 17 feet wide.

MONTANA.

BEAVERHEAD COUNTY.

The Eriega Copper & Coal M. & S. Co., J. F. Firch of Butte, Pres., is pianning for a smelter to be placed on the mine at a cost of between $25,000 and $50,000. The company ciaims to own forty copper claims and several thousand acres of coal iands. In addition to the smelter the company will put in a sawmili, a number of buiidings, and possibiy an electric piant this summer.

CARBON COUNTY.

P. H. Gailagher, C. E., representing the Amalgamated Copper Co., has surveyed the Bear Creek coal fields near Red Lodge. It is helieved the Amalgamated is planning to buy these mines and consolidate them with the copper mines.

FERGUS COUNTY.

R. Hendry & Co. have bonded a group of claims near Kendall at $57,000, from A. Newman, A. Clark, F. A. Barnes, C. Young and P. Morris. A bond has also heen taken hy the same people on tbe Hugh Green group of cyanide ciaims, situated in the same district, at $5000.

LEWIS AND CLARKE COUNTY.

B. B. Kelly, E. E. Doty and C. Lindquist, of Helena, formed iast year the Combination M. Co., which has been working upon property near Austin and now have hetween 200 and 300 tons of ore on the dump, which has an average goid value of $7 per ton, in addition to $3 per ton which the smelter will pay for the ore as flux.

MADISON COUNTY.

J. M. King has bonded to W. M. Brown the U. S. Grant and Fairweather mines in the Fairweather district, near Virginia City, at $40,000, $500 cash down. Brown agrees to put a mill of forty tons capacity on the mine before January 1, 1903. The bond has heen assigned to G. A. Pratt of Minneapoiis, Minn.

Reports from Sand creek say that the country has been staked 10 miles on tbe contact from the Whippoorwill mine. It is claimed that the ore is sylvanite in a 5-foot vein hetween limestone and schist. Assays run from $56 a ton upward

W. A. Lord, O. Huffman and E. Mahoney have leased the Mountain Cliff mine at Pony.

SILVER BOW COUNTY.

Gemmell Bros. have struck ore in the Gemmell ciaim, near Butte, in a vein 2½ feet wide at the point at which the tunnel, hy which the ground is heing opened up, cut it. The ore carries, in gold, silver, copper and lead, a value of more than $100 per ton—12% copper, fifty-two ounces of silver per ton, some lead and $4 50 in gold.

NEVADA.

ESMERALDA COUNTY.

A gold strike is reported in the Silver Peak mines—the property of the Blairs of New Jersey—south of Candelaria. The

men at work under the direction of S. Wasson, in following a small stringer, came upon a pocket of coarse gold. It is claimed that more than $100,000 has been taken out.

HUMBOLDT COUNTY.

The Hardesty mine in Relief district has been sold to San Francisco people.

LINCOLN COUNTY.

E. A. Higginson of Spokane, Wash., has bonded the Mendha mine, near Pioche, from T. J. Osborne, J. Cook and W. Lloyd, and the Gold Eagle and Gelder mines adjoining from H. Weiland and J. Bingham.

LYON COUNTY.

Beck, Wright & Allson are doing work on the Taylor mine, near Wellington, and have rigged up an arrastra to mill the ore. The ledge in the mine is small, but some of the ore, it is claimed, will go over $100 per ton.

NYE COUNTY.

The old Liberty mining district, which was prospected and worked in the early '60s, located adjacent to the Tonopah district, has lately been relocated and extensive developments are projected on the Burbanks (old Liberty), Florence and Sheridan claims. The principal development work in this district has been done on the Liberty claim. These claims have been recently bonded and new companies organized.

The Fraction mine, at Tonopah, is having a gasoline hoist installed in place of the whim now in use. The vein of high-grade ore in the north crosscut is still widening, about a foot of ore being broken and raised to the surface daily. A shipment of ore has been prepared and the first carload of ore started to the smelters.

NEW MEXICO.

GRANT COUNTY.

The General Turquoise Co., operating near Burros, has increased its force and regular shipments are being made.

A 10-stamp mill will be erected at Gold gulch soon by H. Finch, who recently bought the A. Hamilton mine. The ore is now being tested to determine the best method of treatment.

Assays from the Gold Hill, near Lordsburg, show values of $125 per ton in gold, silver and copper.

It is reported that $100,000 will be used by Eastern people for the buying of ore as soon as the new Silver City smelter is built. Also a refinery will be erected.

A proposition is now under consideration to erect a plant at Hanover for the reduction of low-grade zinc ores owned by the Mineral Point Zinc Co. The concentrates will be shipped to the smelter at Mineral Point, Wis.

D. C. Kling, Supt. of the Empire Copper Co., is doing extensive work on the Clearwater group at Silver City. Three shafts have been sunk. In the workings native copper has been encountered at a depth of 20 feet.

The Silver Cell mine, near Pinos Altos, has been sold by Dimmick Bros. to H. Finch and associates of St. Louis, Mo., for, it is reported, $100,000. The sale includes the mill and smelter, built by Dimmick Bros. Both will be operated by the new owners.

LINCOLN COUNTY.

W. A. McIver has sold the Vera Cruz group of mines near Nogal for $50,000 to Chicago people. It is a low grade free milling gold proposition. The new company will erect a large cyanide plant at the mine to treat the ores.

S. S. Doak, manager of the Iowa & New Mexico M. & M. Co., says the tunnel is now in 350 feet and has cut an ore body 20 feet thick which runs as high as $19.50 in gold. When completed, the tunnel will be 2000 feet under the surface.

RIO ARRIBA COUNTY.

J. P. Rinker, Supt. of the Danbury mine at Bromide, is placing a steam hoisting plant on it. The Payroll shaft will be sunk another 100 feet.——The St. Michael's and New Mexican copper properties have consolidated and their Gold Pan shaft is now in fine ore.

The Glen-Woody M. & M. Co. has been incorporated at La Crosse, Wis., capital $1,800,000, with the New Mexico office at Rinconado and W. M. Woody the New Mexico agent.

TAOS COUNTY.

G. B. Paxton and Pittsburg, Pa., people have bonded the Anaconda mine at Red River. Three shafts have been sunk. One, 420 feet deep, has developed a lead of quartzite and porphyry that averages $3.10 in gold. Mr. Paxton says that the ore can be treated by the cyanide process for 50 cents a ton.

OREGON.

BAKER COUNTY.

(Special Correspondence).—L. C. Jaquish, president of the American D. & M. Co. of Chicago., Ill., has started work on the Blue Canyon placers, near Auburn. They are on an old river channel that was worked in the early 60s very profitably.

The Phœnix M. Co. has resumed work at its mine near Sumpter. C. Parker is Supt.

An electric plant has been installed at the Prairie Diggings mine at Prairie. The present capacity of twenty-five stamps is to be doubled this season.

During April the Bonanza mine produced $54,760, exclusive of concentrates. The new hoist is completed and the work of sinking resumed. The shaft is 500 feet and will be sunk to the 2500-foot level.

A 300-foot tunnel has been completed at the Brooks property, adjoining the Ibex mine, near Sumpter. They will resume work as soon as supplies can be hauled in.

Sumpter, May 1.

Should the ores uncovered in the tunnel of the Baby McKee mine at Cable Cove prove of commercial value, a plant to treat them will be installed. It is also proposed to commence sinking on the Last Chance mine. O. Townsend is manager.

It is reported that the Cornucopia mine, owned by J. E. Searles of New York, has been sold by him to R. A. Aiger of Detroit, Mich., and associates. In connection with the buying of the mine is a proposition to build a railroad from Baker City to Cornucopia to facilitate transportation of the ores.

On the Golden Wizard property, near Sumpter, a new hoist, capable of sinking to a depth of 300 feet, has been installed. Manager McPhee expects to have ore enough blocked out by the end of the summer to justify the erection of a treating plant and to put in a larger hoist.

GRANT COUNTY.

G. J. Barrett, manager of the Big Four and Grand Union groups, near Granite, states that he has cut the main ledge 13 feet wide on the Big Four in a 400-foot tunnel.

JACKSON COUNTY.

The Last Chance G. M. & M. Co. of Ashland has elected R. P. Nell president, D. A. Applegate secretary-treasurer and O. C. Tiffany Supt. The company owns the Last Chance gold quartz mine and extension, near Gold Hill.

A. M. Williams of Los Angeles, Cal., has bonded the Indian Girl mine, near Ashland, from Booth & Burleson for $20,000, and has had ten men developing the property under I. C. Burleson, foreman. He is installing a 10-stamp mill.

LANE COUNTY.

A rich strike is reported in the Treasure mine owned by C. H. Park, in Blue River district, near Eugene. The ledge is said to be from 18 to 25 feet wide.

SOUTH DAKOTA.

OUSTER COUNTY.

The North Star M. Co. expects to have ten stamps running on its property near Custer City by July 1. The mill building is practically completed and is large enough for thirty stamps. It is the intention to adopt some tailing-treatment process, probably cyanide. The ore is said to average about $10 gold to the ton, $4 or $5 of this being free-milling and the rest refractory.

The Penobscot M. Co. has commenced work at the May & Johnson mine, in Garden City, with E. Manion as Supt. The old machinery at the mine is to be replaced and an air compressor and air drills installed.

LAWRENCE COUNTY.

The Spearfish G. M. Co., at Ragged Top, from the first cleanup of the new mill built to replace the one destroyed by fire early in January, has $14,000 gold. This is the April production. The mill lost considerable time during the month in order to readjust the plant which is perfectly new. Only eighteen tanks were handled out of a possible sixty. The mill is equipped with ten cyaniding tanks and the process is so adapted that these can be filled and emptied six times every thirty days.

PENNINGTON COUNTY.

The Cumberland M. Co. is doing development work on the J. R. mine, near Hill City. A hoisting plant has been installed.

UTAH.

BEAVER COUNTY.

The Majestic Co. has marketed sixteen carloads of ore from its mines at Milford. Thirteen from the O. K. mine contained 40.65% copper, $2.25 gold and 7.75 ounces in silver to the ton, and three cars were high grade silver-lead ores from the Harrington-Hickory mine. The copper ore, it is said, brought in the neighborhood of $65 a ton, the shipment being sent east of the Missouri river for treatment. The O. K. mine is said to be in excellent physical condition with large bodies of high and low grade ore in sight, and it is stated that it is the intention to begin at once the erection of a smelter for the treatment of the low grade product of the mine, and to make other improvements.

BOX ELDER COUNTY.

The Gibraltar C. M. Co. has been incorporated, capital $25,000, with W. E. Weihe president and W. D. Mathis secretary and treasurer. The company owns a group of thirteen claims in the Newfoundland district.

EMORY COUNTY.

The Hecker M. Co. property consists of a group of five claims near Woodside and is being developed under H. Hardy, Supt. Two shafts have been sunk and crosscuts run across the vein 40 feet wide, assays yielding from 30% to 62% lead, 4% copper and 68 to 238 ounces silver to the ton.

JUAB COUNTY.

Forty-five tons of ore from the Utah M. Co. mine at Fish Springs sold for $3143, the lot containing 62% lead and 93 ounces silver, with a little gold per ton, going to one of the Eastern smelters, the latter paying $17.50 per ton for transportation, and giving more for the ore than is to be had from local smelters.

SALT LAKE COUNTY.

Plans for the projected concentrator for the milling ore in the Bingham Con.'s Dalton & Lark group at Bingham have been completed by J. B. Fleming, the company's mechanical engineer. Supt. Fleming says it will be completed within four months after starting construction. The plans show a number of new devices designed specially in addition to the best features of plants now in operation. The plans as completed provide for a half dozen Wilfley tables, a dozen jigs, five sets of rolls, screens, sizing machinery and filter presses for the treatment of the slimes.

The Boston Con. Co., of Bingham, is adding to its equipment and is grading for a new compressor plant with a battery of three boilers to supply a dozen additional drills.

Two of the converters of the Bingham Con. smelter have been started up, beginning the production of copper bullion, carrying gold and silver. With all the furnaces and the two converters in operation, the product will be over a carload of bullion daily.

SUMMIT COUNTY.

The Belmont M. Co. has been incorporated at Salt Lake City, capital $300,000. J. R. Walker is president and E. McGurrin secretary and treasurer. The company owns the O'Donovan group, in Uintah mining district.

J. H. Conrad has bonded the J. J. C. group of five claims, near Park City, at $200,000 for eighteen months from W. H. Dodge, J. R. Clawson, M. McGrath, A. V. Taylor, F. W. Clawson and the Tufts estate.

TOOELE COUNTY.

The Hercules mine at Stockton, of the Cygnet M. Co., has been bought by C. H. Scheu of Salt Lake City. The retiring owners have made their output from levels above the 200.

The Con. Mercur mill during April treated 29,400 tons ore. The mill at Manning has been running on tailings. The Electric mill level tunnel has reached the 450-foot station from the main opening.

WASHINGTON.

FERRY COUNTY.

Manager E. J. Deibridge of the California mine is constructing a 6-mile wagon road from the mine and ore bins of 300 tons capacity on the Washington & Great Northern road at San Poil lake.

KITTITAS COUNTY.

The Elizabeth Gold Hill M. Co. of Yakima, have started work on their claims at the headwaters of the Natchez river. The company will sink a shaft and put in reduction machinery. The ore is said to carry $15.80 in gold, $28.02 in silver and $2.46 in copper, with a trace of lead.

OKANOGAN COUNTY.

The Clackamas G. M. Co. of Wauconda has resumed work on the tunnel. J. B. Chapman is president, C. E. Lawson secretary, J. C. Kerley general manager and W. C. Malott Supt.

PIEROE COUNTY.

The Consolidated G. Co. has been incorporated at Tacoma for the purpose of economically working many mines consolidated under one management. The capital is $15,000,000. S. R. Balkwill of Tacoma is president and L. F. McConihe of Tacoma secretary of the corporation. Eight groups of properties are comprised in the consolidation, including the Saw Pit Flat group in Pumas Co., Cal., twelve claims in the Mount Baker district, Skagit county, five claims in the Swauk district, Kittitas county, and many claims in Montana, Idaho, Oregon and Alaska.

STEVENS COUNTY.

The Blue Point Marble Co. of Spokane is building a wagon road from Addy to the quarry, and arrangements are being made to commence opening up the ledge. It is expected that machinery will be installed during this summer.

FOREIGN.

BRITISH COLUMBIA.

Out of an old channel on Lightning creek, in Carlboo, S. Montgomery has lately taken out in one day 100 ounces of gold worth $1875.

T. R. Lane of London, England, has bonded the Wakefield mine, near Silverton, for the Anglo-Slocan Syndicate, Ltd., and operations have been commenced under C. A. Sandiford superintendent and consulting engineer and W. McDonald foreman.

S. Norman, Western manager of the Ohio Northwestern Development Co., says his company has bonded the Black Prince mine, near Slocan City, for two years at $65,000, from J. Elliot of Nelson, W. E. Bore of Kaslo and C. Murphy, P. M. Schonberg, Dorin Bros. and others of Slocan City.

The Crofton smelter, on Vancouver Island, near Victoria, is expected to be ready about July 1. There are now about 250 men at work. It will smelt the ore from the Leonora mine. A new strike in the Leonora recently has, it is claimed, increased the ore tonnage of the mine about 30%.

It is reported that the Tyee M. Co. at Ladysmith will put in a 100-ton smelter in the near future.

The balance sheet of the St. Eugene M. Co., at Moyie, for the year ending Sept. 30, 1901, shows assets valued at $3,631,880, including a cash balance of $109,834, and stores on hand of $27,168. The mines are valued at $3,200,000 and the machinery and equipment at $150,004. After paying during the year two dividends, aggregating $210,000, and writing off $20,019 for depreciation, a balance of $125,359 is carried forward to profit and loss. Concentrates produced were 11,000 tons, which were shipped to Antwerp, Belgium. Development work blocked out over 200,000 tons of ore. A shaft was sunk to a depth of 60 feet below the level of Moyle lake, but there has been no inflow of water.

A consolidation of the Dominion Copper Co. and the Snowshoe gold-copper mines, Ltd., at Phœnix is projected. The control in the former corporation is held by R. Jaffray and Mackenzie & Mann of Toronto, and J. Breen of Spokane is a large owner. The Snowshoe group, a mile distant, is on a shipping basis, and the owners say it could easily ship 600 tons daily. Aside from the underground workings, the ore can be quarried from huge open cuts on the surface. The control of this company is held by the British Columbia (Rossland and Slocan) syndicate, A. J. McMillan of Rossland as managing director. If an amalgamation of the two companies is effected a smelter for the treatment of the ore of both mines will be erected at some point in the Kettle River valley.

G. W. Hull, manager of the Sullivan S. Co., says that at the Sullivan mine a shaft will be sunk to the 125-foot level and connected with the old workings, where there are now 265,000 tons of ore blocked out ready for shipment to the smelter. The smelter at Marysville is to start up about July 1. Work on the railway spur to the mine has been started.

The surface tramway from the portal of the main shaft of the Queen mine to the Yellowstone company's 10-stamp mill at Salmo has been completed and the mill started on the ore from the Queen. The Queen is under bond to P. McL. Forin, A. Cameron, G. Hopkins and M. Holmes of Nelson at $50,000.

The Mound and Copper Cliff claims on Copper mountain, in the Similkameen, are reported sold to the Standard Oil Co. by W. Y. Williams, O. Johnson and L. Jacobson for $52,000.

MEXICO.

Near Soyopa, Sonora, the Chicago G. M. Co., R. C. Coy president, is reported as operating its mill and projecting the construction of a larger plant, the ore producing capacity of the mine requiring it.

The Refugio group of copper mines, near Cananea, Sonora, owned by M. Latz of Magdalena and his associates, is being prepared for development work upon an extensive scale.

The Minnesota & Mexico M. & Dev. Co. are starting development work upon copper properties with great surface showings located near Matape, Sonora. The company has 1300 pertenencias of copper-bearing lands. M. P. Wright is Supt.

The Carlotta G. M. Co. has been incorporated to operate the Calera district, near Magdalena, Sonora. R. C. Bogy of Denver, Colo., is president and E. E. Quentin of Denver, Colo., is secretary and treasurer.

Personal.

J. B. FARISH of Denver, Colo., is in San Francisco.

J. W. PROUT of Denver, Colo, is at Globe, Ariz.

W. A. FARISH of Denver, Colo., is at Milford Utah.

J. W. ABBOTT of Donver, Colo., is in San Francisco.

M. LINDLEY of Fruitvale, Cal., is at De Lamar, Cal.

S. A. KNAPP of Hawthorne, Nev., is in Virginia City, Nev.

E. C. VOORHIES of Sutter Creek, Cal., is in San Francisco.

H. C. BELLINOER of Crofton, B. C., is at Greenwood, B. C.

H. M. CHANCE of Philadelphia, Pa., is in San Francisco, Cal.

S. S. TERRILL of Sumpter, Or., is in Salt Lake City, Utah.

H. L. HOLLISTER of Hailey, Idaho, is in Salt Lake City, Utah.

F. H. PROBERT of Los Angeles, Cal., is in Salt Lake City, Utah.

G. W. SMALL has returned to Salt Lake City, Utah, from Mexico.

E. I. FIELD of Telluride, Colo., is in Montana examining mines.

R. McF. DOBLE has returned to San Francisco, Cal., from Mexico.

W. J. WAIT of the Mack mine at Big Oak Flat, Cal., is in New York.

G. A. WANOER of Kingman, Ariz., has gone to Dawson, Yukon Territory.

J. S. HEDOES of Republic, Wash., is in Thunder Mountain district, Idaho.

N. H. GETCHELL of Tonopah, Nev., was in Silver City, Idaho, last week.

C. PARKER, Supt. of the Phœnix mine, near Sumpter, Or., is in New York.

G. D. B. TURNER of Butte, Mont., is examining mines at Bingham, Utah.

J. D. SWORD of Toronto, Canada, is examining mines near Jesus Maria, Cal.

S. J. CADY, Supt. of the Wolverine mine at Park City, Utah, has resigned.

T. MCSORLEY, Supt. of the Sunrise mine at Railroad Flat, Cal., has resigned.

G. A. PRATT has returned from Virginia City, Mont., to Minneapolis, Minn.

D. M. PURMAN, manager Leviathan G. M. Co. at Congress, Ariz, is in New York.

F. R. BYRNS, manager of the Penobscot M. Co. at Garden City, S. D., is in Chicago, Ill.

H. J. DUBOIS of New York is making a trip through the mother lode region in California.

J. HOOPER has heen appointed mine foreman at the Mammoth mine at Central City, Colo.

C. H. DUNTON has heen appointed Supt. of the Eureka slate quarry at Placerville, Cal.

D. H. ALLEN has been appointed manager of a new sampling mill at Black Hawk, Colo.

R. WALLACE has been appointed mine Supt. of the Independence Con. M. Co. at Victor, Colo.

U. CURTIS, formerly of Johanneshurg, Cal., is Supt. of the Fraction mine at Tonopah, Nev.

G. V. NORTHEY, Supt. Manzanita quicksilver mine at Sulphur Creek, Cal., is in San Francisco.

H. K. MASTERS of New York is Supt. of the Unlted States Co. smelter at Bingham Junction, Colo.

J. CUSICK of Deadwood, S. D., has been appointed Supt. of the Cape Nome Hy. M. Co. at Nome, Alaska.

O. C. TIFFANY has been appointed Supt. of the Last Chance G. M. & M. Co., operating at Gold Hill, Or.

J. W. CHENHALL, E. M., of London, England, is ln Denver, Colo., en route from Australia home.

P. G. DAWSON, Supt. of the Meguntlcook mine at Lake City, Colo., has returned from New York.

E. W. DAVIES of Central City, Colo., has been appointed manager of the Charter Oak mine at that place.

W. F. SNYDER of Salt Lake City, Utah, has been appointed manager of the Honerine mine at Stockton, Utah.

M. BRADLEY of Prescott, Ariz., has heen appointed mine foreman for the Lion G. M. Co., operating near that place.

O. TOWNSEND of Cripple Creek, Colo., has heen appointed manager of the McKee and Last Chance mines at Cable Cove, Baker county, Or.

G. L. HOLMES, E. M., of the Link Belt Machlnery Co. of Chicago, Ill., is ln San Francisco en route on a trip through the gold dredger mining districts of the Pacific coast.

Latest Market Reports.

SAN FRANCISCO, May 7, 1902.

METALS.

SILVER.—Per oz., Troy: London, 23d$\frac{13}{16}$ (standard ounce, 925 fine); New York, bar sllver. 51$\frac{5}{8}$c, refined (1000 fine); San Francisco, 51$\frac{5}{8}$c; Mexican dollars, 44$\frac{1}{2}$c San Francisco, 41$\frac{1}{4}$c New York.

COPPER. — New York: Standard, $11.00@11.15; Lake, 1 to 3 casks, $12.10; carload lots, 11.87\frac{1}{2}$; Electrolytlc, 1 to 3 casks, $12.00; carload lots, $11.75; Casting, 1 to 3 casks, $12.75; carload lots, $11.50. San Francisco: $14.00. Mill copper plates, $17.00; bars, 18@24c. London: £53 5s per ton.

LEAD.—New York, 4.12\frac{1}{2}$; Salt Lake City, $3.60; St. Louls, $4.00; San Francisco $4.50, carload lots; 4$\frac{1}{2}$o 1000 to 4000 lbs.; pipe 5$\frac{1}{2}$, sheet 6, bar 5$\frac{1}{2}$c; pig, $4.75. London, £11 12s 6d per ton.

SPELTER. — New York, 4.42\frac{1}{2}$; St. Louis, $4.00; London, £18 2s 6d per ton; San Francisco, ton lots, 5$\frac{1}{2}$c; 100-lh lots, 5$\frac{3}{4}$c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8$\frac{1}{2}$c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN. — New York, plg, $28.25; San Francisco, ton lots, 30c; 1000 lbs., 30$\frac{1}{2}$o; 500 lbs., 30$\frac{1}{2}$c; 200 lbs., 30$\frac{1}{2}$c; less, 31c; bar tin, ℔, 35c.

PLATINUM.—San Francisco, orude, $17 ℔ oz.; New York, $18 per Troy oz.

QUICKSILVER. — New York, $50.00 large lots; London, £8 15s; San Francisco, local, $47.50 ℔ flask of 76$\frac{1}{2}$ lbs.; Denver, $51.00. Export, $45.00.

BABBITT METAL.—San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure lngots, 35c; No. 2, 90%, 30c to 35c.

SOLDER. — Half-and-half, 100-lb. lots, 19.30c; San Francisco, Plumbers', 100-lb. lots, 16c.

NICKEL.—New York, 50@60c ℔ lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer plg, $17.25; gray forge, $17.75; San Francisco, bar, 2.75 ℔ lb .,3c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $31.75; open hearth billets, $32.25; San Francisco, har, 7c to 12c per lb.

CEMENT.—Germania, $2.65; K. B. & S., $2.65; Hewmoor, $2.50; Trowell, $2.50 per bbl.

LIME.—Santa Cruz, $1.60; Roche Harbor, $1.60 per bbl.

LUMBER.—(Retail): Pine, ordinary sizes, $18.00@19.50; extra sizes hlgher; redwood, $19.00@20.00; lath, 4 feet, $3.90 @4.00; pickets, $19.00; shlngles, $2.00 for No. 1 and $1.75 for No. 2; shakes, $13.00 for split and $14.00 for sawed; rustic, $25.00 @31.00.

GENERAL SUPPLIES.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.50; Cut, $3.50; 10d to 16d, Wire, $3.55; Cut, $3.55; 8d, Wire, $3.60; Cut, $3.60; 6d and 7d, Wire, $3.70; Cut, $3.70; 4d and 5d, Wire, $3.80; Cut, $3.80; 3d, Wire, $3.95; Cut, $3.95; 2d, Wire, $4.20; Cut, $4.20. Special rates for carload lots.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., ln carload lots, 15$\frac{1}{2}$c; less than one ton, 17$\frac{1}{2}$c. No. 1*, 60%, carload lots, 13$\frac{1}{2}$c; less than one toss 15$\frac{1}{2}$c. No. 1** 50%, carload lots, 11$\frac{1}{2}$c; led, than one ton, 13$\frac{1}{2}$c. No. 2, 40%, carloan lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9$\frac{1}{2}$c; less than one ton, 11$\frac{1}{2}$c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blastlng powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Trlple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ℔ set; 14 oz., 40s., 9c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $6.50; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $9.56, long ton; Colorado Anthracite, $14.00. Coke, $15 per ton in hulk, $17 in sacks; Sunnyside, $11 75, long ton.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 29@30c ℔ lb.; carloads, 27@28c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c ℔ lb.; soda ash, $1.90 ℔ 100 lbs.; hyposulphite of soda, 2$\frac{1}{2}$@3c ℔ lb.; blue vitrlol, 5$\frac{1}{2}$@6$\frac{1}{2}$c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 5c; alum, $1.90@2.00; flour sulphur, French, 2$\frac{1}{2}$@ 2$\frac{1}{2}$c; California refined, 1$\frac{1}{4}$@2c; nitric acid, ln carboys, 8c ℔ lb.; caustic soda, in drums, 3@4o ℔ lb.; Cal. s. soda, bhls., $1.25 @1.50 ℔ 100 lbs.; sks, $1.05; chloride of lime, spot, $2.50@2.60; nitrate of potash, in bbls, 8c: caustio potash, 10o in 40-lb. tins.

OILS.—Linseed, boiled, bbl., 76c; cs., 81c; raw, bbl., 74c; cs., 79c; lots of 5 hhls., 1c less; Lucol oil, boiled, hbl., 66c; cs, 71c; raw, hhl., 64c; cs, 69c. Kerosene —Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13$\frac{1}{2}$c; Mineral Seal, lron hbls., 19c; wooden hhls., 22$\frac{1}{2}$c; cs, 25c; Mineral Sperm, cs, 26$\frac{1}{2}$c; Deodorized Stove Gasoline, bulk, 15$\frac{1}{2}$c; do., cs., 21$\frac{1}{2}$c; 86° Gasoline, bulk, 20c; do., cs., 26$\frac{1}{2}$c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14c; do., in cs., 20$\frac{1}{2}$c; Lard Oil, No. 1 bbl., 60c: cs., 65c; Neatsfoot Oil, bbl., 70c; cs., 72$\frac{1}{2}$c; No. 1 bhl., 52$\frac{1}{2}$@55c; cs., 57$\frac{1}{2}$@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6$\frac{3}{4}$c; 1 ton and less than 5 tons, per lb., 7c; 500 lbs. and less than 1 ton, per lb, 7$\frac{1}{4}$o; less than 500 lbs., per lb., 7$\frac{1}{2}$c; in 25-lb. tin pails, $\frac{1}{2}$c per lb. ahove keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2$\frac{1}{2}$c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6$\frac{3}{4}$c; do. in kegs, 7$\frac{1}{2}$c.

ASSAY LITHARGE.—Per lb., 9c.

BISMUTH.—Subnitrate, per lb., $1.60.

BONE ASH.—3c ℔ lb.

BORAX.—Crystal, 7c; calcined, 20c.

CHROMIUM.—(90% and over) per lb., $1.25.

COPPER.—Carbonate, 20c; Red oxide, ℔ lb., 60c.

MAGNESIUM.—Per lb., $3.00.

MANGANESE.—(90% and over) ℔ lb., $1.25.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—25c. ℔ gramme; 1000 grammes=2$\frac{1}{2}$ lbs.

PHOSPHORUS. — (American) ℔ lb, 80c.

SILVER.—Chloride, ℔ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ℔ lb., $1.00

URANIUM.—Oxide, ℔ lb., $3.50.

ZINC.—Metallic, chemically pure, ℔ lb., 50c.

ZINC.—Dust, ℔ lb, 10c.

ZINC.—Sulphate, ℔ lb., .04c.

(These prices are wholesale, f. o. h. San Francisco, unless otherwise noted.)

Obituary.

HOWARD VAN FLEET FURMAN, one of the best known metallurgists, chemists and mining engineers in the Unlted States, and a recognized authority on smelting, died of pneumonia on April 28, ln Mapimi, State of Durango, Mexico, aged 45 years. He graduated from the School of Mines of Columbia College, New York, in 1881, with honors, and went to Colorado in 1882. As a metallurgist he built a reputation while employed as chemist by the Globe S. & R. Co. in Denver. Between the years 1882 and 1888 he was successively assayer, chemist and foreman of the Germania Lead Works in Utah, assistant superintendent of the Billings smelter, Socorro, N. M., and superintendent of the Bailey smelter, Denver, Colo. From 1894 to 1895 he was chlef assayer at the United States mint at Denver. In the fall of 1895 and until the spring of 1897 he was professor of metallurgy at the Colorado School of Mines. He was a man highly valued professionally and by a wide circle of friends, from which, cut down ln the prime of his life, he will be missed.

Commercial Paragraphs.

THE Raymond Bros. Impact Pulverizer Co. have moved their Chicago, Ill., offices to 738 Monadnock building.

SPON & CHAMBERLAIN, publishers of engineering books, after fifteen years' location at 12 Cortlandt St., have removed to 123 Liberty St., New York, N. Y.

GEORGE W. MYERS has been appointed Pacific coast representative of the Chrome Steel Works of Brooklyn, N. Y. His office is at 417 Hayward building, San Francisco, Cal.

THE Fred. M. Prescott Steam Pump Co. are now located at their fine new manufacturing plant at West Allis, Milwaukee, Wis. The new huildings cover several acres of ground and are equipped with the latest machinery.

THE British Westinghouse Electric & Manufacturing Co. of Manchester, England, has taken the contract to install Westinghouse steam turhines in the electric generating station to he huilt for the Metropolitan Railway Co. of London, and is now filling a similar contract for the Metropolitan District Electric Traction Co. of London. Arrangements are to he made for connecting the two and making them interchangeahle, as far as the supply of current is concerned, thls feature heing required by the franchises of the two roads. The Metropolitan power station will be located at Neasden ln the northwest of London, and will contain three sets of 3500 kilowatts capacity each. The Chelsea station of the Metropolitan District Railway will contain four sets of 5000 kilowatts each. The current will be three-phase alternating and of 10,000 volts. to be transformed in sub-stations to direct current for use in the car motors.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of tho following U. S. patents issuod to Pacific coast inventors:

FOR WEEK ENDINO APRIL 29, 1902

898,900.—ROCK DRILL CLAMP—F. R. Brown, Unga, Alaska.
898,814.—DOUGH MANIPULATOR—Chase & Rickey, S. F
898,915.—CULTIVATOR—W. C. Evants, Antioch, Cal.
898 699.—TRACTION DEVICE—F. L. Gould, Seattle, Wash.
898,701.—CAN CAPPER—H. L. Guenther, Chinook, Wash.
899,108.—EXTRACTION OF PRECIOUS METALS—B. Hunt, S. F.
898,706.—WRENCH—E. Huntley, Seattle, Wash.
898,718.—NIPPLE CHUCK—W. G Leas, Seattle, Wash.
898,530.—VALVE—F. H Mason, Spokane, Wash.
898,847.—TAPPET—McDonald & Tregoning, Grass Valley, Cal.
898,553.—INJECTOR W. Plotts, Whittier, Cal.
899,011.—MANUFACTURE OF SULPHURIC ACID—W. R. Quinan, Pinole, Cal.
898,737.—CONCENTRATOR—M. D. Rochford, Kingman, Ariz.
898,740.—CAR COUPLING—R. H. Rutherford, Marion, Or.
898,742.—SASH LOCK—W. Scharnweher, Seattle, Wash.
898,750.—LOO TURNER—J. J. Skinner, Paso Robles, Cal.
898,5*8.—CULTIVATOR—J. H. Thompson, Edna, Cal.
898,789.—WINDOW OPENER—J. M. Thorp, Alameda, Cal.
898,784.—PRUNINO SAW—Geo. R. Tyler, Pomona, Cal.
899,053.—OIL BURNER—R. Witty, San Bernardino, Cal.

SITUATIONS WANTED.

CHEMIST AND ASSAYER, WITH TWENTY years' experience in mill and smelter work. Can run same. Address A. C., care of Mining and Scientific Press.

Thoroughly experienced and reliable Chemist, Assayer and Millman open for engagement. Ten years' Western States, Canada and Central American experience. Address "Orland," care of Mining and Scientific Press.

MININO ENGINEER AND METALLURGIST, with twenty years' practical experience, desires position as superintendent of mine or smelter, or as consulting engineer to company. Best references. Address M. M., care this office.

OPEN FOR A PROPOSITION TO PROSPECT, east, west, north or south. Thoroughly understands mining, also mining laws. Have a good prospecting outfit. Address R. H. J., oaro of Mining and Scientifio Press.

WANTED.—Position as Foreman or Superintendent of quartz proposition or developed mine. Timbering and air machine drills a specialty. Sixteen years' experience. No fake references furnished. Correspondence soiicited. Present position not desirable. Address T. J. P., care of Mining and Scientific Press.

CHEMIST AND ASSAYER, with experience in mining, at present employed with large copper and lead smelting company in Mexico, seeks position as chief chemist or assistant superintendent. Has practical furnace work experience Address "Furnace," care of Mining and Scientific Press.

WANTED.—By a young School of Mines graduate, a position with reliable mining company as assayer, chemist and surveyor. Considerable surveying practice, besides one season with U. S. Geo. Survey. Can handle both and more. if necessary, for small company. State salary Have had practical mining experience. Good references. Address "Worker," care of this office.

WANTED.—Position hy an exrerienced and reliable assayer of all metals, and Bookkeeper. Has also had five years' experience in general merchandise business. Will give references from one of the best gold-producing quartz mines in California. Wire or write E. C. M. W, care of Mining and Scientific Press.

MINING ENGINEER, practical miner and mill man, assayer, etc., desires position of superintendent or assistant manager of a big property. Eleven years' experience. Best references. Now working in southern California. Address A. M. P., care of Mining and Scientific Press.

WANTED.—SITUATION AFTER MARCH 15, 1903, as Manager or Superintendent of mine. Have had five years' experience in manufacturing and constructing mining machinery and plants. Three years' experience in underground work Four years' experience as manager and superintendent. Treatment of low grade ores a speciality. Practical in every detail. State location of mine and salary. Best of references. Address X. Y. Z., this office.

Notice of Removal of Principal Place of Business of Corporation.

WHEREAS, at a special meeting duly called and noticed, of the Directors of the HASKELL GOLD MINING COMPANY, held at the office of Company in San Francisco, the 24th day of April, 1902, a resolution was duly adopted that the principal place of business of the Company be changed and removed from San Francisco, California, to the City of Auburn, County of Placer, State aforesaid, and that notice thereof he published at least once a week for three successive weeks in some newspaper published in the City and County of San Francisco; and

WHEREAS, at said meeting the consent in writing to said change and removal of Stockholders holding more than two-thirds of the capital stock of the company was obtained and filed in the office of the Company,

NOW THEREFORE, notice is hereby given that the HASKELL GOLD MINING COMPANY (a corporation organized and existing under and by virtue of the laws of the State of California) which has heretofore had its principal place of business at San Francisco, State of California, intends to change and remove its said principal place of business from the said City and County of San Francisco, State of California, to the City of Auburn, County of Placer, State of California.

HASKELL GOLD MINING COMPANY,
By HAROLD T. POWER, President.

By order of the Board of Directors.

NOTICE OF ANNUAL MEETING OF STOCKHOLDERS.

In accordance with the By-Laws of that Company the regular Annual Meeting of the Stockholders of the Jamison Mining Company, for the purpose of electing Directors for the ensuing year and transacting such other business as may properly come before it, will he held at the office of the Company, Room 620 Hayward Building, northeast corner of California and Montgomery Streets, San Francisco, California, at 2 o'clock P. M. on Monday, the 19th day of May, 1902.

By order of the Board of Directors.
SAM. W. CHEYNEY, Secretary.

To Stockholders of the Jamison Mining Company:

REMOVAL OF THE SAN FRANCISCO OFFICES OF THE COMPANY.

By order of the Board of Directors, made at a meeting of Tuesday, April 29th, 1902, the San Francisco offices of the Company were changed from 120 Sutter Street to Room 620 Hayward Building, northeast corner of California and Montgomery Streets, San Francisco, California.

SAM. W. CHEYNEY, Secretary.

BEGEER'S
IMPROVEMENT OF
Cyanide Process.

Insures highest and quickest possible extraction. Does not increase working cost; can be attached to any cyanide plant at small expense Does not present any mechanical difficulties and does not foul solutions. Has doubled leaching capacity in practical mill operation and thereby greatly reduced working expenses.

ASSESSMENT NOTICES.

SILVER KING MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Pioneer Mining District, Pinal County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of April, 1902, an assessment (No. 24) of one ($1) dollar per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 310 Pine street, Room 36, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of May, 1902, will be delinquent, and advertised for sale at public sanction; and unless payment is made before, will be sold on TUESDAY, the 24th day of June, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. W. PEW, Secretary.

Office—310 Pine street, Room 36, San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of April, 1902, an assessment (No. 29) of seven (7) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of June, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 18th day of July, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CHAS. BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

DELINQUENT SALE NOTICE.

VIRGINIA CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Kearsarge Mountain, Inyo County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 12) levied on the 2nd day of April, 1902, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.

WANTED.

WANTED.—A PRACTICAL CONCENTRATOR man, one who has had considerable experience with horonite and copper glance ores. State references and salary. Address "ETHEL" Copper Mining Co., Index, Wash.

Wanted to Bond a Dry Placer Claim, One Rich in Flour Gold.

Must he a dry proposition. Address "Placer Claim," care this office.

WANTED TO BUY:

Interest in or all of a going Sampling Works, Ore Business, or Smelting Works. Address with particulars, L. X. D., Mining and Scientific Press, 330 Market St., San Francisco, Cal.

WANTED, for a developed mine in California, a competent mining engineer to look after development and exploration. Must he a full graduate of a recognized mining college and have had several years' practical experience in large iron, coal or copper mines, and he fully skilled in the engineering problems pertaining to extraction, haulage, ventilation, etc. Give full particulars of career, experience, age, etc, to "Vulcan," care of this paper.

WANTED.—A FIRST-CLASS MILL FOREman for 30-stamp mill with concentrators and cyanide tailing plant. Middle-aged or young man of education and extensive experience in above line preferred; must be thoroughly sober and furnish good references as to experience and character, give complete information as to experience, age, salary wanted, etc. Address "Mill Foreman," care of Mining and Scientific Press.

Mine foreman, having practical experience with Arizona copper deposit, understanding the handling of men in a large property, sober and industrious. Best of references required. Wages $6.00 per day. Apply in writing. Address "Copper Sulphide," care Mining and Scientific Press.

WANTED.

Consulting Mining Engineer,

familiar with making examinations of mines, prospects and mineral lands. Address stating experience and references. Moderate salary to start, with advancement to competent man. Position permanent if found satisfactory. Address A., care of Mining and Scientific Press.

STAMP MILL WANTED,

either ten or twenty stamps, second hand, as near Amador County, California, as possible. Must be in good condition, and low as to price—advertiser has himself built mills and then tried to sell, so don't quote fancy figures. Water-power mill preferred; steam no objection, however. Give full details, price, location, condition. Concentrators acceptable if with plant. Will also buy small hoist and any good second hand mine equipment. Address E. N. DARLING, 9 Pine St., New York.

WANT TO INTEREST PARTIES

in group of mines (70 acres) working under bond and lease, profitably shipping 160 tons per month of lead ores. Have developed large reserves of excellent carbonate and sulphide ores of the best of concentrating material. Mill and lead smelter near mine. Will stand a rigid examination.

Address DAN C. TOBIN,
White Pine, Gunnison Co., Colo

Wanted, Capital

to develop a group of mining claims recently discovered in northern California. Six lode locations from 10 to 30 feet in width, carrying gold, silver and copper.

For further particulars, apply to

MINING AND SCIENTIFIC PRESS.

Whole No. 2182.—VOLUME LXXXIV. Number 20. SAN FRANCISCO, CAL., SATURDAY, MAY 17, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Cripple Creek, Colo., Ore Veins.

The fact of wide ore veins in Cripple Creek, Colo., mines is one not generally known. The generally accepted idea is that they are narrow, compensating by richness what they lack in volume. The illustrations of the Captain vein in the Portland mine, at Victor, on this page and on page 269, show a width of mined ore body that is more commonly associated with the mines on the mother lode in California, Deadwood, S. D., and the Treadwell mines at Juneau, Alaska. In the issue of this journal of May 4, 1901, in an article on the Keystone mine, on the mother lode, at Amador, Cal., are illustrations of the lode underground, sufficiently like these illustrations of the Portland lode for both to be considered views in the same mine.

Cripple Creek ore veins are like those of other gold-bearing districts, some large, the great majority small. The characteristic difference is a notable absence of sharp definition between what is ore and what is barren rock. The ore minerals extend out from a rich streak into the country rock without sensibly changing its appearance, but gradually diminishing till they are no longer regarded as payable. What is payable and what is not is a different value in different mines. The range is considerable within the limits of one district. At some of the mines $6 and $7 a ton ore is regarded as payable; at others $16 to $20 ore just pays costs.

Such a wide range of the lower limit of payable values is suggestive of possibilities in mining and treatment which will reduce the difference. The causes which operate to create it are many of them eliminatable. A common system of mine drainage by tunnel, providing at the same time an outlet for ore, would remove one cause of the difference. A cheapening of the milling costs would be another. By reducing the minimum limit of pay values the payable width of vein that could be broken out of mines on the narrow veins would be increased and the ton cost of mining correspondingly reduced.

Low-grade ores in the Cripple Creek mines will be the mainstay of their mining. There is no advantage gained by deferring the time when the low-grade ores shall become available. It is certainly not economy to take out a part of the width of an ore vein at one time and to thereafter keep up the opening until the remainder of it becomes pay ore. It does not pay to lock up capital in taking out this possible ore now at a high cost for mining to let it remain on a dump awaiting cheaper transportation and treatment than at present. The present system of leasing, while adapted to existing conditions, is a wasteful system that can be improved once the minimum values of what is pay ore are reduced to their real minimum.

The problem, so far as mine owners are concerned, is purely commercial. How much will it pay, and how soon will it pay, to work their mines for all that there is in them rather than for part of what is in them? It is quite within the ability of engineers, guided by the results of mining to date, to solve this problem. It looks big so long as the elements are unknown. Once known, it will be found easily within the combined resources of the mine owners who will profit by it. Every mine in Cripple Creek district has not the great veins of the Portland, but many of them, with less profit possible from mining narrower veins under existing conditions, will find their payable veins widened, and their profits increased, after the causes which keep the minimum limiting the value of pay ore up have been removed as suggested.

Cripple Creek district is well suited to the application of the community of interest principle to its exploitation. Its metal production is gold, so that commercial questions as to market and price cannot hamper joint action. The district is fairly com-

Captain Vein, No. 5, 400 Level, Portland Mine, Victor, Colo.

pact, and a common drainage system would make a new mine floor for all the mines at nearly the same depth below the surface. The laterals off from the main tunnel will all be near enough of a length, so that the mines would benefit at reasonably near the same time. The outlet to ore furnished by the drain tunnels would be closer in distance and less in cost of transportation to reduction works than at present, in addition to saving the hoisting expense. The system of treatment for all the ores is about the same and works could be designed for all the mines combined that would give the highest possible economy of cost in working to all of them. The elimination of general operative losses that can not now be eliminated would aggregate an enormous sum. This includes the unwatering of mines left unworked for a greater or less length of time, the cost of maintenance during periods of labor difficulties and the losses by theft of rich ore.

Elimination of Wastes in Mining.

A striking characteristic of existing mining and metallurgical practice is the effort to reduce, and to even eliminate altogether, avoidable wastes. The object is, of course, to increase profit through making production at a lower cost. This effort does not always result in conspicuous successes, but the penalty of continuous failure is so disastrous and inevitable that the effort is always being made. One improvement is found to be the suggestion for yet another, so that no practice can be finally considered as settled permanently beyond the possibility of improving modifications.

Operations are on so enormous a scale at the present time that exceedingly small unit savings and additions to the profit margin aggregate large sums. These large operations having commercial advantages as such over small ones of the same kind, the improvements and economies are even more necessary to the latter. There is a very general tendency to substitute machinery for labor wherever it can be done. Men are required to do less of the heavy manual work of mining and ore reduction and more directing of machines. The ore output of a mine is increased by machine operation at the same time that the number of men and the cost per unit of the output are reduced. Accurate accounts are kept of all the separable operations about a mine or plant to see where more efficiency can be had and the cost reduced thereby. The economic point is closely studied so that a saving made in one direction shall not be carried on till it produces a net loss in another direction.

Ore concentration has developed a new branch of metallurgy, which may be termed ore separation or parting. There is much to be done in this direction yet that will repay the investigation of workers. The losses of minerals are in many concentrations and separations far too considerable. There is no profit in taking mineral out of the earth if it is wasted afterward. Losses of 15%, 20%, 25% and 30% of mineral should not be definitely accepted as good enough practice. The difference that remains to be recovered may turn out to be recoverable at a profit which will make the difference between success or failure, should the market price lower or the ore get leaner. The saving made in copper mineral recovery at some of the Lake Michigan mines by changing the stamping is an illustration of the money value of saving an avoidable waste. There is no reason to assume that it could not have been accomplished sooner had the money value of it been a necessity. Made earlier, it would not be necessary to be at the cost of going into Lake Linden to dredge up tailings to work them over for copper. There would have been no copper in them to be recovered. Cripple Creek, Colo., waste dumps and the numerous piles of stamp mill tailings throughout the mining districts of the West are all examples of avoidable wastes.

The fact that it pays to work these old wastes is an incentive to avoid their duplication in wasted values or unnecessary costs at the present time. The selection of a reduction process for the ores of a mine is no longer a simple affair. As a rule there is always more than one known process that will accomplish the reduction, and some unknown that will yield to a study of the conditions. It pays to work these down to a comparative basis of the respective profits before making a final selection. It pays to devise new schemes if thereby unavoidable waste is eliminated.

Cheap Power Development on the Pacific Coast.

It is not so many years ago, nor even many months ago, that the Pacific coast had the patronizing sympathy of Eastern people over its deficiency in cheap power. It was conceded that the Pacific coast had vast, unoccupied areas, enormous natural resources in minerals, a wonderfully productive soil, and the best climate and some of the biggest things in the world. But the Pacific coast could never manufacture its raw material production, and must always remain subordinate, commercially and industrially, to the East, because there was no cheap source of power. Cheap coal and iron were believed to insure to the Atlantic coast an indefinite period of supremacy over the Pacific coast.

It is certainly the fact now that so far as cheap power is concerned the Pacific coast is in a fair way to reverse the conditions. Also the cheapening of the cost of making iron is providing an opportunity for the Pacific coast to engage in its manufacture. This last may seem surprising since it is within memory that the cheapening of the manufacture of iron on the Atlantic coast twenty years ago forced the abandonment of the first iron making industries on this coast at Clipper Gap, Cal., and Irondale, Wash. Nevertheless, the further great reduction in the cost of manufacture there has contributed to renew the opportunity here. The reason for this is that the later economies introduced into the business are as possible here as there, and the cost of transportation from the East to the Pacific coast has not been reduced in the same ratio as have manufacturing costs. This transportation cost has now become the largest single item in the cost of iron to the Pacific coast consumers, and will, on the establishment of the iron industry here, provide the profit margin for the manufacturers.

The development of the fuel oil industry in California has not only provided the Pacific coast with a cheaper substitute for the cheap coal of the Atlantic coast for all general power producing purposes, but it is forcing the utilization of the developed coal resources of the Pacific coast in work for which the cheaper petroleum is not adapted. For instance, the Southern Pacific Railroad Co., which was supplying its locomotives with coal from its own mines at Carbonado, Wash., having supplied its locomotives with the cheaper petroleum fuel, is now engaged in manufacturing the product of its coal mines into furnace coke at the mines. There it will be cheaply manufactured in quantities that can only find a market in the blast furnace work of iron and steel manufacture. This coke is to be made in by-product ovens, utilizing the oven gases as another cheap source of power, and the chemicals produced to lessen the cost of coke, which in the end, with allowance for the difference in quality, will make iron and steel nearly as cheaply as it is made east of the Rocky mountains at the present time. The invention recently announced of the process of making steel direct from the ore, still further reducing the cost of its manufacture, by increasing the ratio of the cost of transportation from the East to the flat cost of manufacture on this Pacific coast, also increases the percentage profit margin possible on its manufacture here.

Cheap fuel oil and cheap coal and coke are not the only cheap power resources of the Pacific coast under development. Furnishing the cheapest power of all is the electrical development of the water powers in the mountain streams. Like the petroleum and the coal, this water power electrically transmitted has its special fields of use in which the entry of the others as competitors is not practicable. The development of these electrical transmissions of water power will not in the end displace the other two, but add to their sum total. The Pacific coast region is, as compared with the Atlantic coast region, much more mountainous. Its streams have their sources at higher elevations and fall more rapidly to the ocean. They lie closer to the coast and to the seaport cities than on the Atlantic coast. The milder climate keeps the smaller streams unfrozen during the winter. The net result of these favoring conditions is that water power on the Pacific coast can be economically developed in smaller units than on the Atlantic coast and at a much less cost per unit. This advantage at the hydraulic end of an electrical power transmission proposition is so considerable that it more than offsets the extra cost of the electrical end of the installation due to the increased amount of copper required for the long distances of transmission.

The economy of small units of hydraulic installation is a considerable commercial advantage. It enables the capital investment to go in as it becomes income producing instead of in advance of it. For example a projected power plant installation on the Mississippi river had to be planned to utilize 60,000 H. P. in order to pay interest on the cost of the hydraulic end of the installation. Not being able to sell this the project had to be deferred. On the Pacific coast initial installations in units as small as 3000 H. P. are commercially profitable and can be made without putting capital into the hydraulic end far in advance of its becoming income earning.

The low heads and large volumes of water of Eastern plants make the cost per unit of the hydraulic end of the project much higher than on the Pacific coast, where high heads and small quantities of water are possible of utilization. The variations between the different projects in capital investment per unit of power output on the Pacific coast is quite considerable, as would naturally be expected. Per horse power delivered at the consuming end of the transmission the capital costs of installation, including both water and electrical, range from $120 to over $500. The majority of installations range about $250 per H. P. delivered at the end of the transmission. The expense of maintenance and operation is low so that with even the highest cost of installation noted the power is cheap power.

Enormous as is the possible aggregate of power that can be developed from water and electrically transmitted to the Pacific coast seaport cities for utilization, it does not appear that there will be an over supply. The establishments already made have so far found the market ahead of them, able to take all the power offered and wanting more.

THERE is a disposition by the public at large to let the imagination influence its ideas of mine valuation. Few people realize how many dollars have to be put into a mine to get more dollars out, and not necessarily many more, either. Great values are put on stocks frequently which do not exist in the ground. It is not realized that all of the metal in the mine is not an available fund for profit. There would not be so much mischief in this extravagance of ideas if it was limited to the mine owners themselves. The real mischief is the influence the ideas of great profits and vast wealth in mines have on those people who do not own mines and on officials who levy taxes. These people and officials think that if mine profits are so large, and the wealth in mines so enormous, the mines should pay a larger sum in taxes or royalties. The effort to so load the industry always shows that the extravagant ideas of great profits and enormous valuation are an overestimation, but not until the industry has undergone a squeezing from which much time is required to make recovery. The British Government is dallying with propositions to transfer the taxation on account of the Boer war to the mines on the Rand. That the proposition should receive serious attention shows how far afield popular comprehension of the Transvaal mines is. It is to be hoped that nothing of the kind will be undertaken. The Rand mines left unhampered by royalty taxation of the kind contemplated will speedily make a gold output which, livening all other British industries, will make its present burden of war taxation no burden at all.

Concentrates.

A LODE mining claim can be legally located in the form of a rhomboid.

THE American production of copper is about three times that of Europe.

THE location of a mining claim near a well-known mine is by itself no assurance of probable value in the mining claim.

A GOOD blacksmith's welding compound is said to be made of 12 ounces of borax, 2 ounces carbonate of iron and 2 ounces bicarbonate of soda.

A MINER'S INCH OF WATER in a reservoir is 2160 cubic feet. A reservoir to store 50,000 inches of water would be of 108,000,000 cubic feet capacity.

TWELVE oil wells put down by the Peerless Oil Co. in the Bakersfield, Cal., petroleum field, averaging 1000 feet in depth, cost from $3011.14 to $5612.32, the average cost per well being $4302.58.

ORE DRESSING, while resembling concentration very closely in its general features, implies the separation of two minerals, each valuable in themselves when separated, but valueless when mixed.

THE voltage in common use in direct current electric motors is 500, in the polyphase system 2000 volts pressure is used. The use of the latter permits of a considerable saving in copper used for conduits.

GOLD AMALGAM will be liquid if the percentage of gold is as small as 10%. It is in this form that amalgam losses are most apt to occur. Excess of quicksilver should not be fed into stamp batteries.

THE courts of California have held buried river channel deposits locatable as placer claims. Other courts have held that claims almost identical with the one mentioned in the California case may be located as a vein in place.

WHERE the records of location and conveyance of a mining claim are lost or destroyed, proof of five years' continuous uncontested possession will enable the owner to get a patent. It is better in such cases to make a relocation.

WHAT is known as the oil concentration process for sulphurets—with more exactness it should be oil separation process—is said to effectively separate chalcopyrite from magnetite. Magnetic concentrators will also make this separation.

THE expense of operating a telephone system has been found to increase in geometrical ratio with the number of telephones in the system. If the number of telephones is doubled the expense of operation will be somewhat near quadrupled.

BRASS which contains copper 90% and tin 10%, and which contains only traces of lead, zinc and iron, is exceedingly resistant to the solvent action of sea water. A coating forms with the copper as the base which protects the metal underneath from being further eaten into.

ALL the quartz mines in California are working lower grade ores than the same mines in the period of early day mining, but they are all working more tonnage. The lowering of the grade of ore from which the output of a mine is made does not necessarily mean that the mine is petering out.

THE oil used in the so-called oil concentration process is a residuum of petroleum distillation. It is cheap, and the oil lost—about two gallons to the ton of ore treated—is principally with the sulphide minerals, from which its value is effectively recovered as heat in their subsequent roasting or smelting.

A COTTON ROPE is preferable for transmitting power to a hemp rope. Either, before being used, should have the stretch taken out. The cotton rope is smoother than a hemp rope and, compared with one of the same diameter, gets more surface in contact with the pulleys and a better grip on them.

ALL natural building stone will absorb water and collect dirt which cannot be washed out. A sand blast will clean it by resurfacing the stone. Stone filling compositions have been invented which filling the capillaries at the surface prevent the entry of water and dirt. The stone can then be washed clean.

THE revised statutes do not in express terms require discovery as a prerequisite to location, and it has been held in California and by courts in other States in effect that none is necessary, but under the provisions of Section 2319 it does not appear how the character of mineral ground can be determined in any other way than by discovery.

IT would be a distinct advantage to the mining industry if it were required by law that the underground workings of mines should be mapped up to date at least once a year while the mine is operating—the maps, when the mine is closed down, to be filed with some properly authorized official, so that they would become available when it is desired to reopen the mine.

A DRIVE ROPE should not be permitted to slip on the pulleys any more than a belt would be permitted to slip. The slipping means that an avoidable loss of power is being made; also that the rope is in danger of receiving injury by getting off of the pulleys. The trouble may be either too small a rope for the power it is called upon to transmit or the rope may be slack from stretching.

IT is held in California and Nevada that if one abandons tailings from his mine or works and they flow down stream and become deposited on the lands of another, they belong to that other, and if they accumulate on unappropriated public land it has been the custom to recognize the right of the first comer to appropriate them by proceedings analogous to the location of placer claims.

ONE certificate of annual assessment work will answer for the recording of the work on a group of claims. The certificate should mention specifically the claims by name, the amount of work done, where it was done, the nature of it and its relation to the development of claims for which it is done. The last is not a requirement of the law, but properly done it will tend to prevent claim jumping disputes.

IT is estimated that a 20% reduction will be made in working costs of gold mining in the Transvaal under the British government of the country. This addition to the profit margin will have a greater proportionate effect in extending the mining to ores of lower grade. Roughly, it is estimated that under Boer rule mining costs averaged about $6 a ton. The reduction will bring this to $4.80 a ton.

THE flat costs per foot of driving a drift heading, as between hand and machine drilling, are not by themselves to be taken as determining the question of which is the cheaper. The hand drilling may cost materially less per foot than the machine drill work, but the longer time taken to make the same advance adds so largely to this cost from the general expense of the operation that it becomes the more costly.

GOLD frequently occurs impregnated in volcanic rocks and occasionally in sedimentary rocks. Rhyolite is, perhaps, the commonest species of volcanic rock carrying gold. This is the characteristic gold-bearing rock at Thunder mountain, Idaho. There it is soft and without distinct crystallization. Elsewhere gold has been found in rhyolite species of hard, compact crystalline structure. Diorite is another eruptive that is sometimes gold-bearing.

ELECTRICAL GENERATORS and motors, while they will work under a peak load, which is a considerable overload, should be subjected to this kind of strain to as little an extent as possible. The load should be kept preferably constant. Storage batteries can be used to equalize the generator load, or at a mine a compressor plant can be driven intermediate between the electric motor and the machinery which has great variations of load, such as the hoisting rig.

A BLANKET VEIN is an inexact descriptive term for a vein that approximates a horizontal plane in dip and strike. There is no definite angle of dip limiting the definition. Veins having a dip of as little as 15° are not necessarily blanket veins, though the term might be applied to one vein of this dip where the prevailing vein dip was much greater. The outcrop of a flat vein can be located on and followed on the dip, just as any other vein can, unless the local laws or customs provide otherwise.

A MINER'S INCH in California is legally 1.5 cubic foot of water flow per minute, and 20 inches would be 30 cubic feet, which, at 62.25 pounds per foot, would weigh 1867.5 pounds. This weight of water falling 26 feet, the full diameter of the overshot wheel would generate 48,555 foot pounds of energy per minute, or, divided by 33,000, 1.4712 + horse power. But the overshot water wheel would not develop but two-thirds to three-fourths of this, or, say, 70%, which would be practically only 1 H. P.

THE workman who knows how to strike a fair balance between labor lost and material saved is worth encouraging. He is an intelligent fellow and, without doubt, is a safe man in other directions also. On the other hand, there are men showily smart at their work who are great and incurable wasters. The money value of their wastefulness should be debited against the sum total of their usefulness. At the other extreme there are a few who are too nervous with the stuff. They undervalue their time and overvalue the material.

IT is a perfectly safe proposition to observe the exact letter of the law in making a mining location. Certain special contingencies may make it proper to deviate from the letter of the law while observing the spirit of it. That is your reasonable view of it. It is ours, also. But we have always observed it never is the view the third man's lawyer takes of it. He does not know your view or our view. He knows the letter of the statute though; so you had better conform to it and let the other man's lawyer do the wrestling with the spirit.

DEAD WORK in a mine is any work underground which does not directly produce ore or the metal or mineral for which the mine is operated. Mine managers have subdivisions for classifying dead work under which some of it keeps off of the report as dead work. Timbering in drifts which are solely mine openings is dead work without any qualification. Timbering a stope is, however, properly directly chargeable to the cost of mining the ore. Waste rock taken out of the mine is dead work. Waste used for filling stopes is properly directly chargeable to the cost of mining.

A TRIAL of Beaumont, Texas, fuel oil in a sea going steamer recently showed a consumption of 800 barrels of oil displacing 218 tons of coal, the oil costing just one-half the cost of the coal, five men tending to making steam in place of eleven with coal. A gain of ½ to 1 knot an hour was made in speed. The direct saving in fuel and wages amounted to $770 a month. The saving due to increased speed is not reported, but assuming that the ship was at sea 60% of the time, the saving in time at sea would reduce the entire expense of operation about 6%.

THE water used to drive the water wheel in a water power air compressor can be used afterwards to cool the air compressed. It is good and economical practice to cool the air before it enters the compressor, to cool it again while being compressed, to give it a third cooling between the compressors where a two or three-stage compression is made, and finally to cool it after it leaves the last compressor. Each cooling saves power employed in making compression. If the same water used for power is used for cooling the cost of cooling is only interest and repairs on the cooling plant. After the air leaves the receiver and before it is used, the quantity of heat that has been taken from it put back into it again adds to its effective working value.

A RIVER BED alongside of a bar rich in placer gold is not likely to be equally productive. The bar was the situs of the original channel of the stream through a many times longer period than the existing channel represents. The latter, relatively, represents only a temporary diversion from the old channel situs. Conversely, the existing bed of a stream, if rich in gold, is evidence that the bars lying closely alongside are comparatively or even absolutely barren. High bars may be equally as rich as the present stream channel under such conditions. These statements are broad generalizations, but observation will confirm them, and they are safe to use in estimating the commercial value of untried placer ground alongside of rich worked ground.

IT is possible to build a ditch on a 30° mountain slope into a California river canyon that will be 40 feet wide and 10 feet deep. The excavation required would be 70 cubic yards to the linear foot of ditch. The cost of making this excavation would be about $1 a cubic yard and would make a mile of such ditch cost about $400,000. To carry 2500 second feet of water the surface velocity of the current would be about 10 feet per second, which is far too high, 3½ feet per second being the allowable limit. A break in such a ditch would have the destructive effect of a cloud burst on the mountain side down which it would flow. While possible to build such a ditch it would be exceedingly doubtful if it could be operated. It is not a practical construction. There are practical limiting dimensions to side hill ditch construction which should not be exceeded if a stable economical construction is desired.

THE common method of determining the nature and amount of the different elements of coal is by what is termed a proximate analysis, which is made by pulverizing a weighed sample of coal and then subjecting it to repeated heating not exceeding 280° F. The coal is then weighed and the difference between its original and present weight is counted as the percentage of moisture. The coal is then placed in a covered crucible and gradually heated to a red color, and there maintained until gases cease to be thrown off; and, after being cooled, is again weighed and the difference noted as volatile matter. An increased heat is then applied until a white color is shown and air enough is admitted to supply oxygen, this part of the process being continued until all the carbon is burned away, when the shrinkage, as shown by weighing at this stage, is recorded as the fixed carbon, the residue being ash, or, if mineral exists, small clinkers.

A COPPER ORE assaying 7% copper by wet assay, .12 ounce gold and 4 5 ounces silver would be taken by smelters about as follows, the New York price of casting copper being 12 cents per pound, silver 54 cents per ounce and gold $20 per ounce: For the copper 7% less 1.3%, leaving 5.7% at 20 pounds = 114 pounds paid for at 12 cents less 6 cents, or 6 cents, $6.84; for gold, .12 ounce less 5% is .112 ounce at $20 = $2 24; for silver, 4.5 ounce less 5% equals 4.27 ounces at 54 cents is $2.30, making gross value per ton $11.38, less smelting charges $6, makes net value of ore paid producer $5 38, from which must be paid transportation and mining. From this ore under some circumstances an assayer might return full market and mint values without any deductions at all, showing gross metal values amounting to $21.71. The difference between this and $5.38, the commercial value, $16.33 disappears as loss in the slags, costs of smelting and transportation, refining and minting of smelting products.

THE brown iron oxide outcrop of a vein in metamorphic rocks is an indication of the presence of sulphide minerals in the veins below water level. The brown oxide is the result of nature's oxidization of iron sulphide, pyrite usually, by the oxygen carried by the percolating surface waters. The brown oxide sometimes takes the cubic form of crystal of the pyrite that it replaces, forming what in crystallography of minerals is known as a pseudomorph. The presence of copper sulphides and iron sulphides in the brown oxide at 50 feet depth is probably an indication of nearness to the water level. The quartz crystals undergo no alteration during the process of oxidization of the iron and copper sulphides, so that the impressed forms of other crystals are the result of the original formation of the quartz crystals around them. A hematite cropping may be, and generally in the Rocky mountains is, a capping to copper ore deposits whether or not a rich enough ore to make a mine can only be determined by mining it. Any gold in the original sulphide mineral would be in the iron oxides.

Costs and Profits in Pyritic Smelting of Low-Grade Copper Ores

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by F. H PRENTISS, E. M.

The profit by smelting direct (with limestone flux) as given in column 35 is obtained by subtractions from the $17 matting value the sum of the costs and losses as given in columns 11, 17, 18 and 26, together with the cost of mining ($2.25) and general expenses (0.17).

Column 36 is obtained by adding the figures given in columns 21, 25 and 26 and dividing by the matting value ($17).

Columns 37, 38 and 39 are obtained by deducting the actual loss in concentrations (30%, 25% or 20%, as the case may be) from the number in column 36 corresponding to the type of ore and multiplying the difference by $17 (the matting value).

MATTING VALUE, $17 PER TON.

Cost of Mining, $2.25, and General Expenses, 0.17.

Type...	Profit Per Ton by Smelting Direct.	Loss in Concentrating That Would Offset Gain.	Extra Profit Made by Using Sulphurets to Reduce Barren Flux When Concentrating Loss Is 30%	25%	20%

At type K (matting value $12 per ton) we begin to find a loss in smelting with barren limestone flux. This loss must be subtracted from the concentrating gain given in columns 62, 63 and 64. While the silica is quite truly a necessary part of the slag, the method of calculation requires the silica to be debited with the cost of limestone and coke it requires, and the iron and sulphur to be credited with the limestone and coke they replace.

105.4% loss (column 76) is, of course, a mathematical expression, as we cannot lose in concentrating more copper, gold and silver than the ore contains. The point is that the cost and loss in smelting of that type and value of ore are so great that we could afford equally well to pay the cost of concentrating, and lose all the available metal value and 5.4% more.

CORRECTIONS.—The following deductions from the profits per ton are to be made when the ore mined is less than 100 tons per day, and when the ore smelted (omitting concentrates) is less than 100 tons:

TONS OF ORE MINED OR SMELTED DAILY.

	100	90	80	70	60	50
Smelted	$0.00	$0.05	$0.12	$0.21	$0.33	$0.50
Mined	0.00	0.02	0.04	0.07	0.11	0.17

The foregoing tables are based on 3% copper ore. When the per cent exceeds this an allowance must be made for the additional iron and sulphur carried into the matte. As each unit of copper carries with it (into a 50% matte) ¾% of FeS, equivalent to about 1% FeS_2, a deduction of 5.7 cents per unit of copper must be made for smelting, and about 4 cents (less on account of loss of copper) for ores concentrated.

In case the temperature is not raised 1000° Fahr. by the hot blast apparatus, the following corrections are required:

*DEDUCTION FROM PROFIT PER TON FOR LOWER BLAST TEMPERATURE.

K	.06	.12	.18	.26	.33	.42	.50	.60	.72	.84

*The increased amount of air required for cold blast smelting means increased power for blast, and hence increased cost in addition to the figures given in the table.

The profit to be derived from such ores depends in a large measure upon the method of working them. For example, the average ore runs about as follows:

SiO_2	62 00%
Fe	10 00%
S	12.00%
Al_2O_3, CaO, FeO, MgO	10 00%
Cu	3 50%

While the assay and matting values are:

	Assay Value.	Matting Value.
Cu	$10.50	$ 7.00
Au	4.25	4.00
Ag	1.25	1.19
Totals	$16.00	$12.19

By hand sorting, the ore may be divided into two equal parts, which for purposes of illustration we will assume to have the compositions and values as follows:

	First Grade.	Second Grade.
SiO_2	52%	72%
Fe	14%	6%
S	17%	7%
Al_2O_3, CaO, FeO, MgO	9%	11%
Cu	5%	2%
ASSAY VALUE.		
Cu	$15.00	$6.00
Au	6.00	2.50
Ag	1.75	.75
Totals	$22.75	$9.25
MATTING VALUE.		
Cu	$10.00	$4.00
Au	5.66	2.36
Ag	1.66	.71
Totals	$17.32	$7.07

The original ore corresponds very closely to Type I,

while the first grade corresponds to Type F and the second to Type K.

The original ore, if smelted direct, would yield (Col. No. 60) $1.27 + .19 + $1.46 profit per ton.

The first grade ore, if smelted alone, would yield (Col. 35) $8 28 + .32 = $8.60, from which must he deducted $2.42 (the cost of mining the second grade ore), which it will not pay to smelt, leaving a net profit of $6.18.

As stated above, the second grade ore cannot be smelted direct except at a loss. Col. No. 85 shows a loss for ore of Type K of matting value of $7, amounting to $5.18 per ton. Col. No. 88 shows that by concentrating (with 25% loss) before smelting a gain is made of $7.72, thus leaving a net gain of $7.72 — $5.18 = $2.54, to which is to he added 7 cents (the matting value of the second grade ore was $7.07), thus making $2 61, or, since the mining cost has already been charged against the first grade ore, the extra profit becomes $2.61 + $2 42 = $5.03, thus making the profit per ton for both first and second grade ores ($6.18 + $5.03) ÷ 2 = $5.60 per ton.

Should we only smelt half the first grade ore direct and concentrate the halance, we should get enough sulphurets to make a self-fluxing mixture, and the profit would he greater.

(TO BE CONTINUED.)

Crude Oil for Tempering Rock Drills.

TO THE EDITOR:—I have been experimenting lately on the use of common crude oil for tempering drills with such favorable results as to warrant its more extended use. The most serviceahle slack tuh I found to be a common five-gallon oil can, with the top left as a flap or cover to throw down and smother the flame in case the oil ignites from the hot steel. Provided the vessel is left open, this ignition, if it does happen, is very quiet, like that of coal tar, but with a partially closed tub or tank the accumulated gases are liable to introduce fireworks, as the writer can testify. There is really no necessity for an ignition of the oil, however, as the proper heat for plunging the steel—a bright red—is a little helow the point necessary to flash the oil.

It is a very rare thing for an oil-tempered drill to break, and they wear much hetter than water-tempered steel. With oil, the amateur will find no trouble in tempering steel to stand like an expert's work, as a slight variation in temperature does not effect such a change in the final condition of the steel as occurs in using water.

I do not use more than 5 inches of oil in the hottom of the can. The hotter the oil hecomes the hetter are the results. The consumption of oil is small, principally due to that portion sticking to the drills on withdrawal. Plunging them afterwards in loose dirt cleans them of this. BENJ. HASTINGS.

Chloride, Ariz., May 1.

Invert Foundations.

Written for the MINING AND SCIENTIFIC PRESS by C. H. FITCH.

The first of these will relate to road building—a much-threshed subject and a troublesome one, which stands hetween many a mine owner and the wealth he would like to realize. I propose to show an improved theory and method of making foundations for roads and structures of every kind, drawn from reasoning on very familiar and primary ideas.

The first of these takes us hack of the Copernican system to a conception of the earth as supported on the hack of a turtle, and that on a slab, and that on clouds of mystery. We very readily see that this old cosmic idea is ahsurd, but it is not a whit more ahsurd than it is to excavate to an indeterminate depth and lay down an immensely heavy hase course of solid rock, or grillage of iron beams at a point where the pressure is not the greatest, and not great enough to require this construction for the support of a huilding. It works, to he sure—increasing the load on the hase and putting needless weight and expense where it does not do the most good nor meet the most stress; hut it is a survival of the old turtle-hack idea, in which the turtle's hack was assumed to he strong enough, and no more questions asked.

Our second suggestion is furnished hy the familiar case of McAdam vs. Telford, which is usually stated hy prize essayists on roads without coming to any decision. But some engineers denounce McAdam as a quack and an empiric and extol Telford as the greatest road engineer since the Romans, who, by the way, had much to learn about economical construction of roads. The ideas of Telford were anticipated hy Tresagues, the French engineer, who built roads for the first Napoleon, the Simplon and other Alpine roads—roads that could be afforded by empire builders, hut would come rather high for most mines. Both of them are modelled after the foundations of buildings—a large, massive underpinning, on which a superstructure might rigidly rest. A Telford road is laid to a depth of a foot or two with as large stones as can be teamed upon it, on the hottom, where the pressure is less than on the surface. Telford was expensive; he was a trained engineer.

McAdam was a tenderfoot on roads, who was not technically trained, but did his own thinking. Mark Twain sought to erect a monument to the first Adam. The second Adam—McAdam—has monuments in all the roads after his idea and a souvenir in the name macadam, generally applied to hreccia or hroken stone of 1¼-inch to 2½-inch ring. Post roads under his charge were found kept in good order, while other post roads were mired and the mail riders delayed.

The pre-McAdamite idea was to fill the holes in dirt roads with more dirt. I know villages in which enough money has heen spent in a few years in such filling of dirt or small round gravel to suffice, if necessary, to pave the main street with cast iron.

McAdam's idea was, in one word, surface. For this reason people who can not cut loose from the old base-foundation idea say that he was a mender of roads rather than a road builder. His aim was to distribute the surface pressure, putting down a hlanketing of broken stone and making the surface of the smallest stuff, so that wheels would not get a lever-

Captain Vein, No. 9, 400 Level, Portland Mine, Victor, Colo.—(See Front Page.)

age on sizeable stones and loosen them up. This may do in moist England, hut here high winds in dry weather remove the surface dressing. Oil sprinkling helps to retain it and to shed surface water.

A third idea of foundation is afforded hy the turnip or beet, which has a hase analogous to that of a building, hut is tap-rooted rather than squared off at a definite point. A tree has to resist a lifting pressure, and its roots may find some analogy in the foundation bolts of machinery and the piles driven to support structures on unstable ground. If the ground be so soft that piles closely driven cause those previously placed to rise, the base is a kind of float constructed in a very extravagant way.

For a fourth idea we notice that nature, when she constructs a foundation on the unstable flood, builds from the surface, and in the thickness of a few inches of ice is able to support heavy loads over large areas. In the McAdam road the angular hroken stone composing the blanket locks together under pressure and distributes the pressure applied at a single point, as is done hy the springers of an arch, or, more properly, the elements of a dome. It does not require much thickness to sustain half a ton on a wheel rim, if the surface only he hard and unyielding. A surface as strong and continuous as ice on a hasis as substantial as dry earth would make a road in need of no further foundation. The trouble would he with abrasion—a surface difficulty to be met hy providing

as hard and continuous a trackway as can be afforded. The usual expedient would be to even up the ruts with broken stone filling and make the surface as hard, smooth and impervious to water as materials obtainable will permit.

In nature the tread of animals and men compacts the surface ground, kills vegetation and makes the trail. It serves its purpose, and, so far as it goes, the trail is built right from the surface. For heavier requirement, as of freight wagons, a broken-rock surface, heavily rolled, is an extension of the same idea of surfacing hard and compact at minimum cost. The heavy rolling or ramming of the surface is the road maker. It makes the refractory skin similar in resistance to wear and stress to the chill of molten forms.

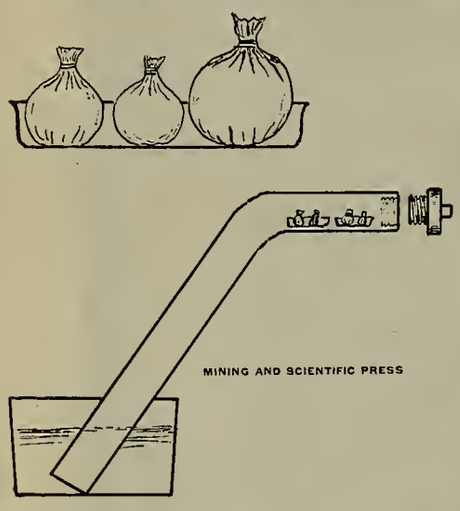
I have gone far afield for ideas already, but for the fifth suggestion I will go still farther and call attention to the parachute, which is steadied and sustained bearing quite a weight upon thin air. It is this domical form, rather than the heavy plug of granite or grillage of iron beams, which will render the greatest service in supporting the weight of high buildings or monuments.

Prospectors' Retort.

Written for the MINING AND SCIENTIFIC PRESS by F. RIGAUD.

For small quantities of amalgam, I tried, in Hungary, with complete success, the following simple apparatus·

The amalgam is put in a small piece of clean cloth, well pressed and tied by a thread; then the cloth is cut short as shown by the figure. With this precaution, the ball does not break up in calcination.



The balls of amalgam are placed in small pans made with a piece of thin sheet iron in order to keep them in place.

For a retort, I took a piece of iron pipe 6 feet long, 3 or 4 inches in diameter, bent at an angle of 135°, a foot from one end, which is closed by a screw plug. The short part of this pipe is placed level on the blacksmith's forge; the amalgam balls in their pans are put in the pipe and the cap screwed on. The other end of the pipe is put into water in a bucket, the quantity of water provided being too small to fill up the pipe when raised by vacuum.

A sufficient temperature is quickly obtained by blowing; the heavy vapors of mercury condense easily in the water. In a few minutes all the quicksilver is driven out of the amalgam, the cloth is burned to a white ash and there remains the golden balls of retorted amalgam ready for melting.

Fusible Plugs.

Fusible plugs have been used in boilers for a great many years, and the Government requires that all plugs used on boilers of steam vessels should be made of bronze and have no other filling but pure Banca tin stamped with the manufacturers' name, and that an affidavit setting forth this fact should be filed with the inspector having charge of the boiler inspection at whatever points the plugs are used.

INSIDE TYPE

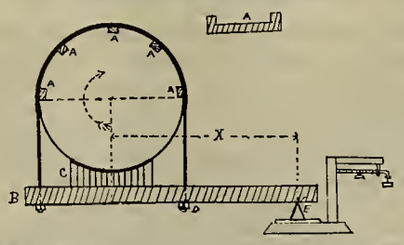
The Lunkenheimer Co. have manufactured fusible plugs for a number of years, all of which comply with these specifications, and, having made affidavit before the United States Steamboat Inspection Service to the effect that their plugs comply with these requirements, they are accepted by all inspectors throughout the United States.

Herewith is illustrated the inside pattern of plug, screwed in from the inside of the boiler. The Lunkenheimer Co. of Cincinnati, Ohio, will be pleased to give further particulars upon application.

Determination of Horse Power in Gas Engines.

By ALBERT STRITMATTER.

The method commonly used is by the pony brake, of which there are a number of varieties. The accompanying sketch shows one which is easily gotten



up. Several blocks of wood "A" are attached to a piece of leather belting. These blocks are made U-shaped to hold the belt on the pulley. One end of the belt is fastened to the beam "B" on which is a block "C." The other end of the belt is fastened to a bolt which extends through the beam "B" as shown. This bolt is threaded and a washer and nut "D" are placed on it. This is for the purpose of tightening the brake during the test. The beam "B" projects out from the pulley to a platform scale and rests on a knife-edged block "E." It is desirable that the beam be placed perfectly horizontal as the distance from the center of the crank shaft to the knife edge can be measured on the beam. If the test lasts for any length of time it will be necessary to have a stream of water play on the inside of the engine pulley, as it will get very hot from the friction.

In making a test of an engine for its maximum possible power it is necessary that the engine be in perfect adjustment, that the mixture of gas or gasoline and air be correct, and so on.

To make the test, start engine and gradually tighten the nut "D" until the engine is carrying its maximum load and yet maintains the normal speed. In four-cycle engines on full load the engine will take and explode a charge on every other revolution of the crank shaft. In a two-cycle engine it takes a change at every revolution. In the graduated charge or throttling type of four-cycle engine, a charge may be taken at every other revolution of the crank shaft, but the charge may not be put to its full size. On full load, however, the full sized charge is taken.

When the engine is at full load, balance the scales and ascertain what weight is shown. Also be sure that you know what the speed of the engine is. Measure the diameter of the pulley, also the diameter of "X" from the center of pulley or crank shaft to point of leverage on scales. Notice that this is not the distance from the center of shaft to point of leverage, but the horizontal distance between two vertical lines passing through the point of leverage and the center of crank.

There are several methods of figuring the horse power. One of these is to multiply the diameter of the pulley (in feet) by 3.1416. Then multiply this product by the distance "X" (in feet) divided by the radius of the pulley (in feet). Multiply this product by the number of revolutions per minute of the pulley and multiply the result by the net weight or pressure on the scale. Divide this product by 33,000 and the quotient is the brake horse power.

Another method is to multiply the net pressure on the scales by the length of the brake arm "X" and the product by the number of revolutions per minute. Then multiply this product by .0001904. The result is the brake or actual horse power.

These two methods are really the same and, with any one set of figures, will give the same result. They may be expressed algebraically as follows:

$$\frac{D N \frac{X}{R} N P}{33{,}000} = .0001904\ P \times N = B.\ H.\ P.$$

In these formulas D is the diameter of the pulley, R the radius, P the net pressure on the scales, N the number of revolutions per minute, and the length of the brake arm.

It will be noticed that the net pressure on the scales is to be used. This is not the pressure the scales actually show but the weight shown less that exerted on the scale by the unbalanced portion of the brake and the weight of the knife edge. Prof. E. W. Roberts, in his "Gas Engine Handbook," gives the following method for ascertaining the net weight of the brake: When engine is still, let a man stand on the scales and weigh him. Then ascertain the weight shown when he takes hold of the brake near the knife edge and pulls upward with a slight friction on the pulley. Then find the weight when he pushes down on the brake. The pressure due to the unbalanced portion of the brake is the difference between the weight of the man and half the sum of the weights when pulling up and pushing down on the brake.

It will now be understood why actual horse power is sometimes called the brake horse power; i. e., it is the amount of power delivered at the brake, or the amount shown by the brake test. It should be borne in mind that any test does not necessarily mean that the engine cannot develop more power, but only that it developed that much power at the time of the test, and any error made is more likely to be against than in favor of the engine.—American Manufacturer.

Origin of Ore Concentration in America.

The subject of concentration yearly becoming more important as improvements are made in machines and methods, it will be interesting to go back to the origin. I suppose the "golden fleece," really a sheep pelt, anchored in the auriferous sands of a river bed, is about the oldest device of record. Then we find that in A. D. 1571 Pedro Fernandez de Velasco, in Peru, performed a rude concentration of silver ore upon a hide (laid upon a sloping bank), upon which the pulverized ore was spread by throwing water thereupon in such manner and quantities that the lighter gangue was washed down and off the lower edge, while the heavier, more valuable particles were caught and retained by the hair thereon, to be recovered by a subsequent washing. This method is still in use in Mexico, the peon substituting a piece of canvas for the hide.

The first concentrators to be used in a mill in the United States, as the writer believes, were in the mill of Bouton & Uznay in 1863. Captain Uznay, a compatriot of Kossuth, being banished from his native land, settled in the then Territory of Nevada, and, associating himself with A. P. Bouton, they erected a 20-stamp mill in Gold canyon, just below Silver City. Finding the Hungarian bowls, used by them to amalgamate Comstock ore, unsatisfactory, Captain Uznay (probably copying some Hungarian device) designed a bumping table, of which the following is an accurate description:

Two 2-inch planks, 12 inches wide and 16 feet long, were fashioned like sled runners, set 4 feet apart and floored across the bottom with 2x8-inch stuff. A piece of 4x4 was spiked on underneath this floor along its longitudinal center (like the keel of a vessel), and projecting at the front, or curved end, about 2 feet. This keel was reinforced at the front end with 4-inch stuff up to a level with the top of the front end and side pieces and secured by bolts therethrough. A heavy sub-frame, with four corner posts and caps to which this big table was hung, carried a heavy bumping block at one end, to which the above keel was held in contact by the gravity of the table, due to the inclination of the hangers. This huge table was alternately pushed away from the bumper block by a cam having a throw of about 15 inches and allowed to swing back to a violent and rebounding contact when released by the cam. The pulp was fed across this table about 5 or 6 feet from its head through holes in the bottom of a cross-box, and dressing water was supplied at the head through a similar but smaller box. A man with a broom and a square-pointed shovel was kept busy attending to two of these tables. His duties were to sweep the bed of the table crossways so as to keep the material evenly distributed and to remove the concentrates as they accumulated, with the shovel. They made a good concentrate, which was worked by the patio method by Mexicans; but the less said about the tailings the better. This device was at that time considered a wonder, and is undoubtedly the parent, if not the grandparent, of the justly celebrated "Gilpin county bumper."—W. L. Card in Denver Post.

Platinum Mining in British Columbia.

Consul L. E. Dudley writes from Vancouver: "Platinum has long been mined in the Similkameen, about 150 miles east of Vancouver. It is said that Chinamen have been earning living wages for the past fifteen years by recovering platinum from the placer deposits of the Tulameen river, and also of Granite creek. Local newspapers announce that the Slate Creek Hydraulic Co. has been formed to develop the platinum claims in that vicinity. It is understood that a considerable amount of capital is interested in it, largely from the city of Seattle, Wash. It is proposed to work a tract of 320 acres on Slate creek. Slate creek is just over the divide of the Similkameen river, on the Washington side, but operations will be extended into British Columbia territory also.

"The fact that the creeks in this region have been producing platinum will doubtless lead others to begin prospecting. The proportion of precious metals in the gravel, as shown by hundreds of assays made by the Slate Creek Hydraulic Co., is about two-thirds gold to one-third coarse platinum. Some of the nuggets are as large as the little finger of a man's hand. The gravel runs 25 cents to the yard in platinum and gold. It is believed, however, that somewhere in the 220 acres of the company's claim, the old bed of the creek will be crossed and that richer gravel will then be found.

"Another deposit of platinum is also said to have been discovered in Kennedy mountain, near Princeton, B. C. Samples of the gravel have been sent for assay."

The Golden Gate Cyanide Plant.*

This is the oldest cyanide mill in the district, and is known as the Rossiter, the First Ward or the Deadwood cyanide mill. The mill was erected in 1892 as a cyanide mill, but was never in continuous operation, although a great deal of ore has been treated there. Since its construction no radical changes have been made in the mill, except to increase its capacity, and in consequence it represents the past type of mill. It is a dry-crushing mill, having facilities for drying and roasting the ore. Roasting, however, as far as the writer's information goes, has not been used of late.

NATURE OF THE ORE TREATED.—The ore comes from the Bald Mountain district and is in part oxidized and in part non-oxidized. The latter is commonly known as "blue ore." Both kinds are highly siliceous, the unoxidized being a hard, blue siliceous ore, very dense, carrying a small percentage—2% to 6%—of finely disseminated pyrites. The oxidized ore is more or less porous and of a somewhat shaly nature. The blue ore is much more difficult to cyanide than the oxidized ore, and, as both come from the same mine, mixtures of the two are not always avoidable. The two classes of ore are best treated separately, in order to get the best results. The extraction on blue ore is low. The ore ranges in value from $10 to $30 per ton, the average being $12 to $15.

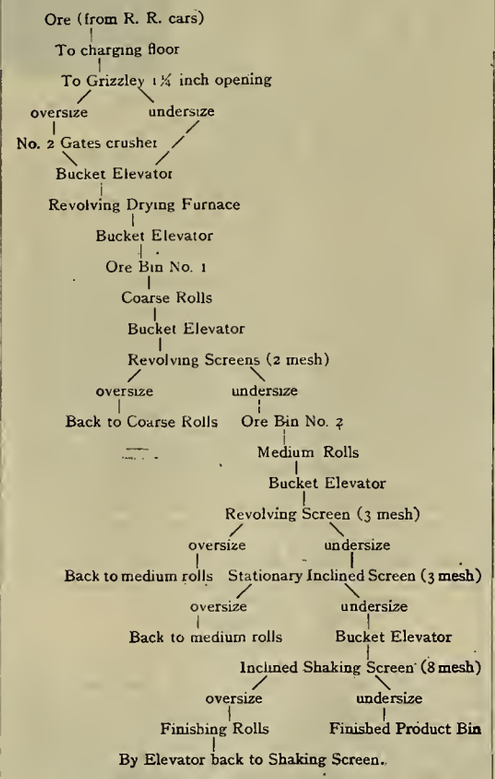
THE CRUSHING OF THE ORE.—The situation of the mill site is not very favorable as regards slope, and hence the crushing department has of necessity a considerable number of elevators, as shown in the scheme of crushing. As the mill is a dry-crushing mill, provision is made to collect as much dust as possible. All the rolls, elevators and screens are connected by rectangular wooden flues, with a 55-inch Sturtevant fan. The dust collected by the fan is discharged into collecting bin No. 1 through a rectangular horizontal flue. In this first bin the coarser dust settles, while the finer material is blown out through another rectangular horizontal flue into the bin No. 2, where more material settles. The finer dust which escapes from bin No. 2 passes through a long wooden flue, 100 feet long, situated on the roof of the main mill building, into a large dust chamber provided with an exhaust stack. The dust collected amounts to $\frac{1}{12}$ to $\frac{1}{15}$, or 7% to 9% of the amount of ore crushed. The material thus collected contains nothing coarser than what will pass through a 120-mesh sieve. A diagramatic sketch of the dust-catching apparatus is shown. Bins Nos. 1 and 2 are cylindrical, 8 feet in diameter and made of boiler iron.

* Bulletin No. 5, South Dakota School of Mines.

CRUSHING AND SCREENING MACHINERY.—Grizzly is short, 3 feet long, and spaces between bars are 1¼ inch.

The rough crushing is done in a Gates No. 2 gyratory crusher, crushing to a 1½-inch ring. The capacity of this crusher is sixty-five tons per twenty-four hours when running on dry ores and but about thirty tons when running on wet ore. The other crushing machinery of the mill has a capacity of about 100 tons per twenty-four hours, but the mill is limited to sixty-five tons by its tankage and rough crusher.

The following diagram is illustrative of the crushing:



ROLLS.—There are five sets of rolls in the mill. One pair of Gates rolls for coarse crushing and one pair of Gates and one pair of Bowers rolls for the medium crushing. The Gates rolls are at present crushing all the ore, the Bowers being out of use. There are two pairs of Gates rolls for fine crushing.

The coarse crushing rolls are 26 inches in diameter and 16-inch face; rolled steel shells 4 inches thick are used, and the last set wore for twelve months. The speed of these rolls is ninety revolutions per minute.

The rolls for medium crushing are 26 inches in diameter and 12-inch face. The speed of the rolls is 120 revolutions per minute.

The rolls for fine crushing have the same size and speed as the medium crushing rolls.

The size of the Bowers rolls, which are not in use, is: Diameter, 26 inches; face, 14 inches.

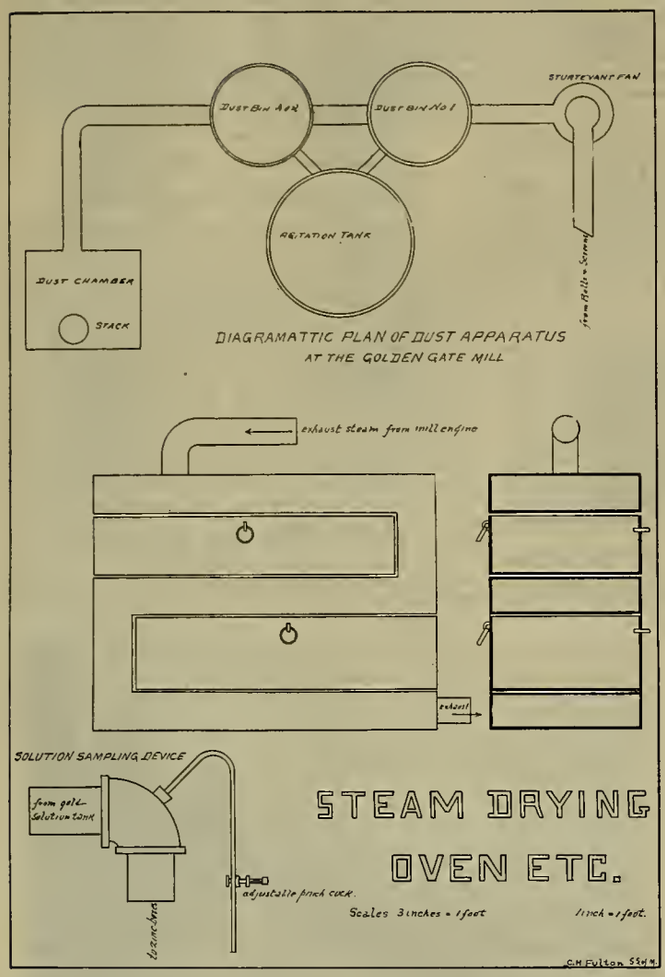
REVOLVING SCREENS.—The revolving screens, of which there are two, screen the ore as it comes from the coarse rolls and are 7 feet long and 3 feet in diameter. The screening surface is a 2-mesh wire cloth, four openings per square inch.

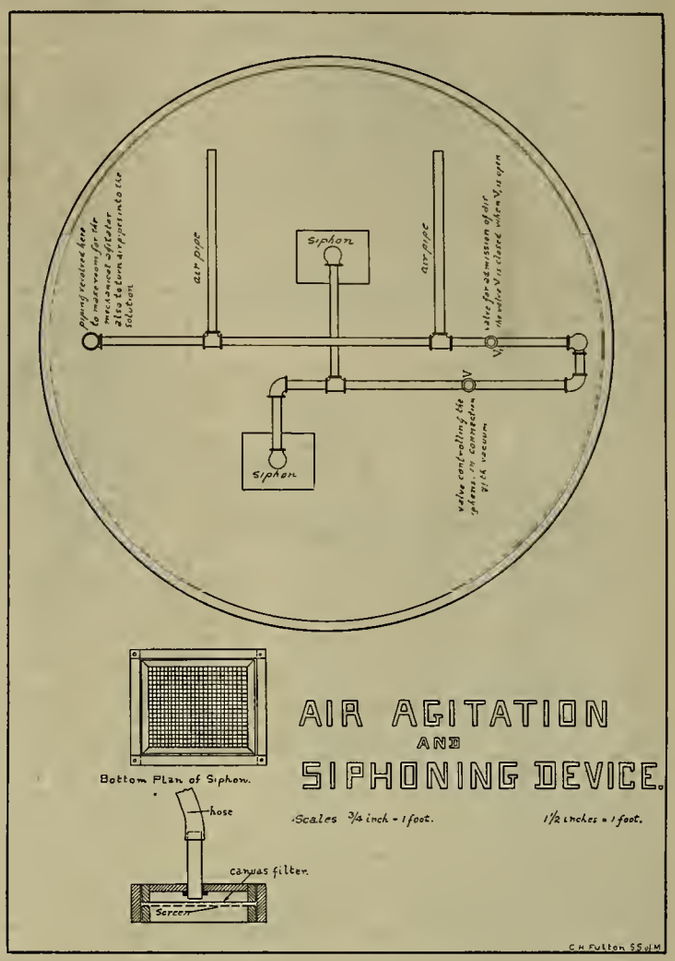
The revolving screens which take the material from the medium rolls are also 7 feet long and 3 feet in diameter. The screening surface is 3-mesh wire cloth, nine openings per square inch.

The two screens which take the material from the fine rolls are shaking screens. These are built double, each single screen having an area of 16 square feet, making 64 square feet for the two double screens. These screens are inclined at 45° and make 168 vibrations per minute. The power is transmitted to the screens by chain and sprocket. The screening surface is 8 mesh, No. 16 wire, sixty-four openings per square inch. As these are the finishing screens, they determine the size of the ore cyanided. It has already been stated that the dust apparatus takes out everything above 120 mesh, so that the material cyanided ranges between 8 and 120 mesh. There is probably only a small portion, however, as coarse as 8 mesh, for the reason that the finishing screen, being an inclined flat screen, most of the material as coarse as this is carried back to the fine rolls for recrushing.

There is also a stationary inclined screen (3 mesh) placed in connection with the revolving screens of the medium crushing rolls, as may be seen by referring to the scheme of crushing. Its utility is doubtful. It could be done away with by having a finer mesh in the revolving screens. It will also be noticed that the material from the medium rolls undergoes a triple screening: First, by revolving screen; second, by stationary inclined screen, and, third, by the inclined shaking screens. This relieves the finishing or fine rolls very much.

THE DRIER.—This is a long, cylindrical furnace of





the White-Howell type, 30 feet long and 5 feet in diameter, which, with ore carrying considerable moisture, has a capacity of 100 tons per twenty-four hours. With an ordinary percentage of moisture, it makes one revolution in thirty-five seconds and consumes 1½ to 2 cords of wood (pine) for sixty to sixty-five tons of ore.

LEACHING DEPARTMENT OF THE MILL.—There are six leaching vats, three in a row, built of steel, 24 feet in diameter and 36 inches deep, holding fifty tons of dry ore. There are no bottom or side discharge gates, the tailings being shoveled out over the sides into cars. The tanks have the usual slat bottom, the filter consisting of a layer of cocoa matting, burlap, and another cocoa matting on top of this. The top matting protects the burlap, which is the real filter. The top cocoa matting lasts about two and a half years without any renewal. The actual leaching depth of the vats is 32½ inches, deducting from this about 1½ inch, the ore not coming flush with the top, the depth of ore is 31 inches; evidently a very shallow vat. These vats have been in use for six years.

The two gold solution tanks are 10 feet in diameter and 6 feet deep, built of steel, and placed just above the zinc boxes. The two sump tanks are the same size as the gold tanks and situated below the floor, under the zinc boxes.

The strong and weak solution tanks, or distributing tanks, are also of steel, 10 feet in diameter and 8 feet deep, and placed at the head and above the leaching vats.

The solutions as they come from the leaching vats are very clear, and, owing to the shallow depth of the vats, the leaching is very rapid; in fact, so rapid that it must at times be checked by the valves, in order to maintain the proper rate of flow through the zinc boxes, and also keep the solution sufficiently long in contact with the ore pulp.

The pipes which carry the solution to the tanks are 2½-inch pipes. The discharge pipes from the filters are 3-inch pipes. The piping is arranged in the usual way, so that strong and weak solution can be run into the respective zinc boxes.

The mill is also provided with a vacuum filter arrangement, but that is not at present in use except to drain tanks of moisture, as the leaching, if anything, is too rapid. The air pump is used to furnish air for the treatment of the dust, as will be described under the heading "Dust Treatment."

ZINC BOXES.—There are two zinc boxes—one for "strong" solution and one for weak solution. The boxes are 10½ feet long, 30 inches wide, and have a depth of zinc of 24 inches. The box is divided into nine compartments, the last two of which do not contain any zinc, but serve to settle any fines before discharging into the sump tanks. The boxes are provided with inclined bottoms and a side launder to facilitate the clean-up.

The fine precipitates are washed into a round, steel filter tank, 3 feet in diameter, provided with a heavy canvas filter and connected with the vacuum pump. All of the finer portion of the precipitates are thoroughly washed in this tank before being transferred to the acid tank.

CYANIDING OF THE ORES.—The vats are charged by end-dump steel cars, holding about 1200 to 1500 pounds of crushed ore. The tracks run close to the side of each row of vats and at a level with their top. The cars are charged from the finished-product bin by the usual chute. A change has recently been adopted in charging the cars, necessitated by the fact that it was found advisable to wet the ore with cyanide solution before charging into the vats. This is done by letting a carful of ore flow out on a platform in front of the chute, then moistening it with cyanide solution, shovelling it over, then transferring it to the cars and then into the vats. The amount of cyanide solution used is just enough to thoroughly moisten the ore. Its strength is ¼%, or five pounds of potassium cyanide per ton of solution. The moistened ore is allowed to stand only a short time, until the car comes back for the next load; but repeated tests have shown that in time about 40% of the gold goes into solution. As the ore is dumped from the cars into the vats, it is raked down by men standing in the vats. When conditions are favorable it takes about sixteen hours to charge a vat, two men and one car being employed in the work.

The strong solution is then turned on, the vats being filled from the top, and allowed to stand for about twenty-four hours, although this is sometimes varied. The strength of this solution is five pounds of cyanide per ton. This solution is then circulated for some time and then replaced by a weak solution containing 2½ pounds of cyanide per ton of solution. This is not allowed to stand, but is continuously circulated. The total amount of weak and strong solution that is used on the ore is from fifty to sixty tons, the relative amount of weak and strong solution differing with the class of ore. The average rate of leaching is about three tons of solution per hour. The weak solution is finally displaced by eight to ten tons of wash water per vat, the ore being dried as far as possible by the use of vacuum, to draw off as much moisture as possible. The amount of moisture in the tailings after the application of the vacuum pump is about 8% to 10%. (?)

The time of leaching and washing is generally about ninety-six hours. Vats are usually discharged in twelve hours, the tailings being shoveled out over the side into cars, the total time required for one vat thus being 124 to 140 hours.

Slacked lime is used to neutralize the acidity of the ore, eight pounds per ton being added. This is added in proper quantity at suitable intervals to the finishing rolls, thus insuring a very fair mixture of ore and lime.

The aim is to have a "protective alkalinity" of about 2 2 pounds of lime per ton of solution. The protective alkalinity is that part of the alkalinity of the solution not due to the potassium cyanide or other cyanide salts. It is usually expressed in pounds of alkali per ton of solution.

The consumption of cyanide is about three-fourths of a pound per ton of ore, and the actual extraction of values, or the saving, is about 79% to 80%.

The rate of flow of the solution through the zinc boxes is one ton per hour for the strong solution and three-fifths of a ton per hour for the weak solution. The precipitation is very good, no trouble being met with in the zinc boxes, the solution issuing from the boxes rarely running more than 4 cents to 20 cents per ton of solution.

DUST TREATMENT.—The dust or fines from the crushing, which, as already stated, amount to from 7% to 9% of the material crushed, is treated separately by agitation in a tank provided with mechanical stirring apparatus. The agitation tank is of steel, 10 feet in diameter and 56 inches deep. The agitator is a central steel shaft 2½ inches in diameter, provided at the bottom with two horizontal arms and driven at top by bevel gear. The agitator can be lifted out of the tank by means of pulley and chain. The usual speed of the agitator is twelve revolutions per minute.

In treating the dust the tank is first filled with ten tons of strong solution, five pounds of cyanide per ton, and then eight tons of dust are added by means of a movable 6-inch galvanized iron pipe provided with a conical hood at the end. This hood dips beneath the solution, preventing dust. The charging pipe leads from the dust bins, which are immediately above the agitator tank, and have already been mentioned. The agitator is set in motion at the beginning of the dust charging and the mass is agitated for six hours. Then air is pumped through for an hour, the air being furnished by the reversal of the vacuum pump. This first treatment with strong solution by agitation and aeration gives an extraction of about 50% of the values. The treatment with strong solution is followed by four treatments with weak solution, containing from 1 to 2½ pounds of cyanide per ton. The treatments with weak solution are identical with the treatment with strong solution, except time consumed, which is agitation for half an hour and aeration for one hour. After the aeration the slimes are allowed to settle for twelve hours, and the supernatant solution, amounting to about 60%, is syphoned off, the syphon being a square wooden box provided with canvas filter and started by the vacuum. (See drawing for apparatus for syphoning and agitation.) The solution which is drawn off is passed again through a canvas filter, which is a long, inclined launder-like box, in which a horizontal sheet of heavy canvas is stretched, the solution entering beneath the canvas and being forced up through it. This effectually clears the solution of all suspended matter and leaves it in condition to enter the zinc boxes. By these successive treatments an actual extraction of 85% to 86% is finally obtained. The slimes are washed with one lot of wash water, which solution is discarded if it does not run over 40 cents per ton. The total amount of time consumed in treating a tank of dust is generally about seventy-two hours, sometimes more, up to 120 hours, depending on the nature of the ore the mill is treating. It is interesting to note that the dust has a higher value than the ore from which it originates, and that the extraction is 5% to 6% above that made on the sands, or the coarser material treated in the large vats; also, that the time of treatment is considerably shorter by more than a day.

(TO BE CONTINUED.)

THE average cost of petroleum wells at Baku, Russia, is now conceded to be not less than 60,000 rubles (about $30,900). The Baku man's machinery and rig ready for drilling costs much more than the average American well completed. In the Baku fields, to get to a depth of 1500 feet, they start with not less than a 26-inch hole, and in deeper territory with even larger holes up to 32 inches in diameter. The pipe used is ⅜-inch iron riveted, in 4-foot joints, which are joined by riveting. The practice is to drill ahead of the pipe and then drive it, and they continue driving the first pipe until it collapses or for some reason will go no farther; then they start another string of a diameter which will go inside the first, generally 2 inches less; and when this can be no longer driven, then another string inside it, and so on until they strike the oil. In deep wells, there is sometimes more than $10,000 worth of pipe. Then the cost of drilling by contract is generally made at about $5 per foot up to 700 feet, the price increasing about 75 cents per foot for the next 70 feet, $1.50 for the next 70 feet and so on till after 900 feet the price is about $7.50 per foot. Thus, a 1500-foot well will cost nearly $10,000 for drilling.

The Josephine Mine, at Volcanoville, Cal.

Written for the MINING AND SCIENTIFIC PRESS.

The northern portion of the mother lode system of veins enters El Dorado county, Cal., on its southern border at Nashville, and extending thence nearly due north is strongly developed and readily locatable near Placerville and thence northward to the vicinity of Kelsey. Here the Mariposa slates, a characteristic rock formation associated with the mother lode, turns northwest and is traceable by the lode system that accompanies it, one branch of the mother lode, at Greenwood and into Placer county at Butcher Ranch. The intrusive eruptive rocks, so closely associated with the pay ore bodies of the mother lode to the southward, at Kelsey hold to the direct north course of the lode, and are accompanied by a system of lodes passing by Georgetown, Volcanoville and into Placer county, are strongly developed at Bath and Forest Hill. The Josephine mine is located on the eastern contact of these eruptives with the metamorphic rocks, at Volcanoville, on the northern line of El Dorado county. Both branches of the mother lode system have proven notably rich feeders to the placer deposits and many quartz mines have been exploited on them in El Dorado county.

Mine Buildings No. 3 Tunnel, Josephine Mine, Volcanoville, Cal.

The Josephine mine lode seems to have from its erosion fed the early-day placers of Volcanoville and contributed to the enrichment of the Middle Fork of the American river in its richest section. The lode was mined in the early '50s and more or less continuously since until the 20-stamp mill was destroyed by fire about ten years ago.

The present owner of the property, the San Francisco M. Co., J. M. Nouges, Jr., Supt., is now reopening the mine. The view given herewith shows the mine buildings at No. 3 tunnel in the canyon of the Middle Fork of the American river.

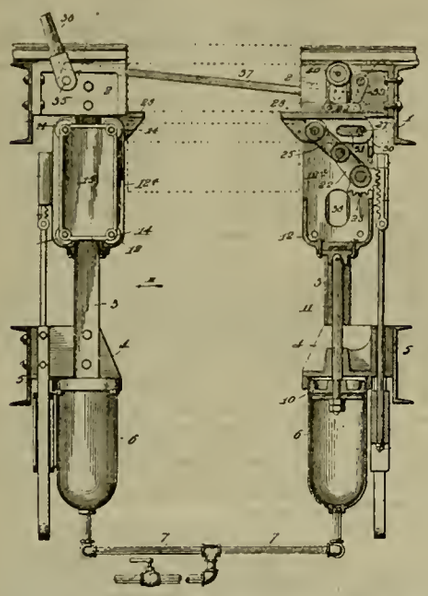
Tunnel No. 3 has been reopened a distance of 320 feet, tunnel No. 4 a distance of 1020 feet, and tunnel No. 5, a new tunnel, at a perpendicular depth of 1000 feet down from the summit at Volcanoville, has been driven nearly 600 feet, and work is being continued in it. There has been encountered in this tunnel, one ledge 11 feet wide and another 6 feet wide, both carrying pay values. A tunnel which has been projected along the ledge, beginning at the bottom of the canyon near the river where the new mill is to be located, will open this property about 2100 feet in depth. The water flowing from tunnel No. 3 is carried in a V flume and pipe, and, joined with the water from tunnel No. 4, enters a pipe line and is used under 600 feet head on a water wheel which provides power for tunnel No. 5. Power drills have been installed and it is proposed to use a water right on the Middle Fork of the American river to furnish water power for a mill and large air compressor.

Mining and Metallurgical Patents.

Patents Issued May 5, 1902.

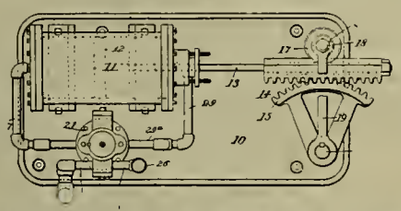
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

CHAIR FOR MINE CAGES.—No. 699,135; J. O. Bardill, St. Louis, Mo.



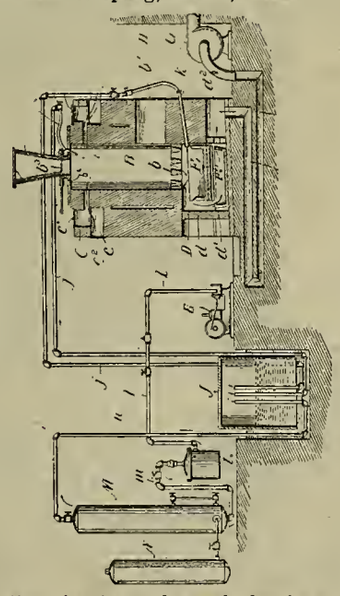
Dog-supporting means, dogs carried thereby, pressure receiving cylinders, piston rods connected to dog-carrying means and extending through cylinders, pistons on rods, racks carried by piston rods at their lower ends, spur wheels arranged in engagement with racks on pair of shafts by which spur wheels are carried, and third shaft geared to two first-named shafts.

HYDRAULIC GOVERNOR FOR WATER WHEELS.—No. 699,142; W. J. Bridger, Phœnix Mills, N. Y.



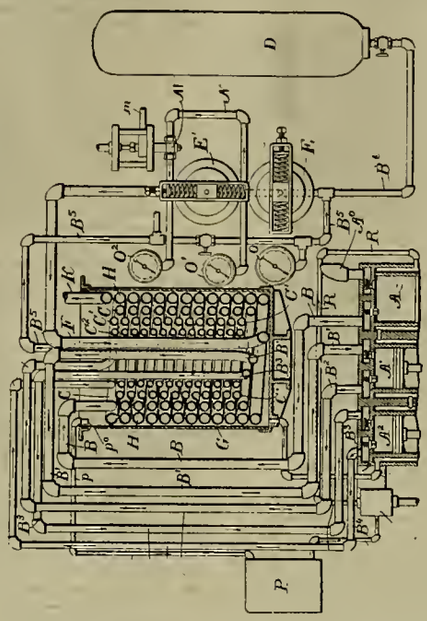
Pressure cylinder, gate shaft operatively connected with cylinder for regulating water supply, valve cylinder communicating therewith, longitudinally movable valve in valve cylinder provided with openings to form ports and having its stem slotted longitudinally and perforated transversely of slot, casing secured to stem provided with angle slot, spring-pressed pin within casing in position to enter perforation of stem, pin projecting through angular slot for moving first-mentioned pin, and governor provided with perforated stem within slot of valve stem and adapted to be locked against longitudinal movement therein by spring-pressed pin.

APPARATUS FOR TREATING ORES.—No. 699,457; A. M. Dorr and J. Spang, Boston, Mass.



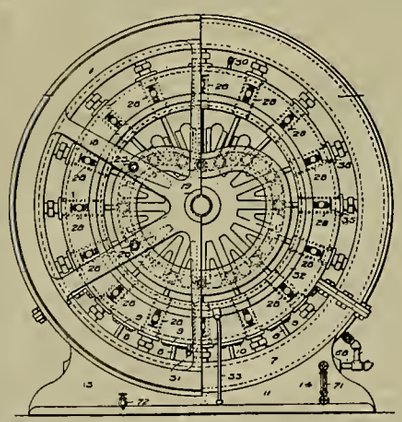
Reduction chamber; charcoal chambers C communicating with upper portion of reduction chamber; matte chamber below reduction chamber; molten metal receiver in matte chamber; means for creating and maintaining downdraft in furnace, downward through reduction chamber thence down, into and through matte chamber and around receiver therein, and thence out from furnace, and means for introducing gas into both reduction chamber and matte chamber.

AIR COMPRESSOR AND INTERCOOLER.—No. 699,288; W. B. Cowles, Cleveland, Ohio.



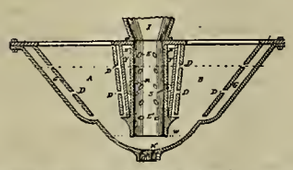
Tank, reservoir for compressed air, means for supplying compressed air to reservoir including compressor cylinder with water jacket, cooling coil in tank, and means for carrying off compressed air comprising pipe, two reducing valves, in pipe, by-pass for one reducing valve, means for controlling by-pass by hand, heating coil located in tank, fluid pressure main receiving air from heating coil, and means for circulating water through tank and jacket.

AIR COMPRESSOR.—No. 699,570; G. W. Rhine, Altoona, Pa.



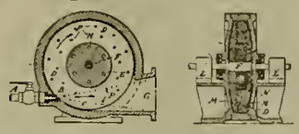
Stationary disk having central hub, revoluble shaft extending loosely through hub, wheels fixed upon shaft one at each side of disk, grooved cams carried by wheels, annular water casing surrounding disk and secured thereto, pipes for supplying water to casing, series of air pumps arranged radially in pairs within water casing, rollers mounted on piston rods of pumps and extending into grooves of cams, and annular air chamber surrounding water casing into which all pumps deliver air.

AMALGAMATOR.—No. 699,550; J. McKelvey, Louisville, Ky.



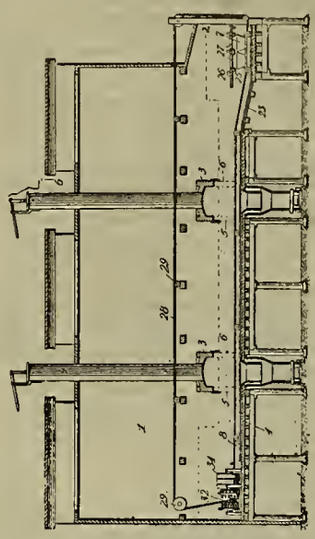
Case having mercury holding basin, provided with means for withdrawing amalgam therefrom, also having outer chambers, intermediate chamber and separate chamber having openings leading to outer and intermediate chambers, and means through which water under pressure is admitted to separate chamber, sluice tube in intermediate chamber, having series of downwardly inclined apertures for admission of water from intermediate chamber, apertures near lower end of tube extending through wall of same at angle nearer horizontal than those above, and overflow pipes in outer chambers, having non-radial apertures in their walls for admission of water from their respective chambers, tube and pipes having communication with basin.

TURBINE.—No. 699,636; E. C. Thrupp, Walton-upon-Thames, England.



Shaft, number of flat circular disks spaced apart on shaft and means for forcing liquid in straight line between disks, whereby disks and shafts are caused to revolve by friction of liquid on sides of disks.

FURNACE CHARGING SYSTEM.—No. 699,525; A. B. W. Hodges, Grand Forks, Canada.



Furnace, charge carrier having plurality of compartments, combined dumping area of which approximately equals cross sectional area of furnace, means for moving carrier, and charge distributing means occupying location above carrier when in position to be charged, charge distributing means being constructed to effect distribution of charge in carrier in conformity with position to be occupied thereby in furnace.

PROCESS OF REDUCING METALS AND PRODUCING ALLOYS THEREOF.—No. 699,282; H. S. Blackmore, Mt. Vernon, N. Y.

Process of reducing metals by exposing a composition therefor to be reduced containing metal and two or more non-metallic elements to action of heat and metallic carbide, combined elements of which are capable of combining with electro-negative constituents of compound.

EXTRACTION OF COPPER BY THE WET METHOD.—No. 699,326; T. A. Irvine, Hornsey, England.

Process for extraction of copper consisting in treatment of ore within mixed solution of chloride of sodium and sulphuric acid in which solution there is excess by weight of chloride of sodium in respect to sulphuric acid.

GASH VEINS twenty-five years ago furnished an excuse for many a mine failure. Now such a thing is seldom mentioned. The theory was that such a vein was a crack in the earth's surface which closed together with depth. A pinch in a vein cutting off the ore made it a "gash" vein to the old miners and led to its condemnation. In fact, the old miners were not particular about the pinch being there. If the ore failed to pay, it was the same thing to them, and "gash" vein covered it up. Later, when more persistent mining went on downward and laterally, the pinches were passed or pay ore came in again. Now, it is realized that the bottom of a vein has never been found, though the lateral extent has limits.

THE cost of attendance of water-power plants is less than that of steam or other plants, and, on account of the absence of a fuel bill, the operating expense is very small; but, on the other hand, the first cost may be very large, and therefore make fixed charges correspondingly greater than with other kinds of plants. The depreciation and repair bill is less than in the case of steam, an allowance of 4% usually being considered ample to cover these items, while the corresponding allowance for a steam or gas engine plant is 10% to 15%.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

KETCHIKAN.

A Tacoma, Wash., company, headed by A. C. Little of Tacoma, has secured a deposit of gypsum on Freshwater bay and proposes to construct a refining plant at Tacoma to cost $20,000. The gypsum ledge which has been uncovered is 70 feet wide for 1000 feet in length. A tramway 3500 feet long is being built to convey the mineral from the quarries to barges, upon which it will be transported to Tacoma. The factory will be planned to work up 15,000 to 20,000 tons of gypsum yearly into plaster of Paris and fertilizers.

VALDEZ.

A report has come to Valdez from the head of the Tanana river that a 500-foot ledge of very rich copper ore has been discovered in that section, A. B. Iles of Valdez owning the discovery. According to his report, the copper deposits of the Tanana promise to compare with the copper deposits on the Chittyna river. The place of the discovery is located in the Nutzotin mountains, northwest of the head of Tanana, and between that stream and the head of the Nabesna river. This copper belt is about 40 miles long and is thought to be a continuation of the deposits on Kletsan creek, near the head of the White river. The summer route to the Tanana copper country is by way of the government trail from Valdez to the mouth of the Chistuchina, then up the Copper river to Batzulneta, an Indian village, located on a creek of the same name tributary to the Copper river. From that point there are several trails across the divide to the Tanana waters. It is not a hard divide to cross, being low and timbered most of the way.

Work on the Moon Shine group of quartz claims at Ellamar is being done under Supt. F. Nelson. A tunnel is in 74 feet and has struck the lode, developing a good body of ore 3 feet wide. Samples assay from 12% to 30% in copper and from $4 to $12 in gold. W. D. Heidhorn of Valdez is the owner.

YUKON.

At a mass meeting of the miners and citizens held at Circle City resolutions were adopted strongly favoring the passage of Congressman Cushman's bill doing away with mining locations by power of attorney.

ARIZONA.

COCHISE COUNTY.

The Commonwealth M. Co., headed by R. A. F. Penrose and D. M. Barringer of Philadelphia, Pa., is reported to have bought the Casey copper group near Dos Cabezas and other properties along the probable line of a branch railway to be built by the Southern Pacific to the Commonwealth mine.

The Eureka M. & M. Co. at Hartford, south of Bisbee, has recently struck a large body of rich ore in shaft No. 5, which it is claimed runs over $200 per ton, while the mill ore averages about $30.

A Los Angeles, Cal., company has been incorporated to work a group of placer claims near Dos Cabezas by F. K. Rule and others. They have bought 520 acres and will put in water and machinery. F. K. Rule is president of the company.

GILA COUNTY.

G. Lobb has bonded his mine near Silver King to A. C. Sieboth of Globe. It is a gold property, on which 2500 feet of development work has been done.

At the Old Dominion works at Globe a briquetting machine is being installed to utilize the flue dust. Other minor changes at the smelter are contemplated.

It is reported that the Grand Prize Copper Co. will shortly resume operations on the Cracker Jack mine, near Payson, also that work is to be started on the Tonto Chief mine, owned in Jerome. It is claimed a custom mill could be kept employed at Payson.

GRAHAM COUNTY.

In the manufacture of gas by the Detroit Copper Co. at Morenci there are two generators, which, when put into blast, are fed with bituminous coal, from which the gas is made. Through these generators air and steam are passed in a downward current, the steam being generated by passing the hot gas through a tubular boiler, from which it is returned to the generators mixed with air. The gas from the generators goes through scrubbers, which free it from carbonic acid, soot and other impurities. It is then passed into the holder, from which it is drawn as needed to supply the various departments with power. The capacity of the plant is over 2,000,000 feet per day. The cost at the plant of each horse power generated by gas as compared with steam is about as one is to four, but when the added cost of freight and transfer is reckoned it reduces the rates in favor of gas.

J. Molder, Supt. of the Home Copper Co.'s mines, near Morenci, states that the mine shows a quartz lead 12 feet wide which will average $17 in gold and silver.

The Shannon smelter at Clifton is now running and shipments of copper have been commenced. The plans for converter and concentrating plants are nearing completion, after which work will be commenced on them.

J. Colquhoun, who retired as general manager of the Arizona Copper Co. at Clifton, May 1, at a farewell meeting with the heads of the various departments, in speaking of the many improvements made on the property during the past two years, stated that owing to the energy and intelligence of his mechanics the company had been able to construct concentrating plants and erect smelters in less time than they had ever before been erected in any country within his knowledge. He said that the company is now treating lower grade ores at a better profit than any other company in the United States, which he attributed mainly to the capacity of the men under his employ. Since the erection of the new smelting plant the output of the company had jumped from 10,000 tons annually to 15,000 tons, and this would be greatly increased as soon as the new reverheratory furnaces were completed, which would be in a short time.

The Home Copper Co. has struck a large body of gold and silver ore on their property just west of Morenci, which averages over $16 to the ton. The company is considering the question of putting up a mill in order to work the ore.

MARICOPA COUNTY.

The gold strike made by Scott, Gilbert & Rowe in the White Picacho district, 12 miles east of Hot Springs Junction, is a ledge 60 feet wide, averaging, it is claimed, about $5 to $6 a ton. Two 50-foot prospect shafts are being put down.

MOHAVE COUNTY.

I. C. Conkey of Mineral Park and F. Harter of Kingman have relocated the old Lone Star mine at Mineral Park. It was thought that the mine was patented, an application having been made twenty years ago, but, it seems, was never completed, owing to a defect in the title. Mr. Conkey states that there are 4 feet of $70 ore in sight in the mine, and men will be put to work at once and shipments made.

Mrs. J. Kay of Kingman is having a drift run on the Setting Sun vein, at Mineral Park, in which recently a body of almost black copper, carrying values in gold and silver, was struck.

J. Barry has taken over the Cerbat mine, at Cerbat, after extended litigation for several years. In the early days of the district the mine yielded largely.

PINAL COUNTY.

P. C. Robertson of Globe has bought some copper mining locations near Reymert. The ledges are quite large and the surface ore is rich in copper and carries some silver.

J. W. Cope of Illinois, Recorder McFall of Maricopa county and W. H. Ream of Phœnix have been examining the Specie Pay and other mining claims near Florence with a view to determining the advisability of installing a smelting plant there.

YAVAPAI COUNTY.

C. M. Gorin, owner of the Hidden Treasure mine, Black Canyon district, near Prescott, has sold six tons of ore for $138 a ton at the sampling works. The ore shoot in the Hidden Treasure ranges from 1 to 2½ feet in width. The property has 700 feet of development work. One shaft is 175 feet deep.

Nathan & Cleator has made a strike of free gold ore carrying some silver and lead, in a shaft down 20 feet on a 2-foot vein. The ore goes about $150 a ton. Their mine is near Prescott.

At the Model, near Kirkland, the shaft is down 300 feet deep and has drifts extending 100 feet each way. It is stated that the ore body is 4 feet wide and that the ore ranges in value from $150 to $500 gold per ton. President F. Jager has bought for the Model M. Co. the Alta, Batchelor and Wolftone gold claims for, it is reported, $150,000. L. W. Felt is general manager of the company.

C. L. Baker, manager of the Monarch G. & C. M. Co., near Jerome, has made arrangements for the sinking of a double-compartment working shaft to a depth of 500 feet, and will install a steam hoist.

The Bannie G. M. & M. Co. has been incorporated at Prescott. M. S. Taft is president, W. J. Wilsey secretary and J. J. Brooks Supt. The company will operate the Northern Belle, Jupiter, Bonnie, Georgia, Ethel and Fannie quartz claims, in Walker district, near Prescott, which will be started up at once. Machinery for deep sinking and a shaft to be sunk 500 feet will he started.

YUMA COUNTY.

M. L. Pool of the Desert Dwarf gold mine near Welton station, says the shaft is down 120 feet, and the ledge has widened to 36 inches, the value running from $15 to $30 per ton.

CALIFORNIA.

AMADOR COUNTY.

The first full monthly clean-up of the Keystone mine at Amador since the additional stamps were installed has been made. Five thousand tons were crushed during April. The yield averaged about $4 per ton. Under the improved conditions of mining the costs are now about $1.60 a ton. The air compressor to run the hoisting machinery has been started. Another economical move under contemplation is to have all drilling machines of the same make. Six machines will be installed. The ore is taken from the 900 level and levels above, and the ore bodies are so vast in the east vein, upon which the present prospects of the mine are based, that there is no likelihood of searching below the present works for a long time. About 100 men are on the pay roll, the use of machine drills having reduced the working force to some extent.

The water is all out of the Gover shaft, near Drytown, and the ledge has been exposed 84 feet wide of rock which assays about $4.30 to the ton. Grading for a new 80-stamp mill will be commenced this month and the mill will be put up during the summer. Rock from the Fremont shaft is still being crushed at the Pocahontas mill.

At the Sargent mine, at Middle Bar, a location for a shaft has been staked off and grading started. W. R. Thomas of the Central Eureka mine is Supt.——At the Farrell mine the tributers are sinking at the north end of the mine. About 1100 feet of tunnel has been run with a back of about 300 feet.——At the Del Ray the tunnel is in about 500 feet.

At the Lincoln mine at Sutter Creek the shaft is down nearly 2000 feet. It is believed that the rich shoot of rock recently struck in the Wildman, striking north towards the Lincoln, will be met with in the latter mine.

At the Central Eureka mine at Sutter Creek Supt. Thomas has changed his boiler plant from wood to crude oil for fuel.

The Edinburgh G. M. Co., recently incorporated in San Francisco to operate a mine near Wieland, has let a contract to drive the tunnel 500 feet along the vein. D. Fisher is Supt.

BUTTE COUNTY.

At the Golden Trout mine, near Lumpkin, a power plant is being put in to run the mill, pump works and all other machinery by electricity. The number of stamps will be increased to fifteen stamps.

CALAVERAS COUNTY.

The shaft in the Kiser-Maguire quartz mine on French hill, near Jesus Maria, operated under bond by F. O. Cortmarsh, is down 50 feet and crosscutting has been commenced.

The hoist at the Giuffra mine, near Jesus Maria, has been finished and the mill will now be started crushing.

C. H. Munroe, Supt. Oroville Gold Dredging & Ex. Co, working at Jenny Lind, says the dredger will be at work in about two months.

On the Cutler ranch, near Jenny Lind, prospecting to begin dredging is being done by Hammond & Carnduff.

The Sunrise mine at Railroad Flat has been temporarily closed down.

F. W. Allyn, manager of the Conrady gravel mine at Railroad, is preparing for a commencement of operations.

At the Vorlander mine, near Middle Bar, the shaft has been unwatered. It is the intention of the owners to begin active sinking operations at once.

On the Cassinelli, near Middle Bar, a well defined vein 3 feet wide, showing as high as $4 to the pan, has been struck.

DEL NORTE COUNTY.

M. T. Lawrence of Auburn and J. S. Goodwin of You Bet are opening hydraulic mines in the eastern part of the county.

EL DORADO COUNTY.

The Cosumnes copper mine, near Nashville, owned by J. Theisen of San Francisco, has been sold to the Rio Vista Copper & G. M. Co., and development work will commence on a large scale immediately.

The Omo mine, owned by the Omo M. Co., has been sold to J. H. Smith of Santa Rosa, and will be started up at once.

Work is being done prospecting the Little Joker mine, near Pilot Hill. Machinery has been installed.

Work on the tunnel of the River Hill mine at Placerville is to be resumed. The tunnel has been run about 700 feet and between 1000 and 1500 feet remains to be run to intersect the main shaft of the mine. Sinking is now in progress, 150 feet more depth taking it down to the level of the tunnel.

Some rich ore has been struck in the 700-foot level of the Mount Pleasant mine at Grizzly Flat. Supt. Jackson thinks it is as rich as any that ever came out of the mine.

INYO COUNTY.

Machinery for the Arondo M. Co. is being taken in from Johannesburg. The plant will include nine cyanide tanks, each 4x24 feet, a combination crusher and rolls weighing ten tons and a large gasoline engine for power. The company owns a group of thirteen claims, all showing large bodies of low-grade ore which is not free milling but yields to cyanide treatment. The plant will work 100 tons per day when operations begin. The main owners of the stock of the company are Dean & Jones of Johannesburg.

LOS ANGELES COUNTY.

M. Wiley of San Fernando has discovered placer ground about 7 miles north of San Fernando, adjoining his graphite claims in Pacoima canyon. He has been taking out gold from surface ground 12 feet above bedrock.

MONO COUNTY.

The 3-stamp mill of the Golden Gate mine in Antelope valley will be started about June 1st for the summer's run. Two new ledges have recently been opened up, making five in all of different grades and widths from which ore is being taken.

The upper cyanide plant of the Standard Con. M. Co., No. 2, at Bodie, which now treats tailings pumped directly from the mill, is to be torn down and moved to the No. 1 site. The capacity of the latter plant will thus be doubled, and all tailings to supply it will be hauled from the pond. The practice of treating the tailings direct from the batteries will be discontinued. The steam engine which was to be used in scraping the tailings pond being found unsatisfactory, an electric motor scraper is being put in, with which it is proposed to do the work of twelve horses under ordinary circumstances and to scrape out the slimes in places where horses cannot stand.

NEVADA COUNTY.

At the Gage & Hampton mine in Willow valley, near Nevada City, the double-compartment shaft is down 250 feet, and the rock shows free gold and an unusual amount of sulphurets. Grading is now being done for a mill.

The California G. & C. Co. of Spenceville have struck in their mine at Mineral Hill a ledge 8 feet wide, in which 4 feet is ore claimed to average over 10% copper, with some gold and silver.

C. O'Dell, Supt. Shady Creek mine, near Nevada City, which is being opened by a company headed by C. L. Canfield, says that work has been started up again. The dams have all been completed and a dredger will be built. The work was interrupted by the large flow of water in the creek.

The machinery at the Gold Tunnel mine, near Nevada City, is in place and the work of pumping out the old shaft commenced. The motive power is electric. J. Eddie is Supt.

Gale & DuBois, who recently bonded the Baldwin mine on Gold Flat, near Nevada City, have commenced work and are putting in 1500 feet of pipe.

PLACER COUNTY.

A rich vein of copper ore has been struck at Ophir by S. Bartlett, A. L. Smith and P. S. Lozano. The ore is in an iron belt and has a footwall of quartz. The ledge is 3½ feet wide at the foot of a 130-foot incline. The bulk of the ledge is meleconite or black oxide.

SAN BERNARDINO COUNTY.

A test run of 5000 pounds of ore from the mines of the Providence G. & C. Co., near Fenner, is being made to decide on a treatment process that will save the values. The mines have been worked at intervals during the past twenty years, and the new company is preparing to develop the property on a large scale. The ore is free milling and ledges are from 2 to 12 feet wide at the surface. Assays from croppings show average values ranging from $15 to $25 a ton. A 20-stamp mill is under consideration. J. H. Mathews of Los Angeles is president of the company.

SHASTA COUNTY.

C. C. Lawton has sold his one-half interest in the Independence mine at De Lamar to M. Lindley of the Shasta May Blossom M. Co. for $2000—$800 down. Prospecting has shown a good value in copper sulphides.

The Washington mine at French Gulch has been taken over by a new company, and the once rich mine will be reopened, after having lain idle for a number of years.

The Sybil mine, near French Gulch,

owned by G. A. Van Krusze, pays all expenses, including the installation of new machinery, from the prospecting work. Returns from the last shipment of twenty-five tons of the ore show an average of $202 a ton. Hoisting machinery is being installed.

A rich strike is reported to have been made on Salt creek, near Middle Creek, by S. Stewart, of a 2-foot vein of quartz.

SISKIYOU COUNTY.

The Portland company opening up a bar on the Tom Quigley ranch, above Walker, are completing a ditch from Beaver creek for supplying the elevator and giants.

J. M. Quigley of Oro Fino has fifteen men at work in his hydraulic claim. There is an abundance of water to keep the elevator and giants constantly in use until late in the summer.

Mr. Whitney of the Detroit Co., working the Buckeye Bar claim on Klamath river, is preparing to put in more machinery and apparatus for working the claim.

H. J. Barton of Oak Bar is preparing to work claims in the Oak Bar district.

The Phillips Brothers have discovered a promising quartz ledge near Salad creek and have bonded it to a Mr. Wilbur, who intends working it.

The Square Deal quartz mine, or Rusby mine, at Deadwood, has started up with a full crew. The company is about to enlarge the milling machinery by installing a larger boiler.

TUOLUMNE COUNTY.

T. R. Dunn of San Francisco has bonded from W. M. Phillipson of Confidence the Bowler, Minnie, Powell and Iron King quartz mines, near Confidence, a water right of 4000 miner's inches from the south fork of the Stanislaus river, and a ditch, until Jan. 1, 1903, at $12,500. A company is to be incorporated to develop the properties. The mines are operated by tunnels.

S. W. Van Syckel of San Francisco and F. J. Carman of Detroit have sold the Red Haugh, Lena Belle, Mayflower, Young American, Iron Cloud and Mayflower extension, also a mill site of five acres and improvements at Carters to the Red Haugh M. Co. of San Francisco. F. J. Carman, S. W. Van Syckel, S. C. Mason, J. B. Bradley and R. V. Ellis, all of San Francisco, are directors.

J. Kruger has bonded to W. R. P. Wirthle of San Francisco the Jupiter and Saturn quartz mines, near Jacksonville, together with the water rights connected with it, until March 18, 1903, at $6000.

C. G. Brush and H. T. Whitley of San Francisco have sold the Gladys mine at Big Oak Flat to the Gladys G. M. & M. Co., which is now engaged in developing the property.

Ballard & Martin of Jamestown have bonded the Lady Washington mine at Carters. The Lady Washington is on this side of North Fork from the New Albany, and the plan is to build tramways to the river and operate both properties with one mill.——W. H. Martin has bonded from Baker Bros. a piece of ground at Carters, believed to contain the extension of the Dead Horse vein. The bond is for two years at $12,000, work to be commenced in sixty days. Mr. Martin proposes to sink a shaft 600 feet and crosscut for the vein.

At the Long claim, 18 miles southeast of Carters, J. Long & Co., formerly of Jamestown, and his partner have sunk on their claim a shaft to a depth of 100 feet and struck ore that goes over $100 to the ton. The vein is 2 feet wide, the pay streak being about 14 inches.

In the New Era mine, near Stent, drifting is being done on the ore shoot on the 180 level which was recently struck. The ore body is 3 feet wide and of high grade.

The foundation is being laid for a 20-stamp quartz mill at the Lost Fox mine, 18 miles southeast of Carters, in the Buchanan section.

Operations have been resumed at the Clio mine at Jacksonville in a small way.

The App mine shaft at Quartz is 1200 feet deep and sinking is still continued.

The Mohican mine, near Sonora, is being steadily worked. The clean-ups give returns of over $20 to the ton.

H. J. Dykes of San Francisco is starting work on the Ajax mine, on the Berger ranch, near Sonora. The mine is being unwatered.

At the McAlpine mine, at Pinon Blanco, work has been commenced preparatory to a thorough prospecting of the property.

The Long claim, east of Summerville, is reported to be showing at a depth of 100 feet $100 a ton ore.

A shoot of rich ore has been struck in the Riverside mine, near Columbia, and the mill is working steadily. E. A. De Haven is the owner.

About seventy-five men are employed at the Harvard mine, near Jamestown, and thirty of the sixty stamps are being run. A connection is being made between the 550 and 800 levels. Three-ton skips are being used in the two shafts. As soon as development is forward, the force of men will be increased to about 125.

At the Horseshoe Bend mine, near Melones, work is being done in the tunnel from the river, following a large lead, and on the gallows-frame at the shaft. A hoist will be put in and sinking commenced. G. Morrice is manager.

YUBA COUNTY.

C. F. Adams has recently discovered a gold-bearing quartz lode between Woodville House and Clipper Mills. The ore taken out shows free gold.

COLORADO.

ARCHULETA COUNTY.

The Omaha M. Co. is working on a large vein of free milling gold ore near Pagosa Springs. W. R. Black is Supt. Machinery to put the mine on a paying basis is being installed.

BOULDER COUNTY.

The people working the Boulder County mine at Cardinal are about to add twenty additional stamps, which will be put in at once, to their 10-stamp rapid drop mill. A. Larson of Black Hawk is in charge of the mill.

At the Notro Dama mine at Sunset, owned by O. Landstrum, the shaft is 40 feet deep in ore which goes $16 per ton; 1000 feet of road will be built to connect the mine with the main road.

The Golden group at Magnolia, formerly owned by G. Fairhurst, has been sold for $40,000—$10,000 down—to Mr. Adams and others of Cripple Creek, who will put on a hoisting plant and sink the shaft 500 feet deeper at once.

The Cripple Creek people who recently bought the Cash mine, at Magnolia, are replacing the old machinery by new and heavier machinery and are putting in a 160 H. P. boiler and a five-drill compressor. The company has opened up a 3-foot vein in the 140-foot level, which is reported to run $70 per ton.

CHAFFEE COUNTY.

J. D. Whitehurst and G. Sullivan of Salida have bonded the Grand View mine at Turret to E. D. Lowe of Victor at $10,000. A hoisting plant is to be installed at once.

CLEAR CREEK COUNTY.

Nelson Bros. have taken a five years' lease on the McKinney and Key West lodes at Georgetown and propose extensive development. Mill runs from the Key West have returned as high as 750 ounces in silver, 10½ ounces in gold and 28% in lead. A drift is to be run on the McKinney and a crosscut made to the bottom of the shaft on the Key West.

A twenty-year lease has been granted the Georgetown G. M. Co. on the minerals under the streets of Georgetown at a royalty of 10%. Work will be commenced in the near future at a point where it is believed the vein found in the Garharino well will be disclosed at slight depth.

The Allan mill, near Idaho Springs, has been bought by the Gold Cord M. & S. Co. for about $10,000, and its reconstruction will be made at once.

CUSTER COUNTY.

No. 1 shaft on the Valley mine at Silver Cliff is down 200 feet, all in low-grade ore, but reducing readily and at small cost. The pyritic ores encountered are believed to be a strong indication that the formation and the minerals are going to be identical with Leadville.

DELTA COUNTY.

C. L. Pike, of Hotchkiss, says assay returns on ore found, it is said, on Crystal creek, in the Black Mesa country, showed 22.5 ounces gold to the ton. The Black Mesa, where this sample was found, is about 30 miles south of Hotchkiss, and is a high and wide strip of mountain country lying between the North Fork valley and the Black canyon, below Gunnison. It has been known that placer gold has been found paying wages by panning at points along the Gunnison river in the Black canyon, and prospectors believe that they have struck one of the lodes from which it comes. The formation is a brownish quartz, interspersed with yellow talc, which seems to carry the real value.

GILPIN COUNTY.

The Four Mile Gulch M. Co. has commenced work enlarging the Klondike tunnel, near Central City. The same company is preparing to run the Wheeler tunnel in to connect with the Klondike tunnel. The underground work is under J. Brohl, foreman.

Denver people have bonded the Lone Star mine, near Enterprise. A plant of hoisting machinery is to be installed. The property is owned by J. R. Miller and others.

The Morning Star mine in Pleasant Valley is being operated by the Ahhandwal M. Co., in which Boston people are interested, with C. Morgan of Idaho Springs as manager. A small shaft building and plant of machinery have been installed on the property. Drifting and stoping are being carried on in the 250-foot level. Concentrating ore is being shipped to the Wilkie mill at Idaho Springs and smelting ore is being sacked for the sampling works. The underground workings are in charge of J. Stasney. The company is figuring on buying the Arizona claim, adjoining, on which they may install a large hoisting plant.

The Klondike group, near Russell, is being operated by the Keystone G. & C. Co., with J. L. Mitchell as Supt. The shaft is down 230 feet on a ledge showing between 8 and 9 inches of ore carrying values in iron and lead sulphides. It is believed that the company will install a hoisting plant in the near future.

The Town Topics G. M. Co., M. D. Draper manager, operating the East Notaway mine, near Lake, has been opening up new ground and is installing a new and larger hoisting plant at the working shaft.

JEFFERSON COUNTY.

The success of the new hot air furnace at the Carpenter smelting works at Golden is reported. The saving in consumption of coke and other fuel is stated to be fully one-half, and there is also a very large saving in the consumption of lime rock. Three hundred tons of ore is treated every twenty-four hours, a considerable increase since the hot air furnace was started up.

LAKE COUNTY.

A proposition to construct an electric line in Leadville, an electric railroad to connect with the mines of the district, and an electric plant sufficiently large to furnish power to the mines and smelters of the district is under consideration. It is understood that water and reservoir rights have been secured and it is the intention to furnish electricity from a water power plant. To prevent failure in the power through a severe winter a subsidiary steam plant will be erected at Malta. It is stated that something like a million dollars will have to be expended in the enterprise. Electric power, it is estimated, can be furnished to the mines much cheaper than they can generate their own steam.

The output of Leadville mines for April was 2150 tons daily, or a total of 64,500 tons. The daily production from the different sections are as follows: Leadville basin, 650 tons; Carbonate hill, 250; Breece hill, 500; California gulch and Iron hill, 475; Fryer hill, 75; zinc ores, 125; outlying districts, 75. The tonnage of April exceeded that of March by 5000.

OURAY COUNTY.

The Camp Bird M. Co. has been incorporated, capital $50,000 with 500 shares, $100 per share. Incorporation, it is stated, was placed at a low figure in order to save fees. The principal officers of the company will be in London, England, and the officers are: S. W. Baker of London, president; H. Richards of London, secretary, and J. W. Benson, former manager of the property for T. Walsh, resident manager. The company will operate both in San Miguel and Ouray counties, and it is reported is organized to take over the Camp Bird mine at Ouray.

SAN JUAN COUNTY.

Manager J. McCoy says a 3-foot vein has been cut in the Index tunnel, near Silverton, which is a cream-looking quartz, exceedingly rich in gold. He states that the Index M. Co. will build a 2-mile tramway line and concentrating mill.

The Trans-Atlantic group at Silverton will be developed this season by a Chicago company represented by W. C. Munsell of Denver, who has the property bonded from J. Reynolds of Silverton. Work has been started cleaning up the main tunnel.

At the North Star mine at Silverton H. Starkweather, Supt. for a Chicago, Ill., company, the old original North Star vein has been struck and found to be 4 feet in width, the entire vein carrying a high grade of copper and gold ore.

SAN MIGUEL COUNTY.

J. H. Shockley, manager at Telluride of the Four Metals M. Co., says that in two months his people will start the erection of a 100-ton reduction plant with forty stamps. The mine is located in Turkey Creek basin.

The annual report of the president, treasurer and Supt. of the Butterfly-Terrible G. M. Co. of Telluride shows operating expenses of the mill were 56 cents per ton of ore and the total cost of mining, including supplies, as well as tramming, crushing, blacksmithing supplies, was $3.92 per ton. The balance sheet shows receipts from bullion, $63,454.29; from concentrates, $10,113.57. C. Bullock is president, F. J. Hobbs treasurer, and D. J. Sayer Supt.

The Cashin mine at Paradox is idle, the reason given being that a method has not been found by which half the values can be prevented from going away with the tailings. The principal value is copper, and it appears that most of it gets away from the plant now in operation. The ore taken from the mine carries high values.

SUMMIT COUNTY.

The Bucyrus dredger on the Swan mine at Breckenridge has been started up for a season's run. Manager Dyar of the American Co. will, besides the dredger, operate the placer at the mouth of Galena gulch, and the Peabody and Gold Run placers.

TELLER COUNTY.

A cyanide reduction works is to be constructed on Ironclad hill, at Cripple Creek, to treat the low-grade ore in the Ironclad mine, which will not pay any hauling charges. The ore shoots vary from 10 to 20 feet in width and the ore runs from $4 to $7 per ton, and is so thoroughly oxidized that it is adapted to direct cyaniding and can be handled cheaply. It is the intention to build the mill at the present dump. The ore will be hoisted and dumped into a hopper, from which it will go through rollers and then into tanks where the cyanide solution will be started.

Mr. Lewis and associates, leasing on the Colorado King claim, at Cripple Creek, have made a strike, practically at the surface, in a shaft down 8 feet, opening up a vein 4 feet wide. At 15 feet, three tons, made as a trial shipment, gave returns of $70.40 a ton. It is the belief of Mr. Lewis and associates that they have opened up the vein of the Temonj mine adjoining.

At a depth of 1000 feet in the Golden Cycle mine a vein has been struck in cutting the station which yields assays from screenings of between $40 and $60 gold to the ton.

The Bedford G. M. Co., by its Cripple Creek agent, E. J. Moxley, has undertaken to solve a low-grade ore problem of the Cripple Creek district. The company will install a 100-ton concentration plant, work of construction to commence immediately, with the expectation of being able to start the mill by the first of August. The ores will be trammed from a tunnel and dumped into the crushing department, going thence to the concentrating room, where eight tons will be reduced to one. In addition, the company has decided to build a small cyanide plant to handle the tailings from the concentrating mill. Tests made with cyanide treatment show from 93% to 94% of values saved. The company is working a vein 90 feet wide which yields an average value of between $6 and $8 per ton.

The Lexington Co. reports that the lessees operating its Gold hill property at Cripple Creek shipped 450 tons during April, average grade $30 in gold to the ton, producing $13,500. The lessees are now stoping above the 135-foot level in a vein which, in many places, measures 12 feet between walls. About 4 feet of the vein runs good pay, and the balance is all mineralized, but of a very low grade.

IDAHO.

BLAINE COUNTY.

O. Rorem has bonded the Fisher mine and mill, about 40 miles beyond Galena, at $120,000. He is privileged to operate the mine, the royalty to apply upon the purchase price. He expects to begin milling by June 1. Last summer the mill crushed an average of thirty-two tons a day of ore that yielded over $7 a ton. The ore is free milling.

CUSTER COUNTY.

R. Bell has sold the old Montana mine of Yankee Fork district, near Challis, to Eastern people. The new owners, it is stated, will start development at once. It is stated that J. Hutchinson, late manager of the Trade Dollar mine at Silver City, will superintend the development.

IDAHO COUNTY.

A strike is reported on the west fork of Monumental creek, in Thunder Mountain district. The formation is blue porphyry and is 1½ mile wide. C. Brewer and Behendorf Bros. are the discoverers. The porphyry is crystalline and has, it is said, the appearance of onyx. The pan tests of the porphyry are said to show good values in free gold.

C. I. Flock, an owner in the San Francisco group of claims at Hump, is preparing to do considerable work upon the mine this season.

The Hydraulic M. Co. at Lucile and Slate creek, on the Salmon river, is bridging the river at Slate creek to carry 5000 inches of water across the river to work the high placer bar on the west side. The bridge will be 225 feet above high water. It is expected that the work will be completed this season.

SHOSHONE COUNTY.

The St. Joe Basin Placer M. Co. of Colorado Springs, Colo., has been incorporated, capital $2,000,000, to operate near Wallace. The directors are E. Edmundson, Jr., G. B. Leonard, L. H. Crick, J. T. Golden, J. Robinsteen and C. Ehnl of

Pittsburg, Pa., and W. T. Hales of Wallace.

WASHINGTON COUNTY.

R. E. Johnson and G. Wells are reported to have made gold discoveries on Clear creek, near Payette, while prospecting for Boise people. A tunnel and cut have been started on ledges which give good prospects. Five or six parallel ledges 2 to 3 feet wide run through the claims from 50 to 100 feet apart.

KANSAS.

Prof. E. Fahrig of Philadelphia, Pa., says he has discovered a method by which commercial values can be obtained from the gold-bearing shale in western Kansas. He has given results in twelve tests from four species of shale, claiming them to show that there is an average value of $2.80 gold per ton of shale. The minimum amount of gold found in any one ton was 60 cents, and the maximum was $6.75. It is stated that it has been decided to erect a plant of 100 tons daily capacity after plans prepared by the professor.

MICHIGAN.

HOUGHTON COUNTY.

At the Calumet & Hecla mine at Calumet a new timber car has been tested in No. 2 shaft. By the use of two cars twenty-four skiploads of lumber can be sent underground in two and one-half hours. This will result in a gain of six to eight hours daily available for hoisting rock. These cars will probably be introduced in the other shafts of the mine.

MONTANA.

The deposits of gold and silver at the assay office at Helena during April amounted to $103,312.49 for Montana and $34,490.87 from other States and Territories. The deposits in April, 1901, were $97,654.96 from Montana and $57,297.79 from other States and Territories.

DEER LODGE COUNTY.

A rich strike of free milling gold ore is reported made in the Metz mine at Anaconda, in the incline shaft, at a depth of 120 feet from the surface, some of the ore taken out running as high as $500 to the ton. The ore body is said to be 2 feet wide.

FERGUS COUNTY.

The Kendall King Cyanide G. M. & M. Co. has been incorporated at Kendall by M. Solomon, F. Elliott, W. C. Archer, G. A. Taylor and A. Wilson, capital $300,000, to operate the Minnie Healy and Baby Boy gold mines near Kendall.

JEFFERSON COUNTY.

Only the pumps are now in operation at the Elkhorn mine at Elkhorn, the mining of ore waiting on a cheap railroad rate to market.

MADISON COUNTY.

R. F. Krause and J. Smith, of Butte, have taken an eighteen months' lease on the Silver Bell mine, near Virginia City, from the Elling estate. The mine has been worked to water level. The lessees will erect a steam hoist of 25 or 30 H. P. and unwater the mine.

SILVER BOW COUNTY.

P. Mullins and associates have bonded several pieces of ground at Butte and have started the work of exploration on a shaft which they are now sinking on the Yankee Boy placer claim. The shaft is to be sunk 150 feet; and if the showing is good, another 100 will be added at once.

NEVADA.

ESMERALDA COUNTY.

The Lone Mountain strike, 60 miles west of Tonopah, is holding up with the first reports. Free gold can be seen in much of the ore now. Plenty of wood is close to the camp, and water, it is believed, can be developed. C. D. Van Duzer of Tonopah has an option on the main group of claims. The camp has been named Weepah.

HUMBOLDT COUNTY.

The Sheha G. & S. M. Co., in its No. 2 tunnel at Mill City, is reported to have struck ore going $6 a pound. C. W. Greene is Supt. Manager W. H. Child, at Salt Lake City, Utah, says ore of fine shipping quality is developed in three places.

LINCOLN COUNTY.

The New Era M. Co. at Searchlight is installing a new hoist and will erect a roller mill. H. A. Perkins is manager.

The Quartette mill at the river has been started up and is working on ores from the Dunn group at Searchlight. The Quartette expects to average about $40,000 a month output in gold bullion.

The Searchlight M. Co. of Searchlight, F. P. Swindler manager, is putting in a 10-stamp quartz mill.

LYON COUNTY.

On the Nevada Chief mine, near Rockland, Vaillencour & Collier have finished a contract on running a 50-foot drift. The last 20 feet passed through a ledge of high-grade ore averaging 2 feet in width, which is claimed to go about $200 per ton.

The Nevada Reduction Works, near Dayton, is to put in a water wheel below the Rock Point dam to provide power for pumping, etc., at the cyanide plant, in order to do away with the more expensive steam power.

NYE COUNTY.

A new discovery has been made by W. McWilson, 10 miles east of Tonopah, that shows a well-defined ledge of quartz that runs well in both gold and silver.

The Tonopah Co. at Philadelphia, Pa., has elected A. Brock president, C. R. Miller vice-president, C. Highee secretary and treasurer, and C. A. Daniel, W. J. Mendenhall, R. H. Rushton, J. F. Anderson directors.

WASHOE COUNTY.

J. Sheehan, it is reported, has made a rich strike on the Crown Point mine at Olinghouse. The ledge, broken into at three points, assays from $300 to $500 per ton.

NEW MEXICO.

GRANT COUNTY.

It is announced that operations will be resumed on the Wild Cat group of the Clifton Copper Co., near Santa Rita, in the near future.

L. Deming, manager of the Allesandro M. Co., operating on the Gettyshurg group at Burros, has the main shaft down 110 feet and a good body of sulphide ore exposed. The sinking of a well will be made to get a supply of water for a 50-ton leaching plant, which it is the intention of the company to erect. A contract has also been let to G. D. Reid to run a 1000-foot tunnel.

The new concentrator owned by the Lena M. Co., at Lordsburg, has shipped three carloads of concentrates which netted $500.

A new vein of ore has been discovered in the Carbonate mine, near Lordshurg, 10 feet in width and assaying $20 per ton.

The Last Chance M. Co. has bought ground in Lordshurg for the erection of a 50-ton concentrator.

SIERRA COUNTY.

The New Era group, near Chloride, has been sold to a Boston company by C. T. Brown of Socorro. Development and prospect work has produced two cars of high-grade ore and several hundred tons of good milling ore that will he worked on the ground. A douhle-compartment shaft has been started and a pumping and hoisting plant is now being put in place. A 10-stamp mill is under consideration to he put in. J. L. Terry is Supt.

OREGON.

BAKER COUNTY.

The shoot of ore recently encountered in the North Pole mine, near Sumpter, is 65 feet long and from 3 to 7 inches in width. The ore, it is stated, runs from $2 to $10 per pound. The ore was a black sulphide similar in character to the rich ore found in the Columhia and Golconda mines, which are located on the same vein, known as the mother lode of the slate helt.

At the Black Hawk mine, owned hy F. W. Wheeler and others of Detroit, Mich., at Robinsonville, an average output of $100 a day is being made with a small mill.

A strike is reported of rich ore hy M. Dourty in the Yellow Daisy group. An arrastra to be run hy water power is heing erected.

A strike has heen made of 7 inches of what appears to he almost pure cohalt in the Standard mine, owned hy Z Houser & Co. of Portland, near Quartzhurg. It is reported that the ore in the streak assays $243 gold. Cohalt values are reported to have steadily increased with depth, together with gold. The ledge has a surface width of 30 to 50 feet.

JACKSON COUNTY.

The mill on the Lucky Bart group at Gold Hill is running on ore from the Doubtful claim, on which a 30-inch vein of high-grade free milling ore assaying $45 per ton was recently struck.——The Gold Hill M., Power & Dev. Co., in their Bowden mine, in Blackwell district, is down 135 feet in 3 feet of free milling ore carrying an ounce of gold per ton. It is the intention to sink to 750 feet.

The Gold Hill Quartz M. Co., C. R. Ray, Supt., operating the Braden mine near Gold Hill, will install a new mill for the present ten stamps.

JOSEPHINE COUNTY.

The old Channel mines of Galice operate two giants and a ground flow that is used in washing out Rich Gulch canyon just helow the diggings where operations are being carried on. In this canyon there was an accumulation of wash gravel and tailings to a depth of 35 feet or more which had been dammed up. Manager Harvey put in sluices below the gravel and has washed the whole canyon down to the hedrock, making a rich cleanup from this gravel. The two giants are working upon a hank over 200 feet in height, which pays evenly and well from the grass roots to the hedrock. The red clay capping on top contains flour gold and this is saved by a system of undercurrents.

W. Bohle has sold his placer mine, situated in Grave Creek district, near Grants Pass, to Mr. Wilson of The Dalles for $2000. —— A tunnel is being run on the Orme quartz mine in Foots Creek district. —— A half interest in the Yokum & Madden quartz mine in Grave Creek district has been bought hy J. E. Auten, and considerable work is heing done on it. —— W. E. Finney has honded his quartz mine in Steamboat district to H. Kling for the Seattle Co-operative M. Co., who will run a tunnel. ——Work has been hegun on the dam of the Golden Drift M. Co. in Rogue river to furnish water and power for operating the company's placer mines. —— The company which has bonded the Eureka mine in Soldier Creek district is putting in two carloads of machinery. G. J. Coles is president of the company. —— In the Gopher mine in Jump Off Joe district, under T. Lacy, Supt., considerable development work has been done and a hody of fine ore exposed. There is a small mill at the mine.——Capt. Leavenworth and associates of Olympia, Wash., are erecting a 30-ton mill and concentrator on their Mayhelle group, a low-grade base ore property.

A smelter and complete plant for treating copper ore is heing installed on the Sewell copper mines at Waldo, owned hy the Mountain Copper Co. They have heen opened up to a good depth, exposing a body of high-grade copper ore.

Preparations for building the Oregon & Pacific Railroad out of Waldo are resulting in all availahle copper claims being taken up and old ones more thoroughly worked.

The holler and other machinery for the Eureka mine on Soldier creek, near Grants Pass, has been taken into the mine.

In the Ajax mine at Leland the company has struck rich rock in its new tunnel.

LANE COUNTY.

A snowslide in the Blue River mining district struck over the mouth of the longest tunnel of the Treasure mine, and the blacksmith shop, engine house, machine shops and hunk houses were carried to the bottom of the canyon. The mouth of the tunnel is filled with 60 feet of dirt and debris. The snowslide occurred when the twenty or thirty men employed were away from work.

UNION COUNTY.

The Fargo M. Co. is reported to have made a rich strike on the Last Chance claim, near Imnaha, of a ledge of copper sulphites and bornite, which has heen exposed 100 feet in the tunnel. Crosscuts show from 12 to 14 feet of ore, assaying an average of 35% copper.

SOUTH DAKOTA.

LAWRENCE COUNTY.

On the 350-foot level of the Glover G. M. Co.'s property at Lead a hody of free milling gold ore in a large vertical quartz vein has been struck. G. W. Glover is president and manager. The shaft is equipped with a whim hoisting plant, hut it is the intention of the company to install a steam hoist without delay.

The Horseshoe M. Co. has decided on plans for the cyanide mill it is projecting at Pluma. The mill will he wet crushing, with stamps, constructed on the terrace or gravity plan. The hattery will be 300 1100-pound stamps, arranged in two rows of thirty double-discharge mortars in each row. Two No. 7½ Gates rock crushers will he located on a hedrock floor above the stamp hatteries. The hatteries will occupy a frontage space on the hill of 216 feet. The iron structure that will enclose them will he somewhat longer. The boilers and engines of 800 H. P. will he located in a separate huilding, adjoining. The tank room will he situated on a level plat at the hase of the hill, below the crushing machinery. This building will he 525x125 feet and will contain six leaching tanks, 6 feet deep hy 50 feet diameter, having a capacity of 500 tons each, and six slime tanks, 20 feet deep by 50 feet diameter, with a capacity of 1833 tons each; also three solution tanks, 8x50 feet. The whole works, from base to apex, will have an elevation of over 200 feet. The Horseshoe ore will requlre pulverization through 10 to 16-mesh screens. The plant will have a crushing capacity of 1200 tons per day, and a leaching tank capacity of 1700 tons.

UTAH.

BEAVER COUNTY.

A. B. Lewis is completing the buying of the Comet mine at Millford and is organizing the Columbia Company to develop it.

IRON COUNTY.

The Johnny mine at Stateline, W. J. Dooley, manager, is to have a mill, the construction to cost approximately $30,000.

JUAB COUNTY.

Capt. Bridges, manager of the St. Louis-Eureka property at Tintic, states that the directors have authorized the installation of hand-power drills in the mine.

KANE COUNTY.

The Copper Cliff M. & M. Co., of Springville, has heen incorporated, capital $20,000, with W. A. Warthen, president, and H. L. Cummings, secretary and treasurer. The company owns the Copper Cliff, Kruger, Iron Duke and Jim Lew claims in the Pahroah district.

SALT LAKE COUNTY.

The Utah Consolidated Gold Mines Co., Ltd., annual report for 1901 shows a balance to profit and loss after payment of $800,000 dividends, of $649,468, against $882,779 on the same date in 1900. Sales were: Gold, 14,782 ounces, $295,645; silver, 240,880 ounces, $137,157; copper, 7,123,197 pounds, $1,163,900; total, $1,596,703. During the twelve months ending Dec. 31, 1901, the smelter treated 167,823 tons of sulphide ore, an average of 460 tons per day. When copper prices dropped approximately 1,500,000 pounds of refined copper were on hand and 2,500 000 pounds in transit and process of refining. The average price realized on sales since May, 1899, to the end of 1901, was 15 31 cents per pound. Manager Channing estimates that 95,000 tons of sulphide ore are in sight.

SUMMIT COUNTY.

The territory consisting of the properties of the old Crescent, Apex and Boss companies, at Park City, together with other locations, ahout sixty claims in all, have heen consolidated hy Thos. Kearns and D. Keith, who have organized the Kearns & Keith Co. to operate it. T. Kearns is president; D. Keith, vice-president, and J. F. Westcott, secretary and treasurer. The new company will operate its territory in part through the old Hanauer tunnel. In the near future a big electric plant is projected to operate drills, cars through the tunnels, machine shops, etc., as well as to light the works and mines.

Mrs. Pbœbe A. Hearst and J. B. Haggin have hegun suit to annul the conveyance of its property made by the Putnam M. Co. to the Quincy M Co. and the suhsequent conveyance of the Quincy M. Co. to the Daly West M. Co., and ask that they he awarded about 7% of all the moneys earned by the Quincy M. Co., including $1,200,000 which, it is recited, has been paid in dividends, and of $200,000 that remained in the treasury when the transfer to the Daly West was made; and that a decree be entered in their favor for $\frac{6586}{100000}$ part of the stock received or to he received hy the Quincy M. Co., together with interest, less $3194.22 that has heen received.

WASHINGTON.

SNOHOMISH COUNTY.

The 100-ton concentrator at the Ethel mine, near Index, has heen started up. The concentrates resulting from the operation of the plant thus far are said to be very high grade. The first check assay off the sliming tahles went $211; while from the finer jigs the results were $162. The ore concentrates ahout 10 to 1, giving a product of some 60% copper, 200 ounces in silver and from $12 to $15 in gold. At the mine stoping ground is hlocked out to keep the mill running for some time, while several thousand tons of ore are already mined. The mine is equipped with air compressor, power drilis, electric lights, tracks, ore cars. There are upwards of 3000 feet of levels and upraises, a large part in ore. G. A. Pounder of Seattle is manager.

FOREIGN.

BRITISH COLUMBIA.

The Mining Exchange, Ltd., of Nelson, says: The installation of the 297 H. P. electrical plant at the Hall mines smelter at Nelson has been completed and it is now in operation. Besides the installation of this plant many improvements have been made in the building and machinery. The installing a power plant at the Camborne group on Fish river, Lardeau, owned by the Northwestern Dev. Syn. of Nelson, is nearly completed and the plant will he in operation by June. It will operate electric drills. The Slate Creek Hydraulic Co. of Seattle, Wash., has bought 320 acres of placer ground on Slate creek, in Similkameen, which they will work for platinum and gold. Operations will hegin at once. Three veins of bituminous coal, aggregating 29½ feet in thickness, have heen cut by the diamond drill on the Vermillion Forks M. and Dev. Co. mine at Princeton. The first at a depth of 35 feet is 4½ feet thick; the second 6½ feet in

thickness at 40 feet, and the third 18½ feet thick at 27½ feet. A group of claims on Crawford bay, near Ainsworth, the ore of which is said to carry gold, silver, nickel and copper values, has been bonded to an English company represented by A. W. Heyland, at $25,000 for two years. A 60-drill compressor will be installed by the Granby Con. M., S. & P. Co.. to be operated by electricity. The ore shoot on the Fisher Maiden group, near Slocan, has been drifted on for 40 feet. The pay streak is 27 inches wide and averages 150 ounces silver to the ton. Four carloads of ore have been taken out in development. McCuaig, Rykert & Co. of Montreal, Canada, have bought the Noonday mine, near Slocan, which, it is said, will be operated in connection with their Galena Farm property. A concentrator is to be erected.

S. Norman, ropresenting the Ohio & Northwest Dev. Co., has bonded the Black Prince group of five claims on Lemon creek at $85,000 for two years.

Nelson, May 5.

The Vancouver, Pearl and Pothole claims near Similkameen have been bought by W. T. Shatford of Slocan City for $15,000 from Murphy, Angsteadt & Allen. The Pothole, located on a strong, iron-capped dike, carries values in gold and silver, the copper values increasing as depth is attained. On the Pearl a tunnel has been driven 60 feet.

The North Star M. Co. at Kimberly has resumed operations, putting on forty men. A 4-foot ledge of solid galena has been struck just below the 60-foot level, and a very rich lead with the diamond drill. A contract has been let for a 600-foot tunnel into this last strike.

E. G. Boynton and A. S. Trow of Merrillan, Wis., for the Perry Creek M. Co., have bought creek and bench diggings on Perry creek, near Fort Steele, about 2 miles long by half a mile wide. The ground was worked over in the early days and a large amount of gold reported taken out by panning and rocking surface ground. The company is proceeding at once to install a large plant. The intention is to sink to bedrock and drift, using hydraulic elevators to hoist the pay dirt to the surface.

At the Mother Lode mine at Greenwood the company has installed a large crusher plant, making possible the increasing of output of ore and at the same time lessening the number of men required to get it out. The working force has been reduced by about fifty men.

YUKON TERRITORY.

The accounts of the Klondike Consuls Co, operating in the Klondike, as reported at the 1902 meeting of the company in London, show that the total output of gold amounted to £88,197, while the Klondike expenses, including government royalty of £4289, were £49,915. London and other expenses amounted to £3842, thus making the net profit £34,440, which, with the balance brought forward, was increased to £48,207. The dividend of 15% absorbed £37,500, leaving £10,707 to be carried forward.

Personal.

S. O. TRESCOTT of Denver, Colo., is in Prescott, Ariz.

W. W. WISHON has returned from Pony to Butte, Mont.

C. E. FORCE, manager Bobtail M. Co., Ray, Ariz, is in New York.

C. L. MAGNUM is Supt. Granite Hill mines, near Grants Pass, Or.

C. C. BITNER is Supt. Cal. G. & C. Co.'s copper mine, Spenceville, Cal.

F. P. SWINDLER is manager Searchlight M. Co., Searchlight, Nev.

F. H. PROBERT of Los Angeles, Cal., was in Clifton, Ariz., last week.

W. A. DOBLE has returned from Denver, Colo., to San Francisco, Cal.

W. G. MOTLEY is now operating the Buckeye mine, Nevada City, Cal.

J. B. BALCOMB, Supt. Heald's School of Mines, is in Shasta county, Cal.

C. R. RAY, manager Gold Hill Q. M. Co., Gold Hill, Or., is in San Francisco.

R. TEWKESBURY has been appointed foreman Transatlantic mine, Silverton, Colo.

J. W. BENSON, manager Camp Bird mine, at Ouray, Colo., is in Washington, D. C.

J. H. STRITE is Supt. construction for the Tomboy Mines Co., Ltd., Smuggler, Colo.

B. B. THAYER, Supt. of the Santa Rita M. Co., at Santa Rita, N. M., is in New York.

A. E. RITER has been appointed Supt. Little Joe mine, at Hope, Kootenai county, Idaho.

H. LEE HUSTON is now Supt. Emma G. M. Co. of Boston, Mass, at Mokelumne Hill, Cal.

FRANK LLOYD has been appointed assistant manager Arizona G. & C. Co, Patagonia, Ariz.

J. A. HALL, manager Caldwell mine, at Granite Basin, Plumas county, Cal., is in San Francisco.

ALEX. VEITCH succeeds James Colquhoun as general manager Arizona Copper Co., Clifton, Ariz.

RICHARD A. PARKER of Boston, Mass., consulting engineer U. S. M. Co., is sojourning at Las Vegas, N. M.

H. BLACKWELL, formerly of Marquette, Mich., has been appointed manager Anderson Lake, B. C., gold mine.

W. WESTERVELT, of New York, consulting engineer for the Ray Copper Co., at Ray, Ariz., is at that place.

S. W. MUDD, of Leadville, Colo, is engaged in an examination of some of the large Cripple Creek, Colo., mines.

O. TOWNSEND has been appointed general manager Baby McKee and Last Chance Mining Companies, Sumpter, Or.

J. A. FLEMING, manager of the Black Warrior Copper Co., Amal., has returned to Black Warrior, Ariz., from San Francisco.

T. W. FORRESTER of Cedar, Utah, has gone to Cerro del Pasco, Peru, as one of the staff of the Cerro del Pasco copper mines.

H. W. FAIRBANKS, geologist, of Berkeley, Cal., is at Las Cruces, N. M., where he will study the geology of the Rio Grande valley.

C. A. SANDIFORD, E. M., has been appointed Supt. of the Anglo-Slocan Syndicate, Ltd., for the Wakefield mine near Silverton, B. C.

JAMES COLQUOHOUN, manager Arizona Copper Co. for eighteen years at Clifton, Ariz., has resigned and gone to Edinburgh, Scotland, to reside.

AT Santa Fe, N. M., the New Mexico School of Mines has selected Charles R. Keyes of Des Moines, Iowa, as president of the institution, to succeed F. A. Jones.

JOHN PLAYER, Supt. of machinery and motive power of the Atchison, Topeka & Santa Fe since June, 1890, will resign June 1. The office will be discontinued.

H. W. TURNER, late of the U. S. Geological Survey, has returned to San Francisco, Cal., from an absence of six months in Oregon examining quicksilver deposits.

W. P. HEADDEN of Cripple Creek, Colo., has been appointed manager for the Gowers Mines Syndicate, operating the Running Lode mine, near Black Hawk, Colo.

FREDERIC IRWIN has resigned as Supt. of the War Eagle Tunnel, at Silver City, Idaho, to accept the position of manager of the Dewey mine, at Thunder Mountain, Idaho.

R. HARROP of England, formerly of the Esperanza mine, near Placerville, Cal., is now at that place engaged in a mine examination in the interest of British investors.

P. NICHOLAS has resigned as manager Longfellow mines of the Arizona Copper Co., Clifton, Ariz., but continues his connection with the company as consulting engineer.

Catalogues Received.

The Brunton patent pocket transit is the subject of the latest catalogue issued by Wm. Ainsworth & Sons, 2151 Lawrence St., Denver Colo., illustrating and describing the uses of that valuable instrument, of which the manufacturers say there are now over 1000 in use. The catalogue contains thirteen fine engravings and gives detailed description of the instrument. A copy will be sent anywhere on request.

The California Electrical Works of 547 Mission street, San Francisco, Cal., has issued a folder descriptive of the several types of Emerson fans operated by alternating current electric motors. These fans are designed to ventilate and cool heated apartments, and operate with an exceedingly small consumption of power. At the beginning of the hot season the catalogue offers timely and interesting information.

A. Leschen & Sons Rope Co., 920-922 N. First St., St. Louis, Mo., send their catalogue, No. 23, which, in its eighty pages, beside detailing the merits of their manufacture, gives a great deal of valuable technical information regarding transmission, hoisting and hauling ropes, steel cables and appliances, including packing, oakum, snatch and tackle blocks, sheaves, chains, clips, turnbuckles, wire rope preservers, etc. An illustrated chapter on wire rope splicing and a description of the Leschen Co.'s patent automatic wire rope tramway is of noticeable value. Percy R. Stuart, 85 Fremont St., is the San Francisco agent. A request addressed thereto, or to 92 Center St, New York, 137 East Lake St., Chicago, or 920 N. First St., St. Louis, Mo., will bring a copy of the treatise to any one.

Commercial Paragraphs.

E. J. KENDALL, manager Three Stars mine, Placer county, Cal, has a pneumatic hammer, from Eccles & Smith, 91 Fremont street, San Francisco, which is a money saver.

THE statement in the issue of the 3rd inst., that the Standard Diamond Drill Co. of Chicago "continues the manufacture of the Bullock diamond drills," was a little misleading. It is not the intention of the company to continue to manufacture the "Bullock" drills, but they manufacture a distinct type of drills which they say "contain all the excellencies of the old Bullock drills."

THE W. J. CLARK CO. of Salem, Ohio, who make the "Lane patent" joist and timber hangers, are issuing a new illustrated price list of hangers, in which is given not only the width and thickness of steel plate of which each of the many sizes of hangers are made, but also a table showing the load which each respective size of hanger sustains without showing any sign of bending or yielding in any way. Norway pine timber was used in the tests, and it was found that the timber would mash before the hangers would bend or move. No hanger showed any sign of breaking in any of the tests, though they wore loaded to all that the timber would bear. For example, a hanger for a 10x14 timber was loaded to fifty tons when the timber began to crush and the banger to straighten. Anyone contemplating the use of hangers should send for the new hanger list which has the table of strength of each size of hangers.

METALS.

SILVER.—Per oz., Troy: London, 23⅝d (standard ounce, 925 fine); New York, bar silver. 51½c, refined (1000 fine); San Francisco, 51½c; Mexican dollars, 44½c San Francisco, 41½c New York.

COPPER. — New York: Standard, $11.65@12 00; Lake, 1 to 3 casks, $12.25; carload lots, $12.00; Electrolytic, 1 to 3 casks, $12.00; carload lots, $11.75; Casting, 1 to 3 casks, $12.50; carload lots, $11.50. San Francisco: $14.00. Mill copper plates, $17.00; bars, 18@24c. London: £54 5s per ton.

LEAD.—New York, $4.12½; Salt Lake City, $3.60; St. Louis, $4.00; San Francisco $4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, $4.75. London, £11 12s 6d per ton.

SPELTER. — New York, $4.45; St. Louis, $4.00; London, £18 10s per ton; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN. — New York, pig, $29.00: San Francisco, ton lots, 31½c; 1000 lbs., 31⅝c; 500 lbs., 31¾c; 200 lbs., 32½c; less, 31c; bar tin, ℔ lb, 37½c.

PLATINUM.—San Francisco, crude, $17 ℔ oz.; New York, $18 per Troy oz

QUICKSILVER. — New York, $50.00 large lots; London, £8 15s; San Francisco. local, $47.50 ℔ flask of 76½ lbs.; Denver, $51.00. Export, $45.00.

BABBITT METAL.— San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER. — Half-and-half, 100-lb. lots 20c; San Francisco, Plumbers', 100-lb. lots, 17½c.

NICKEL.—New York, 50@60c ℔ lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $18 00; gray forge, $18.50; San Francisco, bar, 2.75 ℔ lb .,3c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $32 00; open hearth billets, $32.50; San Francisco, bar, 7c to 12c per lb.

CEMENT.—Germania, $2.65; K. B. & S., $2.65; Hewmoor, $2.50; Trowell, $2.50 per bbl.

LIME.—Santa Cruz, $1.60; Roche Harbor, $1.60 per bbl.

LUMBER.—(Retail): Pine, ordinary sizes, $18.00@19 50; extra sizes higher; redwood, $19.00@20.00; lath, 4 feet, $3.90 @4.00; pickets, $19.00; shingles, $2.00 for No. 1 and $1.75 for No. 2; shakes, $13.00 for split and $14.00 for sawed; rustic, $25.00 @31.00.

GENERAL SUPPLIES.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.50; Cut, $3.50; 10d to 16d, Wire, $3.55; Cut, $3.55; 8d, Wire, $3.60; Cut, $3.60; 6d and 7d, Wire, $3.70; Cut, $3.70; 4d and 5d, Wire, $3.80; Cut, $3.80; 3d, Wire, $3.95; Cut, $3.95; 2d. Wire, $4.20; Cut, $4.20. Special rates for carload lots.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one toss 15½c. No. 1** 50%, carload lots, 11½c; led, than one ton, 13½c. No. 2, 40%, carloan lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ℔ set; 14 oz., 40s., 9c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $6.50; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $9.56, long ton; Colorado Anthracite, $14.00. Coke, $15 per ton in bulk, $17 in sacks; Sunnyside, $11.75, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 29@30c ℔ lb.; carloads, 27@28c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c ℔ lb.; soda ash, $1.90 ℔ 100 lbs.; hyposulphite of soda, 2½@3c ℔ lb.; blue vitriol, 5½@6½c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 5c; alum, $1.90@2.00; flour sulphur, French, 2½@2½c; California refined, 1½@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.25 @1.50 ℔ 100 lbs.; sks, $1.05; chloride of lime, spot, $2.50@2.60; nitrate of potash, in bbls, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, boiled, bbl., 76c; cs., 81c; raw, bbl., 74c; cs., 79c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 66c; cs, 71c; raw, bbl., 64c; cs, 69c. Kerosene —Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bbls, 19c; wooden bbls., 22½c; cs, 25c; Mineral Sperm, cs, 26½c; Deodorized Stove Gasoline, bulk, 15½c; do., cs., 21½c; 86° Gasoline, bulk, 20c; do., cs., 26½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14c; do., in cs., 20½c; Lard Oil, No. 1 bbl., 60c; cs., 65c; Neatsfoot Oil, bbl., 70c; cs., 72½c; No. 1 bbl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6¼c; 1 ton and less than 5 tons, per lb., 7c; 500 lbs. and less than 1 ton, per lb, 7¼c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6¾c; do. in kegs, 7¼c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb, 7c; 500 lbs. and less than 1 ton, per lb., 7¼c; less than 500 lbs., 7½c.

ASSAY LITHARGE.—Per lb., 9c.

BISMUTH.—Subnitrate, per lb., $1.60.

BONE ASH.—3c ℔ lb.

BORAX.—Crystal, 7c: calcined, 20c.

CHROMIUM.—(90% and over) per lb., $1.25.

COPPER.—Carbonate, 20c; Red oxide, ℔ lb., 60c.

MAGNESIUM.—Per lb., $3.00.

MANGANESE.—(90% and over) ℔ lb., $1.25.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—25c. ℔ gramme; 1000 grammes=2¼ lbs.

PHOSPHORUS. — (American) ℔ lb., 80c.

SILVER.—Chloride, ℔ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ℔ lb., $1.00

URANIUM.—Oxide, ℔ lb., $3.50.

ZINC.—Metallic, chemically pure, ℔ lb., 50c.

ZINC.—Dust, ℔ lb., 10c.

ZINC.—Sulphate, ℔ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING MAY 6, 1902.

699,450.—CORRECTINO COMPASS ERRORS—J. Christensen, S. F.

699,451.—STEERINO MECHANISM—J. Christensen, S. F.

699,454.—CULTIVATOR—F. D. Cook, Terminus, Cal.

699,497.—WASTE PIPE CONNECTION—A. Dellsmore, Los Angeles, Cal.

699,374.—LADDER—Edmison & Myers, Spokane, Wash.

699,380.—OIL BURNER—R. H. Fullaway, Los Angeles, Cal.

699,513.—APRON—W. Garms, Los Angeles, Cal.

699,519.—BOOT HEEL—M. L. Hansen, Oakland, Cal.

699,468.—SIDEWALK TRAP DOOR—P. H. Jackson, S. F.

699,395.—PROTECTING DYKES—W. S. Keyes, S. F.

699,226.—FRUIT COVER—E. Nyswonger, Hanford, Cal.

699,635.—CREMATORY—R. Robinson, Portland, Or.

699,417.—SHIPPING PACKAGE—G. F. Samberg, S. F.

699 418.—EGO SAFE—R. B. Sears, Secramento, Cal.

699,583.—MOTOR VEHICLES—H. H. Sherk, Pasadena, Cal.

699,386.—FUSE CAP—C. E. Stevens, Lovelocks, Nev.

699,351.—WATER MOTOR—G. E. Thurston, Colby, Wash.

699,431.—MAIL POUCH—H. D. Weller, San Jose, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CONCENTRATOR. — No. 698,737. April 29, 1902. M. D. Rcobford, Kingmsn, Arlz. This devlce is designed for the seperatlon of veluable heavy and preclous metals and sulphurets from sand and tailings. It consists of a table having along one side a concentrate trough and superposed water supply pipe, and on another portion a line of riffles extending transversely and tapering in the direction of their length to form central portions of greater thickness than the ends so that the material at the ends of the riffles is agitated with greater effect than that of the thickened center, and a deflecting surface extending in line with the trough and below the water supply pipe and rising from the table in a series of independent and gradual curves.

DOUGH MANIPULATING AND LOAF FORMINO MACHINE.—No. 698,814. April 29, 1002. E. C. Chase and I. E. Rickey, San Francisco, Cal. This apparatus is designed to manipulate dough and to fold it into the form of loaves and deliver it in readineee for the oven. It comprises rollers, endless traveling belts, with reciprocating cutting and stamping devices whereby the dough is rolled into sheets of even thickness, the edges folded over to counteract the transverse stretch, and the sheet folded lengthwise by successive operations and cut into proper lengths, then pressed into required form for loaves. The loaves are then delivered upon carriers with folds of cloth in between them to prevent contact.

EXTRACTION OF METALS FROM ORE AND THE LIKE.—No. 699,108. April 29, 1902. B. Hunt, San Francisco, Cal. This invention has for its object the treatment of ores containing gold, silver, copper, zinc, nickel, etc., in a single operation. It is especially applicable to such ores when containing a relatively small amount of copper, zinc or base metals which prevents their successful treatment by the ordinary cyanide process. The invention and process consist in leaching the ores or tailings with a solution containing a quantity of free ammonia and a quantity of cyanide.

SIDEWALK TRAP DOORS.—No. 699,468. May 6, 1902. P. H. Jackson, San Francisco, Cal. The object of this invention is to provide improvements in that class of sidewalk trap doors having stairs which lead from the sidewalk into the basement, which stairs are normally covered with hinged closable doors. It consists of a means for supporting the rear ends of the doors by a bar carried and movable with one of the doors, the supports for the ends of the bar when the doors are closed, a support for the meeting edges, means for preventing the entrance of water into the stairway through the joints between and around the doors, and means for conducting away the water which enters through such joints.

CULTIVATOR ATTACHMENT.—No. 699,454. May 6, 1902. F. D. Cook, Terminus, Cal. This improvement relates to cultivators and weeders such as are employed for cultivating the ground where corn, beets and like crops are planted in rows. It consists of a main plow frame, a supplemental lateral frame pivoted thereto carrying plows or shovels which are adjustable upon a frame, a segmentally flanged plate on the main frame which flange is concentric with the pivot of the clevis and means for uniting the clevis and flange so that the clevis may stand at any desired angle with relation to the axis of the cultivator, and a colter carried by the clevis.

METHOD OF PROTECTINO DIKES. — No. 699,395. May 6, 1902. W. S. Keyes, San Francisco, Cal. The object of this invention is to protect dikes, levees and like earth structures from the destructive burrowing influences of gophers, squirrels, etc., and at the same time to resist the action of the waves. It consists in coating the surfaces of said structures with crude petroleum or other hydrocarbon products to form a cruet or surface impermeable to the water and distasteful to the rodente.

EGO PRESERVINO SAFE. — No. 699,418. May 6, 1902. R. B. Sears, of Sacramento, Cal. Assigned to H. C. Muddox, of same place. In this invention an apparatus is provided to prevent the yolks of eggs from settling to one side where the eggs are stored in large quantities. It consists of a box having individual compartments for the eggs in which they are kept separate, and this box is so mounted that it can be revolved at intervals to present all sides of the eggs upward and prevent such settling; means are also provided for the introduction and circulation of cold air so as to reduce the temperature and maintain it at a low degree.

HYDRAULIC STEERING MECHANISM.—No. 699,451. May 6, 1902. J. Christensen, San Francisco, Cal. This invention is designed to relieve the steering gear of a ship of the sudden strains and shocks to which it is subjected by the action of the waves upon the rudder, and to provide an automatically operating brake whereby the movement of the rudder is limited independently of the steersman. It consists of oscillating cylinders having their piston rods operatively connected with the rudder stock, and communications between said cylinders and a source of supply. A slide valve admits the fluid employed to the cylinders and is controlled by a rod attached to the valve. A short lever to which the other end of the rod is pivoted is connected with a resiliently supported and slidable block, a tiller wheel is fixed upon the shaft and connections are made between the lever and the wheel whereby the lever may be actuated to operate the valve by the movement of the wheel. A tripping device is operated by the movement of the rudder and adapted to engage the block when the rudder is swung a certain distance in either direction and this moves the valve independently of the operation of the tiller and automatically checks the flow of the fluid to the cylinders.

DEVICE FOR CORRECTING COMPASS ERRORS.—No. 699,450. May 6, 1902. J. Christensen, San Francisco, Cal. This invention is designed to correct compass errors of any description which may arise either from the character of the cargo, or from exterior sources. It consists of a ring having points of compass and degrees marked upon it, and an exterior support in which the ring is turnable, this support being suspended and counterweighted so that it retains its horizontal position at all times. Within the compass ring another ring is fitted and turnable independently thereof, and within this ring is a peculiarly subdivided clock face pivoted and turnable to give it any angle of inclination relative to the horizon, and a graduated arc shows the angle of elevation. Across the axis of the top face an arm or needle extends which is turnable about its axis in a plane parallel to the clock face. This forms an indicator with relation to the subdivisions of the clock face and a perpendicular shadow pin is provided with a plate upon which the shadow of the pin is cast. The compass error is marked by a pointer movable with the clock face and over the compass marked ring.

MAIL POUCH ADDRESS AND FASTENING ATTACHMENT.—No. 699,431. May 6, 1902. H. D. Weller, San Jose, Cal. Three-fourths assigned to W. G. Hawley and H. P. Laronette, of same place. In this invention the mail pouch has a lock permanently secured to the flap having an end opening, and a strap has one end secured to the flap. A channeled plate is secured to the free end of the flap having a bolt projecting to its front end, the under side of said bolt forming the top wall of said channel whereby the address card or label is inserted from beneath the bolt and its end protected by the overhanging bolt. The end of the card or label is in line with the solid wall of the lock below the opening.

SITUATIONS WANTED.

CHEMIST AND ASSAYER, WITH TWENTY years' experience in mill and smelter work. Can run same. Address A. C., care of Mining and Scientific Press.

THUNDER MOUNTAIN.—A successful superintendent of over 15 years' experience and acquainted with this district, desires to take charge of property there for a good company. Address T. M., care of Mining and Scientific Press.

OPEN FOR A PROPOSITION TO PROSPECT, east, west, north or south. Thoroughly understands mining, also mining laws. Have a good prospecting outfit. Address R. H. J., care of Mining and Scientific Press.

WANTED.—Position as Foreman or Superintendent of quartz proposition or developed mine. Timbering and air machine drilling a specialty. Sixteen years' experience. No fake references furnished. Correspondence solicited. Present position not desirable. Address T. J. P., care of Mining and Scientific Press.

MINING ENGINEER, practical miner and mill man, assayer, etc., desires position of superintendent or assistant manager of a big property. Eleven years' experience. Best references. Now working in southern California. Address A. M. P., care of Mining and Scientific Press.

WANTED.—SITUATION AFTER MARCH 15, 1902, as Manager or Superintendent of mine. Have had five years' experience in manufacturing and constructing mining machinery and plants. Three years' experience in underground work. Four years' experience as manager and superintendent. Treatment of low grade ores a specialty. Practical in every detail. State location of mine and salary. Best of references. Address X. Y. Z., this office.

A technically educated Mining Engineer, at present employed as superintendent of mines for one of the largest corporations in Mexico, desires a change of position to the United States about July 1st. Has had 18 years' successful experience as engineer and superintendent, never having made a failure; 36 years of age; strictly temperate; a skilled designer, geologist and metallurgist, and a practical miner, as well as a hard worker and thorough business man. References of the highest order, including present employers. Address Supt., care this office.

EXAMINATION OR SUPERVISION of Mines, Smelters and Mills.

Mining Engineer and Metallurgist, of unquestionable reputation and long experience, now permanently residing at Seattle, Wash., will examine or take general supervision of mines, smelters or mills, in Pacific Coast States, British Columbia or Alaska, as consulting engineer, for reliable parties. Is also reliable accountant to examine. Box 813, Seattle.

Quicksilver

BY THE FLASK OR CARLOAD.
WEIGHT AND QUALITY GUARANTEED.
The Eureka Company,
OF SAN FRANCISCO.
320 SANSOME STREET, - SAN FRANCISCO.

Quicksilver

IN LOTS TO SUIT.
Write for Quotations.
REDINGTON & CO., 23-25-27 Second Street, SAN FRANCISCO, CAL.

WANTED.

Mine Blacksmith and Drill Sharpener to go to Hawaiian Islands—18 months. Unmarried man preferred; sober. Apply by letter, with testimonials, to D. Y. Z., this office.

Wanted to Bond a Dry Placer Claim, One Rich in Flour Gold.

Must be a dry proposition. Address "Placer Claim," care this office.

WANTED TO BUY:

Interest in or all of a going Sampling Works, Ore Business, or Smelting Works. Address with particulars, L. X. D., Mining and Scientific Press, 330 Market St., San Francisco, Cal.

Mine foreman, having practical experience with Arizona copper deposit, understanding the handling of men in a large property, sober and industrious. Best of references required. Wages $6.00 per day. Apply in writing. Address "Copper Sulphide," care Mining and Scientific Press.

WANTED, for a developed mine in California, a competent mining engineer to look after development and exploration. Must be a full graduate of a recognized mining college and have had several years' practical experience in large iron, coal or copper mines, and be fully skilled in the engineering problems pertaining to extraction, haulage, ventilation, etc. Give full particulars of career, experience, age, etc., to "Vulcan," care of this paper.

A practical smelterman and metallurgist wanted, competent to handle a 250-ton matting plant, sulphide ore, in Arizona. Good opening for right party. State fully past experience and references.
Address "Matting," care of Mining and Scientific Press.

WANTED.

Consulting Mining Engineer,

familiar with making examinations of mines, prospects and mineral lands. Address stating experience and references. Moderate salary to start, with advancement to competent man. Position permanent if found satisfactory. Address A., care of Mining and Scientific Press.

STAMP MILL WANTED,

either ten or twenty stamps, second hand, as near Amador County, California, as possible. Must be in good condition, and low as to price—advertiser has himself built mills and then tried to sell, so don't quote fancy figures. Water-power mill preferred; steam no objection, however. Give full details, price, location, condition. Concentrators acceptable if with plant. Will also buy small boiler and any good second hand mine equipment. Address E. N. DARLING, 9 Pine St., New York.

WANT TO INTEREST PARTIES

in group of mines (70 acres) working under bond and lease, profitably shipping 160 tons per month of lead ores. Have developed large reserves of excellent carbonate and sulphide ores of the best of concentrating material. Mill and lead smelter near mine. Will stand a rigid examination.

Address DAN C. TOBIN,
White Pine, Gunnison Co., Colo

Wanted, Capital

to develop a group of mining claims recently discovered in northern California. Six lode locations from 10 to 30 feet in width, carrying gold, silver and copper.
For further particulars, apply to

AUGUST QUITZOW,
CRESCENT CITY, CAL.

HENRY CAREY BAIRD & CO.,
INDUSTRIAL PUBLISHERS, BOOKSELLERS & IMPORTERS,
810 Walnut St., Philadelphia, Pa., U. S. A.

Our New and Revised Catalogue of Practical and Scientific Books, 92 pages, 8vo.; a Catalogue of Books on Metallurgy, Mining, Prospecting, Mineralogy, Geology, Assaying, Analysis, etc.; a Catalogue of Books on Steam and the Steam Engine, Machinery, etc.; a Catalogue of Books on Sanitary Science, Gas Fitting, Plumbing, etc., and our other Catalogues and Circulars, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

FOR SALE.

Gold Mining Properties For Sale.

Two First-Class Placer Mines,

one having 20 years' record as a producer. Both in good working condition. Terms reasonable.
Address "Enquire," care this office.

The Mines Exchange, Ltd.

Mines and prospects in British Columbia, the Western States, and Mexico, for sale.
Free milling gold properties a specialty.
Write us for reports and information.
Bank references given.
Address THE MINES EXCHANGE, LTD.,
P. O. Box 700, Nelson, B. C.
Branch Office: P. O. Box 594, Salmon City, Idaho.

$158\frac{42}{100}$ Acres of Dredging Property for Sale.

Best location for dredger. Two power lines within ¾ mile. Blueprints furnished to reliable parties, so no agents need apply. Nearest working dredge 1 mile. One building within ¾ mile.
For particulars, address J. H. G. H., Chardon, Butte Co., Cal.

FOR SALE.

Three patented and joining placer claims with seven (7000) thousand tons or more of tailings, having an average assay value of five ($5.00) dollars per ton in gold.
Price, five thousand ($5,000.00) dollars.
For particulars, address

JOHN P. SCHMIT,
Helena, Montana.

FOR SALE.

ONE HEINE BOILER.

Five miles from R. R.; built 1896; used only four months, with wood fire; sixty-seven 3¼-inch tubes, 17 feet long, with fittings, and 85 feet of 3-foot smokestack.
For terms and particulars, apply to
L. J. HOHL, Cherokee, Butte Co., Cal.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the National Cons. Mining Company will be held at the office of the company, 773 Mission St., San Francisco, California, on MONDAY, the 2nd day of June, 1902, at the hour of 8 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting.
GEO. W. FLEISSNER, Secretary.
Office—773 Mission St., San Francisco, California.

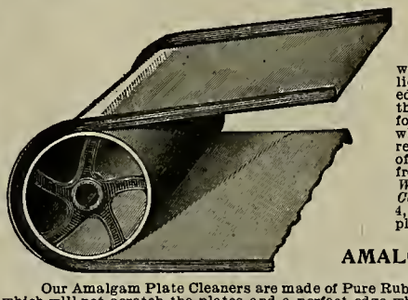
SPADONE'S CONCENTRATOR BELTS.

PATENTED.



This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ⅛ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Send me your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

THE GUTTA PERCHA RUBBER AND M'F'G CO.,
30 and 32 FREMONT STREET, Telephone Main 1813. SAN FRANCISCO, CAL.

URIE PATENT BOILER.

Adapted to all light service. Use less fuel. No small flues to clean. Strong and durable.
Write for prices, stating requirements. URIE BOILER & MACHINE CO., KANSAS CITY, MO.

MINING AND SCIENTIFIC PRESS.

Whole No. 2183.—VOLUME LXXXIV. Number 21. SAN FRANCISCO, CAL., SATURDAY, MAY 24, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Mine Head Gear.

Steel is fast superseding timber for mine head gear. The steel head frame of the High Ore mine at Butte, Mont., is illustrative of this newer style. The height of that frame is 100 feet to the center of the sheaves, base 38x65 feet. Timber, however, still holds its own in many localities. The head gear or "gallows-frame" of the Wolftone shaft, Leadville, Colo., illustrated, is built of redwood, is 82 feet high, main timbers not mortised, but bolted. The two-post frame at the Potosi mine, Coulterville, Cal., is easy to build and of use in the first stages of mine development. The 4-foot frame is, however, more indigenous to California. A new wrinkle in such construction is shown in the engraving of the one over the Fremont, Amador City, Cal. In this the old angle braces have been omitted. The two-post head frame at Cripple Creek, Colo., shows that in building that style of head gear the side braces tend to give it greater rigidity, and the tieing iron rods to keep it from swaying. The frame of the Oneida, Cal., has no superfluous material; the manifest intent in jointing it was to equalize and distribute the strain occasioned in any deep shaft from which heavy loads are quickly hoisted.

Head Gear Wolfetone Shaft, Leadville, Colo.

Head Gear Oneida Shaft, Amador, Cal.

Head Gear Malvina-Potosi Shaft, Coulterville, Cal.

Steel Head Gear, High Ore Mine, Butte, Mont.

Head Gear, Cripple Creek, Colo.

MINE HEAD GEAR, COLORADO, MONTANA AND CALIFORNIA MINES.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Published Every Saturday at 330 Market St., San Francisco, Cal.

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada.....$3 00
All Other Countries in the Postal Union..... 5 00

Entered at the San Francisco Postoffice as second-class mail matter.

San Francisco, May 24, 1902.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Mine Head Gear, Colorado, Montana and California, 278. The Urie Vertical Boiler, 281. E. J. Moore, Colorado Manager MINING AND SCIENTIFIC PRESS; The Otto Aerial Wire Rope Tramway; Otto Aerial Wire Rope Tramway for Transport of Logs in Cimpa, Hungary; Otto Aerial Wire Rope Tramway for the Krupp Mines in Sayn, Germany, 285. Mining and Metallurgical Patents, 286.

EDITORIAL.—Mine Head Gear, 278 Concordance Between Theory and Practice; National Bureau of Standards; What Zinc Ores Contain; The Advertising Part of Paper; What the Miner Gets; No Authority for Changing Courses of Patented Claims; Value of Waterfalls; Value of Catalogues and Trade Treatises; "Absentee Landlordism" in Mining; Hydroleum System of Burning Liquid Fuel; Code of Mining Laws for the Philippines; Trials of Steam Generating Apparatus; Forty-second Anniversary of This Paper; "Legitimate Mining;" Volume and Fall of Water in Coast Streams, 279

MINING SUMMARY.—287-288-289.

LATEST MARKET REPORTS.—290

MISCELLANEOUS.—Concentrates, 280. Production of Rare Minerals; The Urie Vertical Boiler; Limited Area of Claims in Peru, 281. Costs and Profits in Pyritic Smelting of Low-Grade Copper Ores, 282. Compressed Air in Mining, 283. Arizona Railroad Companies; The Golden Gate Cyanide Plant, 284. Our Colorado Manager; A New Zealand Novel Prospecting Plant; The Otto Aerial Wire Rope Tramway, 285. Mining and Metallurgical Patents; Mining in Formosa; Lengthy Working of an Artesian Well in France, 286. Personal; Recently Declared Mining Dividends; Obituary; New Patents; Books Received; Catalogues Received; Commercial Paragraphs, 290.

THERE is a concordance between theory and practice, or theory and fact. There can be no antagonism, for the theory can only result from correct understanding of the facts that create the theory. When apparent antagonism exists, it is because the facts have not been correctly noted, or else the theory is incomplete. All this is better understood if it be kept in mind that facts always precede theory.

MORE than a year ago the U. S. Government created a national bureau of standards. Its work is now going on at Washington, D. C., and consists mostly in comparison of standards used in science, engineering, manufacturing and commerce; the construction of standards where necessary, the testing of measuring apparatus and the determination of the properties of materials. The need of such action has long been manifest and the economy of the measure is already apparent.

SOME zinc ores contain small quantities of tin. If present to the amount of 1%, the metal is brittle and unfit for rolling. Small quantities of arsenic and antimony are frequently found in commercial zinc, but they have no apparent effect upon the properties of the metal. Sulphur or copper are seldom present. Zinc precipitates all the heavy metals, except iron and nickel, from their solutions in the metallic state. Zinc is not precipitated from its solutions in the metallic state by any metal which is stable in the air at ordinary temperatures.

THROUGH the years the advertisements have been preserved in the bound volumes of this paper, and it is of interest in connection therewith to note the fact that in many of those old volumes, as in more recent ones, the advertisements are the most interesting part of the contents. It is further to be noted that ofttimes those advertisements establish the date of introduction of some important mining or metallurgical improvement. Taken altogether, the eighty-five volumes of this paper contain a compendium of modern mining and scientific progress.

THE statement is made that W. A. Clark of Arizona and Montana "draws a check on the first of every month for $900,000, for the contractors who are building his Western railroad," and that "these checks do not decrease his capital; they are drawn upon his income account." Very likely; it is only a miner who can ordinarily do those things, and the matter illustrates how it is that miners and the result of their mining have developed and are exploiting the great empire comprised in the area from the 100th meridian westward. The miner has done more and got less from the federal government than any other representative of any creative industry.

THE U. S. General Land Office announces that there is no authority of law for changing the courses of patented claims in making survey for patent of adjacent grounds, and that the lines of the subsequent survey must be made to conform to those of the already patented claim, which must be recognized as covering the ground for which patent has issued. It is stated that if errors exist in mineral patents the only relief is to surrender the erroneous patent and to have made a correct survey, describing the ground intended to be covered.

THE value of waterfalls has greatly increased since the electrical era. Time was when a cataract was valuable only for scenic purposes, but now it is useful as well as ornamental. Niagara is worth one thousand million dollars more as a source of electrical power than merely as a sight. California waterfalls are increasing in value in a commensurate degree. Snoqualmie Falls, in Washington, has enhanced in value 5000% in the last few years. A proposition is now under way to generate electricity therefrom for use over a portion of the Great Northern Railway.

NEXT in value to such a journal as this the catalogues or trade treatises now being issued by manufacturers of mining machinery and appliances are of greatest worth to the mining public. Their contents are better and more practical than the ordinary technical text-book, and the presentation of the subjects treated are plain and clear. The typographical excellence of those trade treatises is also notable. While primarily those "catalogues" are for advertising purposes only, yet the progressive commercial spirit of their compilers has made them works of art, worthy of preservation.

COMPLAINT is made that in two California and Colorado instances cited the men who draw big mine dividends take the money elsewhere to live in luxury thereon. While, as a general proposition, a man has a right to do what he likes with his own, if he harms no other in so doing, yet, in the instances referred to the most of the prospecting and developing work in the districts mentioned is done with the money that comes out of those very dividend-paying mines. And this is often the case that apart from labor and supplies considerable of the money taken out of the ground is put back again in development work. Indeed, it is largely thus that mines are made. There is probably a less percentage of this "absentee landlordism" in mining than in any other occupation.

IN the hydroleum system of burning liquid fuel, all descriptions of liquid hydrocarbons, from petroleum to tar, are consumed with entire absence of smell or smoke. The burner comprises a combined feed of steam and oil, or oil refuse, and the vapor of these two is concentrated upon an incandescent firebrick, upon striking which the combined steam, by means of the intense heat, is divided into oxygen and hydrogen and passed through the boiler. So perfect is the combustion and so intense the heat that is generated that considerable economy is effected. By the system, fifteen pounds of water are evaporated by the consumption of one pound of tar refuse; with the same quantity of steam coal, only nine pounds of water are ordinarily evaporated.

A SUB-COMMITTEE of the U. S. Senate Committee on the Philippines has agreed upon a special code of mining laws for the islands. The best thing the Government can do at present is to let those matters alone, for they can adjust themselves much better than can be done by premature interference or control. But since the Government is assuming control of the mineral lands, as well as other resources of the Philippines, the conclusions of the sub-committee are to be heartily commended. This sensible sub-committee recommends that in the case of lode locations the side lines shall be vertical, and that only so much of the lode or vein as is contained within lines carried down vertically from the surface boundaries of the claim shall be controlled by the locator. This is as it should be, and it is to be hoped that that provision will have a majority vote in Congress. Were such a provision in the Federal statutes regarding continental mineral domain it would have saved much loss and litigation, but even in that far-off corner of our possessions it is well that common sense and twentieth century ideas have sway. The sub-committee in question is to be congratulated. It is the first time in many years that the Congress of the United States has shown the slightest correct understanding of the subject in attempting to deal with the mining industry.

AS A RULE, the information concerning the trials of steam generating apparatus is not complete; the composition of the gases is not often determined, although some of the testers make good use of gas analysis; but, so far as the writer knows, there is no published report of a trial where evidence was submitted that effort was made to attain maximum efficiency. In a speed trial of a steamship they are not satisfied to measure whatever speed may happen to be attained, but, on the contrary, do everything to make the ship go as fast as possible. And so with a generating apparatus; but the maker and the purchaser should be interested in its true efficiency, and not be satisfied with the uncertain performance which might result from unskillful operation. There is a disposition to decry what are called "fancy tests," and "expert firing," and to state that certain results were obtained with "ordinary firing," and with "common every-day practice," but common every day practice and ordinary firing may be such that a boiler will not make steam at all.

FORTY-TWO years ago to-day—May 24, 1860—appeared the first number of this paper. It has recorded the growth of the mineral development of this country, bas exercised a constant creative influence, and as the oldest journal of the kind on the continent takes pleasure in the consciousness of good work well done. Thousands of friends throughout the world will recall how through the years they have been pleased to commend its course. Rarely does this paper grow reminiscent. The horizon constantly widens and the future grows broader. Yet, occasionally, as in this paragraph, a milestone is marked in our progress. Through the years many journals with like aim and intent have sprung up—and passed away. This has kept on steadily and successfully for forty-two years, which is perhaps sufficient to say as to its worth and manifest value to readers and advertisers. Probably one element in its success is that it always aims to tell the truth and that it has never taken a dollar to put anything in its reading columns—or keep anything out.

A LETTER has come to this journal inquiring what is meant by the term "legitimate mining," which appears so freely in print—in some journals. The answer is that nothing is meant by the expression at all. It is meaningless. Mining is an industry neither prohibited by law nor the practice of a moral life. The qualification implied by the use of the adjective "legitimate" in connection with it is untrue. Tbe term as used is simply the evidence of the user's ignorance of mining and the pretense of an apology for his confession of the fact. Commonly, it is used to impress the careless reader with the writer's candor and truthfulness, on the theory that nothing is so deceiving as the truth well told and that ignorance to the ignorant is a virtue. There is good mining and bad mining. There are good mines and mines that are not so good. There are neither legitimate nor illegitimate mines, and neither legitimate nor illegitimate mining.

THE volume and fall of water in coast streams is a subject that is being given considerable deserved attention. Their utilization for electrical purposes is one of the foremost factors in present development. In this regard it is to be observed that the greatest accuracy and most complete detail is necessary in all experimental work with a view to determining practical value. Particularly is tbis the case in relation to the lessened summer flow. The minimum rather than the maximum flow should be the special object of information. While storage naturally enters into all final calculations, yet the costly experience with hastily constructed electrical work makes manifest the need of care and accuracy in all determinations of this kind where investment of capital is contemplated.

Concentrates.

STEAM of 100 pounds pressure has a temperature of 337.7° F.

AN electrical current cannot break through an insulation of ice.

IN the case of friction, the co-efficient of steel to ice is stated to be 0.02.

IF a well could be dug to a depth of 46 miles, the air at the bottom would be as dense as quicksilver.

THERE can be no federal tax or duty on any article exported from any State of the American Union.

CO-OWNERS in a mining claim have 180 days from the date of the first publication of their delinquency in which to pay up.

ACTINOLITE is not uncommon: it somewhat resembles asbestos, but has no fiber, and has little, if any, commercial value.

AT an altitude of 14,714 feet water boils at 85° C. At an elevation of 7500 feet the pressure of the atmosphere is about eleven pounds per square inch.

"MINING DIRECTORIES" are merely made to sell and are not designed or considered to be of any permanent value to others than the compiler and publisher.

IN Peru the Tarica mine is 11,466 feet above the sea and the smelting plant is 14,714 feet above sea level. It is 13 miles from Tarica. The road has a 12% grade.

WHERE not practicable to paint the iron pipe it can be kept from rusting by being painted with coal tar, then filled with light wooden shavings, the latter set on fire.

IRON combines with 53.3 parts of sulphur in 100, and is found abundantly in the carboniferous sulphur as a carbonate. Silver combines with 12.96 parts of sulphur in 100.

THE California Legislature passed a law in May, 1897, giving a mining claim locator sixty days in which to record the location. That law was repealed in February, 1899.

THE "free zone," sixty mile strip along the Mexican border, inwhich imported goods were allowed to enter for only a nominal duty, has been abolished by the Mexican Government.

THE founder of this paper was George H. Winslow. He leaped into San Francisco bay to rescue a child from drowning, sustaining injuries which resulted in his death, Jan. 18, 1864.

GOLD obtained by pulverization or disintegration of pyrites mixed with copper, zincblende and lead has a grayish-brown tint, is indifferent to the action of quicksilver, and will not amalgamate.

NINE MILLION ampere hours of current would be required to deposit one ton of copper on a single cathode surface. In practice many such surfaces are connected in series, thereby multiplying rate of deposition.

IN single leather belts it is calculated that 144 square feet of belt passing a given point per minute equals 1 H. P. A double belt is about 40% greater in power than a single belt of same width, but must have greater tension.

IF apertures of the same size and shape be located along a pipe at 1, 4, 9, 16, 25 feet, etc., below the surface, the relative velocity of the water flowing therefrom will be 1, 2, 3, 4, 5, etc., times the first velocity whatever that may be.

FOR a solvent for old paint or putty, mix soft soap with solution of potash or caustic soda: or pearl ash and slacked lime mixed with sufficient water to form a paste. Either applied and left for some hours will render the paint or putty easily removable.

IT is reasonable to believe that the modern roller bearing is capable of far higher speeds than ordinary journals, without undue wear or danger of heating, and without the necessity of those elaborate devices for supplying a continuous stream of oil.

THE characteristics of a high head plant differing from that of a low head plant is that the penstock, instead of being short, of large diameter and of low water velocity, is long, of comparatively small diameter, with the water velocity rising as high as 12 to 15 feet per second.

NO TAX upon mining claims can be laid that would be just in its burdens or equitable in its results. When the sagacity and toil, the anxiety and patience of the miner are rewarded with success, the results of that success become the subject of taxation and the source of State revenue.

IT is stated by those who claim to have demonstrated it by repeated experiment that if a plate of pure lead, about 3 inches in thickness, be placed on top of a plate of pure gold, that in three days samples from the top of the lead will show by analysis appreciable quantities of the gold—a case of interdiffusion.

THE mining term "wheal" prefixed to Cornish mines is a corruption of the word "huel," which means "mine." One of the oldest mines in Europe is Huelgoeth, near Poullaouen, Brittany, France, which shows by its Celtic name that it is a mine originally worked by the Goths, or Norman invaders of France.

MINING men visiting San Francisco, Denver or Chicago are invited to make use of our offices in those cities. Mail may be directed in care of any of these offices, papers examined and every facility afforded visitors. The San Francisco office is 330 Market street, the Denver office 606 Mack Building, corner 16th and California streets, and the Chicago office 737 Monadnock Block. In any of the three a courteous manager will attend to the wants of visitors.

PREVIOUS to any time of which there is a historical record, the whole Lake Superior region, including even the remote islands on the north shore, were mined over in, literally, thousands of places, shafts sunk through solid rock to the depth of 50 feet without the aid of steel or powder, and masses of copper raised of several tons weight.

THE term "horse power," as applied to motors of any kind, is deservedly becoming obsolete. The term arose when men began to supersede horse mills by steam mills. The manufacturer would naturally inquire of the party desiring a steam engine how many horses he wished to dispense with. The term has no proper place in twentieth century practice.

FOR lubricating the journals of heavy machinery, either rape or sperm oil is the best to use in admixture with mineral oil, as they have the least effect on brass and iron, which two metals usually constitute the bearing surface of an engine. Tallow oil, unless it is deacidized, should be used as little as possible, as it has considerable action on iron.

MERCURY is almost invariably sold pure. If the quicksilver is suspected of being adulterated with lead, tin or bismuth—which is extremely unlikely—such mixture can be shown by rubbing some of the metal on the open palm. If it soil the skin, it is adulterated; if pure, it leaves no trace. If dosed with lead, the drops, instead of being gobular, will be elongated and flattened.

WHERE necessary to solder full water pipes, that are broken off where it is inconvenient to turn off the water, put a plug in both broken ends; then surround the two portions of pipe near the fracture with ice and salt. When the water within the pipe is frozen solid the plugs may be withdrawn, the fracture repaired, the salt and ice removed and the water allowed to resume its flow.

IN intersections of veins the portion thrown out is on the side of an obtuse angle, and the more obtuse the greater the out-throw. In the question where the workings of a copper lode striking E. N. E. and dipping 80° N. N. W., are stopped by a cross vein striking N. 15° E., the obtuse angle being on the right of the lode as the miner drives north, southeast would be the course to find it again.

AFTER conducting a number of experiments and determining the advantages of looking after the small economies in mill operation, an engineer recommends the use of large pullies, fast running belts, plenty of the best oil, the preservation and purification of the drip, regular oiling of the shafting and careful and frequent inspection of line shafts, to see that they are in line and that they can be turned easily.

THE Schwarz process for desulphurizing coal difficult to coke consists in compressing the coal outside the oven, and again continually in the oven by means of heavy cast iron plates so that the coal undergoes the whole operation of transformation into coke under constant pressure, the object being to prevent a too rapid escape of the gases and to obtain a better fixing to the coal of the carbon of the portions susceptible of distillation.

THE size of a drop of liquid depends upon the chemical nature of the dropping liquid, and is not affected materially by its density. Water has the greatest and acetic acid the smallest drop size. The above rule holds good with solids. So far as observation goes antimony delivers the smallest and tin the largest drops. Temperature affects the size of the liquid drop; generally the higher the temperature the smaller the drop.

THE British Columbia "Legislature" defines a "mine" as follows: "Mine" means—A mine to which the "Inspection of Metalliferous Mines Act, 1897," and amending Acts apply, except as hereinafter stated, that is to say: This Act shall not apply to a prospect that is being developed or to a mine that has not a regular output of metalliferous product, unless more than twenty-five men are employed in the development of such prospect or mine.

IN France no mine can be opened without permission from the department of State charged with the supervision of mining affairs, and, if the permission be given and the work begun, it is done under the inspection and with the advice of graduates from the imperial school of mines, who are charged to see that no wasteful expenditures are made, no loss of life caused by ignorance or haste, and no imposition practiced on the public by false representations of what is going on.

THE Transvaal gold-bearing "reefs" are not quartz lodes, though composed entirely of quartz. They are bedded deposits of what was originally hard quartz gravel carrying fine placer gold. These beds, during the process of hardening into a compact rock, became subjected to what is described as the quartzite alteration, a metamorphic change made by the deposition of silica, or quartz, from the ascending saturations exactly as if it was in a fissure, by which the quartz pebbles became cemented together into a conglomerate.

SAND uniform and free from dust will flow in the air at angles above 32°, but not at smaller angles. Sand in a box or reservoir, allowed to flow through an aperture either in the bottom or side, will flow in the same quantity whatever the head or pressure may be, being thus unlike fluid. When a perpendicular tub is filled with sand very little of the weight is borne by the bottom of the tub; about as much as would equal the weight of a cone of sand standing on that bottom. The most of the weight is supported by the sides.

REVOLVING COLLARS for shaft bearings have been introduced into some leading machine shops. They consist of rings of metal, each made up of several segments, and great saving in lubricant is effected by their use. By having three or four such ring collars, working one within the other, well oiled, the surfaces brought into frictional contact by the turning of the central shaft, travel very slowly over one another, and the possibility of heating is reduced to its lowest.

THERE was as much gold extracted from the mines of the world within the ten years which followed the year 1848 as during the 366 preceding that date. During the three and one-half centuries which preceded the discovery of gold in California the whole amount of gold brought to the markets of Christendom was $2,000,000,000. At the beginning of the last century all the countries from which civilization drew its supply of gold produced annually about $17,000,000. California has produced about $1,200,000,000 in gold. The present gold yield of the world is about $400,000,000 annually.

THE trade journal is a tool of business. If the tool is poorly tempered, of weak constitution and untidy appearance, it will exert no influence, do more harm than good, turn traders into blunderers and live a short life. If, on the other hand, this tool of trade is well tempered, put together in attractive style, has force, a moral tone, and puts character first, it will live and thrive, and as it grows older exert more and more influence—secure respect for its opinion. The trade journal, then, to be a power, to have merit, to become a trader's aid, must be worth paying for. It must have individuality of its own, for in this world men count more than method.

AMONG the units of modern mining practice are: Attention to detail: the successful mine operator cannot afford to overlook any point where an economy can be effected or an improvement made. It is in making close propositions pay that stamps the genius of the management. Standardization: by this is meant a general uniformity of practice in every part of the mine. For instance, in the running of a drift or tunnel the timbering should be uniform, so that a stock cut to a standard size can always be kept on hand for use in any portion of the work. It is simply the system of interchanging parts in use in all manufacturing establishments applied to mining; application of the best mechanical practice to the machinery. The best plants and the best practice in their operation always pays in the long run.

TO DETERMINE the piston speed of a steam engine in the case of an ordinary engine taking steam on one end of the cylinder and then on the other, it is proper to take the piston speed for both strokes and for the number of revolutions made in one minute, for the horsepower of every engine is calculated on the basis of what it does in one minute of time. In the case of a 20x42-inch engine making 85 revolutions per minute, as it starts from the center and travels over to the other center it goes 42 inches or 3½ feet. As the piston comes to a full stop and then reverses its motion, it comes back to the place from which it started, making another stroke of 3½ feet, and this completes one revolution. It has traveled 7 feet, and as it does this 85 times each minute, multiply 85 by 7 and find that the speed is 595 feet. With a 16x20-inch engine running 150 revolutions per minute, the calculation is as follows: The travel is 40 inches which is 3⅓ feet for each revolution, and $150 \times 3\frac{1}{3} = 500$ feet per minute.

CONSIDERABLE inquiry comes as to the use of copper water-jackets, prompted doubtless by sundry statements in daily papers concerning the alleged use of all copper therefor at the Mountain Copper Co., Ltd, Keswick, Cal. The facts are as follows: They abandoned the use of built-up steel jackets in 1898, as they were too rapidly eaten out by the water they then had available for cooling purposes. For a time they used cast iron jackets which were partly satisfactory, but the cast iron jackets made in the Keswick foundry were particularly subject to cracking, so that they determined to find a cast iron that would be tougher and that would better resist sudden changes of temperature without cracking. As it takes a long while to make the jackets and get the test of time on them, it was decided, in the interim, to try cast copper jackets. It is commonly supposed to be impossible to get sound copper castings. After a little work the Keswick company found they could cast copper jackets sound enough for their purposes, and cast several, not in their ordinary foundry cupola, but from a reverberatory furnace. So far their special cast iron is satisfactory. The copper jackets have not yet been sufficiently tried but the experiment looks well. They have long used bronze for special water-jackets with success and continue to use that material for special work on account of its superior hardness. The Mountain Copper Co. are having better water than formerly and are now making another trial of wrought steel jackets. Thus they are trying three classes of metal. They want to see the copper succeed, believing it would be a safer material in case of an explosion. It would bend and bulge, not burst and scatter around like cast iron. Copper has long been used for water-jackets but it has been wrought copper built up. Copper jackets cast in one piece are deemed to be new.

Production of Rare Minerals.*

The manufacture of lithium carbonate has created within the last few years an unusual demand for lithium minerals, says Dr. Joseph Hyde Pratt in "Mineral Resources of the United States," 1901, now in press, published hy the United States Geological Survey; David T. Day, Chief of Division.

But two lithium minerals have thus far been mined—lepidolite, a lithia mica, and spodumene, a metasilicate of aluminum and lithium. The largest deposits of lepidolite in the United States are near Pala, San Diego county, California, and they were the only ones producing the mineral in 1901. On a neighhoring property, a large deposit of amhlygonite has heen discovered associated with the lepidolite and this amblygonite also may he used for the manufacture of lithium salts. The most noted occurrence of spodumene in quantity is at the Etta group of mines in the Black Hills of South Dakota. In this vicinity also the Sunday, the Golden Star, the Traction, and the Bob Ingersoll mines are known to contain spodumene in some quantity. It is not the natural lithium hut its salts, principally lithium carhonate, that are used in the arts, especially in preparing mineral water and lithia tablets. The production of lithium minerals in 1901, amounting to 1750 tons, valued at $43,200, was more than three times the production in 1900, ahout 520 tons. The average price received was $24.68 per ton. The highest price was for lepidolite. The California lepidolite was sent to New York, where a part of it was subjected to chemical treatment, and the remainder was shipped to Germany. None of the spodumene has been shipped ahroad. For years all the lithium minerals mined in this country were shipped to Germany, and the manufactured lithium salts then imported and sold at from $2 to $4 per pound. Now these salts are manufactured hy the Century Chemical Co., Camden, N. J., and the Eos Chemical Co., Rahway, N. J. There is talk of estahlishing a similar maufacturing plant on the Pacific coast.

MONAZITE.—The monazite industry of the United States, nearly at a standstill from 1896 to 1900 hecause of the Brazilian production, has heen revived, and is now a small but thriving industry in North Carolina.

Monazite is essentially an anhydrous phosphate of the rare earth minerals, cerium, lanthanum, and didymium. There is nearly always present a varying hut small percentage of thorium oxide, and this oxide gives monazite its commercial value. Monazite is found very widely distrihuted as an accessory constituent in varying proportions of many granites and their derived gneisses. Thus it is found in the Maritime mountains of Brazil, extending for 300 miles through the Provinces of Bahia, Minas-Geraes, Rio de Janeiro and Sao Paulo; and the South mountain region of North Carolina, covering the area of some 2000 square miles in McDowell, Burke, Rutherford, Cleveland, Polk, Catawha, Lincoln and Gaston counties, and extending into Spartanhurg and Greenville counties, South Carolina. Although occurring in hut small quantities, it has heen identified in the granites or gneisses of Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, and Georgia. In North Carolina there are a numher of mica schists that carry monazite, as the mica schist near the Deake mica mine, Mitchell county, and at Milhholland's mill, Alexander county. The commercial deposits of monazite are not in the original rocks, hut occur in the placers of the present streams, and in the old sand and gravel deposits of former streams. The Brazilian deposits occur as beach sea sands, and their concentration has heen hrought about hy the action of the waves. In the Carolinas the workahle deposits of monazite sand are found along streams that have their sources in the South mountains, as Silver, South Muddy and North Muddy creeks, and Henrys and Jacohs forks of Catawha river, in Burke and McDowell counties; Second Broad river and its trihutaries in McDowell and Rutherford counties; First Broad river and its trihutaries in Rutherford and Cleveland counties, North Carolina, and in Spartanburg county, South Carolina. Associated with monazite in these sand deposits are zircon, garnet, magnetite, rutile and other minerals. Monazite is also reported from the gold placer deposits of the Glades, Hall county, Georgia and of the Oro Fino, Idaho. Monazite has also heen found in the pegmatitic dikes of southern Norway, and in the pegmatitic dike at Mars hill, Madison county, North Carolina.

Monazite is ohtained hy sluicing the sands and gravels, just as placer gold is washed. The resulting concentrates are then dried, and the minerals separated hy means of the electro-magnet; but the commercial sand thus obtained is not pure monazite. A company is erecting a mill near Shelby, Cleveland county, North Carolina, to treat the saprolitic rock containing monazite.

The economic value of monazite is dependent upon its containing the oxides of the rare earths, cerium, lanthanum, didymium, and of thorium, the last heing used with much smaller quantities of lanthanum and didymium in the manufacture of the cylindrical hood or mantle of the Welshach and other incandescent gaslights. The cerium oxalate ohtained is used in pharmacy. The monazite products of 1901 was 748,736 pounds, valued at $59,262, as compared with 908,000 pounds, valued at $48,805, in 1900, this increase of $10,457 in value with a decrease of 159,264 pounds in production being due partly to the cleaner condition of the sand produced. Representatives of German manufacturers are said to have hought recently monazite deposits in Cleveland county, North Carolina.

TUNGSTEN.—The metals tungsten, molyhdenum, uranium and vanadium are still attracting much interest in the steel industry, hecause of the heneficial properties which they impart to steel, although the alloys ferro-uranium and ferro-vanadium are still in experimental stage as to their actual commercial value; the ferro-alloys of molyhdenum and tungsten have passed this stage. The demand for tungsten has not increased during 1901, hut molyhdenum has heen greatly in demand, and its market value has remained nearly constant.

The sources of tungsten are the three minerals scheelite, wolframite and hubnerite, and of these scheelite, a tungstate of calcium, is the one that can he used in producing the metal, or ferro-alloy. Thus far scheelite has heen found in only one locality in the United States in sufficient quantity. Wolframite and hubnerite occur ahundantly, and the sources of supply greatly exceed the demand.

For a numher of years practically all the tungsten used in the United States was imported from England, Austria, Hungary, Saxony, Germany and Australia. The principal deposits in this country have heen found in Arizona, Nevada and Colorado. Deposits have also heen found in Oregon, Washington, Idaho, Montana, New Mexico, South Dakota, Connecticut and North Carolina. The Arizona deposits are in the Arivaca district, Pima county; in the Dragoon mountains, Cochise county, and 60 miles south of Hackherry, Mohave county. The Nevada deposits are near the base of Wheeler peak, in the South mountains, ahout 12 miles south of Osceola, White Pine county. The Colorado ores have been found in quantity in San Juan, Boulder, Gilpin, Ouray and Lake counties; the principal mines worked in 1901 being those in Boulder county, where the Great Western Exploration & Reduction Co. has been recently organized hoth to mine and reduce the ores and to manufacture ferro-tungsten alloy. The massive scheelite deposit in the Cliff mine in the Virtue district, east of Baker City, Oregon, carries considerable free gold. There has heen a little tungsten mining at the Harrison and the Durango mines in the North Lead district of South Dakota; and also at the scheelite mines of the American Tungsten Mining & Milling Co., near Long hill, Fairfield county, Connecticut.

Tungsten has been used for making colored cotton goods "fast" or washable, for rendering clothes noninflammahle, for the manufacture of stained papers, for coloring glass; as an alloy with copper and aluminum for the manufacture of propeller blades; as calcium tungstate in Roentgen ray apparatus. Now the chief use, either as ferro-tungsten or as the powdered metal, is in making tungsten steel. The production of tungsten ores during 1901 amounted to 179 tons, concentrated from 1221 short tons of crude ore, valued at $27,720, at an average price of $154.86 per ton. The price of tungsten ores has decreased from 50% to 75% during the last two years.

MOLYBDENUM.—Molyhdenum, found as the minerals molyhdenite and wulfenite, generally occurs in beds, or is disseminated through crystalline rocks, granite, gneiss, syenite and granular limestone. It has been found ahundantly in many localities, as in California, in Mono county, 12 miles northwest of Bridgeport, on the west fork of Walker river, where the molybdenite core is about 20 feet in diameter; on Alamo mountain, in northeastern Ventura county, where the vein is said to be from 8 to 15 feet wide. In Washington, molybdenite deposits are worked hy the Crown Point Mining Co., of Seattle, on Railroad creek in the Stehekin mining district, in western Chelan county. This deposit is associated with gold, silver and copper ores, and is in quantity. In Montana, at the Leslie copper mine, in Missoula county, molyhdenite was found in quantity in the upper parts of the mine. In Utah, molybdenite deposits have heen discovered near Leamington, Millard county, hut not sufficient development work has yet been done to determine their extent. In Arizona a vein of molybdenite 5 feet wide is reported in the Santa Rita mountain district, Pima county. In New Mexico, molyhdenite is reported in quantity ahout 25 miles from East Las Vegas, San Miguel county. It is also reported in quantity near Portage, Aitkin county, Minnesota, and near Cripple creek, Colorada. A deposit of molyhdenite of good indications has heen developed near Skaguay, Alaska.

The chief uses of molybdenum until recently have heen in determining phosphoric acid hy ammonium molyhdate, and in preparing "blue carmine" for coloring porcelain. The ferro-alloy of molyhdenum is now used in making a special steel, to which it gives valuable properties. The production of molyhdenite in the United States in 1901 has probably not been over ten or fifteen tons, which does not supply the demand. The ore, to be marketable, must contain over 45% of molybdenum and he free from copper. The average price of a 50% to 55% ore is prohahly ahout $400 a ton. The increase in the domestic production of 1902 over 1901 should be large.

URANIUM AND VANADIUM.—During the last few years there has been some demand for these metals for experimental work as to their heneficial effect upon steel. Uranium is found in the forms uraninite, gummite and carnotite. The principal occurrences of uraninite are at the Wood, the Black Hawk, and the Kirk mines near Central City, Gilpin county, and on Dolores river at the mouth of Disappointment creek, Montezuma county, Colorado. It has also heen found on the eastern slopes of Paradox valley, Montrose county, Colorado. It has been found in douhtful quantity in the Ross Hannihal mine in the Ruhy basin of the Black Hills, South Dakota; in the President mine, near Elizabethtown, Colfax county, New Mexico; and, with gummite also, in some of the pegmatitic dikes of Mitchell county, N. C.

Carnotite, which contains the oxides of both uranium and vanadium, occurs at La Salle creek, 6 miles from Cashin, Montrose county, Colorado; and it is reported from the western slopes of the La Salle mountains in southeastern Utah.

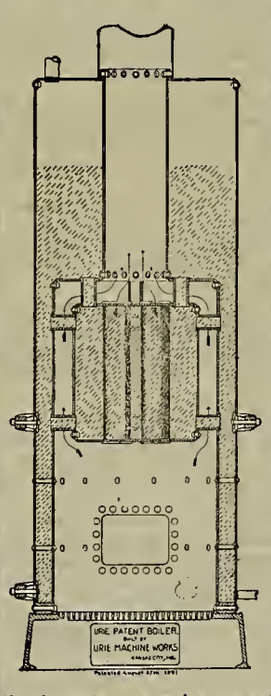
The other principal source of vanadium is canadinite, which has been found in some quantity at the Vulture and the Phœnix mines in Maricopa county, and at the Mammoth mine, near Oracle, Pinal county, Arizona; and at Lake valley, Sierra county, and at the Mimbres mines, near Georgetown, Grant county, New Mexico. Vanadium has heen ohtained from certain slags at Creusot, France; and it has also been found in the ash of certain coals—a source that is attracting the interest of manufacturers and chemists.

Both uranium and vanadium, as ferro-alloys, increase to a remarkable degree the tensile strength and toughness of steel, though no commercial steel seems thus far to have heen made with them. Uranium compounds are used in manufacturing and decorating porcelain and glass, and canadium is used for vanadium hronze in the place of gold bronze. The production of uranium and vanadium minerals during 1901, confined for the most part to Colorado, amounted to ahout 375 short tons of the crude ore. The highest recorded price for the crude ore was $150 per ton; uranium oxide has been sold as high as $1.20 per pound.

*From "Production and Distribution of Lithium, Monazite, Tungsten, Molybdenum, Uranium and Vanadium in 1901," in Advance Sheets of "Mineral Resources of the United States, 1901."

The Urie Vertical Boiler.

Herewith is illustrated the Urie vertical hoiler, made and supplied hy the Urie Boiler & Machine Co., 601-609 West 5th St., Kansas City, Mo. The manufacturers issue a circular in which, among other things, they say that the hoiler is made of flange steel throughout, has no flues to clean, has perfect draught and will burn lowest grade of slack coal; the boiler is especially adapted to steam and hot water heating and general steam use, owing to the little floor space they occupy. "Our heat is uniform throughout the hoilers. We have one of these boilers (20 H. P.) in operation now in our shops. Our coal hill for six months averaged 34 cents per day. We have three times the firehox room. The water magazine in firehox causes great circulation of water and discharges all the sediment in outer shell of hoiler, where it can be hlown out. Owing to great circulation in water magazine, no sediment can settle; magazine keeps perfectly clean. Magazine is kept full with great hody of water, so that it cannot hurn out. We have many orders for these boilers to replace the common tubular hoiler, aud can give endorsements from those who have watched the working of our boiler. This hoiler, on a test made hy one of the most practical engineers in Kansas City, evaporated 8.44 pounds of water to 1 pound of slack coal."



AT Cerro del Pasco, Peru, a claim is limited to 275x550 feet and is usually worked like a stone quarry. A large open cut is made and then a slope is sunk on an incline of about 45°. In the foot or hottom of the incline steps are cut so that the miners can walk up and down. They carry the ore out in leather sacks. There is no waste to handle—the ore body being 1000 feet wide and 2 miles long.

Costs and Profits in Pyritic Smelting of Low-Grade Copper Ores.

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS by F. H. PRENTISS, E. M.

The profit per ton when half the first grade ore is concentrated and used as a flux (allowing 25% loss in the concentrating) is the sum of $8 28 (Col. 35) and $2.35 (Col. 38) and .32, making $10.95 per ton. The total profit, therefore, is:

One ton of the first grade ore	$ 8.60
One ton of the first grade ore	10.95
Two tons of the second grade ore	2.61
	2.61
Total	$24.77

Or dividing by 4 the average profit becomes $6.19. We have found the varying profits to be as follows:

	Per Ton Smeltd.	Per Ton Mined.
The ore smelted direct	$1.46	$1.46
The ore sorted, the first grade smelted and the second grade thrown on the dump	6.18	3.09
The first grade smelted and the second grade concentrated, briquetted and used as a partial flux	5.60	5.60
Only half of the first grade smelted direct, the balance being concentrated with the second grade so as to make a complete flux	6.19	6.19

It will be readily seen that with more careful sorting a still better profit could have been obtained, as it would not in practice be necessary to concentrate high-grade ore to obtain a flux; and if the concentrating loss falls only on low-grade ore, the net results will be higher.

The above figures show the necessity of carefully hand sorting and concentrating the ore.

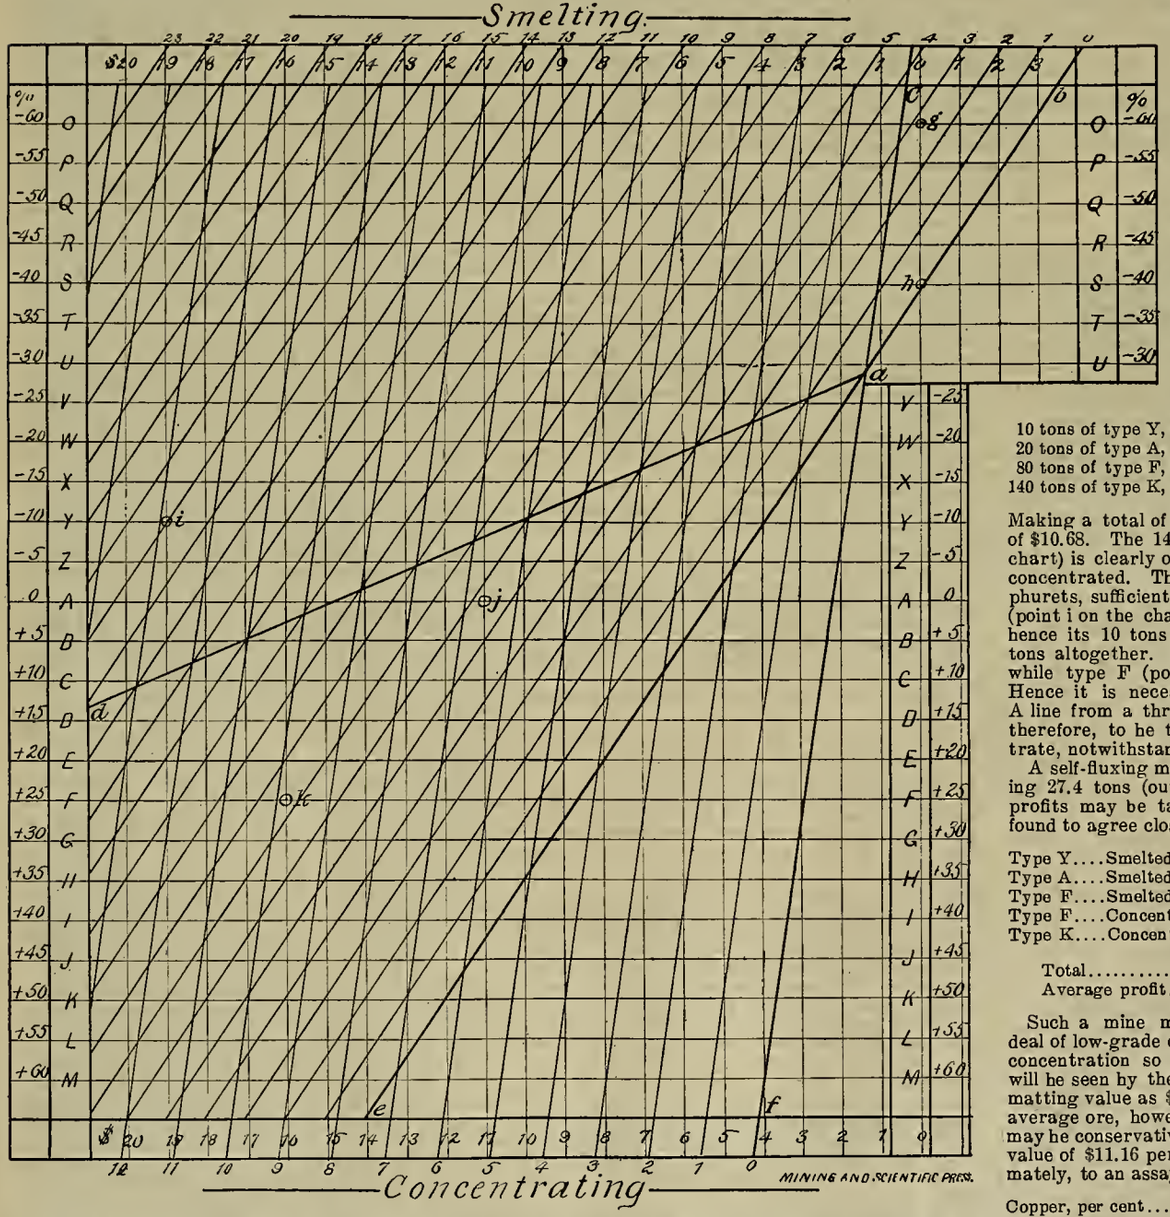
The ore should first be broken to a size suitable for smelting and the first grade sorted out by hand. The remainder should be broken to a smaller size and the best ore removed by jigging, the balance passing to the mills for fine crushing, and the sulphurets saved by concentrators and afterwards briquetted.

The types of ore A to K are those which carry more than silica enough (A being neutral) to flux the bases in the ore. The table below gives types which are deficient in silica. All ores of these types which have a matting value of $10 or over should be removed by jigging and added to the hand-selected ore.

TYPES OF ORE DEFICIENT IN SILICA TO MAKE A 50% SILICA SLAG.

Type.....	ANALYSIS OF ORE: SiO_2	Fe	S	Al_2O_3 CaO FeO MgO	Cu	Deficit of SiO_2.
	%	%	%	%	%	%
O	0	40	45	10	3	60
P	3	39	44	10	3	55
Q	6	37	42	10	3	50
R	9	36	41	10	3	45
S	12	34	39	10	3	40
T	15	32	37	10	3	35
U	18	31	36	10	3	30
V	21	30	34	10	3	25
W	24	28	32	10	3	20
X	27	27	31	10	3	15
Y	30	25	29	10	3	10
Z	33	24	27	10	3	5

In the accompanying chart the abscissæ A, A, B, B, etc., represent types of ore as given in table on page 255, and the numbers plus or minus 5, 10, etc., opposite each letter indicate the excess or deficit of silica (on the basis of a 50% silica slag). The ordinates represent the matting value in dollars per ton of the ore. The lines parallel to eb represent the profit per ton by smelting, and the lines parallel to cf the profit per ton by concentration prior to smelting. The chart is plotted from the preceding tables, and the loss in concentration is taken as 25%. All of the ore that comes within the space above and to the left of the lines da and ah should be smelted, as the profit will be greater than by concentrating.



Within this space comes the product of hand picking and of jigging. Similar ore may fall into the space between the lines da and ca, and such ore may be either smelted direct or concentrated prior to smelting, according to the needs of silica or iron for flux. Concentration will yield the most profit. The ore that falls between the lines ea and fa must be concentrated, as smelting will result in a clear loss. All ore that falls to the right of fab goes to the waste dump, as it cannot be worked at a profit. The line af, therefore, shows the division between valuable ore and waste, and where there is no further profit in concentrating.

It is evident that should the necessity exist for more concentrates for fluxing purposes, some of the ore which would fall on the waste dump side could be profitably sent through the mill, since it has already been charged with mining costs ($2.25+0.17) and could be credited back with that amount, as otherwise it would have to be charged back to the ore utilized.

The line ae shows the division where there is no further profit in smelting, and the line ad shows the division where it begins to be more profitable to concentrate than to smelt. The line ah is a continuation of ea, the line of no profit in smelting. It extends, however, into the space to the right of the ordinate marked zero—that is to say, beyond the point where the ore ceases to carry any gold, silver or copper. Ore of the types O, P, Q and R show, however, some profit notwithstanding. Type O (which has no silica at all) shows a profit by smelting even when its matting value is nothing (point g on the chart) of $2.80 per ton. This is its value as fuel and flux over and above the cost of mining. This is easily shown, since the ore contains 85% FeS_2 and 10% of other bases (CaO MgO, FeO Al_2O_3.) The FeS_2 is worth 5.7 cents per unit, or $4.84 per ton, and the 10% of bases are worth the cost of the limestone they replace—45 cents—making a total value of $5.29 per ton, from which there is to be deducted the cost of mining—$2.42—thus leaving $2.88 net, a practical agreement with the chart. Ore of type S carries 12% silica, and when it has no assay value (point h on the chart) the value of its FeS_2 is just sufficient to pay the cost of mining and smelting and leave no profit. This is shown on the chart by the intersection of the line of no profit eah with h.

To further illustrate the chart, suppose that the daily output of ore was:

10 tons of type Y, matting value	$19
20 tons of type A, matting value	11
80 tons of type F, matting valve	16
140 tons of type K, matting value	7

Making a total of 250 tons of average matting value of $10.68. The 140 tons of type K (point 1 on the chart) is clearly ore that has passed the jigs and is concentrated. This ore yields 14 tons available sulphurets, sufficient to flux 8.4 tons of silica. Type Y (point i on the chart) has 10% deficit of silica, and hence its 10 tons will flux 1 ton of silica, making 9.4 tons altogether. Type A (point j) is self-fluxing, while type F (point k) carries 25% excess silica. Hence it is necessary to obtain more sulphurets. A line from a through j shows k to fall below it and, therefore, to be the more desirable ore to concentrate, notwithstanding its higher assay value.

A self-fluxing mixture will be had by concentrating 27.4 tons (out of the 80 tons) of type F. The profits may be taken from the chart and will be found to agree closely with the tables.

Type Y....Smelted	10	tons at $14.95 =	$	149.50
Type A....Smelted	20	tons at 5.67 =		113.40
Type F....Smelted	52.6	tons at 7.27 =		382 40
Type F....Concentrated	27.4	tons at 9.80 =		268 50
Type K....Concentrated	140	tons at 2.60 =		364 00
Total				$1,277.80
Average profit				5.11

Such a mine may be found to carry a great deal of low-grade ore which will show good profit by concentration so long as a basic flux is needed. It will be seen by the tables that ores with as low a matting value as $3 per ton may be worked. The average ore, however, of the recognized ore bodies may be conservatively estimated as having a matting value of $11.16 per ton, which corresponds, approximately, to an assay:

Copper, per cent	3.00
Gold, dollars	4.25
Silver, ounces	2

For purposes of an approximate estimate let us suppose the ore divided into two grades, one having a matting value of $15 (type E) and the other a matting value of $10 (type K), in the proportion of 100 tons of the former to 330 tons of the latter. The sulphurets of the second grade ore would just about

flux the silica of the high-grade ore. The gross yield of this ore would be :

330 tons at $10	$3,300.00
100 tons at $15	1,500.00
Total	$4,800.00
Average value per ton	11.16

The expense of mining, concentrating and smelting would be as follows :

	Tons.		Cost.	
Mining	430	×	$2.25 =	$ 967.00
General expenses	430	×	.17 =	73.00
Hot blast	100	×	.58 =	58.00
Coke	100	×	.38 =	38.00
Labor, power, supplies, etc.	100	×	1.45 =	145.00
Concentrating	330	×	.50 =	165.00
Briquetting	42.5	×	2 00 =	85.00
Smelting loss	100	×	1 20 =	120.00
Concentrating loss	330	×	2.50 =	825.00
Total				$2,476.00
Net profit				$2,324.00
Or, per ton				5.40

The cost of coke would have been $140 (Col. 16, Type E), but the sulphurets saved $102 worth of coke (Col. 23, type K) .31 × 330 = $102, thus bringing the coke cost down to $38.

Approximately the same results may be obtained directly by the tables.

Type E (Col. 45) = 6.95 × 100 =	$ 695.00
Type K (Cols. 70 and 73) (6.98 — 2.07) × 330 =	1,620.00
Total profit	$2,315.00
Or, per ton	5.39

Distributing the cost of treatment over the entire 430 tons, the items of cost per ton are as follows :

Mining	$ 2.25
General expenses	.17
Hot blast	.13
Coke	.09
Labor, power, supplies, etc.	.34
Concentrating	.38
Briquetting	.20
Smelting loss	.28
Concentrating loss	1.92
Profit	5.40
Average value of ore	$11.16

The two items in the above list that catch the eye are the cost of mining and the heavy loss in concentrating. To reduce the latter to a minimum requires great care in first eliminating the high-grade ore by hand sorting and by jigging, and afterwards in treating the balance of the ore so as to produce the least amount of slimes. While iron pyrite is easily saved on a concentration table, the ores of copper (bornite, tetrahedrite, chalcocite, etc.) are apt to suffer a heavy loss in the slimes; but if these are kept small in amount they may be briquetted and part of the copper loss recovered. Although in the ore mixture selected for the above calculations no limestone was required for flux, a considerable quantity of quicklime was required for binding the briquettes, and undoubtedly for a long time in the beginning of the smelting work limestone flux will be needed. It will, therefore, probably pay the company to secure its own quarry, if one can be found reasonably near the mine. It will be seen that by means of the hot blast, and by using the sulphurets for flux and fuel, the cost of coke in the above example has been reduced to nearly nothing (9 cents per ton of ore mined), and with an abundance of sulphurets it would, of course, be possible to make a more ferruginous slag; but in this matter there must be considered the question as to what is the most advantageous point in practically working the furnace. The quality of the briquettes would have much to do with this. It is probable that a saving in the cost of the hot blast can be effected by using oil instead of wood.

Owing to the use of so large a quantity of briquettes and fines, rather more than ordinary attention will have to be paid to flue dust.

To treat the 430 tons of ore of the above example would require the smelting of 100 tons of the high-grade siliceous ore, together with 33 tons of sulphurets. This would require (using hot blast) 5880 cubic feet of air per minute (Col. 32, type E), and would require for 20-ounce pressure 40 H. P. (Col. 34).

The Root blower, which was ordered for this work, has a capacity of 5000 cubic feet, or 85% of this amount, and hence would be capable of smelting 85 tons of siliceous ore (of type E) and 28 tons of sulphurets from 280 tons of ore of type K—a total of ore mined of 365 tons. Of course, these figures will vary with the variation in the ore as the mine is developed.

If a cold blast were used (Col. 31), 5000 cubic feet capacity of blower would only smelt 56 tons of ore (type E) and 18.5 tons of sulphurets, or a total of 241 tons of ore mined. The deductions from the profits per ton on account of the less quantity of ore smelted would be for the cold blast (56 tons) 39 cents and for the hot blast (85 tons) 8 cents. And if we further consider the hot blast temperature 700° Fahr., instead of 1000° Fahr., the deduction becomes (type E) 13 cents more, thus making the deductions in smelting 56 tons of ore and 18.5 tons of concentrates with cold blast 56 × (39 + 58) ÷ 241 = 22 cents per ton of ore mined. The deduction in smelting the 85 tons with hot blast becomes (.08 + .13) × 85 ÷ 365 = 5 cents per ton of ore mined.

The desirability of producing high grade matte may be seen in the matter of transportation alone, as the matte must be sent to the Atlantic seaboard for treatment at a freight cost of about $20 per ton. This means 2 cents per pound of copper if the matte carries 50%, and 4 cents per pound of copper if only 25%.

This difference in the grade of the matte would mean on a 3% copper ore (3% recovery) a difference in profit of $1.20 per ton. In case sufficient sulphurets were not added to make the ore self-fluxing, and limestone and coke were used, the value of the iron and sulphur as flux and fuel would amount to 34 cents more, making the loss $1.54 per ton of ore, even on a grade as low as 3%.

The points requiring particular attention in operating the Valley View mine are the following :

1. Economical and methodical mining.
2. Careful hand sorting of ore.
3. Classification by jigging.
4. Special care in concentration and the avoidance of slimes.
5. The production of briquetted sulphurets in sufficient quantity to avoid the use of barren flux.
6. An efficient hot blast.
7. An adequate dust chamber.
8. The formation of a high-grade matte.

(TO BE CONTINUED.)

Compressed Air in Mining.*

By T. W. BARBER.

Compressed air, as employed in mining, is one of the very few sources of industrial power to which scarcely any exception can be taken. Its advantages —putting aside for a moment questions of comparative cost—are so very obvious that it seems almost loss of time to refer to them; yet it is still in its infancy. It has been in various half-hearted ways partially adopted as a mining motive power for, at least, fifty years past. The slow development of its usefulness is explainable on several grounds. Like every other motive power, it requires time to work out the best results. A good many mistakes have been made in installing it which have operated against it, and, lastly, the installers are not free from blame. Mining engineers, as a body, are practical men and not much given to studying theory. But mining, like other industrial enterprises, is fast becoming dependent upon advanced knowledge and ideas, for methods and appliances are fast coming into use which require something more than mere experience—which are, in fact, ahead of experience, and therefore demand insight and adaptability of a high order.

We propose to deal here with one only of these modern improvements—compressed air and its applications and advantages.

Its special advantages are:

1. It can be taken by pipes to any point and used there expansively, just the same as steam, and in the same engines.
2. The pipes and the air are cool and the air loses nothing by transmission, except by leakage and slight drop of pressure from friction in transit.
3. The exhaust is cold, invisible and wholesome, being free air at low temperature, which may be much below freezing point; a welcome help to ventilation.
4. The engines, being cool, are easy to lubricate and to handle.
5. The air does not corrode the pipes internally.
6. None of the compressing plant need be in the pit—in fact, it is almost always at bank.
7. The cost of it can be kept down easily to that of steam as a motive power, if properly installed.

Air is cheap as a motor fluid, and miners are always ready for any quantity of it; but, to use it economically, it must be compressed to about the same pressure as steam is ordinarily used. Sixty to eighty pounds per square inch are ordinary pressures which can be dealt with by the ordinary commercial engines without any special attachment or design. Steam, however, is now used at much higher pressures, 100 to 180 pounds, or more, being common. But such pressures in compressed air installations require extra strength in every part and greatly increase loss by leakage and condensation. In the case of air, the cost of compression and the loss of steam by heating of the air by compression increase very rapidly with the pressure. They require extra strength in the pipes and better joints also.

A compressed air plant consists of boilers, air compressing engines, receiver or air vessel, air mains, branch mains, pipes, valves and air engines.

The character and arrangements of the plant will depend much upon the kind of mine and the work to be done below. In many mines there is no rock work, but much hauling, and in many cases driving power is required for coal cutting machines, fans, etc.

In designing a compressed air plant the proper course to pursue is first to set out a list of all the motors required, their indicated horse power, the number of hours each is expected to be at work, whether continuously or at intervals. From this list the maximum horse power demanded at any one time can be deduced.

In estimating the maximum horse power, the character of the motors must be considered. Some engineers think that any kind of a rough-made, strong engine is good enough in a pit. But this is a serious error. A pit air motor ought to work with the highest possible economy. This is obtainable without any fancy expansion gearing or extensive and complicated valve gear, by using a cut-off slide valve. No engineer should be satisfied with an engine that will not work up to a six or ten-fold expansion. The saving in a good engine from this cause alone may amount to from 10% to 40%.

A high expansion, however, unless the air is heated, produces a very cold exhaust, and, unless the air is dry, the exhaust passage may get blocked with ice. This can be avoided by making these passages large, short and direct.

Having estimated the net maximum horse power required in the pit, a percentage must be added for leakages, which depends on the quality of the pipe joints, as to which any economy in fitting up is a very questionable gain, for a leak leaks twenty-four hours per day and carries off a proportionately large amount of air.

Air mains are frequently of great length; from 1 to 3 miles are common lengths. There must necessarily be some loss by leakage and friction in the mains in such long lengths, and it follows that great care is requisite in laying them. Every pipe should be tested. Settlement of ground is a fruitful cause of broken joints or pipes. A good joint should be flexible and not easily broken by expansion or contraction, due either to temperature or settlement.

If these points are satisfactorily dealt with, the loss by leakage should not exceed 1% per mile and the loss of pressure by friction 1½% per mile. Such results have been frequently attained, and the engineer should be satisfied with no less.

The diameter of the mains and distributing pipes is important and depends on two factors—the quantity of air passing and the distance from the compressor.

Where the compressing engines are of the wet type, a good deal of water is carried over with the air into the mains, and should be trapped out at a point not far from the engines. With the dry compressor there is always some amount of condensation, which should be drained from the main, as dry air is of advantage in the motors, especially if the air is not reheated. Moist air sometimes produces a good deal of ice at the exhaust.

The diameters of the mains depend upon the maximum quantity of air to be delivered, taking into consideration also the reduction in volume it sustains by cooling after passing the delivery valves. This varies between the isothermal and adiabatic lines of the air diagram and can be readily ascertained by computing the area of the diagram outside the isothermal line, as compared with the area of the whole diagram.

It may be assumed that the air will have cooled to atmospheric temperature in about fifteen minutes, more or less, according to its delivery temperature; therefore the point along the main at which it may be reduced to its minimum diameter can be easily found.

Expansion joints should be avoided as far as possible; their place can be taken by bends, or, better still, by a flexible form of packing rings or jointing.

The velocity of the air in the mains and branches should not exceed 40 feet per second.

Sluice valves are the best to use for all purposes on air mains. The compressor is the most important item of the installation. There are wet and dry compressors. The former uses an internal jet of water to cool the cylinder in conjunction with a water jacket and the latter a water jacket only.

Where a jet is used it should be forced in by a pump during the latter part of the compression stroke, or it will be quite ineffective. Its value in cooling is doubtful, while its destructive action in the cylinder and piston admits of no doubt whatever. By all means use a dry compressor and take the inlet air direct from outside the engine house—that is, as cold as possible. This can be done by using a wood or sheet iron air trunk to the inlet valves.

It must be remembered that every degree gained in low temperature at the inlet means several degrees gained at the delivery and that the engine room air is usually about 20° higher than outside.

Another important point is provision for utilizing the air in the clearances. The most simple and advantageous method of doing this is by the bye-pass method; ports of grooves are formed in the cylinder at each end a little longer than the thickness of the piston, so that at the end of the stroke these ports pass the air compressed in the clearances to the other side of the piston, where it adds to the initial pressure of the next compression stroke.

The inlet valve should have a positive movement, so as not to require suction to open it or pressure to close it, as both these cause loss of effective stroke and reduce the capacity of the cylinder.

A positive movement for the delivery valves is not so easy to design, as these valves should be open at the moment the pressure in the cylinder reaches that in the mains, whatever it may be. This may be at

*Condensed from Analyst.

any point in the stroke, as it is customary to use spring-loaded valves, lightly sprung and of special design. If too heavy, the diagram will show delivery line at top to he several pounds ahove the receiver or main pressure. This excess pressure is not all loss, hecause the air expands at the pressure in the mains, hut it increases the temperature which it is important to keep down.

Luhrication and its effectiveness depend upon the temperature, which in hadly designed engines often reaches 300° to 350°, at which point oil scorches and produces dry, hurnt surfaces and corrosion. Gas engine oil should he used. But, if proper attention has heen given to the foregoing points, the temperature at 60 pounds should not exceed 180°.

Good pistons, well fitted to the cylinder, are of more importance than in a steam cylinder; the ahsence of steam and its moisture causes drier surfaces, and much leakage may occur which is difficult to locate in the diagram, as it merely causes the compression line to approach the isothermal, giving a false impression of high efficiency.

But the chief loss in every compressor is that due to heating during compression.

The air, after passing the delivery valves, cools to atmospheric temperature, and loses in hulk proportionately, the loss varying, according to the pressure and other points previously alluded to, from 25% to 60%, and even more.

It is in this direction that the future improvement for air compressors must he aimed.

The latest designs are of the compound or stage compression type, in which the compound principle of the steam engine is reversed, the air is compressed in two or more stages, passing through cooling coils to chamhers hetween the stages. In this way the temperature can he kept down, hut the increase of economy is not in proportion; the mechanical efficiency of the engine is reduced, piston and other leakages and losses are duplicated, and thus the chief actual gain is in the lower temperature and better luhrication.

Stage compression diagrams do not show these losses and, to this extent, are misleading. The gain hy stage compression is chiefly in working at a lower temperature than in the single compressor.

It is evident that the stage compressor does not cool the air while under compression in the cylinder, hut in external coolers after it has passed the delivery valves, whereas the cooling ought to be done in the cylinder during compression.

We have shown that the efficiency of a compressed air plant depends upon a numher of small economies and attention to details, which, in fact, make all the difference hetween an efficient and a wasteful result.

There is another source of economy which has not yet made much progress, hut presents a very promising future—that is, reheating the air hefore losing it in the motors. At first sight, one would say that what is thus gained must he lost in cost of coal or other heating medium; hut this is by no means the case.

In practice, a very small quantity of coal will heat the air in a tuhular heater to 250° or 300°, hut it is not desirahle to heat heyond 300°, and to expand the air to more than douhle the original quantity, and thus similarly augment the useful effect in the motors, hesides which the exhaust is discharged at temperature ahove the atmosphere, and freezing is thus avoided. Actual tests of the heating in this way have shown that the efficiency of the entire plant can he hrought up to 100%—that is to say, as much work can he given out at the motors as is supplied to the compressor in steam energy.

Without reheating, a plant should show an efficiency of at least 50% to 55%.

There are several ways of reheating which are more or less applicahle to all cases. A furnace and coil or surface heater is the simplest, hut is inapplicahle in fiery mines. Where steam hoilers exist underground, steam pipes can he employed to reheat the air, the temperature ohtained heing of course not more than ahout 180°. A furnace or oil hurner has heen used inside the air main, the products of comhustion passing with the air to the motors. Some simple adaptation of this plan as an appliance attachahle to any motor seems to he the hest form capahle of universal application.

Reheating enahles the motors to run with a much higher grade of expansion than with cold air. With the latter we get in the motor a reversal of the effects of heating described as going on in the compressing cylinder—that is to say, we get adiabatic cooling instead of isothermal, the effect heing to reduce the pressure and volume of the air more rapidly than is due to its expansion only. Keeping the motor cylinder hot will remedy this and induce isothermal expansion.

ARIZONA has five railroad companies controlled hy operating mining companies, to wit: The United Verde, narrow gauge, 26 miles; Congress, standard gauge, 3 miles; El Paso & Southern, standard, Benson to El Paso, via Bishee and Douglas, 260 miles; Arizona & New Mexico, Clifton to Hachita, and its hranches; Arizona & New Mexico, Detroit Copper Company's Morenci to Guthrie, narrow gauge, 18 miles, with six loops in that distance.—Globe Silver Belt.

The Golden Gate Cyanide Plant.*

NUMBER II.—CONCLUDED.

The following tahle is a tabulation of the work of the mill on sands and dusts over a considerable period of time:

Lot Number.	Material.	Number of Tanks of Sands in 50-Ton Lots, Dust in 8-Ton Lots.	Average Value of Ore per Ton in Ounces Gold.	Average Extraction Made in Percentage, Determined on the Washed Tailings.	Average Percentage Saved; Determined on the Unwashed Tailings.	Average Time Consumed per Tank in Days.	Remarks.
1.	Sands	32	0.68	81.5	79.7	5.9	
2.	Sands	32	0.76	80.4	77.8	5.54	
3.	Sands	24	0.64	79.9	79.1	7.7	This lot was turned over in vats to aerate. (See text.)
4.	Sands	25	0.51	81.3	79.4	5.75	Moistened with 20% of a 5-lb. cyanide solution at bin.
5.	Dust.	36	1.18	89.6	86.2	4.4	
6.	Dust.	22	0.86	87.6	85.0	3.7	

REMARKS ON THE TABLE.—LOT No. 1.—This was first treated with fifteen tons of strong solution, five pounds cyanide per ton of solution, followed by three tons of weak solution, two pounds cyanide per ton. This last was allowed to stand on the ore for fifty hours, and then followed hy twenty-two tons of weak solution, put on in five-ton lots as it drained off. Then this was followed hy eight tons of wash water, put on in four-ton lots, then allowed to drain, after which vacuum was applied to take off as much moisture as possihle. The total amount of solution used per tank was forty-eight tons.

LOT No. 3.—The amount of solution used in this lot was the same as in lot No. 1; hut after thirty-five tons had heen run through the pulp was shoveled over to supply oxygen and then treated with the halance of the solution. The extraction hefore the shovelling over was 75.7%, and after the turning over and complete leaching 79.7%. The ore in this lot was considerahly haser than lot No. 1, and it is certain that the turning over was of henefit, from previous experience on this class of ore. However, the extra time and lahor halanced the extra extraction.

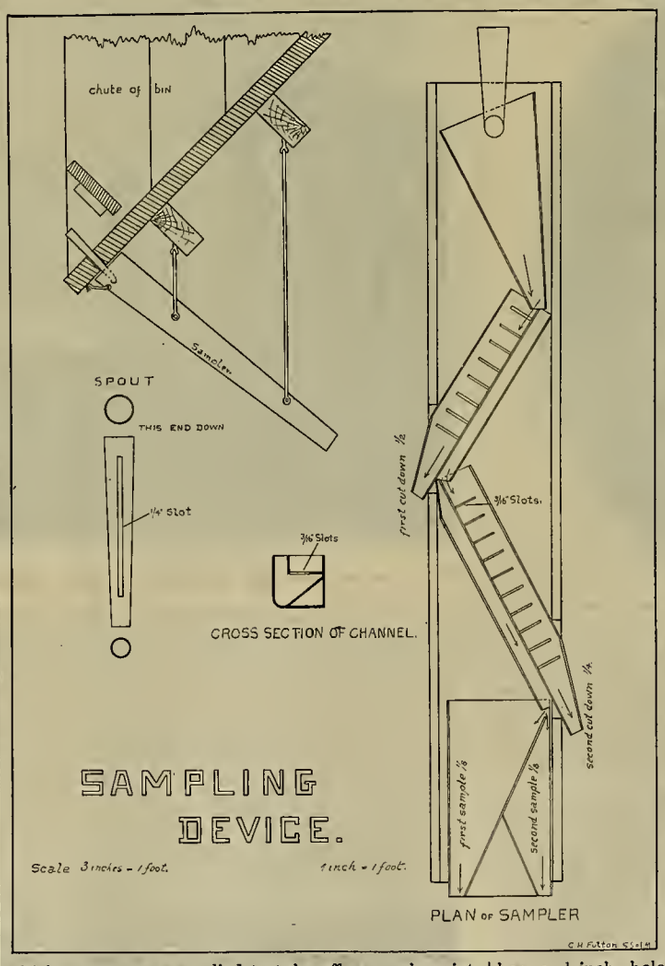
LOT No. 4.—This lot was moistened with 20% of a five-pound cyanide solution at the finished product hin. It was found that 66% to 73% of the values had gone into solution hy the time the vat was levelled off. On this lower grade of ore this method gives a somewhat hetter extraction.

Moistening with a two-pound solution was also tried, hut it was not as effective as the stronger solution. The time of exposure at the hin was also varied, twelve hours and forty-eight hours heing tried, and it was found that twelve hours accomplished as much as forty-eight hours.

LOTS No. 5 AND 6.—The treatment of these lots differed somewhat from that described under "Dust Treatment," in that all the solution used had a strength of hut two pounds per ton. Five weak solutions and one wash water were used. The slimes were allowed to settle for twelve hours, then syphoned off, 50% to 60% of the moisture heing taken out, to he replaced again hy fresh weak solution. Otherwise treatment was the same as described.

FURTHER REMARKS.—There has heen considerahle controversy in the Hills regarding the relative methods of wet and dry crushing, the wet crushing really heing a question of fine crushing. It is an indisputahle fact that in the greater part of the Potsdam ores the gold is very finely disseminated and that fine crushing is required to liherate it. Some of the ahove results would indicate that the fine material can he treated in somewhat less time, and with a higher extraction than the coarse sands, hut with somewhat more trouhle. The fine wet crushing method is coming into prominence, two mills heing in operation. It is a question whether fine crushing may not also he of advantage for those ores in which the gold is not so finely disseminated, in that hy raising the extraction and possihly decreasing the time, in spite of the more complicated plant necessary, an economy could he instituted.

METHODS OF SAMPLING ORE, TAILINGS AND SOLUTIONS.—The ore that goes through the mill is automatically sampled at the finished product hin by the following device: A tin tuhe, 10 inches long, having a longitudinal slot ¼ inch wide, projects into the discharge spout of the hin. The material which enters this tuhe is discharged on an inclined shallow trough, provided with diagonal tin troughs, perforated with narrow slits at right angles to their length. Part of the material passes through the slits and part over them, this last heing discarded. What passes through the slit is deflected to a similar tin trough again, heing halved as hefore, and what passes through is split into two equal parts hy a deflecting sheet of tin, making a final duplicate sample. (See drawing for detail and further explanation.) This device samples automatically whenever the discharge spout of the hin is opened. The device has heen checked against samples taken hy coning and quartering from the hin product, and also hy sampling the ore after it leaves the Gates crusher, taking out every tenth shovel and quartering this product down. It agrees very closely with hoth of these methods.



SAMPLING THE TAILINGS.—The tailings are sampled in the vat hy a pipe sampler, twenty samples heing taken around the outside circumference. Two assays are made on this material, one on the washed sample and one on the sample hefore washing, to determine what goes to waste hy retained solution.

SAMPLING THE SOLUTIONS.—The solutions are sampled at the head and end of the hox by means of drip samples. The elhow which turns the pipe into the hoxes has a ⅛-inch hole into which a cork fits, through which passes a bent glass tuhe, attached to which is a piece of ruhher tuhing. At the end of the tuhe is an adjustahle clamp, which regulates the drip. The drip is caught in an old acid hottle, and hy these means a very fair sample is ohtained. In thus regulating the drip hy an adjustahle clamp a hetter sample is ohtained than where no clamp is used, simply allowing the ruhher tuhe to reach to the hottom of the hottle and letting the excess overflow, as is the practice in some mills.

THE METHOD OF TREATING THE PRECIPITATES.—The precipitates are separated in the cleanup into the

* Bulletin No. 5, South Dakota School of Mines.

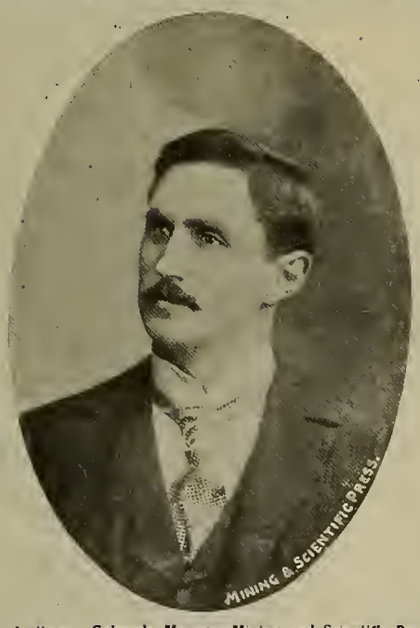
fine slimes and the coarser zinc thread which has been attacked enough to pay to treat. The fine material, after being thoroughly washed on the circular filter already mentioned, is treated with dilute sulphuric acid, one part acid to two parts water, until most of the zinc has been dissolved, then washed and dried and smelted with 75% of its weight of the following flux: Four parts of borax, two parts of soda, one part of nitre, one part of sand. While molten the fusion is thoroughly stirred with green wood, the same process known as "poling" in copper metallurgy. The product from this first melt is remelted with some borax and a little nitre to refine, a little bone ash being also added. The bullion contains very little silver and about 10% of base metal. The fine slimes represent about 90% of the value of the total precipitate. The coarser material is first dried and then roasted at a dull red heat in a covered sheet iron pan, 10 square feet area and 10 inches high, which is set on a large wood-burning stove. The roasted product is then smelted directly with the addition of the above flux. The slag bottoms from the melts are crushed and panned, the pannings melted with lead and the button cupelled. The balance of the slag is sent to the smelter.

The power for the mill is furnished by two boilers, return tubular, rated at 60 H. P., and a 55 H. P. Buckeye engine. Cost of fuel at the mill is: Sheridan coal, $4 25 per ton; mine run, $3.50 per ton; 4-foot wood, $3.60 per cord.

THE NUMBER OF MEN EMPLOYED AT THE MILL.—Day shift—One crusher man, one drier man, one roll man, one oiler, one engineer, one blacksmith, one solution man, two shovellers, one foreman, one assayer, one assayer's helper, one superintendent. Night shift—One crusher man, one drier man, one roll man, one oiler, one engineer, one solution man. Making a total of nineteen men.

Our Colorado Manager.

Herewith appears a portrait of our new Colorado manager, Mr. Edwin J. Moore of Denver, who on the 12th inst. assumed charge of the interests of this journal for the State of Colorado. Mr. Moore has a handsomely fitted-up office at 606 Mack Building, corner 16th and California streets, Denver, Colo., where he will be pleased to meet friends and patrons of the MINING AND SCIENTIFIC PRESS. He has had six years intimate business acquaintance with the mining and business interests of the commonwealth of Colorado and is well and favorably known therein.



E. J. Moore, Colorado Manager Mining and Scientific Press.

A NEW ZEALAND novel prospecting plant, in use by an amateur prospecting party in that country, is described in an exchange as follows: It consisted of a complete hydraulic elevating plant and a prospecting spoon to test the bottom of a river. The whole appliances were so designed that when they were put together they formed a wheelbarrow. The spoon was composed of an old oil drum, attached to a long handle (the detached shafts of the wheelbarrow, spliced together). On the end or mouth of the spoon was a spring trapdoor, which was let go when the spoon was supposed to be full, and the contents were thus prevented from running out. A small ripple was fixed in the bottom of the spoon to catch the gold. The hydraulic department of the plant consisted of about 40 feet of canvas hose with a nozzle attached, and some 6 feet of 6-inch elevating pipe, and the way in which it worked and the quantity of stuff it put through was somewhat surprising. Twenty minutes would transform the whole affair into a wheelbarrow again, and off the prospectors would go to the next gully.

The Otto Aerial Wire Rope Tramway.

As far back as 1644, cars or buckets were carried on ropes, the first account of such system of telpherage coming from a Dutch engineer, Adam Wybe, who in that year carried little buckets loaded with earth across the Moar river, Dantzig, Germany, by a ropeway. For two centuries after little was done, beyond some primitive construction at Klausthal, Germany; but in the last half of the nineteenth century the system developed proportional to the general advance in all scientific appliances.

The designing and construction of wire rope tramways is now a distinct and important branch of engineering, and the matter has engaged the attention of many bright men, with the result that the wire rope tramway is a foremost factor in the problem of transportation, especially where the local situation precludes the employment of other systems of carrying.

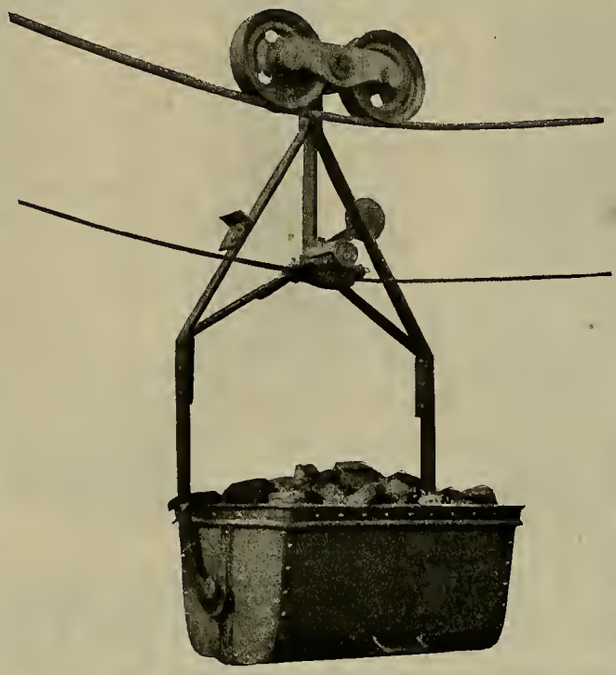


Fig. 1—The Otto Aerial Wire Rope Tramway.

In this regard the Otto aerial wire rope tramway is deemed worthy of note. In this system are two stout wire cables of special construction, the carrying cables forming two tracks on which the cars run, laid parallel in the same horizontal plane on supporting structures of wood, or iron and steel, of varying heights, and tightly stretched in a straight line between two successive stations.

On one of the carrying cables the loaded cars run in one direction, while on the other cable the cars return, usually empty. The carrying cables are anchored at one end, while at the other a tightening or tension gear is provided. The cable ends are here connected to chains or pliable ropes passing over pulleys and attached to balance weights, which are determined by the admissible stress on the cables. In this manner the carrying cables are always equally stretched, the weights rising or falling according to the sag of the cables, due to the weight of the cars and to the expansion or contraction of the cables in consequence of changes in temperature. The car forms an important part of the tramway. An

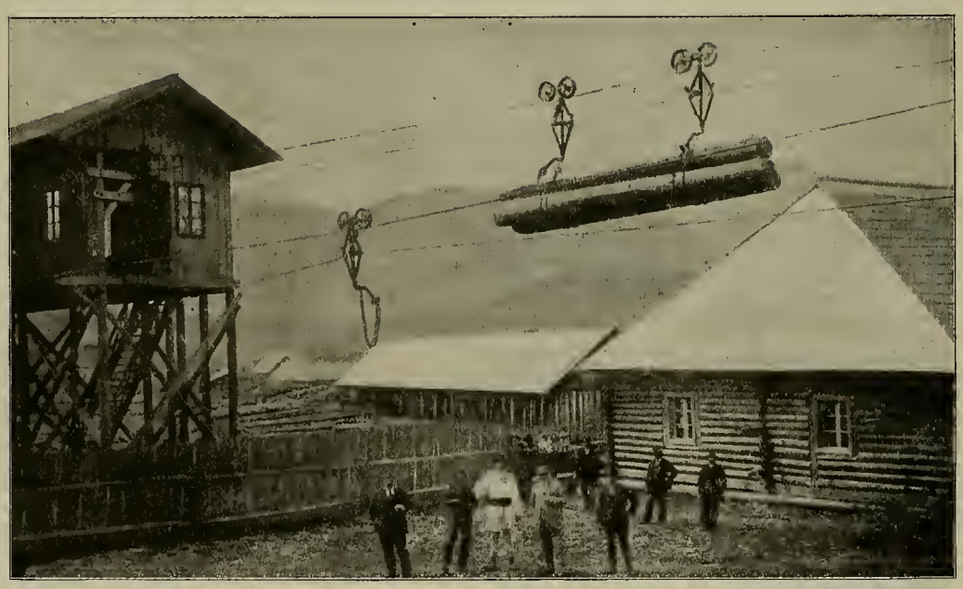

Fig. 2—Otto Aerial Wire Rope Tramway for Transport of Logs, in Cimpa, Hungary; 11¼ Miles Long; Capacity 40 Tons Per Hour.

Fig. 3—Otto Aerial Wire Rope Tramway for the Krupp Mines, in Sayn, Germany; 1558-Foot Span; Length of Line, 12,946 Feet.

ordinary car consists of the truck or carriage, the hanger, the grip and the bucket. The latter hangs perpendicularly under the carrying cable, and forms the lowest part of the car, while the truck running on the carrying cables forms the top part of the car. The hanger to which the grip is fixed connects the truck with the bucket, as illustrated in Fig. 1.

The truck or carriage consists of two grooved steel wheels, placed one behind the other, the axles of which are fixed in two steel plates. The latter are riveted to a distance piece in the middle between the wheels, so as to form one solid frame. The axles of the wheels are made of phosphor bronze and are screwed at both ends into the two steel plates mentioned above, thus forming two distance bolts. These axles are hollow and filled with a lubricant. Through suitable holes the lubricant reaches the circumference of the axles, lubrication being effected automatically.

Fig. 2 illustrates how, for the transportation of lumber, timber, tubes, iron bars, etc., two cars coupled together are employed.

Fig. 3 illustrates an Otto aerial wire rope tramway at the Krupp mines in Sayn, Germany. This tramway, built for transport of iron ore, connects the mine with a narrow gauge railway. The length of the line is 12,956 feet, with an average fall of 1.21 and a required horse power of 3.5. The tramway passes over uneven ground and the longest spans on the line vary from 646 and 1640 feet. All supports are of iron. At the loading and power station at the mine the tramway cars are loaded from bins, through ore chutes with sliding gates. The unloading station of the tramway is located at the loading track of the railway, and is so arranged that the tramway cars are dumped in bins provided with chutes and from which the railway cars are loaded. An elevator or lift is also installed for raising the coal brought by the railway, up to a bin from which the tramway cars are loaded, and the coal transported to the mine.

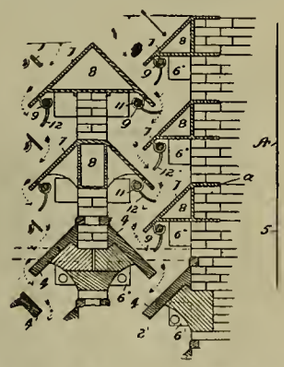
Carl Binder, engineer and contractor, 103 Randolph St., Chicago, is the sole licensee for supplying this tramway, and will furnish such detailed information concerning it as any of our readers may require.

Mining and Metallurgical Patents.

Patents Issued May 13, 1902.

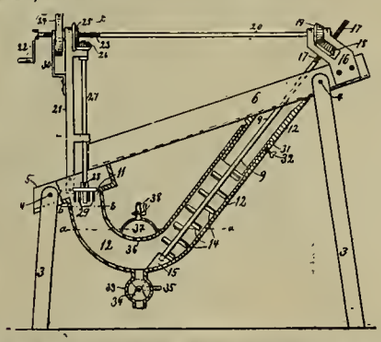
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

QUICKSILVER FURNACE.—No. 699,822; R. Scott, San Jose, Cal.



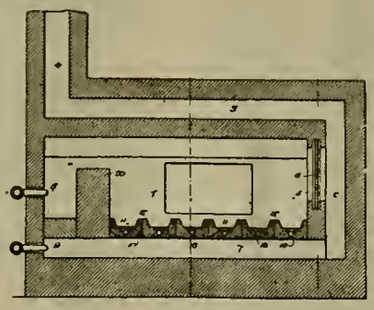
Quicksilver furnace provided with series of tiles over which the ore is adapted to pass, flue formed in one or more tiles through which gases from ore are adapted to pass, means for directing gases from ore to flue.

GOLD SEPARATOR.—No. 699,885; R. C. Lester, Mapleton, N. D.



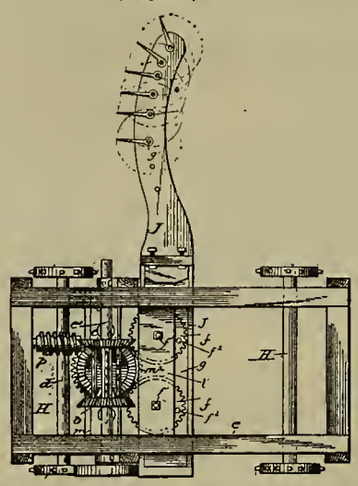
Gold separator having in combination pipe curved downward near middle, or between ends forming short and long inclined arm, vacuum chamber at upper side of curve, opening into pipe having petcock at top, chamber and curve of pipe, adapted to contain mercury; inclined stirrer shaft in long arm of pipe for driving and stirring water mixed gold holding sand through pipe, stirrer at outlet end of short arm of pipe for separating mercury and gold from sand or gravel before it leaves machine, means for connecting and driving or operating stirrers, means for providing current of water to pass through pipe.

METALLURGICAL FURNACE.—No. 699,759; J. A. Hunter, Philadelphia, Pa.



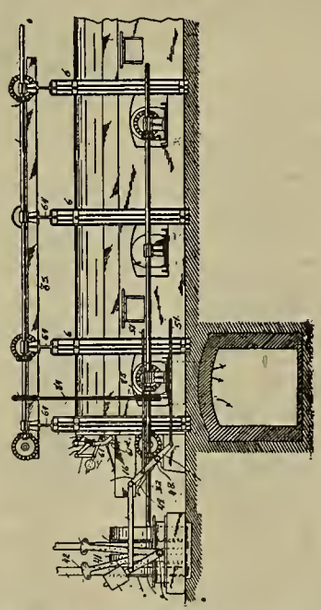
Metallurgical furnace having working chamber with bottom provided with ribs or projections for support of material to be treated, means for heating material by gaseous products of combustion introduced into working chamber, provision for introducing fluid treating agent into working chamber, independently of gaseous products of combustion.

COAL MINING MACHINE.—No. 699,864; J. Burton and W. B. Lodwick, Mystic, Iowa.



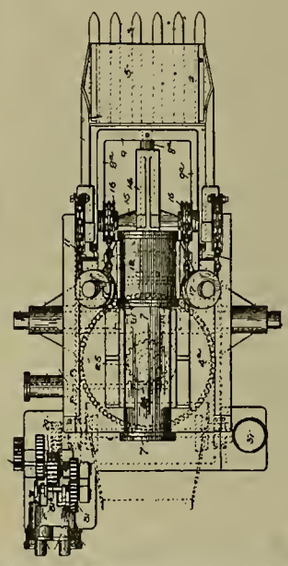
Coal mining machine, combination with frame having rotating shaft with sidewise movable beveled gear wheels arranged at suitable distances apart thereon, girths arranged one above other, slotted slide mounted on upper girth, vertical worm-shaft having upper end journaled in upper girth passing through slot slide, bevel gear on upper end of worm shaft, cog gear wheel on lower end thereof meshing with crank wheels journaled on cross bar of frame, cutter bar drive shaft, cutter bar with teeth mounted on crank pins of crank wheels, whereby longitudinal and vertical movement is imparted to cutter bar.

APPARATUS FOR ROASTING AND COOLING ORES.—No. 700,135; W. C. Davis, Denver, Colo.



Ore roasting and cooling apparatus; combination roasting chamber and hearth, of rabble carriage located in roasting chamber arranged to cause ore to travel toward rear extremity, carriage having side bars on opposite sides of hearth, propelling wheels along sides of hearth, engaging side bars of carriage, shafts outside roasting chamber extending longitudinally, geared to carriage propelling wheels, two longitudinal shafts connected in operative relation, means for transmitting motion to one shaft, cooling hearth, rabble carriage arranged to cause ore to travel from its rear extremity toward forward extremity, propelling wheels engaging carriage, shafts connected with wheels for operating, means for transmitting motion from one operating shaft to similar shaft of cooling hearth carriage, means for automatically reversing rotation of carriage operating shafts when carriages have reached limit of movement in either direction, rabble carriage of roasting chamber arranged to cause ore to travel rearwardly and discharge at predetermined intervals at rear extremity of chamber, while rabble carriage of cooling hearth is arranged to cause ore to travel forwardly, means for receiving each ore discharge from roasting chamber, automatically elevating it separately to rear extremity of cooling hearth, operation of ore receiving and elevating means being so timed with reference to travel of rabble carriages, that ore is carried upwardly and discharged on cooling hearth during forward movement of carriages, ore receiving and elevating mechanism making return movement while carriages are traveling rearwardly.

PNEUMATIC SHOVEL.—No. 699,680; L. Hanchett, Idaho Springs, and W. C. Davis, Denver, Colo.



Combination with suitable truck, of chute carried at rear thereof, arms having sliding and pivotal connection with truck, single shovel carried at forward ends of arms, means carried by truck for reciprocating arms, raising and lowering them whereby shovel is filled, raised, retracted and contents dumped into chute, operating platform at one side of truck, out of path of shovel, means on platform for controlling mechanism for operating shovel supporting arms.

INCRUSTATION PREVENTIVE.—No. 699,684; E. Holm, Chicago, Ill.

Metallic composition for preventing incrustation in steam generating appliances, consisting of zinc, tin, antimony, mercury and nitrate of silver; the zinc being present in greater proportion than that of tin, proportion of tin being greater than that of antimony, proportion of antimony greater than that of mercury, proportion of nitrate of silver being less than that of any other element.

THE island of Formosa, close to the coast of China, was for many years nominally ruled by the Chinese and practically closed to foreigners. At the close of the war with China the island was transferred to Japan, and the Japanese are taking measures to develop its resources. Formosa already contains coal mines, which are now being worked on a larger scale than ever before. Placer gold has been saved by the wild tribes of the interior. Copper and iron ores are said to exist in several places, and there are indications of petroleum. The island is beginning to be better known by foreigners, and the Japanese are quite willing to admit foreign capital.

AN artesian well in Grenelle, France, took ten years of continuous work before water was struck, at a depth of 1780 feet. At 1259 feet over 200 feet of the boring rod broke and fell into the well, and it was fifteen months before it was recovered. A flow of 900,000 gallons per day is obtained from it, the bore being 8 inches. At Passy, France, there is another artesian well 1913 feet in depth and 27½ inches diameter, which discharges an uninterrupted supply of 5,500,000 gallons per day; it cost $200,000. An artesian well at Butte-aux-Cailles, France, is 2900 feet in depth and 47 inches diameter. These are all surpassed by an artesian well in Australia, which is 5000 feet in depth.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

KETCHMAK BAY.

The Aurora G. M. Co. of Cook's Inlet are about to install a plant equivalent to thirty stamps on their property at Ketchmak Bay.

ARIZONA.

On the 19th the United States Supreme Court affirmed the decision of the Supreme Court of Arizona in the case of the United States vs. the Copper Queen M. Co. The claim grew out of the use of timber said to have been cut on the public domain by the mining company, the timber being valued at $183,000. The mining company contended that the taking of the timber was authorized by law, and the effect of the decision is to uphold that contention.

COCHISE COUNTY.

The Bunker Hill M. Co. of Tombstone will put men to work on their properties soon.

At the Cananea copper works is a slag steam generator, which consists of two boilers, one on top of the other, the two connected by a valve large enough for the slag to drop through. The slag from the smelter furnace is run through a large settler, covered to prevent the escape of heat. When desired, a valve at the top of the upper boiler is opened and the molten slag run into a slag bucket above the water in the boiler, fitting so closely that no steam escapes. Then the valve is closed and by a lever the slag bucket is inverted. The slag usually breaks into fragments about the size of gravel as soon as it strikes the water. This, however, is insured by its striking against an iron grate. The greater part of the heat is taken from it here. Then the valve at the bottom of the upper boiler is opened and the slag gravel drops into the lower boiler. By the time it reaches the bottom of the lower boiler it is cooled. Then the valve between the two boilers is closed and the water pumped from the lower boiler into the upper boiler, which is opened and the slag gravel falls into a car and is rolled away to the dump. The new generator will be 35 feet high.

The Gold Hill M. Co. has resumed work on the Eagle group of the Riggs lead. The Hilltop Silver-Lead M. Co. has run through a body of concentrating ore 100 feet from the surface. They are cutting out a station and will sink a winze. The ore body averages well.

The South Bisbee mines are reported sold for $1.000,000 to G. R. Campbell of Calumet, Mich. The holdings are near the Bisbee townsite, Arizona. There are forty-six mining claims. Reduction works may be built.

The new Copper Queen smelter at Douglas is to be controlled by a separate corporation, the Douglas Reduction Co., which has acquired forty acres. The smelter is to be 235x150 feet, the power house 200x400 feet. All these structures will have railroads within them. The machine shop and foundry will be built at once. The ore received by railroad will bo mixed in pits instead of at the furnace mouth as usual. There will be no ore bins, but instead three pits, 38x100 feet, 12 feet deep. The three pits will lie parallel, will be lined with concrete, and will have a capacity of nearly 100,000 tons of ore. In each of the pits will be a traveling steam shovel that will hoist the mixed ore into cars on trestles 18 feet above. At the smelter the ore supply tracks will be 50 feet in height, thence the main work of handling the charges will be by gravity.

The city of Bisbee has granted the Bisbee West M. Co. a water franchise, the company guaranteeing to furnish at least 75,000 gallons every twenty-four hours.

GILA COUNTY.

The Arizona-Colorado C. & G. M. Co. will develop the De Closs group of mines in Irene gulch, three miles north of Globe.

The Black Warrior C. Co.'s plant, including acid works, leacher and melting furnace are treating 100 tons daily of Montgomery ore. The development of the company's mine in Gold gulch, which is expected to furnish all the ore for acid manufacture, is under way.

GRAHAM COUNTY.

At Clifton the Shannon smelter is running successfully. Shipments of copper have begun.

MOHAVE COUNTY.

H. L. Pickett, formerly of Silver City, N. M., owns the Savanic copper mine. Eight cars of ore averaged 25% copper. The owners have been working only a small force, as there is a wagon haul of 140 miles and 300 miles of railroad transportation to land the ore at the smelters, the freight rate being $30 per ton. Mr. Pickett says there are 3000 tons of ore on the dump that will average 15% copper.

PINAL COUNTY.

At Florence the Mammoth cyanide plant has suspended operations, having treated all the tailings on hand. The work of sluicing the old tailings for the recovery of the wolframite will continue The value is molybdic acid. Wolframite is composed of molybdic acid and lead, usually in the proportion of 40% of the acid to 60% of lead.

YAVAPAI COUNTY.

C. L. Barker, general manager Monarch G. & C. M. Co., Jerome, will sink a double-compartment working shaft 500 feet.

A strike is reported in the Cypress mine, Big Bug. The ore is sugar quartz, impregnated with native and black sulphide of copper.

L. W. Felt, general manager Model M. Co., and J. McGinn, assistant general manager, report that the mine will be reopened. The property has been closed down on account of litigation. It is developed by a shaft 300 feet deep and has drifts extending 100 feet each way. It is stated that the ore body is 4 feet wide and that the ore ranges in value from $150 to $200 per ton gold. L. W. Felt is now Supt. at the McCabe.

Supt. Harrington Blauvelt has forty-five men at the Cash mine and mill. He has five men at work at the Monte Cristo camp on Groom creek and is sinking below the 200-foot level.

The Verde S., Dev. & Ore Pur. Co. has succeeded the Grand Prize Co., operating in Tonto Basin. There is a 90-ton smelter on the Grand Prize group.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence.)—At the Keystone the new 300 H. P. compressor driven by 300 H. P. electric motor has been started and is running very satisfactorily. The company is operating their hoist by compressed air and has recently installed eight machine drills. The mine is now well equipped with air driven machinery. All ore and water will be handled by compressed air and considerable reduction in operating expenses will be effected. C. E. Bunker is Supt.

Amador City, May 17.

(Special Correspondence) —At the Mitchell mine R. L. Chase, M. E., has the mortar blocks ready and the timbers framed for the 20-stamp mill, which will be running July 10. Water will be the motive power, and the Gates crusher, mill and concentrators will each have a separate wheel.

The tunnel at the Horn mine, near Defender, is now in 200 feet and in 100 feet more it is expected to tap the ledge 100 feet below water level. The ledge is small and high grade and has to be shipped to Selby's for treatment. Some samples assayed by Supt. Thomas of the Gwin mine went $503.

Drifting along the vein is still continued by the Edinburgh Gold Mining Co. An upraise has been commenced to connect with the perpendicular shaft. The ore shoot is now exposed 200 feet with every indication of continuing.

At the Tuscano mine the Amador Phœnix Co. is driving levels at the 100 and making preparation to stope. The management has under consideration the advisability of sinking the shaft 200 feet farther.

Wieland, May 20.

A strike has been made in the Wildman mine at Sutter Creek, at the 1350-foot level.

A quantity of rich quartz is reported in the Central Eureka mine, on Sutter hill.

At the Gwin mine some high-grade rock has been struck at the 1750-foot level.

The Oneida mine has installed a new pump. Sinking will be resumed. The mine is down 2100 feet vertical.

At the South Spring Hill mine, the management will open up the mine, erect a larger hoist and install new machinery. The old mill will he replaced by a new one. This mine adjoins the Keystone on the south.

The Bay State mine, north of Plymouth, is now employing twenty men; the 10-stamp mill is at work. Sinking at the 800-foot level will begin.

Good ore is reported found in the 800 level of the Bunker Hill mine at Amador City. Electric power is to be installed at this mine with a compressor, which will run the hoisting engines and pumps.

The Richards ranch, near Sutter Creek, has been bonded to the Nixon P. M. Co. L. Nixon of Jackson is Supt.

C. D. Lane has begun primary work on the Ballard & Martin claim, 4 miles north of Plymouth, in charge of W. I. Smart of Placerville.

BUTTE COUNTY.

The Dutch Ravine gold mine has incorporated, with P. P. Austin, W. R. Pond, C. M. Armistead, L. Niateo and W. F. Gates. The mine is southwest of Hurleton and was formerly worked by H. Clowe. The development consists of a double compartment shaft, 150 feet deep, with a drift running 350 feet southwest and 600 feet northeast.

CALAVERAS COUNTY.

Manager Cortmarsh of the Fanny Marie mine at Glencoe says a shoot of ore is struck in the 300-foot level. The ore body in the upraise from the 300 to the 200-foot level looks well.

The first payment on the bond of the Sargent mine at Middle Bar has been made and the deed placed in escrow. W. R. Thomas of the Central Eureka is Supt., and work has begun.

The Reliance mine, near West Point, will be started up this week.

The Golden Gate M. & M. Co. will put an engine and hoist on their mine near Bear mountain.

EL DORADO COUNTY.

The Mount Pleasant M. Co. is incorporated; directors, J. Levaggi, A. Brown, M. P. Morgan, J. J. Davis and F. J. Solinsky; headquarters, San Andreas. The Mount Pleasant mine is near Grizzly Flat, has been worked a depth of 925 feet and has drifts and crosscuts every hundred feet, which cut through ore. The mill has been rebuilt. The mine is under the management of F. G. Jackson. Twenty-five men are at present employed.

The Lucania M. Co., working a placer mine at Sportsman's hall, near Placerville, has installed 4000 feet of 15-inch pipe. M. Hughes is Supt.

T. Clark let the extension of the Big tunnel of the River Hill mine at Placerville—a distance of 1700 feet—to F. E. Huber. The tunnel is to be 7 feet high, 6 feet wide at the bottom and 4 feet 6 inches wide at the top with a side drain 8 inches deep.

W. I. Smart will work the Crown Point mine, east of Diamond Springs. The mine will be unwatered.

A. Harpending will work the Union mine this season.

The California Slate Co., operating near Placerville, shipped a carload of slate recently.

G. Hofmeister has sold the Laukamp property to Meyers & Perry for $200.

KERN COUNTY.

The Inyo G. Co. is incorporated. The company owns seven claims 8 miles from Ballarat.

The Barstow mill is shut down for repairs.

Three teams are now hauling ore from Bagdad mines to railroad. One hundred tons per day of ore rich enough to justify the wagon haul are being taken out and piled awaiting the completion of the railroad. Work on the Bagdad mines is confined to developing, this being entirely in ore; the forty-seven men now employed daily take out 125 tons.

Connections have been made in the Val Verde mine, Johannesburg.

MARIPOSA COUNTY.

A prospect has been opened up near Bear valley by Oyler Bros. and L. B. Chenoweth. A sample crushing of fifty-nine tons from the mine yielded $20 per ton, the rock being sorted.

In the claim owned by Barnard Kane and John Smither on Mt. Buckingham, they have finished a tunnel to tap the ore. The vein was struck 90 feet below the surface, average width 36 feet. The walls are slate. The ore is said to run $4.50 to $7.50 per ton.

MONO COUNTY.

R. T. Pierce, superintendent of Crystal Lake Co. of Lundy, will ship to the smelting company about 500 tons of concentrates.

PLACER COUNTY.

The owners of the Eclipse mine at Ophir will develop the property by sinking the main shaft several hundred feet deeper and drift each way on the lode. The new hoist has been started with water.

At the Eureka slate quarry a tunnel 500 feet long will be run, to be used for drainage purposes. The Eureka Slate Co. has shipped thirteen carloads of slate since Jan. 1st. Each car contains about eighty squares; at $10 per square there is money in it.

Fifteen men are employed on the Baltimore mine near Forest Hill.

At the Sailor gravel mine at Canada Hill the main tunnel is in 460 feet. Pumping machinery will be put in and breasting carried on while lower tunnel is being run.

The Bob Lewis No. 2 gravel mine at Damascus is being developed hy an Eastern company, G. Knutzen, manager; H. M. Jarvis, Supt.; purchase price $20 000, to be paid next August. The main tunnel is in 1300 feet.

The Eclipse mine, 2½ miles from Auburn, owned by F. D. Hussey, is in operation with three eight-hour shifts. The shaft has been retimbered from the surface. Hoisting works have been constructed with new machinery run by water power, a pipe line laid up the hill from the works 2200 feet.

SACRAMENTO COUNTY.

The new dredger at Teat's Flat, near Folsom, resumed operations May 16th. The capacity is about three times that of the one now operating at Mississippi Bar, there being a string of thirty-five buckets each with a capacity of 5 cubic feet. The size of the hull of the boat is 86x30 feet. Electric power will be used to operate the machinery, there being six motors, consuming a current of 200 H. P. Three shifts of three men are required to operate the boat. Fifteen men in all will be given employment.

SAN BERNARDINO COUNTY.

(Special Correspondence).—The Grand Central group of mines is located 50 miles down the Colorado river from Needles, 37 miles below Mellen, the nearest railroad station, 12 miles from the county wagon road at West Wells, and near the old Rincon steamboat landing. The formation of the district is chiefly granite and porphyry. The group consists of six claims. The northeast end of this mine is only a few feet from the banks of the Colorado river. Three tunnels are in 80, 40 and 30 feet, respectively. The ore is free milling, the value gold. All of the claims are much higher than the surrounding valleys and ravines, and slope toward the river. On the Grand Central group the veins are regular, well defined and average from 3 to 6 feet in width. The millsite is on the river bank adjoining the mines, and only 300 feet of pipe would be required to bring in a water supply. Mesquite and iron wood fuel cost from $2 to $2 50 a cord. The claims are owned by Gilroy, King & McGraw, the latter being Supt.

Yuma, Ariz , May 16.

SAN DIEGO COUNTY.

The Noble gold mines, near Julian, are under option to J. H. Thring for $30,000.

SAN FRANCISCO COUNTY.

The Standard Oil Co. has bought the Arctic Oil Co.'s works, including their plants, docks, facilities, tank lines, tank cars, wagons, and the various offices. The Arctic Co. will probably go out of business. This transfer will be a blow to the independent oil companies, both in the East and on the Pacific coast, being at the mercy of the Standard oil trust in the matter of illuminating oils.

SAN LUIS OBISPO COUNTY.

Los Burros district, in the extreme northern part of San Luis Obispo county and the southern part of Monterey county, report activity. Nuggets ranging in value from 50 cents to $1200 are reported found in the loose soil.

The Ralston people are taking out coarse gold on Spruce creek, and gold has been found on the south fork of Willow creek.

The New York mine will soon have a mill up and running on rich ore. H. C. Dodge has bonded the Grizzly property to W. D. Murray and C. W. Burge, who have incorporated as the Mother Lode M. & M. Co.

The tin pipe plant on the claim of the Madrone Quicksilver Co., in the Josephine district, is in process of installation. The furnace will be ready to fire this week. A Los Angeles report says the crude extraction on a small scale yielded 50% of quicksilver.

SISKIYOU COUNTY.

In the Yellow Butte mines, owned by H. J. Sarter and associates, 12 miles east of Edgewood, copper in the ore assays as high as 30%, with $4 to $6 in gold. A small streak of ore on the foot wall carries a little platinum. A shipment of a carload of this ore to the smelter proved satisfactory; but, owing to the low price of copper, the owners will continue development work and store the ore extracted. The cost of transportation is great, as the ore has to be hauled 12 miles to Edgewood, the nearest railroad station.

Bjork & Silva have run a tunnel 400 feet in the mountain north of Hawkinsville to strike their ledge lower down.

C. N. Gordon is prospecting a quartz ledge at Hawkinsville.

Wyke & Davidson have recently discovered rich quartz mines at Salmon river, near Etna.

STANISLAUS COUNTY.

T. Donohue, foreman of the dredging company at La Grange, has started a second steam prospecting drill. The company has secured nearly 4000 acres of river bed, lowlands and hydraulic land for dredging purposes.

TUOLUMNE COUNTY.

The Confidence G. M. & M. Co. at Confidence will put in a new 100-ton cyanide plant.

Gold dredging operations at La Grange are being conducted by Col. Doolittle, Alex. Brown and Maj. Wiltsee. They are

operating a steam drill. The company has bonded 1400 acres of gravel land, 17½ miles of ditch carrying 5000 inches of water. An electric power plant will be built at La Grange.

W. H. Beynon of Rawhide has sold to C. W. Knox of Columbia the F. B. Gandy and Blue Bucket quartz mines, north of Rawhide.

The Yankee Hill M. Co. has bonded a claim at the head of Experimental gulch.

C. P. Hall has struck pay ore on a claim he has located on Moccasin creek, near Big Oak Flat. Some of the rock is good enough to pound up by hand.

J. McCready has made a strike on his claim, from which up to date his returns amount to $1200.

The Cosmopolite, Two Brothers and Longfellow mines have already got started up on a small scale, and it is reported that the Nonpareil Co. is to do extensive development work.

COLORADO.

ARCHULETA COUNTY.

The Omaha M. Co., Pagosa Springs, W. R. Black manager, have ordered hoisting and mining machinery.

BOULDER COUNTY.

Of the Melvina mine at Wallstreet the Miner says it holds first place in having produced from the first assessment shaft $20,000, in sinking a distance of only 20 feet.

The Orphan Boy at Copper Rock is to be equipped with machine drills. Work will begin on the tunnel as soon as the machinery is installed.

CHAFFEE COUNTY.

On July 1, the Monarch mine of Leadville, owned by the Ohio & Colorado Smelting Co., which is building a smelter at Salida, expects to begin shipping 300 tons of ore a day. The manager is T. Goodwin. The company has already expended and contracted for $200,000 worth of material. Arrangements are made for storage ore bins so that 500,000 tons of ore can be carried as a surplus. The three boilers are 200 H. P. each. An apartment 40x120 feet will contain the four lead furnaces, capacity 150 tons each. The matte furnace room is 40x60 feet and will contain a matte furnace 250 tons capacity and also a combination furnace for handling the lead matte. The flue chamber will be 675 feet long. The stack is 30 feet at the base and 150 feet high.

In the Orient mine, operated by the Colorado Fuel & Iron Co., large bodies of excellent grade iron ore have been opened.

CLEAR CREEK COUNTY.

Consolidation of the Hidden Treasure group at Empire and the Edinburgh group on Republican mountain, near Georgetown, under the title of the Hidden Treasure M. Co., combines properties superintended by J. F. Standish, who has shipped 117-ounce silver ore from a drift on the Edinburgh.

C. L. Burt has bought the Vulcan group above Silver Plume. Work goes on under the direction of Supt. Decker.

A new vein on the property of the Omar G. M. Co., Idaho Springs, has been opened in the tunnel 400 feet in, which yields 18 inches of $20 ore.

Regular shipments are being made from the Fraction mine of the Occidental Dev. Co., of which W. Redding is manager.

Lessees on the Aliunde mine have received returns on seven tons at $235 per ton, and on twenty-four tons at $85 per ton.

The I. S. M. & R. mill has its 30-stamp amalgamating section complete, and running constantly. The company have a lease and bond on the Modoc group.

The Burns Moore tunnel is working two drill shifts, and breaking down 8 feet a day. The tunnel is in 630 feet.

DELTA COUNTY.

A gold discovery is reported in the Crystal Creek region, 30 miles south of Hotchkiss, on the north side of the Black mesa. The formation is a brownish quartz interspersed with yellow talc. The Black mesa is a high, wide strip of mountain country lying between the North Fork valley and the Black canyon below Gunnison, and is practically a continuation of the Elk mountains extending west to the Black canyon of the Gunnison. The nearest and most practicable route to Crystal creek is by way of Hotchkiss. One hundred claims have already been staked.

DOLORES COUNTY.

The Mt. Goram M. & M. Co.'s mill at Dunton, is running on ore principally from the Altmont vein, although much of it is being taken from the Smuggler vein.

CUSTER COUNTY.

A strike is reported in the Hector mine at Querida. Jennings Bros. have opened a body of ore 200 feet by 70, which will yield one ounce free milling ore to the ton. The property is bonded to C. H. Haskell of Silver Cliff for $250,000.

The Custer City M. & R. Co. of Pueblo and Custer City is working men on the Whistle property adjoining the Bassick.

EL PASO COUNTY.

The new Portland mill at Colorado City will not be completed before June 15, on account of delay in receiving machinery and steel contractors behind on their contracts.

GILPIN COUNTY.

For the first week of May the shipments of smelting and crude ore, concentrates and tailings from the Black Hawk depot to the smelters and outside points of treatment were 121 cars of 2240 tons.

The Swamp Angel mine, in Eureka district, is being operated again after a long idleness.

The Bertha M. Co is sinking its Colfax shaft at the head of Elkhorn gulch.

Work upon the new miners' sampler in Central City has begun in charge of E. L. Olden.

Operations on the Terrible group are continued. Ten tons were shipped by leasers, which yielded 104 ounces silver, .09 ounce gold and 48% lead, a money value of $70 per ton.

Shipments from the Kansas-Burroughs mines, on Quartz hill, for March were 3321 tons. Half this tonnage went to Denver and Golden smelters; the remainder was milling ore.

GUNNISON COUNTY.

McConaghy & Cunningham, of Victor, propose soon building a new concentrating plant, fifty tons capacity, to treat the milling ore in the Hathaway property on the Cochetopa. The Sterling tunnel is in 975 feet, and shows ore the entire distance. About 4000 tons of ore is on the dump, having been taken out in development. The Colorado Mines Consolidated Co. is operating property in the Cripple Creek, Robinson and Bonanza districts, besides the Cochetopa.

HINSDALE COUNTY.

At Lake City, Supt. Carr of the Moro and Ajax tramway and mill is putting the machinery in place and by July 1 wheels will be turning and shipments begun.

In the Ute mine the body of ore cut when the tunnel intersected the vein at a distance of 1500 feet about a year ago shows no signs of giving out. Supt. Nicholson recently ran a crosscut from the main tunnel to the vein at a point about 500 feet back of where the vein was cut a year ago, the result being the tapping of a body of ore 2 feet wide, assaying, besides gold and silver, 45% lead.

Supt. Wearne tells the Times that at the Bonanza tunnel and upraise of the Henson Creek Lead Mines Co. the raise is up 135 feet and the tunnel 800 feet from mouth to breast.

Men are employed at the Hidden Treasure, and all departments—mine, tunnel, tramway and mill—are running.

Manager D. A. Farrell of the Red Rover Co., operating on Henson creek, will put in an aerial tramway from the mine to the mill, 2 miles. A 100-ton mill is under way. The ore has a lead base and carries gold, copper and silver. The concentrates are worth $65 a ton; there is a gray copper ore in the crude worth $100 to the ton. The entire plant will be operated by electricity. The output averages nine carloads a week. In the Burrows Park district the ore is a sylvanite.

JEFFERSON COUNTY.

(Special Correspondence.)—Dr. Carpenter, manager Golden smelter, states they are getting more ore than they can handle with their present facilities, and they are figuring on enlarging the plant, but no definite conclusion has been reached.

Golden, May 18.

LAKE COUNTY.

The best grade of iron ore now being mined in the Leadville basin is found in the Bohn at about 500 feet. This will run from twenty-five to forty ounces silver, and is classed by the smelter as ore.

At the El Paso on Fryer hill seventy men are employed in installation of new plant. Manager Newell will have it running July 1.

OURAY COUNTY.

In the San Juan district a strike is reported in the Morning Star, in Sneffels district. The tunnel has been driven 400 feet into Stony Mt. The ore is 16 inches wide in the breast and widening. In the Revenue, which has been a silver mine, the silver seems to be giving way to gold, as the recent strike of eight ounces gold per ton would indicate. The new power plant will be ready and current turned on by June 1, when the force of men in mine and mill will be increased.

The output from Sneffels district will be larger than in any year in its history. The Altoona, Humboldt, Governor and Pilot are working large forces.

In the Red Mountain district Eastern capitalists have been making investments, and the old producers are being overhauled and placed on the shipping list. The Genessee, Vanderbilt, Congress, St. Paul, Guston, National Belle, Saratoga and a number of other old-time paying properties are being put in working order. A tunnel 2 miles in length will be constructed to drain the lower workings of the Guston and Yankee Girl. The Treasury tunnel is working a large force and is in 2000 feet. The Swamp Angel group, which is owned by Pennsylvanians, will continue operations all summer. The company has twenty claims patented and a tunnel has been constructed to connect with the Silverton Railroad.

The contemplated pyritic smelter in Ironton is said to be an assured fact; a portion of the purchase price was recently paid. This will afford the owners of low-grade propositions an outlet for the treatment of their products Upon the completion of the smelters, the Silverton Railroad will be placed in running order from Red Mountain to Ironton.

SAN JUAN COUNTY.

The Mogul mine above Gladstone has recently put on forty more men. A strike of milling ore has encouraged the company to begin work on the mill.

Ten men are at work on the Irene. The tunnel is in 500 feet, and a strike of gray copper and iron ore was recently made. Shipments of lumber, material and supplies are going up almost daily.

Preparatory work on the new mill for the Silver Ledge at Chattanooga has begun. The mill will have 200 tons capacity. The size of building 120x120 feet, 60 feet high. Ore will be delivered to mill by tramway from mine 3000 feet long, capacity 200 tons per ten hours. There will be a 10x20 crusher, two 6-foot mills, twenty concentrators; water power will be used; 7000 feet of 12-inch pipe will furnish water under 890-feet head. A large reservoir will be built. W. Feigel is in charge of construction.

The Aztec G. & C. M. Co. have seven men running the tunnel on their mine in Needle Mt. district. Several good ore shoots have been cut.——At the Hercules, on Sultan Mt., two steam drills are working, preliminary to starting the mine and mill under full headway.——A sample test across the 4-foot vein recently opened in the North Star at Silverton give $50 per ton.

SAN MIGUEL COUNTY.

The following is a statement of mill returns from the Tomboy mine and mill July 1, 1901, to March 31, 1902:

Month. 1901.	Tons Crushed.	Yield.	Expenses.	Profit.
July	6,100	$ 92,200	$38,500	$53,700
August	6,600	111,350	43,400	67,950
Sept.	6,212	70,523	40,968	29,555
October	6.972	57,456	43,860	13,596
November.	7,061	73,334	37,908	35,426
December.	7,664	78,500	42,500	36,000
1902.				
January	8,544	87,080	43,666	43,414
February.	7,200	65,100	41,000	24,200
March	7,900	60,250	43,500	16,750
Total	64,253	$695,793	$375,302	$320,491

The average value of the ore was $10.83 a ton, the expense averaged $5.84 a ton and the net profit was $4.99 a ton.

Superintendent Sayer of the Butterfly-Terrible M. & M. Co. says: "In January we closed the mill down, as we felt we could not run during the winter months on low-grade ore at a profit. We have confined our efforts in extending our lower tunnel. We have installed a compresser and power drills at the mouth of No. 3 tunnel. During the past year and up to the time of closing our mill we mined and milled 11,467 tons of ore. The operating expense of the mill was 56 cents per ton of ore, and the total cost of mining, including supplies, as well as for tramming, crushing and blacksmithing supplies, was $3.92 per ton, making a total expense of $4.48 for each ton of ore produced. This expense does not include development expenses, nor do the improvements on the surface plants nor new equipment enter into the cost as here given."

On the 7th inst. the Liberty Bell will resume work.

Treais and Lundstrom have begun work on their contract to drive the deep crosscut in the Japan vein, near Telluride. When completed the tunnel will have a total length of 2700 feet, and will cut the vein 300 feet below the present deepest workings. It is estimated that a year will be consumed in driving this tunnel.

SUMMIT COUNTY.

Parsons & Connors will develop the Wild Irishman group at Montezuma by a 3000-foot tunnel. There is on the group a vein 11 feet wide, from which a siliceous ore carrying 40% to 50% lead has been mined. The Wild Irishman ore, it is stated, runs ninety-two ounces silver and 30% lead. Production of the entire camp of Montezuma is estimated at seventy-five tons daily.

TELLER COUNTY.

At the Elkton the work of cutting the 900-foot station will be finished June 1, when sinking to the 1000-foot level will be resumed, and a small hoisting engine will be placed in the 900-foot station. The rock will be hoisted to the 900-foot level and thence handled to surface. The first of the two pumps ordered will arrive in July, and then the 1000-foot station will be cut large enough to permit installation.

There are five sets of lessees working on the Pharmacist claim of the same company on Bull hill; four are making regular shipments. The ore averages two ounces. Royalties for April amounted to $1075.

Kirk & Co., operating a lease on the Clara D., on Bull hill, have installed a 10 H. P. steam plant and hoist.

The Plymouth Rock, owned by W. D. Stratton, is down 500 feet. It is his intention to sink 2000 feet. No lateral work will be attempted until the shaft has reached the 1000-foot level.

The Empire State, better known as the Orphan Belle, on Bull hill, is now in charge of G. Kilborn, formerly Supt. Isabella. The three-compartment shaft is down 900 feet. In the three lower levels there is ore. No stoping has been done. The ore is being taken out from all of the lower levels and shipments of sixty tons are weekly made.

Shipments are maintained from the Battle Mountain Con. Co.'s property, where a new strike is reported in the lower trail tunnel.

A new steam plant will be installed on the Mountain Beauty claim, now under lease to Hunter, Cartwright & Co. At a depth of 100 feet they have a vein over 3 feet wide from which mill tests gave returns of $25 and better.

C. M. Thayer, president Bedford G. M. Co., projects making the new 50-ton concentrating plant which his company is planning to build at the property in Cripple Creek a 100-ton concern, as double the capacity can be installed at a small increased outlay over the initial expense. He will also install four non-hydraulic concentrators. This mill is being put up by Boston capital. It is the first serious attempt to handle the low-grade ores of Cripple Creek made since the stamp mills of early days.

The Ben Hur Co. made its first shipment May 14. The ore is broken from a depth of 600 feet, north of the shaft, from what is believed to be the extension of the Midget ore shoot.

The Hildebrand Co., on Grouse mountain, is doing extensive development work, extending the 400-foot level, on a strong vein, 5 feet in width. It is the intention to continue drifting for the contact with the phonolite dike.

A trial shipment from the Elkton dump has been closed by E. C. Rickard, who recently leased the dump, which contains 150,000 tons. Case & Williams, lessors on the Morning Glory claim of the Work, have started a new shaft on their recent find. They have a 16-inch streak of ore that averages three ounces of gold to the ton, and they have shipped 27 tons of ore from the excavations.

Cripple Creek reports some possibility of resumption of work on the Moffat tunnel of the Gold Exploration and Tunnel Co. by reincorporation as a railroad company, which will permit of passage through property now denied to them. The tunnel starts on the west side of Gold hill, near Cripple Creek, and is to end on the northeast slope of Bull hill at the Victor mine, about 3 miles. Half the distance has been covered. At the latter point the depth will be 1600 feet, and at one point beneath Bull hill it will be 1800 feet below the surface, which is 100 feet deeper than any shaft in the district has penetrated. It is in this locality that boring has been interrupted. There is a strip of ground 18 feet wide which the company has been refused the privilege of crossing.

The United Gold Mines Co. is the title of the new consolidation of the Woods Investment Co. It will take over the assets of eight Cripple Creek companies, absorbed into a capitalization of $5,000,000. The allotment of shares is as follows: Consolidated Gold Mines, 1,908,000; New Zealand Consolidated, 920,000; Damon Victor, 200,000; Battle Mountain Consolidated, 485,160; Columbine-Victor, 200,000; Columbine Gold, 29,709; Bonanza Queen, 25,000; United Mines Transportation, 22,500; total, 3,994,769.

In the Golden Cycle mine ore is found on 1000-foot level averaging $25 to $30. The vein is 5 feet wide and the pay shoot has been developed 30 feet.

The lessee of the Gold Bond mine, Cripple Creek, has received returns on eighteen tons of ore at $63.40 per ton.

From the Burns claim of the Acacia Co. twenty-two tons gave returns of $55 per ton. A vein has been opened on this property 4 feet wide.

A strike is reported on the sixth level of the El Paso mine on Beacon hill. The ore carries much sylvanite and calaverite.

Superintendent Bainbridge reports the vein 5 feet wide; 12 inches will ship $600 per ton and 24 inches $300 per ton. The vein at the tunnel level has yielded several carloads running as high as $378 per ton; the general average of the shipments has been $50 per ton. The earnings for April were $9000 above all operating, development and improvement expenses. Surface plant, hoilers and shaft have heen paid for and $30,000 is in the treasury.

IDAHO.

BINGHAM COUNTY.

At Blackfoot, miners of the White Knob M. Co. have declared off the strike. The company has granted recognition of the union, and has consented to employ none but union miners. Over 100 men were out, and the mine was tied up.

IDAHO COUNTY.

At Hump, Manager Stevens of the Cracker Jack has machinery for the 5-stamp mill and says he will have the mill running hy June 1st.

Fourteen claims In the Thunder Mountain district, west of Monumental creek, have been sold to Pittsburg people, price $20,000, of which $2000 is paid and $5000 to be paid in thirty days.

The Thunder Mountain Industrial Co. at Thunder mountain has bought the Anaconda group of eight claims for $10,000.

The Belle of Thunder Mountain Co. has bought the Holcomh group of sixteen claims for $200,000.

The bonded claims held by Boise parties on the Apex, Black Jack and Holy Terror has been sold for $40,000.

OWYHEE COUNTY.

In the Addie group, 165 feet from the surface, the ledge has widened out, and the body of ore will mill $15 per ton in gold. The mill grade is completed. Millwright C. E. Knapp has charge of the erection of the plant. The mill will be completed and in operation in July.

The Avalanche hears that the Poorman mill will be in operation this year.

MICHIGAN.

HOUGHTON COUNTY.

At the Calumet & Hecla electric pumps are being installed in No 7 shaft of the Hecla hranch.——The Old Colony C. Co. has broken ground for their new shaft on the lode recently located hy diamond drill.

The new timber cars made hy the Calumet & Hecla M. Co. for No 2 shaft, Calumet, are in service Each car holds thirty-six pieces of timber, instead of the nine which were all that could he lowered under the old arrangement. Each is also so built that it is loaded at the timber piles on the surface and then drawn to the shaft and lowered, while the use of two permits one to he at the timber piles loading while the other is being unloaded down in the mine. The use of these cars facilitates the lowering of timber into the mine; more time will he given for hoisting rock and the daily output of the shaft will be increased.

The report that the Calumet & Hecla will at once resume work on the amygdaloid shafts of the property is denied at the mine.

MISSOURI.

JASPER COUNTY.

Local zinc companies are asked to pool their stock in a combination of leading producing and smelting companies, the Southwestern Ore Purchasing Co. to handle all the ore produced in the Joplin district and maintain a staple price for the metal. Contracts have already been agreed upon hetween a percentage of the producers and the syndicate, whereby the former agree to sell their entire output to the syndicate at a uniform price; similar contracts to he obtained from the smelters whereby they agree to purchase exclusively of the corporation to he formed at a uniform price which shall be $1.50 more than is paid to the producer.

MONTANA.

BEAVERHEAD COUNTY.

Operations at the Golden Era mine, above Argenta, have been discontinued; the machinery will he moved to the Little Whale mine.

In the old Seligman claim, near Argenta, is reported a find of tellurium ore going $2000 to the ton.

DALY COUNTY.

Coal has been discovered north of Anaconda. The development of the mine has been a tunnel 160 feet long. A shaft has been sunk. The coal is said to be a deep black color, and hurns readily.

FERGUS COUNTY.

The North Moccasin Co. is pushing development work on the Possible claim, under the direction of Supt. C. Ridell. A new mill will he put in this season.

FLATHEAD COUNTY.

Cabinet Is 45 miles east of Libby. One year of actual mining has warranted the placing of seven stamp mills within a radius of 6 miles of Cahinet. The Brick & Brannigan 10 stamp mill has run all winter. The Mother Lode and West Kootenai mills, 10 stamps each, are ready to run; the Binkstown mill is running. Machinery for the Black Tail, Fourth of July and the North Fourth of July mills is at Cahinet and is being placed in position. A mill is going up north of town. The Boardman-Hitts claims have ore on the dump that runs $40 to $75 per ton.

JEFFERSON COUNTY.

On the Pearl H the tunnel was driven on a large body of copper ore for 250 feet. Three veins of higher grade ore were cut. J. Johnston of Bernice is general manager.

LEWIS AND CLARKE COUNTY.

The report of the Montana Co. for the half year to December 31st shows that profits are still heing made by treating the ore remaining in the Drumlummon mine. In all 12,000 tons of ore were treated in the stamps and 64,000 tons of tailings cyanided. The former did not yield any profit on working, hut the latter fully compensated, so that a net profit of $55,000 was made. The new properties acquired by the company—the Lucky Girl group in Nevada—have heen equipped with machinery and work started. The concentrating system in vogue at the Drumlummon is not suited to the ore at the Lucky Girl; a cyanide plant is to be substituted.

MISSOULA COUNTY.

Interest is manifested In the recent discovery of gold along the bed of Vermillion creek, one of tbe tributaries of Clark's Fork of the Columbia river, 35 miles from Cedar creek, a section from which much gold was taken in the early days of placer mining in Montana. All of the ground along the bed of Vermillion creek has been located within the past two years. The claims have heen worked In a small way by the old method during the summer season, but always with good results. Several large companies have been trying recently to get control of sufficient ground to justify puttlng in a dredger.

The Vermillion Placer M. Co. has eight claims which it intends to work by hydraulic system. The company can run a tunnel through a ridge lying at the lower end of tbese claims, a distance of ahout 220 feet, for $10,000; it will then he ahle to work the ground ahove, 120 acres, with an average depth of 35 feet to bedrock, at a cost of 3 cents per cuhic yard. Prospecting shows that the ground contains gold, which is distrihuted through the gravelly soil lying ahove bedrock.

SILVER BOW COUNTY.

The Butte Copper M. Co. has a lease and bond on the Amazon claim, amount $75.000, due May 1, 1903—first payment $7500 in ninety days, other payments $22,500 each succeeding three months.

NEVADA.

ESMERALDA COUNTY.

In the Nevada Chief, near Pine Grove, there are 2 feet of ore in the drift, 10 inches of which is reported high grade. The office of the company is in Los Angeles, Cal. It is the stated Intention to huild a stamp mill on the property.

The new strike at Lone mountain, 14 miles from Silver Peak, 30 miles from Tonopah and 35 miles from Candelaria, is spoken of as a substantial ledge 30 feet wide and 100 feet long, assaying about equally in silver and gold, with an admixture of galena. The water supply is 7 miles distant. Several leasers are at work and a community is gathering from Tonopah, Candelaria and adjacent points. The name given to the embryo town is Weepah, which means, in Indian, "Rainwater," in contradistinction to Tonopah, or "Brushwater."

LINCOLN COUNTY.

J. E. & S. Bamberger of Salt Lake City, Utah, have an option on DeLamar's gold mines and mill at DeLamar for $1,000,000.

Farrell & Rice will work the Old-Timers', near Pioche. The group was profitably operated, notwithstanding the haul of 40 miles to transportation. In the stopes is ore that will yield $20 per ton, with the advent of the locomotive, reduction works conveniently located. At numerous properties in the old camp an outlet for the ores Is all that is required to place them on a most productive basis. The old grade, which was made hy the Union Pacific when it sought a way into Nevada, has been repaired to a point within a mile of the town of Pioche.

LYON COUNTY.

Nine men are employed by the Heather M. Co.'s cyanide plant, near Dayton. A 15 H. P. motor is heing installed to furnish power fo the plant, the power being taken from the Truckee General Electric Co.

A strike is reported in the Oest mine at Silver City.

NYE COUNTY.

At Wilmington, Dela., a charter is granted to the Tonopah Water & Power Co., capital stock $1,500,000.

Sale of the Tonopah T. & M. Co has been made to Boston capitalists, price $250,000. It is said the new company will sink a double-compartment shaft 500 feet.

The new smelter at Gardnerville will be in operation June 15th. —— The Poco Tiempo mine at Alkali lake, 40 miles south of Carson, will have a new mill by July 4th.

STOREY COUNTY.

Work will probably be resumed in the Hulley-Logan mine this month.

The work of driving the drain tunnel on the North Rapidan is still progressing; this tunnel may be as important a factor in draining the mines of that district as the Sutro tunnel on the Comstock.

NEW MEXICO.

GRANT COUNTY.

The Owl mine, in Gold gulch, 5 miles from Santa Rita, has heen bonded to H. Finch and associates of Colorado.

The La Corona G. & C. Co. has bought the St. Josephine and Little Gem claims in Gold gulch. On the St. Josephine the lead is 10 feet wide and assays $50 to $75 per ton gold and several ounces silver. Picked samples pan $160 gold. The La Corona Co. has ten claims.

LINCOLN COUNTY.

At Parsons, Bonito district, the Eagle M. & Im. Co. has in contemplation a cyanide mill. J. M. Rice, manager, says that everything is in readiness to proceed on the plans outlined. The first step will he to huild a dam across the Bonito. When the dam is completed work upon the cyanide plant will be started.

At Nogal the Pennsylvania owners of the Helen Rea mine hold forty-two patented claims and expect to work several of them on a large scale, work to start as soon as their new machinery is placed. The American mine yielded recently out of a mill run of seventeen tons, value $50 to the ton. J. H. Lloyd is preparing considerahle work.

SANTA FE COUNTY.

The smelter at Cerrillos has been blown in. The company operates its own coal mine on Pecos Forest Reserve. Recent alterations and additions have made the smelter complete and up to date. The capital has been furnished by Pennsylvanians. Many mines idle for a long time are now supplying ore to the smelter.

The Santa Fe G & C. Co is prospecting its mines at San Pedro with a diamond drill.

The Ingersoll mine has hegun regular shipments to tlie Cerrillos smelter.

OREGON.

BAKER COUNTY.

The two 10,000-pound boilers for the Badger group of claims in the Susanville district are in position. The mill, when completed, will have a capacity of thirty stamps. The property was purchased three months ago hy F. R. Bradley for the Bunker Hill & Sullivan Co. The pay streak of the Badger is from 1 to 10 feet wide.

The April cleanup from the North Pole mine, Cracker Creek, is $80,000 from twenty stamps ——The Red Boy-Concord at Lawton reports $52,000.——From the Virtue mine $15.000 is reported for April.

Manager Meikle of the Golconda mine, at Sumpter, is testing an interesting theory regarding the dimensions of the Golconda ore shoot. It was struck on the 200-foot level; for 120 feet a ledge averaging 18 feet was entirely stoped hetween the walls. The first of the shoot was struck at the convergence of a small vein with the big east vein. It continued in both these veins till they met again, 120 feet distant. Drifting south of that point was continued 300 feet, and also north. Mgr. Meikle has concluded that the rich shoot dipped to the north, as it occurred at the convergence of the two veins, and wbile the strike of these brought them together on the 200-foot level, they dipped east and west, thus causing the point of convergence at the north end to extend farther north as depth was attained. Development is now being pressed to demonstrate these conclusions.

A Sumpter report says that the strike in the Golconda mine proves greater. The winze sunk from the 200-foot level has opened up the ore shoot which was first discovered in 1899 and afterward lost. There is a pay streak of free-milling ore. The Golconda was sold recently to a syndicate of Pendleton people and J. H. Robbins of Sumpter for $300,000 cash.

The Phœnix Co. at Baker City, C. Parker manager, is to start operations at the mine again.

JOSEPHINE COUNTY.

The Eureka mine on Briggs creek, near Grants Pass, has been bonded at $75,000 by the Victory G. M. Co., W. J. Morphy of Cbicago, Ill., manager and principal owner. The main shaft is down 400 feet drifting has exposed an 8-foot ledge, average value $15 per ton.

The Green & Harmon mine on Galice creek is working in a high hank now, as the gravel below is rich in coarse gold it pays to run the top stuff off.

A smelter and plant for treating copper ore has arrived for the Sowell copper mines of Waldo. These mines were hought some months ago by the Mountain Copper Co., who have developed them, presenting a body of copper ore.

Captain Mendenhall, owner of Roaring Gimlet mine, Gold Hill, has twenty pounds of amalgam, the result of three days' work on the vein. This gold was saved by simple panning.

SOUTH DAKOTA.

CLARK COUNTY.

The Realization, Penohscott and Smoky City groups at Garden City have been sold for $250,000. F. R. Byrnes of Deadwood will be manager. New machinery will be installed and a 100-ton cyanide plant erected.

LAWRENCE COUNTY.

The Pluma mine shaft has penetrated a hody of ore 300 feet wide, averaging $6 per ton.

The new Ellison hoist of the Homestake will be completed June 15.

The following cyanide plants are at Deadwood: Dakota cyanide plant: Milling 100 tons daily, netting $4000 monthly; crushing with thirty stamps in cyanide solution. Imperial M. Co. cyanide plant: 150 tons daily, on ores from American Express and Imperial groups and Ruhy Basin ore of Horseshoe M. Co; this plant, built on level foundations, handles ores by elevators and conveyors; roasters are being installed to handle ores from Eagle Chief and Juno groups, near Crown Hill; when complete, the mill will treat 250 to 300 tons daily. The Golden Reward Co. has a 300 ton cyanide plant ready for operation. The Rossiter cyanide plant is working under lease on ores from the Buxton and Big Bonanza mines near Terry; Supt Dorr.

The proposed new plant of the Horseshoe M. Co. at Pluma is announced "to be the largest crushing cyanide mill in the world." It will treat 1250 tons of ore daily. The Homestake plant at Lead has been treating tailings. There is no machinery in the plant at Lead aside from that used in handling the tailings and the apparatus for precipitating and discharging; tbe charging and discharging are accomplished hy water and gravitation and the agitation by the pneumatic process. To crush 1250 tons of ore daily would require 300 stamps. By crushing in the solution 40% to 60% of the values in the ore can he extracted In the hatteries.

PENNINGTON COUNTY.

P. T. Grantz of the Grantz G. M. Co. has let a contract for 100 M feet of lumber for a shaft house, ore bins and timhering the St. Elmo mine. The company has begun a two-compartment working shaft to cut the ore hody in the old workings of the St. Elmo Co.

Tbe National smelter at Rapid City has been blown in. Dr. H. H. Muggely is general manager and T. Knutzen Supt. and metallurgist.

UTAH.

BEAVER COUNTY.

The Ophir Hill Con. M. Co. at Ophir will equip their mine with a 300 H. P. electric plant.

IRON COUNTY.

Iron ore has heen discovered in Willow Creek canyon, 9 miles northeast of Parowan. The ledges are 5 to 50 feet wide.

In the Iron Springs mining district, Frew, Thompson & Page Bros. have disposed of the Reporter, Little Chief, Black Dwarf, Last Chance and Iron Duke iron claims for $44,000, and the Excelsior Iron Co. has conveyed to the Excelsior Iron M. Co. 118 acres of placer ground for $100,000, and the heirs of the T. Taylor estate are grantors to 140 acres of placer ground for $175 000.

Plans for the new mill with which the Johnny of Stateline is to be equipped contemplate a plant of a capacity of thirty tons daily, provision will be made for an enlargement.

JUAB COUNTY.

Following is an approximate estimate from the Herald of the tonnage in sight in each of the Tintic mines named which can he moved at a profit under reduced freight and smelter charges:

Mine.	Number Tons in Sight.
Star Consolidated	125,000
Swansea	125,000
Uncle Sam	100,000 to 125,000
South Swansea	100,000
Eagle & Blue Bell	100,000
Bullion-Beck	100,000
Centennial-Eureka	75,000
Godiva	75.000
Grand Central	75,000
Lower Mammoth	10,000

These estimates are furnished by men

connected with the properties. In addition, the Mammoth and May Day have large tonnages which it is not proposed to mill, but which might be shipped. The Yankee has a large tonnage of second-class ore, and so have Ajax, Gemini, Eureka Hill and Carisa. Other properties, such as the Joe Bowers, Emerald, United Sunbeam and Alaska have more or less second-class ore. All of the properties in Tintic have in sight, according to a careful estimate, a total of not less than 1,500,000 tons of ore not over $15 in value per ton, and of high enough grade to pay to ship with a reduction of $4.50 to $5 a ton in freight and treatment charges. It is said that this ore average $12.50 a ton. The total valuation of the tonnage affected is therefore over $18,750 000, which amount will be put into circulation if the ore is shipped.

A reduction of $1 a ton in the freight charges on low-grade ores from the Tintic district to Salt Lake valley smelters is announced by the railroads, effective on June 1st. The smelters have promised to reduce smelting charges $3 50 to $4 a ton, provided the railroad companies would make the reduction they have just announced. This will make a difference of $4.50 to $5 a ton on the freight and treatment charges on ores not exceeding $15 a ton in gross valuation. It is estimated that there are now exposed in the mines in the Tintic district 1,500,000 tons of ore that can be shipped at a profit under the reduced charges. This reduction, therefore, means a difference to the mine owners of the district of over $7,000,000 in freight and treatment charges.

The freight charges are reduced from $2.50 to $1.50 a ton. If the smelter charges are reduced to an average of $8.50 a ton, as promised, the freight and treatment charges will be only $10 a ton, leaving a margin of $5 a ton on $15 ore for mining, wagon haul and profit. It is impossible to tell accurately just what the second-class ores will average in value, or what the profit will be, but experts estimate that this step means a profit of $5,000,000 on ores in sight in the camp, from which must be deducted the cost of mining and wagon haul. In addition to reducing the tariff on the silver, lead, gold and copper ores of the camp, the Oregon Short Line and the Rio Grande Western will haul iron ores from Tintic for flux for $1.25 a ton instead of $1.85. This is to meet the objection of the smelters that the Tintic ores are so siliceous that the smelters must charge a penalty because of the difficulty in securing sufficient iron for fluxing. There is now only one possible hitch in the arrangements to allow the Tintic mine owners to ship their low-grade ores—the refusal of the smelters to carry out their repeated promises to reduce the treatment charges. If the smelting companies do not keep this promise by June 1st, when the new smelter at Murray starts up, it is probable that the railroad companies will withdraw this rate. Under the new arrangement ores will be billed at $2.50 a ton, as before. Upon the presentation by the smelter of the certificates showing the ore to have a value of $15 or less a ton, the railroads will grant a rebate of $1 a ton. The owners of the Tintic mines have thus been granted something for which they have been struggling vigorously for years. Nearly every property in Tintic will be affected by this move.

SALT LAKE COUNTY.

The trial run of the new converter plant of the Bingham Con. smelter is reported a success. This will enable the company to ship ore to market in form of copper bullion and effect a saving in treatment and freight charges. The plant has a capacity of 600 to 700 tons.

The Bingham Consolidated has forwarded its first consignment of copper, gold and silver bullion to the refinery at Perth Amboy, N. J., to be disposed of under the contract with the United Metal Selling Co. The Bingham product averages 45 tons daily.

SUMMIT COUNTY.

At the Crescent hill, Park City, properties of the recently formed Kearns-Keith Co., active operations have begun. Three shifts are at work on both the Alliance and Hanauer tunnels. M. J. Dally will be manager.

TOOELE COUNTY.

At the Con. Mercur, in Lulu ground, where the largest bodies of ore have been opened up, there has never been a time when so much ore was exposed. The output is averaging nearly 1000 tons daily, the ores are maintaining a fine average. At the Sunshine's new mill a saving of 90% is reported, with the filter presses adding much to its success.

M. H. Walker and C. H. Scheu have bought the Vulcan group of claims at Stockton for $35,000.

At the Sunshine mill 115 tons go daily through the crushers.

The Annie Laurie Co. at Kimberly is producing $2000 per day from its cyanide plant. Electric power is to be installed.

WASHINGTON.

STEVENS COUNTY.

The Northport smelter may be closed down temporarily. In consideration of the fact that 24,528 tons of ore mined during the month of March were estimated to yield a profit of only $9950, the directors cabled Manager MacKenzie asking whether it would not be politic to conserve ore reserves pending reduction of working expenses. He says that while copper and silver are at present prices and fuel and freight at present rates the March grade of ore leaves no profit, and he has already begun to sort the ore more closely, making April grade up to $10.50 per ton. He also reports that he is experiencing difficulty with smelting operations and has reason to believe a considerable percentage of the copper contents is not being recovered. He is, therefore, going to clean up at the smelter to ascertain to what extent this is so. A probable further reduction in the working force of the Le Roi is involved. An estimate has been made that the Trail smelter, with its decreased costs for coke and other advantages, could handle Le Roi ores for $1 per ton less than the Le Roi smelter can do the work and still make a profit. Le Roi ores may be diverted to Trail for a time.

SNOHOMISH COUNTY.

At Index work has begun on the Big Bee mine, owned by W. S. Lovejoy of Wallace. The ore is yellow pyrite and runs well in copper.

On the Chicago group work has begun. J. Walter is the owner.

The concentrator of the Ethel mine is in working order. Manager Pounder says he will build an addition to the concentrator, to make room for two more jig tables, which will increase the output of concentrates to double the amount, the tables being ordered already. There are concentrates sacked, ready for shipment, each sack weighing 125 pounds.

FOREIGN.

AUSTRALIA.

Sydney reports the discovery of a large and rich lode of cinnabar at Yass. Up to 1899 a little quicksilver was produced in that State; in that year a company was formed in Sydney to open and work the cinnabar mines at Ewengar. These mines are now being worked. Cinnabar lodes occur at Cardwell on the Cudgegong river and on the Tambaroora and Turon rivers. To encourage cinnabar mining the department of mines will give a reward of £500 to whoever produces the first 50,000 pounds of quicksilver from cinnabar ores mined in New South Wales. This reward will lapse if not claimed within five years from Jan. 1, 1902.

BRITISH COLUMBIA.

The Cascade Water Power & Light Co. has made a contract with the Granby Co. to supply from 1000 to 1500 H. P. for running the drills and operating the hoists in the Granby mines at Phœnix. If the service is satisfactory the Granby Co. will abandon steam power.

The big rock crusher recently installed at the B. C. Copper Co.'s Mother Lode mine, near Greenwood, has been started up. The ore is trammed by mule power through a tunnel run in below the ore quarry, having been first loaded through a chute into three-ton capacity cars. At the crusher a pneumatic hoist lifts the full car and tips its contents into the crusher hopper. A grizzly allows all the ore below 5 inches in size to drop through into the pit, the larger pieces falling into the same pit after being crushed. The ore is elevated thence by a bucket elevator to the ore bins alongside the railway track, and loaded into the railway cars for hauling to the smelter. The crusher has a capacity of 850 tons of rock, crushed to a size not exceeding 5 inches, every ten hours.

The Albion M. Co., which is operating near Ainsworth, has arranged to buy the Pearl claim, which adjoins the Albion, from D. F. Strobeck for $10,000. This will give the Albion Co. several hundred feet more ground along the vein. The company is exploring by means of a diamond drill.

At the Lenora mine the 90 H. P. boiler is being bricked and the 5-drill air compressor is being installed. The installation of the sorting machinery has been completed. A hoist will be erected in No. 2 tunnel, to be run by compressed air, for work in the double-compartment shaft, which the company are sinking to a depth of 200 to 300 feet below No. 3 tunnel.

R. A. Brown, from development work on the Wolverine, at Greenwood, has made an experimental shipment to the Granby smelter and reports that he has crosscut 25 feet of solid shipping ore without encountering a hanging wall.

MEXICO.

SONORA.

The Westinghouse Electric Co. is reported to have purchased copper mining property in Sonora, price $125,000, and to have paid down $25,000, the remaining $100,000 to be paid in one year.

YUKON TERRITORY.

DAWSON.

Advices from Dawson are to the effect that the country is drenched with water, sluicing has begun and it is estimated $10,000,000 to $15,000,000 in dirt is ready to wash. Summer work will be heavier than ever, especially on El Dorado and Bonanza.

Personal.

A. L. ROBINSON is Supt. Eclipse mine, Ophir, Cal.

J. M. BURKE, of Burke, Idaho, is in Tonopah, Nev.

H. ARGALL is Supt. Cosmopolitan mine, Groveland, Cal.

J. KING is Supt. Farington mine at West Point, Cal.

T. DONOHUE is Supt. of gold dredging operations at La Grange, Cal.

T. MCSORLEY is Supt. of the Easy Bird mine at Railroad Flat, Cal.

R. RESTANO, Supt. of the Golden West mine, near Sonora, Cal., has resigned.

A. SYDNEY ADDITON has returned to San Francisco from Confidence, Cal.

GEO. E. WERNER, assayer and metallurgist, has returned to Telluride, Colo.

W. DUFFY is Supt. Sailor Canyon and X Ray gravel mines, near Westville, Cal.

EDGAR RICKARD is acting consulting engineer El Progresso mines, Lower California.

E. KIDWELL, representing the Stirling boiler, has returned from Globe, Ariz., to San Francisco.

C. PARKER, manager of the Phœnix mine, near Baker City, Or., has returned from New York.

G. KNUTZEN is manager Dardanelles and Bob Lewis gravel mines, Damascus, Placer county, Cal.

S HAMILTON GUYOT is Supt. Dawes lode, adjoining Stratton's Independence, Cripple Creek, Colo.

HUGO VON BERCKENFELDT is now Supt. New York & Sonora M. & S. Co., Las Cruces, Mexico.

G. E. BAILEY AND O. S. BREESE of the California State Mining Bureau, are at Johannesburg, Cal.

H. D. LANE, general manager White Hills, Ariz., mines, has returned there from Los Angeles, Cal.

L. NIXON, of Jackson, Cal., has been appointed Supt. of the Nixon P. M. Co., near Sutter Creek, Cal.

C. L. WELLINGTON, traffic manager Colorado & Southern Railway, has returned to Denver from California.

M. BOWERS, Supt. Valley City G. M. Co., operating the Shurtleff No. 2 on Bull hill, Cripple Creek, Colo., has resigned.

DANA HARMON, formerly of Gaston Ridge, Nevada Co., Cal., is now permanently located at 616 Hayward Building, San Francisco.

A. R. WILFLEY, of Denver, Colo., is in Washington Camp, Arizona, getting the new mill and smelter at the Pride of the West mine in operation.

W. S. HASKENS, Supt. of the Iron Mountain mine of the Mountain Copper Co., at Salee, Colo., will be succeeded by C. F. Nourse, the present Asst. Supt., on June 1st.

F. M. WOODS, general manager Gold Coin, Doctor-Jack Pot, United Gold Mines and Woods Investment Co., Colorado, has gone to New York for a month's vacation.

B. TREWEEK has resigned as assayer and chemist for Clover Leaf M. Co., at Roubalx, S. D., to take similar position with Globe M. Co., at Lead, Lawrence county, S. D.

JAMES LAWLER, recently at Searchlight, Nev., for the Improvement Co., is now in Nacozaria, Sonora, Mexico, having been appointed master mechanic for the Copper Queen Con. M. Co.

W. C. RALSTON, a representative California miner, who so ably filled a place in the last California Legislature, is now a candidate for State Senator in his district. Such men are needed, as they do much real good in properly representing the mining industry.

Obituary.

ROBT. BURNHAM, a well-known Arizona assayer, died at Nogales, Ariz., May 12th.

Catalogues Received.

The Canda improved self-locking cam is the subject of an illustrated treatise issued by the Chrome Steel Works, of which Geo. W. Myers, Hayward Bldg., San Francisco, is the Pacific coast representative.

ALL that a customer desires to know about pipe-threading machinery is to be found in the new catalogue issued by D. Saunder's Sons, of Yonkers, N. Y. The text, always clearly written, is illustrated with many cuts. Especial attention is called to machines driven by electric motors.

The New Process Rawhide Co., Syracuse, N. Y., send an illustrated booklet showing the merits of their noiseless pinions which supply a positive drive that will run silently and still be durable. Wherever metal gears are feasible there is a place for these goods, which give good service without the usual nerve-racking noise.

Handsomely bound in maroon and gold comes the new chain, sprocket wheel, elevating and conveying machinery catalogue of the C. O. Bartlett & Snow Co., Cleveland, Ohio. Its 140 illustrated pages contain much of interest to the miner and mechanical worker in the carrier, conveyor, elevator system and other departments of mine work.

From Eugene Dietzgen Co., 181 Monroe St., Chicago, is received a copy of their new catalogue of drawing materials and surveying instruments, which contains description of an extensive line of drawing, tracing and blue print papers, mathematical instruments, scales, protractors, T squares, etc., and surveying instruments. A number of new and useful instruments and other devices for the use of the mechanical and civil engineer are shown, also electric light printing machines. The San Francisco office is at 508 Market St. The New York office 149 Fifth Ave. A copy of the catalogue will be sent on application to any address.

Books Received.

"Water Supply" (considered principally from a sanitary standpoint), by William P. Mason, Ren. Pol. Inst., 3rd edition, rewritten 1902, 8vo., 448 pages, forty figures, twenty-two halftone plates; cloth. Prof. Mason is a recognized authority, and this edition of his work is comprehensive, treated historically, scientifically and practically—a thorough work on the subject and its relation to life, particularly in centers of population. As a text-book it is complete; as a book of reference, invaluable, and to the lay reader an exceedingly interesting and instructive volume. John Wiley & Sons, New York, publishers. Price $4.

Commercial Paragraphs.

THE Jno. A. Roebling's Sons Co. has bought a tract of land near St. Louis, Mo., on which will be built an extensive branch plant for the manufacture of wire rope and cables.

THE offices and salesroom of the Pacific Tank Co. has been changed from 35 Beale St, San Francisco, to 301 Market St. On exhibit in the new office is a miniature cyanide plant, zinc lathes, wood tanks, wood pipe, etc.

THE A. Leschen & Sons Rope Co., St. Louis, Mo., will build a large factory and warehouse at Morin and Bulwer avenues, to be two stories high, 80x365 feet, warehouse (two stories) 75x150 feet, the cost of the buildings to be $78,000.

THE Burt Mfg. Co., of Akron, Ohio, report a recent shipment of their Cross oil filters to different cities in the Far East—India, China, Japan and the Philippine Islands. Other important shipments recently made by this firm went to England, Belgium, Mexico and Argentine Republic.

THE General Concentrates Co. contracted with the Modoc M. Co., Chicago, to remodel their mill at Las Cruces, N. M. Their mill originally was designed to treat their ore, a galena in the limestone gangue, in the ordinary way; on account of the scarcity of water they expected to be able to operate only 200 days in the year. The president of the company writes from New York city: "The mill was about completed when the attention of the officers of the company was called to the Hooper pneumatic concentrator in March. Operations were suspended while this system could be thoroughly investigated. One thousand pounds of ore were sent to our laboratory in this city and we made a test, saving their values in the form of a 75% concentrate. The Modoc M. Co. saw that installing the Hooper system of dry concentration they would not only be able to save a higher percentage of their values, but would be able to operate their

mill throughout the entire year, and placed their order for Hooper concentrators. The crushing machinery — jaw crushers and rolls—which is already at the plant, will remain, but new sizing machinery and seven Hooper pneumatic concentrators will be required. The work of remodeling the mill is under way."

Latest Market Reports.

SAN FRANCISCO, May 23, 1902.

METALS.

SILVER.—Per oz., Troy: London, 23¾d (standard ounce, 925 fine); New York, bar silver, 51⅝c, refined (1000 fine); San Francisco, 51⅜c; Mexican dollars, 44½c San Francisco, 41½c New York.

COPPER. — New York: Standard, $12.00@12.10; Lake, 1 to 3 casks, $12.50; carload lots, $12.25; Electrolytic, 1 to 3 casks, $12.30; carload lots, $12.00; Casting, 1 to 3 casks, $12.50; carload lots, $11.50. San Francisco: $14.00. Mill copper plates, $17.00; bars, 18@24c. London: £55 per ton.

LEAD.—New York, $4.12½; Salt Lake City, $3.60; St. Louis, $4.00; San Francisco $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, $4.75. London, £11 12s 6d per ton.

SPELTER. — New York, $4.60; St. Louis, $4.00; London, £18 10s per ton; San Francisco, ton lots, 5¼c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN. — New York, pig, $30.00; San Francisco, ton lots, 31½c; 1000 lbs., 31¾c; 500 lbs., 31¾c; 200 lbs., 32c; less, 32½c; bar tin, ℔ lb, 37½c.

PLATINUM.—San Francisco, crude, $17 ℔ oz.; New York, $18 per Troy oz.

QUICKSILVER. — New York, $50.00 large lots; London, £8 15s; San Francisco, local, $47.00 ℔ flask of 76½ lbs.; Denver, $51.00. Export, $45.00.

BABBITT METAL.— San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER. — Half-and-half, 100-lb. lots, 20c; San Francisco, Plumbers', 100-lb. lots, 16½c.

NICKEL.—New York, 50@60c ℔ lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $18.50; gray forge, $19.00; San Francisco, bar, 2.75 ℔ lb .,3c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $32 50; open hearth billets, $33.00; San Francisco, bar, 7c to 12c per lb.

CEMENT.—Germania, $2.65; K. B. & S., $2.65; Hewmoor, $2.50; Trowell, $2.50 per bbl.

LIME.—Santa Cruz, $1.60; Roche Harbor, $1.60 per bbl.

LUMBER.—(Retail): Pine, ordinary sizes, $18.00@19.50; extra sizes higher; redwood, $19.00@20.00; lath, 4 feet, $3.90 @4.00; pickets, $19.00; shingles, $2.00 for No. 1 and $1.75 for No. 2; shakes, $13.00 for split and $14.00 for sawed; rustic, $25.00 @31.00.

GENERAL SUPPLIES.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.50; Cut, $3.50; 10d to 16d, Wire, $3.55; Cut, $3.55; 8d, Wire, $3.60; Cut, $3.60; 6d and 7d, Wire, $3.70; Cut, $3.70; 4d and 5d, Wire, $3.80; Cut, $3.80; 3d, Wire, $3.95; Cut, $3.95; 2d, Wire, $4.20; Cut, $4.20. Special rates for carload lots.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1**, 60%, carload lots, 13½c; less than one toss 15½c. No. 1** 50%, carload lots, 11½c; led, than one ton, 13½c. No. 2, 40%, carloan lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ℔ set; 14 oz., 40s., 9c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $6.50; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $9.56, long ton; Colorado Anthracite, $14.00. Coke, $15 per ton in bulk, $17 in sacks; Sunnyside, $11.75, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 29@30c ℔ lb.; carloads, 27@28c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c ℔ lb.; soda ash, $1.90 ℔ 100 lbs.; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5¾@6¼c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 5c; alum, $1.90@2.00; flour sulphur, French, 2¼@ 2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.25 @1.50 ℔ 100 lbs.; sks, $1.05; chloride of lime, spot, $2.50@2.60; nitrate of potash, in bbls, 8c: caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, boiled, bbl., 78c; cs., 83c; raw, bbl., 76c; cs., 81c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 68c; cs, 73c; raw, bbl., 66c; cs, 71c. Kerosene —Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bbls., 19c; wooden bbls., 22½c; cs, 25c; Mineral Sperm, cs, 26½c; Deodorized Stove Gasoline, bulk, 15½c; do., cs., 21½c; 86° Gasoline, bulk, 20c; do., cs., 26½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14c; do., in cs., 20½c; Lard Oil, No. 1 bbl., 60c; cs., 65c; Neatsfoot Oil, bbl., 70c; cs., 75c; No. 1 bbl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6¾c; 1 ton and less than 5 tons, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7¼c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6¾c; do. in kegs, 7¼c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7¼c; less than 500 lbs., 7½c.

ASSAY LITHARGE.—Per lb., 9c.

BISMUTH.—Subnitrate, per lb., $1.60.

BONE ASH.—3c ℔ lb.

BORAX.—Crystal, 7c; calcined, 20c.

CHROMIUM.—(90% and over) per lb., $1.25.

COPPER.—Carbonate, 20c; Red oxide, ℔ lb., 60c.

MAGNESIUM.—Per lb., $3.00.

MANGANESE.—(90% and over) ℔ lb., $1.25.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—25c. ℔ gramme; 1000 grammes—2¼ lbs.

PHOSPHORUS. — (American) ℔ lb., 80c.

SILVER.—Chloride, ℔ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ℔ lb., $1.00

URANIUM.—Oxide, ℔ lb., $3.50.

ZINC.—Metallic, chemically pure, ℔ lb., 50c.

ZINC.—Dust, ℔ lb., 10c.

ZINC.—Sulphate, ℔ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING MAY 13, 1902

699,829.—PUMP—J. Alhrefczenski, S. F.
700,009.—NOZZLE—J. Bean, Los Gatos, Cal.
699,830.—CARBURETOR—D. Best, San Leandro, Cal.
699,662.—PULLEY—L. C. Coulter, Portland, Or.
699,912.—HYDROCARBON LAMP — C. H. De Voll, Oakland, Cal.
700,163.—FILTER—J. W. Evans, Los Angeles, Cal.
700,039.—BURGLAR ALARM—Handy & Hosford, S. F.
699,755.—TRAIN ORDER BOX—I. G. Hoag, Los Angeles, Cal.
700,069.—SHOE DUSTER — W. G. Mullen, Pomona, Cal.
700,079.—POTENTIAL REGULATOR — R. A. Philip, Seattle, Wash.
699,712.—OVEN—F. Rademacher, Los Angeles, Cal.
699,822.—FURNACE—R. Scott, San Jose, Cal.
699,826.—RINGING PLOW—J. C. Silveria, S. F.
700,100.—DENTAL MALLET—J. W. Thatcher, S. F.
700,102.—WAGON—N. W Thompson, Bigelow, Or.
699,776.—IMPRESSION TRAY—E. L. Townsend, Los Angeles, Cal.
699,991.—STOVE—B. A. Vaughn, Corning, Cal.
700,106.—LOCK—Weber & Frey, Baker City, Or.

EXAMINATION OR SUPERVISION of Mines, Smelters and Mills.

Mining Engineer and Metallurgist, of unquestionable reputation and long experience, now permanently residing at Seattle, Wash., will examine or take general supervision of mines, smelters or mills, in Pacific Coast States, British Columbia or Alaska, as consulting engineer, for reliable parties. He also reliable accountant to examine. Box 813, Seattle.

HUBBELL, FREDERIC N.
MINING AND METALLURGICAL ENGINEER,
306 Pine St., Room 5. San Francisco, Cal.
Specialty: Gold & Copper. Bedford McNeill's Code.

SITUATIONS WANTED.

COPPER FURNACE FOREMAN with eight years' experience at matte and black copper work Best of references. Addrese V. H., care of Mining and Scientific Press.

PHYSICIAN AND SURGEON with three years' experience in both emergency and general hospitals, in addition to experience in mines and private practice, wishes position in a mine. Best of references. Addreee Box 126, care of this office.

CHEMIST AND ASSAYER, WITH TWENTY years' experience in mill and smelter work. Can run same. Address A. C., care of Mining and Scientific Prees.

THUNDER MOUNTAIN.—A successful superintendent of over 15 years' experience and acquainted with this district, deeires to take charge of property there for a good company. Addrees T. M., care of Mining and Scientific Press.

WANTED.—Poeition ae Foreman or Superintendent of quartz propoeition or developed mine. Timbering and air machine drille a specialty. Sixteen years' experience. No fake references furnished. Correepondence solicited. Present poeition not deeirable. Address T. J. P., care of Mining and Scientific Preee.

MINING ENGINEER, practical miner and mill man, assayer, etc., desires position of superintendent or assistant manager of a big property. Eleven years' experience. Best referencee. Now working in southern California. Address A. M. P., care of Mining and Scientific Prese.

WANTED.—SITUATION AFTER MARCH 15, 1902, as Manager or Superintendent of mine. Have had five years' experience in manufacturing and constructing mining machinery and plants. Three years' experience in underground work. Four yeare' experience as manager and superintendent. Treatment of low grade ores a speciality. Practical in every detail. State location of mine and salary. Best of referencee. Address X. Y. Z., this office.

A technically educated Mining Engineer, at preeent employed ae superintendent of mines for one of the largeet corporations in Mexico, desires a change of position to the United Statee about July 1st. Has bad 18 years' euccessful experience ae engineer and euperintendent, never having made a failure; 36 years of age; strictly temperate; a skilled designer, geologist and metallurgist, and a practical miner, as well ae a hard worker and thorough business man. Referencee of the highest order, including present employers. Addrese Supt., care this office.

WANTED.

Mine Blacksmith and Drill Sharpener to go to Hawaiian Islands—18 months. Unmarried man preferred; sober. Appiy by letter, with teetimoniais, to D. Y. Z., this office.

WANTED.—An Engineer and Mining Blacksmith

who understands repairing of machinery. Address "Quartz Mill," care Mining and Scientific Press.

Wanted to Bond a Dry Placer Claim, One Rich in Flour Gold.

Muet be a dry proposition. Address "Placer Claim," care this office.

WANTED TO BUY:

Interest in or all of a going Sampling Works, Ore Business, or Smelting Works. Addreee with partiouiars, L. X. D., Mining and Scientific Press, 330 Market St., San Francisco, Cal.

WANTED, for a developed mine in California, a competent mining engineer to look after development and exploration. Must be a full graduate of a recognized mining college and have had eeveral years' practical experience in large iron, coal or copper mines, and be fully skilled in the engineering problems pertaining to extraction, bauiage, ventilation, etc. Give full particulars of career, experience, age, etc, to "Vulcan," care of this paper.

A practical smelterman and metallurgist wanted, competent to handle a 250-ton matting plant, sulphide ore, in Arizona. Good opening for right party. State fully past experience and references.

Address "Matting," care of Mining and Scientific Press.

WANTED.

Consulting Mining Engineer,

familiar with making examinations of mines, prospects and mineral lands. Address stating experience and references. Moderate salary to start, with advancement to competent man. Position permanent if found eatisfactory. Address A., care of Mining and Scientific Press.

Wanted, Capital

to develop a group of mining claims recently discovered in northern California. Six lode locatione from 10 to 30 feet in width, carrying gold, silver and copper.

For further particulars, apply to

AUGUST QUITZOW,
CRESCENT CITY, CAL.

ASSESSMENT NOTICES.

SILVER KING MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Pioneer Mining District, Pinal County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of April, 1902, an aeeesement (No. 24) of one ($1) dollar per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 310 Pine street, Room 36, San Francisco, California.

Any stock upon which this aeeesement shall remain unpaid on the 27th day of May, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 24th day of June, 1902, to pay the delinquent aeeeement, together with the coete of advertising and expenees of sale.

By order of the Board of Directore.

J. W. PEW, Secretary.

Office—310 Pine street, Room 36, San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of worke, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directore, held on the 21et day of April, 1902, an aeeesement (No. 29) of seven (7) cente per ehare wae levied upon the capital stock of the corporation, payable immediately in United States gold coin to the eecretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any etock upon which thie aeeeesement shall remain unpaid on the 20th day of June, 1902, will be delinquent, and advertised for eale at public auction; and unleee payment is made before, will be sold on FRIDAY, the 18th day of July, 1902, to pay the delinquent aeeeement, together with the coete of advertising and expeneee of eale.

By order of the Board of Directore.

CHAS. BOVONE, Secretary.

Office—217 Sacramento etreet, San Francieco, California.

DELINQUENT SALE NOTICE.

VIRGINIA CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francieco, California; location of worke, Kearearge Mountain, Inyo County, California.

Notice.—There are delinquent upon the following deecribed etock, on account of aeseement (No. 12) levied on the 2nd day of April, 1902, the eeveral amounte eet oppoeite the names of the reepective ehareholdere, ae follows:

Namee.	No. Cert.	No. Sharee.	Amt.
Amiraux, P.	281	50	$1 00

Potent and Poetical.

A few years ago waterfalls were valueless except as "scenery." Now they constitute a potent source of energy and are proportionately valuable.

Better than competitive methods electrical development tends to clear the way for successful distribution of power. The ability to deliver on and from a wire the requisite power and light for an industry 150 miles from its source is a most potent factor in commercial success.

But "vandalism" is charged by lovers of landscape beauty, and the utilization of the cataract is by some considered sordid and destructive to its "poetry."

So much, however, depends on the point of view. There is as much real "poetry," as much food for fine fancy in a motor as in a natural waterfall. One is a splendid adaptation of intellect; the other is merely a gravitational action. Which spectacle produces the most beauty or satisfaction is a matter of opinion.

While, of course, it is sublime to see a mighty cataract pour over cliffs in thundering foam, yet it is of equal sublimity to see that same cataract through man's intelligence create a hundred homes, and while one can feel the poetry of nature in the iridescence of the waterfall as it plunges in its rainbow-sprayed flight, yet it is equally poetic and finely imaginative to trace the sunbeam as it draws water from the sea, note the breeze which carries that water to the mountains, observe the same water showered on the surface, coursing down to the plain, and guided through great wheels, creating electric energy that through the dynamo renews the same sunlight in a thousand lamps, and sets in motion a dozen busy shops; the sunlight thus completing a cycle of use and beauty that is grandly poetic and at the same time commercially creative. The bare waterfall is merely "poetic," the same waterfall partially used is potent and poetic too.

Deep Mining in South Africa.

A pamphlet compiled by A. P. Williams, Kimberly, S. A., shows the large number of American mining engineers now in important positions in South Africa, and since its compilation others have gone there from this country. While the Boer war was going on several returned, and with them came mining engineers, metallurgists and electricians eager to see all that was new in American mining methods and appliances. The cessation of hostilities this week makes certain the rapid resumption and extension of gold mining in South Africa, and prominent in connection therewith is the subject of deep mining in that region. The conditions are: the gold-carrying reef dips into the earth at an angle of approximately 35°, and long since proved its permanence in size and value to warrant laying out properties which will require vertical shafts to interset the reef at a depth of 7000 to 10,000 feet. Of course to a mining engineer there is no such word or condition as "impossible." The whole matter simply means that the greater the obstacle the greater the incentive to exertion and ultimate solution of any mining problem. These conditions were discussed at length in this paper three years ago, and it may be mentioned that the plan there and then proposed for the first time has met with affirmative consideration by many of the men to whom will naturally be delegated the work. The subject is referred to here and now merely because of its present timeliness. The first problem presented in deep mining on the Rand to a depth of 8000 or 10,000 feet is the fact that, in the ordinary way, with a single hoist at the surface, the rope, of whatever material it might be made, would have to be so strong to support its own weight that a limit would be reached at a depth of 5000 feet that would preclude possibility in that direction. The amount of power required, the weight of the rope and the size of surface appliances would make it "impossible" to sink 8000 or 10,000 feet direct hoist from the surface.

The idea is now generally accepted to have a hoist at the surface that would work to a depth of say 3500 feet; at that depth install a similar hoist, and at the 7000-foot level have a third hoist of like capacity, each set capable of raising six tons in each load with a hoisting speed of 2500 to 3000 feet per minute.

It would seem that the motive power will be compressed air or electricity, probably the latter. As the country is six months away from the manufacturers there can be little experimenting, as there is too much at stake. The whole subject has been pretty well threshed out and considerable practical work has been done in a tentative way—enough to demonstrate the feasibility of the main proposition.

ESTABLISHED 1860.

Published Every Saturday at 330 Market St., San Francisco, Cal.

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada.....$3 00
All Other Countries in the Postal Union..... 5 00

Entered at the San Francisco Postoffice as second-class mail matter.

Chicago Office.....737 Monadnock Blk.
Denver Office.....606 Mack Blk.

J. F. HALLORAN.....Publisher.

San Francisco, May 31, 1902.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Barrel Room, Portland Mill, Colorado City, Colo., 291. Jeffrey Sorting Belt Conveyor, 294. Fisher Air Compressor; Sectional Elevation Fisher Air Compressor, 296. Mining and Metallurgical Patents, 297. View of Mill of Portland Mine, Located at Colorado City, Colo., Viewed from the East, 298.

EDITORIAL.—Potent and Poetical; Deep Mining in South Africa, 291. Two Kinds of Competition; Power of a Machine; What Successful Competition Involves; To Protect Gas Pipes from Electrolysis; Announcement of a Seattle, Wash., "Mining Paper;" Grand Boast of Iowa; The Two Great Objects of a Mining Engineer; General U. S. Statute 2400; Saving Expense When Putting in a Small Auxiliary Engine; "New and Rare Minerals;" How a Mine Manager Can Make Progrese; Recording of Assessment Work on an Unpatented Claim; "A Little Learning" Not a Dangerous Thing, 292.

MINING SUMMARY.—300-301-302

LATEST MARKET REPORTS.—15

MISCELLANEOUS.—Concentratee, 293. Electrical Roasting Furnaces; Jeffrey Sorting Belt Conveyor; Daylight in the Klondike; Nickel, Cobalt and Cryolite in 1901, 294. Costs and Profits in Pyritic Smelting of Low-Grade Copper Ores, 295. Unusual Minerals from the Pacific States; The Fisher Compressor; An Apparatus for Producing Thin Films of Electro-Deposition; Prizes for the Best "Vorspannmaschine;" A Recent Application of Blast Furnace Gas; The Expert's Report, 296. Mining and Metallurgical Patents, 297. The New Portland Mill, 298. The Begeer Cyanide Process, 299. Personal; Recently Declared Mining Dividends; New Patents; Books Received; Catalogues Received; Commercial Paragraphs; Notices of Recent Patente, 303.

THERE are two kinds of competition—emulative and antagonistic. Emulative competition is the strife between men for greater excellence and results in human progress. Antagonistic competition is the strife wherein man endeavors to injure his rival that he may succeed, and results in human retrogression.

A MACHINE cannot give off more power than is put into it in one form or another; the power given off is always represented by a fraction, that put into it being unity. This is due to the losses within the machine itself—that is, it takes some power to run the machine alone so that the power given off will be equal to that put into it minus the amount required to run the machine itself.

SUCCESSFUL competition of such a combine as the American Smelting & Refining Co. involves ownership of the raw material, ability to reach and maintain suitable market, and securing of requisite capital to extract and treat the ore. Such possibility exists, but it requires organization to make it effective and the ability to so organize constitutes an additional element that is of even greater value than the three designated.

ATTEMPTS have been made to protect gas pipes from electrolysis by covering with canvas and boiled tar, but destruction was more rapid with that coating than without, the earth seeming to delay electrolysis by absorption. Probably the best remedy is to reduce the return current through the pipes by laying conducting rails properly connected, or by using insulated return transmission cables leading back to the power house.

A SEATTLE, WASH., "MINING PAPER" of current issue has a prominent editorial announcement on its first page, wherein the publisher says he "will guarantee 12% per annum upon money invested according to our judgment" in mining stocks. To exploit or explode such a statement would be unnecessary to those who can understand it, and useless to those who can not. Doubtless there are people who believe such things, but they have not sufficient intelligence to read such a journal as this.

IOWA PAPERS exultantly announce that this year's corn crop in that splendid State promises to be greater in value than this year's gold yield of any nation. This is a grand showing and Iowa is to be congratulated. But the comparision is invidious. The "gold product of any nation for 1902" would be just as much and worth as much if Iowa never produced a bushel of corn. But what would Iowa's corn crop be worth were there no gold produced last year or this year or next year? No miner produces gold thinking how much Iowa corn he can get for it, but no Iowa man produces corn without figuring how much gold his crop will buy.

A MINING ENGINEER has constantly before him two great objects—first, to work his mine with the least possible likelihood of loss of life or injury to the men employed by him; second, to produce the minerals he is working at the least possible cost, having his first object—safety—always in view. In securing success in these two things he must, in a sense, have the co-operation of all his men; that is often gained by social influence and such general action as makes all connected with him in any way feel that they are viewed, not as mere machines, but thinking human beings.

GENERAL U. S. STATUTE 2400 allows the filing of an additional certificate of the location of a mining claim where the locator fears that his original location is defective, or if he desires to change his surface boundaries, or take in part of an abandoned claim. In the case of Duncan vs. Fulton, 61 Pac. Rep., Colo., 244, the court decided that where an original certificate sufficiently located a discovery shaft, and an additional certificate gave a description by metes and bounds starting with the discovery shaft, and running to posts in a mound of stone, the claim could be identified with certainty from both certificates taken together, and hence such certificates were admissible to establish the locator's claim, though neither taken alone sufficiently described such claim.

EXPENSE may be saved when putting in a small auxiliary engine by using a smaller steam pipe than the cylinder calls for, or by making the exhaust pipe one or two sizes less than the engine builder intended, and this may do, so long as the engine is not worked up to its full capacity; but when a full load is put on it the initial pressure will be much less than the boiler pressure, and it will grow less as the piston advances, because the small pipe can not deliver steam enough to maintain it. The small exhaust pipe may be sufficient to conduct the steam away without causing much back pressure, but this can not be known until the indicator is applied. The result is that the engine labors, the machine that it runs is not kept up to speed, and the whole arrangement is unsatisfactory.

"NEW and rare minerals" are being constantly "discovered," but, however interesting to a collector of curiosities, the matter has no general commercial importance. Just because a rare mineral is quoted at so very much per grain, or gram, or ounce, is of no avail in its production. Vanadium has been "discovered" over and over again. True, it is quoted at an extraordinarily high figure, but by the time it is in practical use it costs all it comes to. So, too, with cadmium, which is quoted at a high figure, but the use is limited, and ordinarily, when found in zinc ore, it is a nuisance, as it dyes all paint products a brilliant yellow. One little cadmium deposit can supply the whole world's demands therefor for twenty years, and the moment any other little lot appears the price would drop so fast and far as to make its production unprofitable.

ONE way a mine manager can make progress and get out of the rut is to go out in the world or the next county: anyhow to move around and see what other people are doing. If he vegetates and stays forever around his mine or mill he will cease to advance and that means to go backward, and that spells loss, for even if one makes a little profit he really loses if he doesn't make all that good progressive management should out of the business. A visit to neighboring plants is always productive of profitable operation, for no one knows it all. This is generally understood and acted on. It is a common occurrence to have a mine manager or a superintendent come into this office stating that he is "just looking around," and proposes to visit a number of mine establishments to get pointers. It pays in every sense to do so. Of course to the can't-get-away man the weekly visit arrival of this paper is considerable in the way mentioned, but even the interchange of ideas and the practical experience of others that he weekly finds therein, can be ably supplemented by personal contact and the benefit derived from brushing up against a brother worker in the same line.

THE law does not demand the recording of assessment work on an unpatented claim, but failure to make the record throws upon the miner a burden of proof, in the event of a contest, that he did the work, that at least demonstrates the desirability as a precaution of having the affidavit recorded wherever possible. In the event that the record was made, the person attacking it must make out a case strong enough to overturn the prima facie case that the affidavit is assumed to be. It is well to make the record, but not absolutely necessary. It is well for prospectors and other holders of mining property to bear in mind the general principle that it is best to secure one's self against attack wherever possible. In many hundreds of instances it is immaterial, as it happens, whether the precautions have been taken or not, but that is only because no one has taken the trouble or expended the fertility of resource necessary to find a possible opportunity and pick a flaw. The prospector who has faith in his mine—and where is there one who hasn't—ought to be as careful as if he knew that it would be a bonanza to protect himself against attack in the event that it does prove to be something worth fighting for. And where witnesses become scattered far and wide, as they do in the West generally, and particularly in the mining country, the record of the representation work is an anchor to windward, that costs comparatively little and may be eventually found to be worth much. W. S. Keyes, the veteran mine expert, tells of a recent case in Montana where he was a witness in a big mining suit in which the title to a property worth over $2,000,000 hinged upon the ability of the company to prove that certain work was done in 1874. There was no record and apparently all who could have proved it were dead. At last a man who knew the facts and was able to truthfully swear thereto was found in Bisbee, Arizona: one of the original locators and probably the sole survivor. He was brought to Butte and his testimony saved the company. "Suppose he had died?" says Professor Keyes. One thing is sure. Just as soon as a mining property becomes valuable litigation begins. Next to the ironclad potency of a U. S. patent comes the recorded proof that the requisite amount of work to hold the claim was done in and for any year.

TAKING as a text the line "a little learning is a dangerous thing," a contemporary argues that unless one can get a complete scientific education he is better off with none at all. This is a mistake—a little learning is not "a dangerous thing." It beats none at all; and the more scientific knowledge one has in mining or metallurgy, the better miner or metallurgist he is. Nowadays science is required in everything. There is science in buying a burro or sinking a shaft or making an ore car or building an air compressor. There is nothing secret nor sacred about science. Whenever one gets a new idea of any value he has acquired just so much more practical science. Science is simply organized knowledge, and the prospector or miner who never saw the inside of a "scientific" institution may exercise the latest scientific methods in his work—if he knows them. Ordinarily these scientific methods are learned by study and experience, by practice and observation; and whether the college or university be a crowded building or a lonely cabin or the 1200-foot level of a shaft, the real student is learning and acquiring "science" that will stand him in good stead all his life. The time has gone by when the pseudo scientist can sneer at the "common man," or the rank and file can justly hold aloof from the benefits conferred by real science. The true scientist is always anxious to have all enjoy the advancement afforded by general knowledge, and the progressive miner or mechanic or metallurgist is always eager for the further knowledge that can be acquired only by assiduous scientific study. And when it comes to terms, what is meant by "a little?" Were any of us able and willing to acquire continuous knowledge for a century of existence, he would then be possessed of but "a little," comparatively. Encouragement and not discouragement to scientific research is needed, and that silly line about "a little learning" being "dangerous" should be blotted out.

Concentrates.

ALLOYS of lead and copper are commercially valueless.

THE value of California's mineral production for 1900 was $32,622,945.

ONE H. P. will raise 8 cubic feet of water por minute 50 feet high, or 5.3 miners' inches.

THE revenue tax on mining stock certificates was repealed on April 12. The repeal takes effect July 1, 1902.

BARIUM suiphide is formed from witherite and suiphur by heating in a covered crucibie to duii redness for 30 minutes.

A SQUARE ditch 6.58 inches, running full of water at a velocity of 5 feet per second, will deliver 675 gallons per minute.

IRON at Birmingham, Ala., costs $16 per ton; the freight to San Francisco, Cal., is $12.75 per ton. The Pacific Steel Co. at Irondale, Wash., is now manufacturing pig iron.

AIR becomes liquid at 312° F. below zero; hydrogen at 422° F. below, nitrogen 317°, oxygen 297°. None of these liquid gases have any commercial use. Hydrogen has been reduced to a solid.

THE value of an oil well in California or anywhere else may be considered three times its net earning power in one year. The earning power of a well is about three barrels per day less than the gross output.

CALAMINE is a native carbonate of zinc, containing as high as 50% of the metal, and occurring abundantly; or a silicate of zinc, some mineralogists applying the name to the latter and calling the former smithsonite.

AT Savonas, B. C., are the only quicksilver mines under the English flag. At Nikitowka, Ekaterinoslav, are the only quicksilver mines under the Russian flag. In each case the average yield of the ore is less than 1%.

HYDROCHLORIC ACID is made by the action of suiphuric acid upon sodium chioride, gaseous hydrochloric acid being evolved and suiphate of soda formed. The solution of this gas in water is what is generally called hydrochioric acid.

WHEN a body is constrained to revoive around an axis it will describe the largest circle it is permitted to do, as a large circle differs less from a straight line than a small circle, and in any given advance of the body, therefore, it is less deflected.

WHEN the threads of a screw and its nut become worn a portion of a revolution of a screw is required before the nut begins to move. This movement of the screw, which is inoperative in moving the nut, because of the wear, is called "back-iash."

LAKE COPPER in the forty years from 1860 to 1900 touched its highest point in July, 1865—55 cents; its lowest in June, 1894—9 cents, New York price. Its highest figure in January, 1895, was 10 cents; its lowest figure that year was 9¼ cents, in March.

QUARTZ CRYSTAL cannot be used like glass on account of the high temperature required to melt it. Lenses are made from it by grinding, and in recent years fine silica fibers for physicai apparatus have been drawn out while the material was softened by the oxyhydrogen flame.

THE average value of gold produced is $17.375 per ounce troy, or .03.62 cents per grain, which gives a value of $253.40 per avoirdupois pound; $300,000,000 would give 1,183.89 pounds. Pure gold equals 1.206 pounds per cubic foot. Gold, at $17.375 per troy ounce, will weigh 1,117 84 pounds per cubic foot.

AS BETWEEN the proprietor of an establishment and his general workmen, the presumption of invention is with the workmen. Where one person is employed by another to reduce his ideas to practice, there is a strong presumption against the employe's having originated an improvement while in such service.

A SIMPLE test for the presence of gold is, grind the sample fine, put into a cup, pour over it tincture of iodine. Let the mixture stand covered. After three hours pour out on sheet of biotting paper, or better, filter through filter paper. If gold is present it will be indicated by a purple ring on paper around puip as iodine evaporates.

THE 1870 production of lead in the United States was 16,000 tons. Its highest price in New York that year was on August 25, $6.35 per 100 pounds. The 1890 production was 128,000 tons; highest New York price that year, Oct. 15, $5.87½. The 1899 production was 205,000 tons; highest New York price, December 20, $4.72½. The lowest New York price in thirty years from 1870 was Jan. 14, 1896, $3.02½.

HARVEYIZED STEEL and armor plate differ from other steel in being face hardened by a process in which the steel absorbs carbon. The piece of steel to be treated is put in a furnace while its face is covered with bonebiack and charcoai, the rest of it being sunk in sand. The temperature within the furnace is almost that which melts iron. Water is sprayed on the steel when it is taken out to chill it. Armor plates thus treated gain in their resistance to cannon shot from 50% to 100%.

A MAN locating a mining claim on Jan. 10, 1902, a second locating the same claim on Feb. 1, 1902, and a third locating the same claim on Feb. 11, 1902, the second and third would have to wait for the first man's time to expire—that is, till the original locator failed to conform to the requirements of the statutes. But the first locator has until Dec. 31, 1903, to do the necessary assessment work, and can not be legally dispossessed until Jan. 1, 1904, even if he does not do a lick of work on that claim, from now to Dec. 31, 1903.

A RETORT for small quantities of amalgam may be made by taking two clay pipes, break the stem of one close to bowl, plug hole with stiff clay; place amalgam wrapped in piece of cloth in bowl of pipe; place the second pipe on first, luting the joint with stiff clay; wire the two bowls together with iron wire, using pincers to twist the ends, and make firm joint; set cup under projecting pipe stem to catch the distilled quicksilver; heat over moderate fire at first and bring to red heat finally.

THERE are doubtless many points in Chile where copper could be mined in paying quantities. The ore is found in nearly all the forms known to nature, but the investments in these properties are comparatively insignificant. During the last twelve years manganese ores have been exported to the value of $14,273,896. The first shipments (4324 tons) were made in 1884. The amount of copper exported in 1899 was 35,854,439 kilograms (35,854 tons). The International Mining & Refining Co. of Huantajaya has offices at Iquique.

TO THE QUERY regarding the assaying of ore in which was considerable sulphur, answered some weeks ago, have been received a great variety of other answers. A Central City, South Dakota, assayer makes a comment that "Concentrates" does not note as common. He says: "In my experience with suiphur ores I use sufficient niter to oxidize the entire charge of ore. Then, when fusion has become quiet, I add a blank charge of flux, with the right amount of reducer to secure the desired button of lead, and, when fusion has again become quiet, pour."

THE formation in the gold fields of South Africa are peculiar. The gold is in reefs. These reefs are massive and made up of coarse granite conglomerate and sandstone, with here and there large or small cement seams. The gold is not in the quartz or sandstone, but in the cement. The streaks which carry the gold are from 6 inches to 60 feet in width, and almost invariably widen with depth. When the outcropping is first discovered it looks like a vertical vein, but soon flattens out on depth. The mining there is more like coal than gold mining anywhere else. Shafts are nearly all 16x8 or 16x6.

ROASTING an ore containing both gold and silver, and extracting the metals by amalgamation, is a standard and successful process, but is not continuously successful on an ore containing only gold. It can be done; the reason it has not been is largely because the roasting was not perfectly done. In the roasting the particles of gold become more or less coated with a film of suiphur, and this film prevents them amalgamating with quicksilver. It can be destroyed by a properly conducted roast, but this is seldom given. It is more difficult and requires more skill to roast a gold-bearing ore fit for amalgamation than for chlorination.

WHERE A took up two adjoining claims in August, 1900, and B later located two overlapping claims, neither doing any assessment work, C relocating A's two claims Jan. 1, 1902, the question as to "who owns the overlapping claims" has no significance, as they cut no figure. In any event, such property rights as are conferred by a valid prior location, so long as such location remains valid and subsisting, are preserved from invasion and can not be infringed or impaired by subsequent locators. To the extent, therefore, that a subsequent location overlaps or includes any portion of the surface held by another, to that extent such location is void.

THE idea that veins are branches of a great deposit that lies near the center of the earth, and that therefore they increase in richness as they increase in depth, is relegated to the century gone by. The theory that all veins were once open fissures is another dead one. Heat, cold, electricity, sublimation, infiltration and flowing waters are all recognized as agents that have worked and are working in nature's great laboratory as they work in the puny limitations that man has created to study his work. Just how they worked, what the influence of each one was in special cases, and how surroundings modified the results, form a volume that is being studied by many brilliant intellects. Their discoveries are leading to the end sought. No one knows their imperfections, and the missing links in the chain, as well as he who understands them best. He knows that they may never reach the end sought; but he also knows that they see into the rocks as far as another.

PROBABLY the largest nugget or mass of silver ever mined was a piece weighing 1340 pounds, which was taken from the Smuggler mine, Aspen, Colo., in 1894. In regard to this nugget, S. I. Hallet, of Colorado, wrote at the time: "The nugget in question formed part of a consignment of 15,031 pounds of ore, which with silver at 58 cents or thereabouts, netted us free and clear of all expenses, close to $82,000. This particular nugget was gotten out by itself, and seemed to be extremely pure. It was impossible to assay it in the ordinary acceptation of the word, and it was put directly into crucibles and the crucible returns given to us by the company. This streak of silver occurred as a core in some rich ore, averaging about 1000 ounces a ton. At times it would be ½ inch in thickness, and then widen out to 2 or 2½ feet. It was a little purer than a silver dollar and almost as bright. We were obliged to mine by the side of it, allowing it to hang down into the stope until we had reached a natural crack or thin place, where we could break it off. It extended along the stope 20 or 30 feet in height, was 3 or 4 feet in length, width as given. As to just how it was made it is hard to give a theory. It was sometimes found crystallized in connection with argentite, which might lead one to think that it had simply been argentite, and that by the enormous pressure exerted on it the suiphur had been expelled. Again were found pieces in which the outer surface was a thick mass of silver wire practically welded together, which would, of course, account for it in a different way."

AT the gas power plant of the Moctezuma Copper Co., Nacosari, Sonora, Mexico, two qualities of gas are produced in the generators, according as the fires are supplied with air or steam. There are two gas-holders, one with 6000 cubic feet capacity for water gas, the other 15,000 cubic feet capacity for producer gas. The two gases, when mixed in due proportion, operate the gas engines. At Morenci, Ariz., the Detroit Copper Co. operates a similar plant, the gas being piped one mile to the smelters, there supplying two 200 H. P. three-cylinder vertical gas engines, each belted to a 120 K. W. alternating current dynamo. The gas is also piped 2000 feet to the concentrating mill, there operating three 80 H. P. gas engines. The gas thus supplied can be made from either anthracite or bituminous coal, coke or wood by passing steam and air together or alternately through incandescent fuel deeply bedded, the gas so evolved being passed through water spray towers into tanks for use.

THE metal prices quoted in market reports for Great Britain represent the value in pounds sterling of an English ton—2240 pounds. Usually in this country the 2000-pound ton is the measure of weight, prices being ordinarily quoted in cents per pound avoirdupois, or dollars and cents per 100 pounds. The given price of any commodity, quoted in market reports, pounds sterling per 2240 pounds, can be readily converted into the equivalent into United States currency per 100 pounds by using this formula: $P = (P^1 \times E) \div 22.4$, in which P = price per 100 pounds in dollars and cents. P^1 = price in pounds sterling (shillings and pence being expressed in decimals of a pound), and E = the value of £1 in United States currency at the existing rate of exchange. For instance, on page 15 of to-day's market report spelter is quoted at £18 10s London. With exchange at $4.866, the equivalent in dollars and cents per 100 pounds would be computed as follows: £18 10s = £18½ (18½ × 4.866) ÷ 22.4 = $4.014. This formula will apply to any similar instance.

BLACK OXIDE of manganese is not converted into ferro-manganese, the latter being an alloy formed by the proper admixture of manganese ores with iron. Manganese imparts to iron whiteness and causes it to become hard and brittle. Alloys of iron containing up to 25% manganese are termed spiegel-eisen (mirror iron). With higher percentages of manganese, the grain of the composition becomes more uniform and granular and an alloy is obtained which increases in brittleness with increase of manganese. Alloys of less than 25% or 20% manganese are extremely brittle and hard. But when the percentage of manganese is doubled, alloys possessing different properties are the result, and exhibit a remarkable combination of hardness and toughness, and peculiar, in that while they resist the abrasion of the lathe tool they can be indented by an ordinary blow. A light grey color is a characteristic. To these mixtures the term ferro-manganese is given. The manganese ores (black oxide) are mixed so that if 75% of the manganese in the charge is reduced and 25% goes into the slag, the desired composition will result. It is not practicable in the ordinary blast furnace operations to reduce the whole of the manganese in the charge. To produce a ferro-manganese containing 86% manganese, a richer mixture than the above must be used, of which say 80% of the manganese is reduced and but 20% passes into the slag. Manganese steel contains 7% to 20% (more commonly 14%) manganese. Variations in percentage of carbon produce marked differences in characteristics.

BY cyanidation it is feasible to treat telluride ores, but the result will not compare favorably with the smelting returns. These ores are highly charged with suiphides, and with any process, such as chlorination, where roasting is necessary, a loss of gold will occur. To obtain a sweet roast is one of the most essential points for the successful extraction of the gold by chlorination, and to thoroughly roast these ores at the low temperature necessary to avoid a large loss of gold would occupy a great length of time, and is naturally expensive where fuel is scarce. With many of these ores the large amount of calcite in them would considerably increase the difficulties in treating with chlorine. The treatment by means of a battery and ordinary amalgamation is out of the question, as only the free gold will be saved, and in many cases the saving of the free gold itself would be very difficult, owing to its exceeding fineness. There are many proved methods, by means of which a greater percentage of gold can be obtained, from these ores especially, than by any methods of amalgamation. The term "refractory ore" is misleading, as it is usually applied to all ores that will not amalgamate easily, whether the battery is suitable or not, and whether the battery manager understands his work or not. A great number of so-called "refractory ores" carry little or no gold, and it is impossible to devise a practical method of treatment; but where there is gold, and in large quantities there are brains enough at work to find out the most suitable and commercial methods of treatment.

Nickel, Cobalt and Cryolite in 1901.

"Mineral Resources of the United States, 1901," published by the United States Geological Survey, will contain the report of J. H. Pratt on nickel, cobalt and cryolite for 1901.

The two principal sources of nickel are nickeliferous pyrrhotite, the most widely spread of the nickel ores, and gentbite. In this country the domestic product of nickel has been as a by-product from the lead ore of Mine Lamotte, in Missouri, since the shutting down of the Gap nickel mine in Lancaster county, Pa., 50 miles west of Philadelphia, ten years ago. This mine was worked from 1863 to 1880, when work was discontinued because of the abundant supply of nickel matte from Canada. Occurrences of nickel silicate are found in Oregon, Piney mountain, Douglas county, 3 miles northwest from Riddles.

Nickel ore is reported to occur in some quantity at the Congress mine, in Upper Nine-Mile section, 14 miles north of Keller, Ferry county, Washington. This section was formerly worked for copper and gold, but was abandoned. In the latter part of 1901 the claims were again taken up and are now being developed for nickel.

The Wyoming nickel ores near Sheridan, Sheridan county, do not seem to contain nickel in commercial quantity; at Piney creek, also, nickel ore is reported. Near the northern border of Churchill county, in Cottonwood canyon, 45 miles from Lovelock, Humboldt county, Nevada, deposits of niccolite and gersdorffite have been prospected as nickel ores; deposits are reported at Bunkerville, Lincoln county, and near Candelaria, Esmeralda county. They have not yet been producers of nickel ores. It is reported that the Magnetic mine, near Tucson, Arizona, contains nickel ores in quantity, and that they are now being investigated by Eastern capitalists.

Nickel ores are reported also as found on Spring creek, in the Black Hills, South Dakota, 11 miles northwest of Custer, and at the St. Joe mine, Blackbird, Lembi county, Idabo.

Nearly all the nickel used in the United States is from the mines in the Sudbury district, Canada, which produces one-half the nickel used in the world. The other chief sources of nickel are the mines of New Caledonia, in the Pacific ocean, and of Silesia, Austria.

The first use of nickel was in making German silver. Nickel is used extensively for coinage by the United States and many European countries. The most important use of nickel is in making nickel steel, now used in large quantities in the production of armor plates, turrets, propeller shafts and bicycles.

The only nickel and cobalt produced in the United States during 1901 were as by-products at Mine Lamotte, Missouri; the matte containing the nickel and cobalt was refined at Constable Hook and Camden, New Jersey. There were obtained 6,700 pounds of nickel, valued at $3,551, and 13.360 pounds of cobalt oxide, as compared with 9,715 pounds of nickel, valued at $3,886, and 6,471 pounds of cobalt oxide produced in 1900. This is a decrease of 3,015 pounds in the production of nickel, and an increase of 6,889 pounds in the production of cobalt oxide. Experiments have been made by the Canadian Copper Company to refine, in Canada, the nickel copper matte from the Sudbury mines, but thus far in vain, the greater part of the matte being refined in the United States.

The amount of nickel imported and entered for consumption in the United States in 1901 was 117,364,337 pounds, valued at $1,847,166, as compared with 57.955,988 pounds of nickel matte, etc., valued at $1,323,630 in 1900. The amount of nickel produced from matte and ore imported into the United States was 10,497,097 pounds, worth between five and six million dollars. The price of nickel oxide has been about 5 cents lower per pound than the metal, while the cobalt oxide has been sold at $2.20 a pound. The nickel industry is increasing, and there has been, also, increase in the amount of nickel used in the United States. The export of nickel oxide and matte from the United States in 1901 was 5,869,655 pounds, as compared with 5,869,906 pounds in 1900.

The amount of cobalt oxide imported into the United States in 1901 was 71,969 pounds, valued at $134,208, as compared with 54,073 pounds, valued at $88,651 in 1900. As the United States refines the greater part of the nickel matte produced at the Sudbury mines, naturally the United States exported nickel to the amount of 5,869,655 pounds in 1901, or 251 pounds less than was exported in 1900.

The production of nickel in Canada in 1900 was 8,729,000 pounds, valued at $4,364,500; in France the production was 3,746,800 pounds, valued at $1,020,000; in Germany it was 4,383,756 pounds, valued at $1,999,940.

Cryolite is a fluoride of sodium and aluminum. It is used sparingly in the manufacture of hydrofluoric acid, its greatest use being in the manufacture of aluminum and sodium salts. There is no cryolite produced in the United States, and it has been found very sparingly in only a few localities in this country; namely, at the southern base of Pike's peak, El Paso county, Colo., and in the Yellowstone National Park. All of the cryolite used is imported from Ivigtok, in Greenland, on the Arksuk fiord, one of the deep rocky winding bays which penetrate the steep mountain coast at intervals. The supply of cryolite is controlled by the Danish government, and there is imported into the United States each year from 5,000 to 10,000 tons, the imports in 1900 being 5,437 long tons, valued at $22,763, and the imports for 1901 being 5,383 long tons, valued at $70,886.

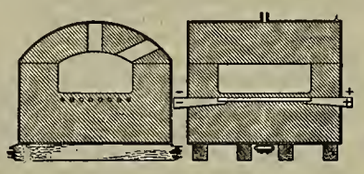
Electrical Roasting Furnaces.

When moderate temperatures (e. g., up to a white heat about 1400° C. = 2552° F.) are required, gas or solid fuel furnaces of well-known types are generally preferable, and certainly much cheaper under ordinary conditions. At still lower temperatures—for example, a moderate or a dull read heat—the case against the electric furnace is even stronger. One may, however, find instances when the use of the electrical furnace is practicable for very moderate temperatures. Already low-temperature electric furnaces are in successful use for laboratory purposes, and for the little muffles employed in mechanical dentistry. It is proposed to extend their employment, given suitable conditions, to larger industrial operations. In modern metallurgical practice it not infrequently happens that an ore of paying richness occurs in a district where fuel is dear or hardly existent, and the means of communication so bad that the cost of imported fuel becomes almost prohibitory by the time the fuel is delivered on the spot.

Such desolate regions, from the nature of the case, are generally mountainous and often abundantly supplied with water power. The enterprising exploiter of a property of this kind naturally turns to some electro-chemical process of treatment, and if the water power can be readily utilized without an unduly large expenditure for impounding, tunneling and the like, there is no reason why the absence of fuel should prevent the successful and profitable extraction of the valuable constituents of the ore. But it often happens that electro-metallurgical processes need some preliminary aid from older methods. Frequently, for example, the ore has to be roasted.

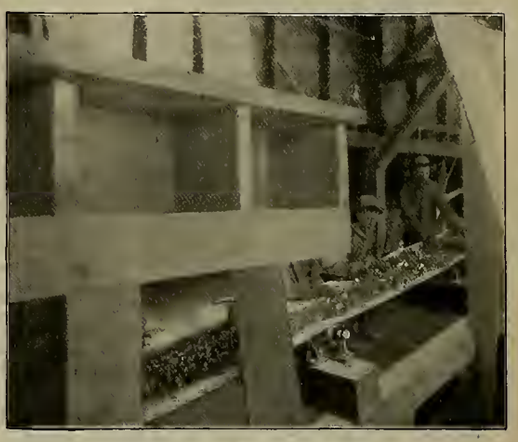
In the case now being considered, as fuel is very dear, an alternative mode of heating is desirable, and this can be secured by an electrical method. The cost even with cheap water power would be excessive under ordinary industrial conditions, but in the special circumstances cited it may fall within moderate bounds.

As long ago as 1883 Faure patented a furnace, an illustration of which is here shown, designed for raising the temperature of a charge lying on the hearth of the furnace by heat generated in a continuous conductor embedded in the sole of the furnace. An obvious alternative is to let the conductor lie on the hearth itself or to embed it partially. This furnace was intended for the manufacture of sodium. It will serve here as an example of a simple method of internally heating a reverberatory furnace suitable for roasting operations. It would be easy to devise other forms to meet special needs. The temperature required is so moderate that the practical difficulties are smaller than most of those encountered in electro-chemical work. Without being conclusive as to the design of such a roasting furnace, it would seem that a firebrick hearth, in which grooves were chased so that iron rods of fairly large sections were embedded nearly flush with the level of the hearth, would serve as well as more elaborate contrivances. One should use a low pressure and a heavy current, so that the iron rods might be stout enough to resist wear and loss by oxidation. They could be easily and cheaply renewed. Systematic roasting in a revolving calciner, instead of on a fixed hearth, needing rabbles and much hand labor, would be accomplished at least as easily as any form of roasting by fuel in a similar apparatus. Roasting furnaces needing ploughs or rakes dragged over the hearth mechanically to stir the ore would be better suited by the electrical method of heating than by the usual roasting processes. The wear and tear of such form of mechanism is heavy, and is largely due to their exposure to the fire gases which heat the ore. With an electrical roaster this would be changed, the sole of the furnace being the hottest part, the ore the next, and the plough, or stirrer, remaining fairly cool. There are certain possibilities in the electric roaster when power is sufficiently cheap and fuel is sufficiently dear.—Bertram Blount in Electrical Review.



Jeffrey Sorting Belt Conveyor.

The accompanying illustration shows a Jeffrey "Century" belt conveyor used as a sorting table at the mines of the Colorado Fuel & Iron Co. This outfit consists of an extra wide Century conveyor belt, having its carrying side reinforced with an extra thickness of a special rubber covering for resisting the abrasion of the material. The belt is supported on special troughing carriers, concaving the belt sufficiently to prevent the material from rolling off. The belt is operated at a moderate speed, which enables the pickers to take the impurities from the product while in transit. These sorting tables are used successfully for different purposes, also for carrying large or small quantities of material from one place to another. They can be operated horizontally or on an incline up to 25° or 30°, if desired. The above conveyor was furnished by the Jeffrey Manufacturing Co. of Columbus, Ohio, which supplies this class of material for the handling of coal, ores, sand, quartz tailings, crushed stone, sulphite chips, clay and for a variety of other purposes. This company also manufactures a complete line of chain elevating, conveying and power transmission machinery. Its new and handsomely illustrated catalogue (No. 67) on "Century" rubber belt conveyors can be had upon application. Frank R. Field, Equitable Bldg., Denver, Colo., is the Western agent.



Jeffrey Sorting Belt Conveyor.

Daylight in the Klondike.

Following is a table of sunrise and sunset in the Klondike. It is computed for every tenth day in the year and is correct to the nearest minute.

The table shows that the shortest day at Dawson is the 21st day of December, on which day the sun rises at 10:13 A. M. and sets at 1:47 P. M., an interval of only 3 hours and 34 minutes. The longest day falls on June 21, when the sun rises and sets at 1:47 A. M. and 10:30 P. M. respectively, the sun remaining above the horizon for 20 hours and 26 minutes. On the 21st of March and September the days and nights are equal, as they are in all latitudes.

Costs and Profits in Pyritic Smelting of Low-Grade Copper Ores

NUMBER IV.

Written for the MINING AND SCIENTIFIC PRESS by F. H PRENTISS, E. M.

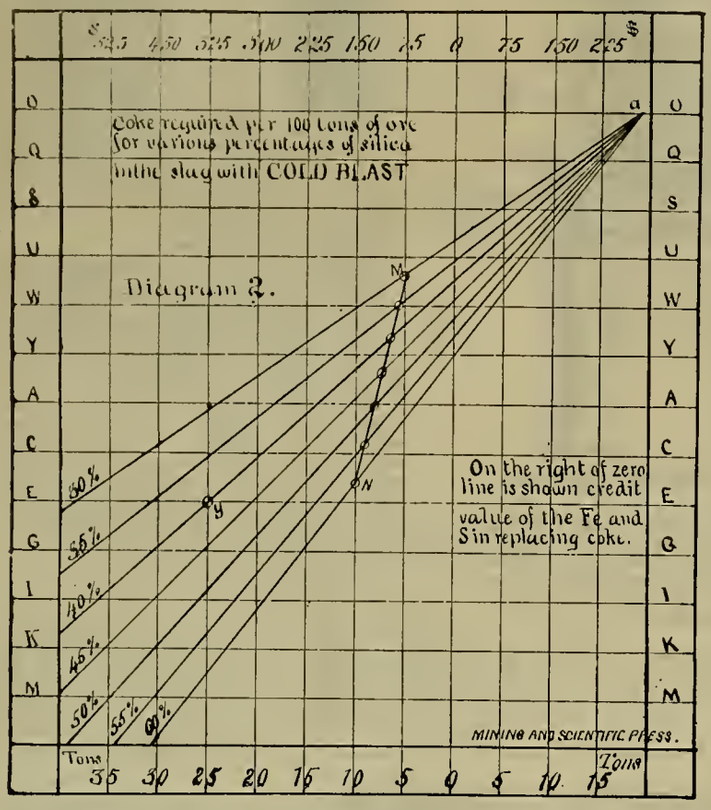
The effect and value of the hot blast is shown in diagrams Nos. 2, 3, 4 and 5. In diagram No. 2 we find that, for example, to make a 40% silica slag (with limestone flux) requires for an ore of type E, using cold blast, twenty-five tons of coke per 100 tons of ore, (marked y on the diagram), while diagram No. 3 shows that with hot blast, under otherwise the same conditions, only 14½ tons are needed, marked x on the diagram). In both of these diagrams the vertical line marked o shows where, under suitable conditions of the type of ore and slag, no coke is required. To the right of the zero line, therefore, the ore will yield of itself a surplus of heat to the extent determined by type of ore and slag. At the point a, where the lines converge, the ore carries no silica, and the limiting credit value is reached.

Diagram No. 5 requires no special comment in addition to the description given.

In diagram No. 4 it will be noticed that the lines ab and cd cover types of ore ranging from about V to D. These types are all self-fluxing, in accordance with the type of slag indicated. At about V we get a self-fluxing type for a 30% silica slag, and at about D for a 60% silica slag, and between V and D for intermediate percentages of silica. In all these cases of self-fluxing ores it requires for cold blast about 6000 cubic feet of air per minute and about 40 H. P. to drive the blower, no matter, practically, what type of slag is made, and similarly for hot blast there is uniformly required about 4000 cubic feet of air per minute, measured at atmospheric temperature and pressure, and about 27 H. P. to drive the blower, while the cost of heating the blast will be 40 cents per ton. This would all hold equally good in the case of smelting 100 tons of a mixture of high-grade ore and of sufficiently briquetted concentrates to flux it—100 tons being total amount of both—no matter what per cent of silica the high-grade ore contained, or, within reasonable limits, the quantity used out of the total 100 tons or what type of slag was made.

This uniformity would produce a very smooth working furnace, requiring but little attention from the furnace man and less from the metallurgist.

Variations in the amount of coke are shown in diagrams Nos. 2 and 3. With cold blast a 30% silica slag would require 5% of coke (M on diagram No. 2) and a 60% silica slag would require 10% (N on diagram No. 2), while for hot blast the requirements would range (diagram No. 3) from nothing up to 4½%.



Coke required per 100 tons of ore for various percentages of silica in the slag with COLD BLAST

MINING AND SCIENTIFIC PRESS

It will be noticed that with limestone as a flux a greater amount of coke is required for a 30% silica slag than for a 60% slag, or just the reverse of the requirements when concentrates form the flux, since the latter bring their own fuel with them in the shape of iron and sulphur.

Diagram No. 4 indicates to a still greater extent the value of hot blast. Take, for example, the same type of ore, E, and of slag (40% Si_2) marked on the diagram x and y. It will be found that to smelt 100 tons of ore daily requires 53 H. P. for the hot blast and 81 H. P. for the cold blast, while the former re-

quires only 7800 cubic feet of air per minute, against 12,000 cubic feet for the latter. The hot blast is supposed to be 1000° F. above the atmosphere, but the effect at any other temperature may be readily had by interpolation. The effect, therefore, of adding a hot blast to a furnace previously operated with a cold blast would be, under the conditions given in the above example, not only to reduce coke cost per ton of ore by more than 40%, hut at the same time to increase the capacity of the furnace by nearly 60%, thus producing other economies as a consequence. It is probahle that the increase in capacity would be more than that stated, since the higher the temperature the more active hecomes the oxygen of the air in its chemical action, and the amount of surplus air would he thereby lessened. Furthermore, smelting would he made easier and a more liquid slag obtained, permitting a higher percentage of silica and a cleaner separation from the matte. The hlast furnace may be compared to a steam hoiler. In the case of the latter some heat is lost by radiation—ahout 4%—a further amount in the waste gases—12% to 20%—while the measure of efficiency is the proportion of the heat ahsorhed hy the water in the boiler to the entire heat generated hy the fuel. We may put this in another way hy stating the efficiency to he the ratio which the actual temperature of the fire bears to the temperature theoretically attainahle hy the combustion of the fuel. To a large degree the temperature of the slag is a measure of the heat efficiency of a furnace. Ore and fluxes in the furnace correspond to the water in a hoiler. The resulting slag and matte may be compared to the steam product of the hoiler, since the object of the furnace is the separation of metallic values from worthless gangue by the difference in specific gravity hetween the molten matte and slag.

Some escape of heat through the jacket and by the waste gases is an unavoidahle loss, and it may he fairly stated that the heat efficiency of a furnace—where no harren flux is used—is the ratio of the quantity of heat carried away by the slag (and matte) to the total quantity attainahle hy the oxidization of the coke, sulphur, iron and other fuels.

(TO BE CONTINUED.)

Unusual Minerals From the Pacific States.

By H. W. TURNER.

Pyromorphite.—This lead phosphate is found ahundantly in the Rocky mountains and elsewhere, hut, so far as known, has not yet been reported from the Pacific slope. G. W. Kimhle of Placerville, Cal., sent some specimens of quartz from a vein in Mosquito gulch, ahout 6 miles northeast of Placerville. This quartz contains a little galena, and a yellow-green mineral supposed by Mr. Kimble to he pyromorphite. The yellow-green mineral was found to be pyromorphite. It occurs as coloring matter in hotryoidal chalcedonic quartz, coating seams and lining cavities; and also as little crystals along seams in the quartz. Mr. Kimble states that the vein occurs in gneissic rock near granodiorite, and that it contains, besides the pyromorphite and galena, a little pyrite and gold.

Monazite.—This phosphate of the cerium metals occurs usually in granites and gneisses, notably in North Carolina and Brazil, hut is known to be common in many parts of the world in sands. Waldemar Lindgren reports monazite in abundance in the Idaho basin, 25 miles NNE. of Boise City. It is usually called "yellow sand." The monazite occurs in small grains, and is presumed to have come from the surrounding granite. Its occurrence here in considerable quantity is of interest, as later it may serve as a source for the rare earths of the cerium group used in the manufacture of the mantles of Welsbach and other similar burners. North Carolina and Brazil now furnish the commercial monazite in sufficient quantity for this purpose.

Apatite.—As is well known, apatite is a very abundant constituent of many granodiorites and other igneous rocks, in the form of minute grains and prisms. The composition of this apatite prohably varies, but to determine its character in a specific instance a gneiss was selected (No. 1743 Sierra Nevada collection) which contains a relatively large amount of this mineral. This gneiss was collected in the canyon of the North Fork of the Mokelumne river east of the mouth of Bear river. It is one of a series of old gneisses possihly Archæan in age. The gneiss is composed chiefly of plagioclase, amphihole, pyroxene, reddish hrown hiotite, quartz, with accessory pyrrhotite, titanite, magnetite, zircon and apatite.

The heavy minerals were separated from the other constituents by means of the Thoulet solution. The magnetite was extracted with a horseshoe magnet, and the amphibole, pyroxene and hiotite with an electro-magnet. The remaining powder contained titanite, zircon and apatite. This was examined chemically hy Dr. W. F. Hillebrand, who states that "the apatite contains a very small amount of chlorine, hut apparently no fluorine whatsoever; at least it could not he detected. Neither does there seem to be hydroxyl replacing fluorine or chlorine." It thus appears in this instance that the apatite is neither a fluor- or a chlor-apatite.

Vivianite ($Fe_3P_2O_8+8H_2O$).—Prof. H. G. Hanks reports this mineral from the Bree ranch in Los Angeles county associated with asphalt. The vivianite is in small enclosed nodules, never larger than a pea and generally smaller.

The Fisher Compressor.

Herewith is illustrated the Fisher compressor, made by S. S. Fisher, 50 So. Clinton St., Chicago, Ill.

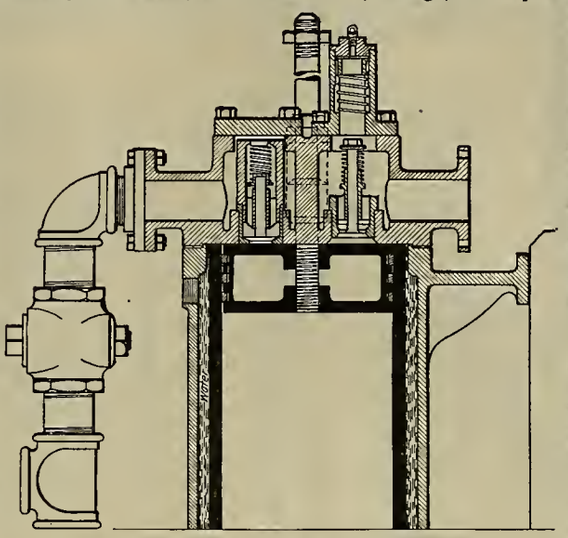

Fig. 2—Sectional Elevation Fisher Air Compressor.

One recently placed in a Racine, Wis., plant has a capacity of 300 cubic feet of free air per minute, 10-inch base, 42-inch stroke. This compressor furnishes air for operating pneumatic tools and also a three-ton pneumatic elevator, and is designed to he attached tandem fashion to a steam engine, or may he operated by belt power.

In attaching the compressor tandem, the back cylinder head of the engine is fitted with a stuffing box to receive the piston rod of the compressor, the head drilled and tapped to attach the two tie rods which hold it in position. The piston rod of the compressor is screwed into the piston of the engine, operating in unison and in a direct line. The receiver pressure is automatically regulated. No air is compressed unless the receiver pressure falls below the point set on the regulator. The capacity of the compressor can he increased or decreased hy a change in the diameter of the inner cylinder and piston; if the hore is 5 inches diameter, the stroke 18 inches, the capacity may he increased by removing the 5-inch cylinder and substituting one that is 10 inches. No change is required in either of the valves, cylinder heads or water jacket. The valve seats can be removed and replaced by new ones. Their construction will he understood from the section elevation (Fig. 2). The compressor is held firmly to the engine hy tie rods, and no foundation is deemed necessary, except enough to carry the weight of the compressor. The air cylinders are cooled hy water circulating through the jacket. Free air can be piped from outside the engine room.

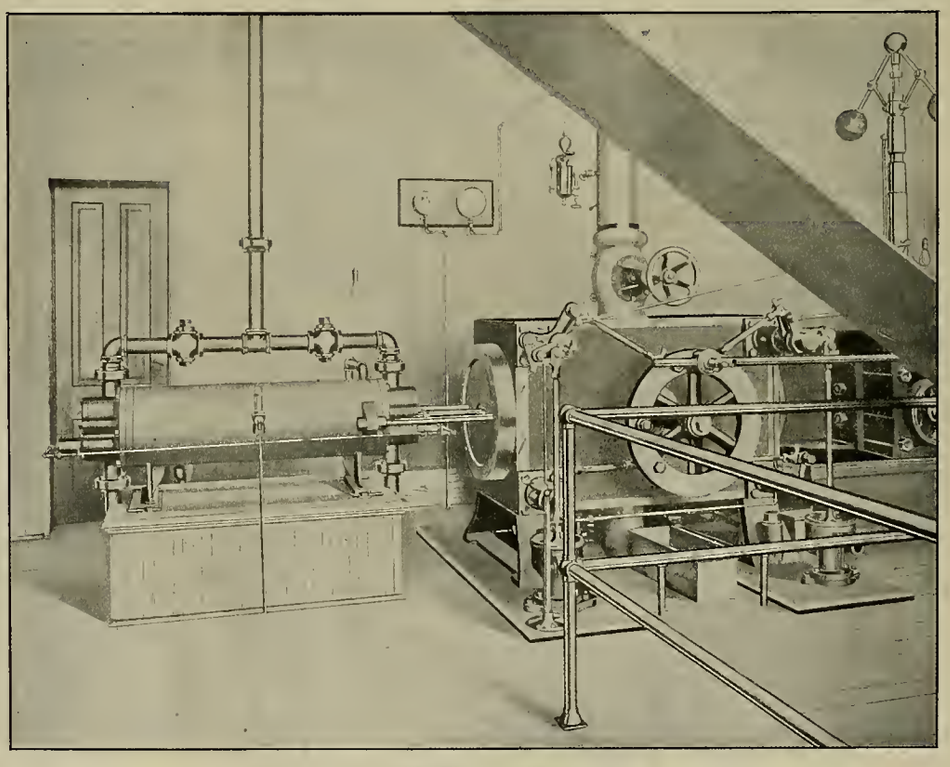

Fig. 1—Fisher Air Compressor.

HERR ENDRUWEIT of Berlin, Germany, has devised an apparatus for producing thin films by electro-deposition. An endless metal band is first coated with potassium sulphide, and, after washing, is passed through a nickel bath of the usual composition. The thin film of nickel obtained in this way is hacked hy copper—by passing through a similar hath containing a copper salt in solution—and by tough paper, hefore being stripped from its support. A strong sheet or roll of paper, faced with hright metallic nickel, can be ohtained in this manner, and the use of this material, after relief stamping and coloring, for wall papers and for advertisement show cards, is said to offer many advantages. The electro-deposited "paper" is also reported to he useful for packing the stuffing boxes of high pressure steam engines.

A FIRST, SECOND AND THIRD PRIZE of 10,000, 5000 and 2000 marks ($2380, $1190 and $476), respectively, for the best "vorspannmaschine," or draft wagon, with alcohol motor, are offered jointly by the Ministries of War and Agriculture, Domains, and Forestry, of Germany, and are designed to hasten and bring out in completed form the several types of spirit motor vehicles for military and general purposes. The specifications are elahorate and precise and provide for a machine which shall weigh, when equipped, supplied and manned in working order, not to exceed 7500 kilograms (15,750 pounds), and the heaviest laden axle shall not carry, when in action, more than 5000 kilograms (11,023 pounds).

A GERMAN colliery reports a recent application of hlast furnace gas to drive a three-phase generator, furnishing current at 1000 volts in the neighhorhood of the hlast furnace, which is transformed up to 10,000 volts and transmitted to the mine, a distance of 4 miles, hy means of three copper wires three-sixteenths of an inch in diameter. At the mine it is transformed down to 1000 volts, and at that pressure is used for driving an endless rope haulage plant, the road over which the rope travels heing another mile in length. The mine is worked hy an adit. The work done is over 4000 ton-miles per day, and the cost is stated to be 1 cent per ton per mile.

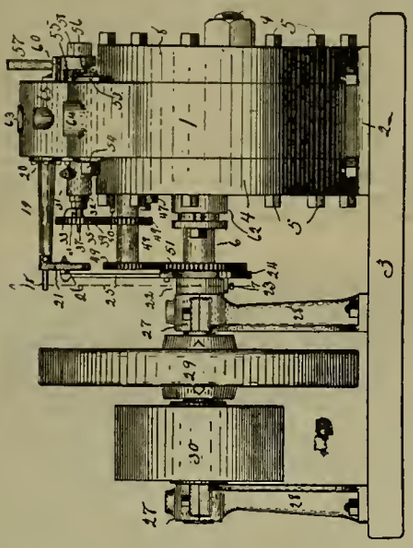
SOME mining promoters need invertehrate experts. The expert's report is important. A London promoter asks an American option holder: "Have you any favorahle expert report?" "No?" Then I fear I can not do anything with your property. We never huy mines; we only buy reports; the mines are thrown in."

Mining and Metallurgical Patents.

Patents Issued May 20, 1902.

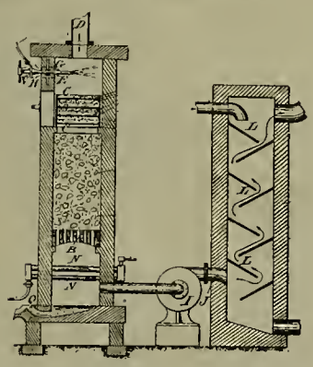
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ROTARY EXPLOSIVE ENGINE.—No. 700,243; S. S. Rose, Amador City, Cal.



Explosive engine comprising cylinder, rotary piston fixed on shaft, passage 12 communicating with interior of cylinder at opposite sides of piston, exhaust passages 64, passages 13; passages 12, 64 and 13 intersecting at common points, passage 16, supsupply passage 63, for gas, cut-off valve 17 interposed between passages 63 and 16, having crank on stem, explosion chamber 31, hollow rocking valve 14 interposed between passage 16 and inner ends of passage 13 communicating at one end with explosion chamber 31, rocking valves 52 interposed between adjacent ends of passages 12, 13 and 64, occupying points of intersection thereof, eccentric fixed on piston shaft, strap surrounding eccentric adjustably connected to crank on stem of valve 17, lever 57 connected with rocking valves 52, suitable means for igniting explosive mixture in chamber 31.

APPARATUS FOR MAKING SULPHURIC ACID.—No. 700,249; M. G. Sebillot, Paris, France.

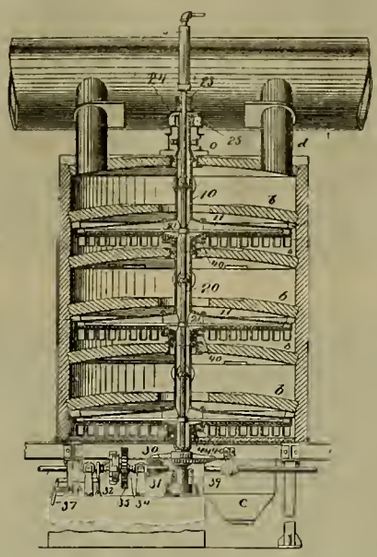


Apparatus for manufacturing concentrated sulphuric acid, comprising vertically arranged casing formed of suitable bricks, perforated partition at hottom within casing, thick layer pumice stone and ashestos supported on partition, series of perforated plates, at top part within casing, layers of spongy platinum on perforated plates, mixing chamher ahove latter, pipe connected to chamher for introduction of sulphurous acid thereto, steam pipe discharging steam into chamber, air admission aperture through which steam pipe extends, means for regulating quantity of steam admitted into chamher, means for regulating quantity of incoming air, means for forcing mixed gases from chamher through various layers contained in casing.

PROCESS OF PRODUCING ALLOYS OR COMPOUNDS OF COPPER AND TITANIUM.—No. 700,244; A. J. Rossi, New York, N. Y.

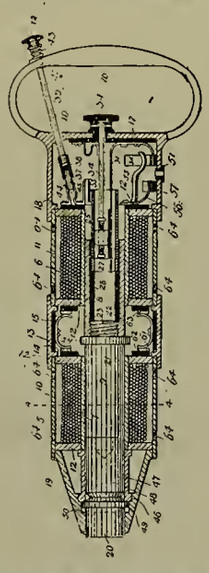
Process of producing alloys of metals assembled in metallic state with metals in oxygenated state, introducing into bath of aluminum and of such metals in metallic state molten together the oxygenated metal, then developing in charge temperature sufficiently high to insure requisite reaction between molten aluminum and oxygen of metals in oxygenated state, leaving metallic residuum of metals to become alloyed with liquefied metal introduced in metallic state into charge other than aluminum, while latter combines with oxygen of oxygenated metals and as alumina slag containing also other impurities of charge is separated from metallic alloy.

ROASTING FURNACE.—No. 700,339; F. Klepetko and W. J. Evans, Great Falls, Mont.



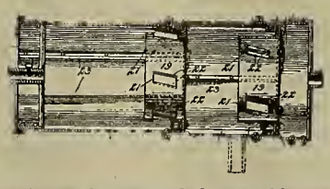
Furnace having plurality of hearths, rotatahle hollow shaft passing through hearths, series of hollow arms radiating from shaft extending into several hearths, inner water feed pipe closed at bottom, located within shaft, rotatahle therewith, series of branches or distrihuting pipes leading from feed pipe communicating at outer ends with interior of hollow arms, for returning water of circulation through hollow shaft to point adjacent to feed end of feed pipe.

APPARATUS FOR ELECTRICALLY OPERATING TOOLS.—No. 700,437; C. E. Moore, Chicago, Ill.



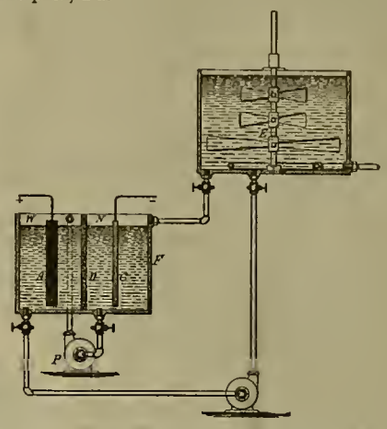
Electrical apparatus for operating tool, comhination with pair of aligned solenoids adapted to he alternately energized, of magnetic core arranged to he reciprocated hy and through solenoids to communicate succession of blows to tool, core heing magnetically insulated from solenoids, independent separated magnetic shields for solenoids to reduce air gap and concentrate lines of force on core.

ORE SEPARATOR.—No. 700,711; F. R. Waters, Salida, Colo.



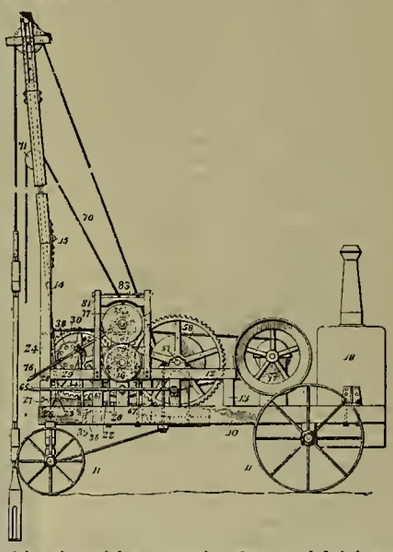
Combination with open-ended rotatahle casing carrying journals at end, of intermediate annular stop flange arranged upon interior of casing, annular retarding collar carried by stop flange spaced from casing, provided with inclined escape openings, inclined wings carried hy collar projecting from hoth faces thereof, stirrer ribs located longitudinally upon inner face of casing projecting into space between collar and casing wall.

PROCESS OF EXTRACTING METALS FROM ORES AND SCRAP CONTAININO SAME.—No. 700,563; S. S. Sadler, Philadelphia, Pa.



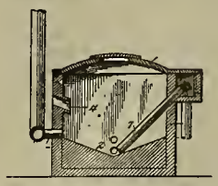
Process of extracting zinc from sulphide ore of same, consisting in dissolving ore in solution containing sodium hypochlorite and sodium hydrate, separating sulphur formed therein, decomposing remaining solution iu cathode compartment of electrolytic cell, simultaneously regenerating, in anode compartment of cell, solution of sodium hydrate left in cathode compartment transferred therefrom to anode compartment after previous operation of same cell.

DRILLING MACHINE.—No. 700,678; R. M. Downie, Beaver Falls, Pa.



Combination with supporting frame of driving shaft and driven shaft, hoth journaled upon frame located in suhstantial parallelism, having reel, means for operatively connecting shafts, including clutch comprising separate members both of which are mounted upon one shaft, one memher heing loosely mounted having geared connection with other, other member arranged to turn with shaft slidable into and out of engagement with first-named member, brake for holding loosely mounted memher against movement, common controlling means connected to hrake, movable clutch memher for successively moving brake into and slidahle clutch memher out of respective engagements and vice versa.

PROCESS OF TREATING ORES.—No. 700,530; A. D. Miller, Mount Peasant, Pa.



Mixing ore with ashestos and a flux, subjecting ore thus treated to action of heat in presence of oxygen furnished both mechauically and by chemical reaction.

CONVEYOR BELT.—No. 700,308; J. M. Dodge, Philadelphia, Pa.

Conveyor belt made of two or more independent endless sections arranged side hy side, ahutting edges of sections hinged together by flexihle hinges so that it will pass around head wheels of conveyor.

The New Portland Mill.

Herewith and on page 291 appear engravings of the new Portland mill from photographs taken while the building was in process of construction. The mill is on a switch of the Colorado Springs & Cripple Creek Short Line, about 1 mile from Colorado Springs, Colo. The four buildings are connected. They comprise the crushing, roasting, chlorination and smelting departments. Each occupies one building. The first two were the subjects of illustration and comment in the issue of the 3rd inst.

The ore is dumped in steel bins of 3000 tons capacity. There are other storage bins for the ore which has been crushed and is ready to be roasted; and still other bins on top of the chlorination department for the ore roasted and ready to be so treated.

The plant is built on comparatively level ground, designed to obviate the necessity of heavy retaining walls and giving a construction enabling each department to be run easily. The mill will have nearly 800 electric lights. The mill, like others treating the Cripple Creek ores now, uses the chlorination process.

The crushing department occupies a building 100x100 feet. An excavation 10 feet deep and 10,000 square feet in area was made first and filled with rock. On this bedding all the foundations for heavy machinery were set in place before the building was erected. There are seven floors. On the bottom floor rests the heavy machinery. The second is a shafting floor, allowing the men to have access to the shafts and pulleys. The third is the bedding floor, on which the crushed ore is mixed and bedded. The fourth is a distributing track floor, from which the cars dump the crushed ore on the bedding floor below. The fifth is the sampling floor, at the bottom of the sampling department. This floor is dustproof, with all joints packed with cloth. The walls of the room are also dustproof. On this floor a large area is covered with steel plates for the quartering of the samples. The sixth and seventh floors are superposed decks for the sampling machinery.

The new feature of the unit system of crushing machinery is conspicuous, as there are two independent sets of crushers and coarse rolls, with their elevators and drying screens. Each set is capable of feeding the whole mill alone, and the two sets can be made to work together or independently, at will. At the bottom of the crushing department are two large crushers, receiving the ore directly from the 3000-ton steel bins. Before reaching the crusher, the ore passes over a grizzly, which separates the rocks of less than 1 inch in diameter and sends them directly by a special elevator to the first set of coarse Cornish rolls. The crusher reduces the rock to the size of 1 inch diameter. It is then taken by an elevator and goes to a set of the coarse rolls. These, as well as the finishing rolls, are placed on a heavy frame, opened below the rolls. With this construction a light can be placed below the rolls when examining them. On page 243 of the issue of the 3rd inst. is an engraving of this department.

From the coarse rolls the ore goes to the sampling room. It is sampled there and can be sent either to the bedding floor or directly to the bins above the dryers. The bedding floor, which is strong enough to support a bed of ore 9 feet thick, is used when the mixing of various kinds of ore is required. From it, as well as directly from the sampling room, the coarsely crushed ore goes to the bins above the dryers. Alongside the floor of the distributing track, on top of the bedding room, is a gallery provided with six dust-collecting fans.

The dryers are two revolving cylinders, made of sectional cast iron. The principle of the drying apparatus is to heat as large a volume as possible and to bring it in contact with the material to be dried. The fireplace of the dryer is especially made with large air channels to heat the air before passing it to the cylinder. Besides, a connection has been made, which allows sending to the dryers the hot air coming out from the roasting furnaces.

From the dryers the ore passes through a set of finer Cornish rolls, 18x42 inches, six in number: the ore crushed by them is sent by an elevator to the sixth floor, where it passes through eighteen hexagonal 40-mesh screens. From these the ore falls into the large ore bins placed below. These ore bins feed the ore to the roasters. On the same floor as the fine screens are twelve rotary dust bag collectors. The ore which is not fine enough to pass through the screens is sent back again to the fine rolls. It passes again through the rolls, the elevators and the screens falling finally into the large bins which are placed just above the level of the top of the roasters, at the limit between the first and second buildings. All the motive power in the mill is furnished by electricity.

The roasting department occupies a building 240x83 feet. There are three cylindrical turret roasting furnaces, connected together underground by a long flue. These furnaces are 60 feet in diameter. The roasting furnace is just above the cooling floor. The ore is fed to the furnace through a hopper and conveyed from the storage bins to the furnace and from the cooling floor to the elevators at the entrance of the chlorination building. Long rabble arms, to which the plows are attached, make the ore pass once through the whole furnace. Then the ore falls down on the cooling floor, making all the work automatic. Another set of arms carries it once around the cooling floor, and the ore falls down into the conveyor, which carries it to the chlorination department. The rabble arms are water-jacketed, thus keeping cool; in the center of the furnace pit the water pours into a basin and is sent back to the pumping station.

The furnaces have each three fireboxes and a flue chamber for outgoing hot air and fumes. The gold losses by volatilization was reduced to a minimum. On page 239 of the issue of the 3rd inst. appears a good illustration of the roaster.

The fireboxes are arranged so that coal or oil can be used as fuel. The temperatures at which roasting is done vary from the cold ore, to about 700° F. at the first firebox, one-third the distance on the hearth, and from this increases to 1100° F. at two-thirds, the finishing heat being between 1500° and 1600° F. The usual time required to pass the ore through the furnace varies from three and a half to five hours, depending on the amount fed in.

The hot air leaving the roasting furnace passes through the long underground flue which connects the three furnaces together. From there it can be sent by a system of doors to the dryers, or allowed to escape directly through a long flue underground building to the smokestack. The smokestack is 193 feet high and self-supporting.

The chlorination building is 194x36 feet, nine stories high, several of these being superposed decks. The ore, which has been cooled and carried by the special mill conveyor, is raised by an elevator to the top of the building, where are storage bins. There are three elevators, one for the ore of each roasting furnace—each elevator feeds two storage bins of 300 tons capacity; the storage capacity of the chlorination department is 2000 tons and occupies the seventh, eighth and nine floors. They empty into hoppers just below. These hoppers weigh automatically the amount of ore put into the barrels. They occupy the fifth and sixth decks. The chlorination barrels are on the fourth floor. There are twelve chlorination revolving barrels of ten tons capacity, distributed in two rows of six barrels each. On page 291 is illustrated the barrel room. The chemicals are raised from the bottom to the fifth and sixth floors. On the sixth floor is the sulphuric acid tank, in which the acid is pumped, and two water tanks. On the floor below the chloride of lime is brought up on an elevator and dumped into little trolleys, which distribute it to each barrel. These barrels have two charging holes, so that the ore can be distributed over the internal length of the barrel and allow of the whole charge being put in without the extra labor of pushing back. When the barrels are full the holes are shut up and the barrels put in motion. After the required time for chlorination, the barrel is stopped with charging hole facing upward and water connections made to a valve on the barrel. At the same time the valve below is opened and the leak runs into the settling tanks. Before going to the settling tanks, the solution passes through several filter boxes. These are wood boxes, lined with lead, in which are three layers of sand—coarse at the bottom, fine in the middle and a layer of gravel on top. From these filter boxes, the solution goes to a group of fourteen settling tanks, at the east end of the building. Then it is pumped into

View of Mill of Portland Mine, Located at

tbe second series of eight intermediate tanks, and the solution is finally pumped from these eight tanks into the seven precipitation tanks. Tbese three sets of settling and precipitation tanks are on the second floor, their top forming the third floor, on wbich are tbe filter boxes.

Below these tanks, on the hottom floor, are four Montejus tanks; two are used for pumping the solution hetween the settling and the intermediate tanks and two others for pumping the solution between the intermediate and the precipitation tanks. Tbe total capacity of the tanks is ahout 300,000 gallons. Tbe solution tanks are made of wood, lead-lined.

When all the leach bas run out of the barrels, the tailings still remain on tbe filters. Tbe charging hole screws are then removed, the harrels are turned upside down, the tailings floated off hy the water into the large bins ahove the concentration department.

Tbe generators for SO^2 and H^2S are on the west side of the barrels floor, just ahove the precipitation tanks, to which they are connected hy a short line of lead pipe and ruhher hose.

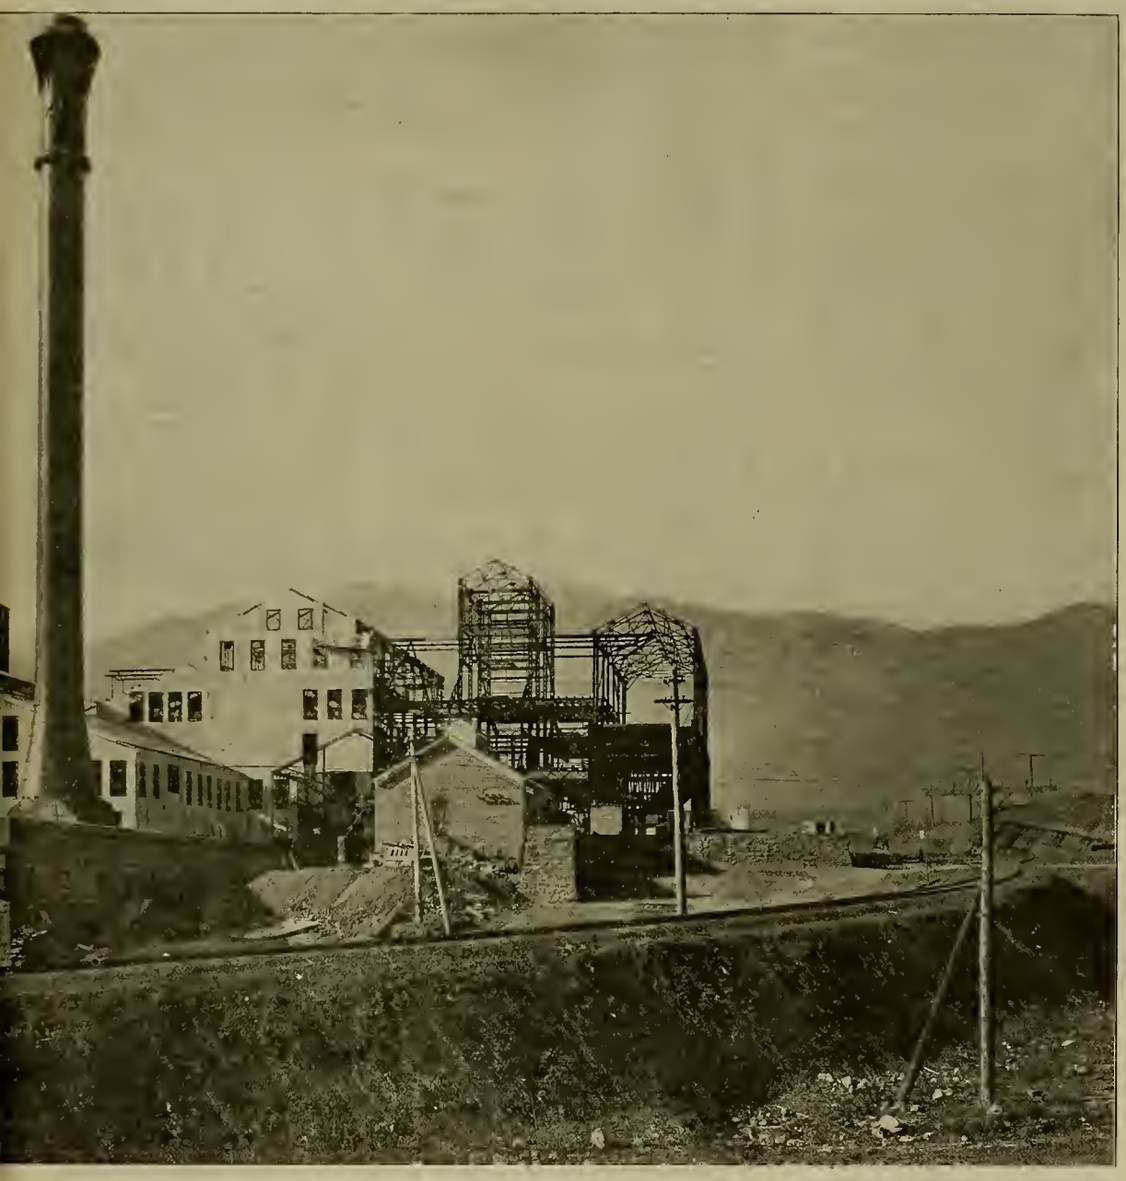
The sulphur dioxide SO^2 is allowed to pass first, and afterwards the hydrogen sulphide H^2S finishes the operation, forming sufficient gold sulphide to collect the finer metallic precipitate brought down hy SO^2. Thirty minutes are sufficient to give satisfactory settling in a tank 6 feet deep. From the filter tanks the solution is made to pass through the filter presses. Wben starting the liquor from the tanks through the presses, it is necessary to release it slowly at first, until the cloths have become firmly hedded and covered with a coating of precipitate, the speed with which the liquor can he run through depending on the condition of the precipitate and the cloths. The filter plates are made of twenty-four chambers, each with a separate outlet, allowing the examination of the filter of each plate and the stopping of the outlet of any chamber in which a hreak may have occurred. From the filter presses the sulphide cake and the cloths are collected and sent to the melting department.

The sulphide cakes and the cloths are placed in the sulphide muffle roasting furnace; the sulphur contained is roasted off and the cloths, if any, reduced to ashes.

The muffle is of cast iron, resting on a hearth of brick. The flames pass over the top of each muffle, tbe roasting being done by the reverberatory action of the fire, no flame or heat passing under the hottom of the muffler. In this way the sulphur is burned off, from the top downward, doing away with necessity of stirring, and with the high heat, which would distort and tend to destroy the muffles, if fired from below, preventing hesides tbe formation of sulphide of iron to any appreciahle extent.

Tbe sulphur gases escape from the muffle through a slot in the hack end into the flue. After roasting and cooling, if the solution has been kept clean in the precipitating tanks, the precipitate will assay from 75% to 80% gold. The gold is then melted into a crucible and a sufficient amount of borax, soda and niter added, so as to form a slag with all the impurities. The gold, nearly pure. is then poured in a mould and finally sent to the United States mint.

The ahove is largely condensed from an article by Etienne A. Ritter in the Daily Mining Record.



orado City, Colo.---Viewed from the East.

WHEN one of our leading sheep men looked at a hunch of amalgam from the Daisy mine worth $3300, he remarked: "Just think of there heing a whole hand of sheep in that pan!" Tbere was a volume in that reflection, for there is no source of revenue so satisfactory as a gold mine. The product is compact and does not cost a fortune for transportation. Moreover, there is never any question ahout the price. There are no huyers hearing the market, and the owner knows he has something the value of which can not be depreciated hy any development.—Idaho Statesman.

PROF. SILLIMAN, at Yale, in discussing the Martinique horror, says: "There are many extinct volcanoes in the western part of the United States, and they are liahle to hreak forth again at any time. There is evidence that they were active at least a few hundred years ago, for there are in existence the stumps of trees that were destroyed at the time of this activity. Tbe volcanic explosions were due to the water getting into the cavities of the earth and coming in contact with the heated rocks."

The Begeer Cyanide Process.

Written for tbe MINING AND SCIENTIFIC PRESS.

Gold and silver can only be dissolved in a solution of cyanide of potassium in the presence of oxygen in accordance with the equation:

$$2Au + 4KCN + O + H_2O = 2AuKCN_2 + 2KOH.$$

It has been proved hy Prof. Cbristie and other autborities that a solution of cyanide out of which all oxygen has heen removed is not capahle of dissolving any gold or silver out of their ores.

Several attempts have been made to supply this oxygen to the solution by means of chemicals, such as potassium permanganate, oxide of harium and sodium peroxide, which had the disadvantage of increasing the cost of extraction and often fouling the solutions.

A pure liquid can ahsorb or dissolve a larger amount of gas than the same liquid mixed witb solid suhstances. A cyanide solution cannot ahsorh a very large amount of oxygen, the cyanide solutions leaving the treatment tanks and the zinc boxes having heen relieved of their oxygen contents for a great part. After having heen hrought to standard strength this cyanide solution is used over again immediately and has, as a rule, very little chance to ahsorb some oxygen.

In the Begeer process the cyanide solution, before heing used in the leaching or agitation vats, is run repeatedly through a centrifugal pump, to whose center is connected an air pipe, and hy means of a system of valves and gauges the solution is saturated with oxygen in a short time, the solution being made to absorh its maximum amount of oxygen. This is done at a cost of about ⅓ H. P. for a 100-ton plant.

In the Dorcas cyanide mill at Florence, Colo., which treats Cripple Creek ores, this was first tried on a large scale and has heen in use since December, 1901. The manager states that where it formerly took thirteen days for the total treatment of a 120-ton tank (including filling and discharging) it now takes about half that time, and that the extraction is higher. It was found in these 120-ton tanks that with the Begeer process after thirty-six hours all the gold was dissolved with the exception of the coarse gold, and this, with the refractory Cripple Creek ores of 1.30 ounce gold per ton, may he considered quick work. The average extraction after thirty-six hours was ahout 87%, while formerly it was after 120 hours only ahout 75.5%. A cyanide solution saturated with oxygen* will contain 30 or more milligrams of oxygen to the like of solution.

When only 1 ton of solution is used for every 3 tons of ore this amount of oxygen contained in the prepared solution is theoretically sufficient for ores containing 8 ounces gold per ton or 4.5 ounces silver per ton. When the cyanide solution is saturated with oxygen it will not lose this oxygen as long as the same conditions of temperature and atmospheric pressure prevail.

Part of the oxygen will escape; when the temperature is raised, when the atmospheric pressure is reduced, and when the air in contact with the solution contains much less oxygen than the atmosphere. As in actual practice, however, the solution will be used immediately after having heen prepared, there is little possibility that some of the oxygen will escape, all the ahsorbed oxygen heing available for the gold and silver reaction.

The amount of dissolved oxygen is in excess over the amount required in the majority of cases in actual practice, hut it is, of course, always an advantage to have as large an excess as possihle, to get the best results.

*The figures relating to results obtained by the Dorcas mill were given by the Dorcas management.

AT Houghton, Mich., the Calumet & Hecla management has under consideration plans for the erection of a plant for the treatment of the slimes from the stamp mills. The treatment is known as the "automatic flange system." Experiments of the method have heen conducted under the direction of C. C. Woodworth of San Francisco, Cal. It is expected that a great saving will he made through its adoption.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

Lake Lebarge broke up May 24 and navigation is open. Boats wintering at the mouth of Thirty Mile and foot of Lake Lebarge arrived in Dawson May 23.

The greatest nugget ever found north of Cariboo was unearthed on J. B. Brooks' hillside claim, between King Solomon's hill and Monte Christo gulch, Bonanza creek, weighing 320 ounces, valued at $4000.

In mining in diving suits at Bluff City holes are cut in the ice a short distance from shore and a deep scoop or shovel operated by a hand windlass; a man in a diving suit does the mining. The water is 9 feet deep. Two pans of sand scooped up are reported to have aggregated $48.

ARIZONA.

COCHISE COUNTY.

In the Eureka M. & M. Co. mine at Hartford, near Bisbee, a large body of high-grade ore was struck in shaft No. 5. The milling ore averages $30 per ton.

At Lowell and vicinity the railroad grading is nearly completed. The shaft in the Lowell mine is 1000 feet deep.

GRAHAM COUNTY.

Supt. J. Molder of the Home Copper Co., near Morenci, says a crosscut has been run on the Buzzard's Shadow, cutting a ledge 40 feet wide, all of which pans well in gold and shows sulphides of silver across the vein.

MOJAVE COUNTY.

J. A. Jordan, manager, has a property in which the values show native and horn silver at the junction of three porphyry dikes. The company is sinking a double-compartment working shaft at the junction of these dikes.

Three French capitalists have gone with O. P. Posey to examine the Gold Road mines, near Kingman. If the investigation results satisfactorily a deal will be closed.

The New Comstock M. Co. has shipped to the Arizona Central Bank bullion worth $500 from a partial clean-up of a week's run of the Sheeptrail mill.

K. St. Charles has a large ore body in the Midnight lode, at Chloride.

At the Cyclopic mine, Gold Basin, the first run of the cyanide plant was satisfactory.

The Arizona & Minnesota G. M. Co. has men employed taking ore from the Eldorado mine, Gold Basin, and hauling it to the mill. The O. K mill will begin crushing soon. J. P. Jacobson is Supt.

PIMA COUNTY.

The Troy miners have voted that it shall be a prohibition camp and Manager C. H. Cutting has raised the wages to $3.50 per day, no Sunday work.

It is proposed to remove and rebuild the stamp mill at the University of Arizona, to do custom milling for the small mines near Tucson, the plant to consist of two 5-stamp batteries and a small cyanide plant capable of making runs of five-ton lots, the mill to be run by the students.

A flow of artesian water was struck 15 feet below the surface at Tucson; 50,000 gallons of water are daily flowing from the well.

PINAL COUNTY.

C. Udall is working 350,000 tons of tailings at Mammoth for lead.

SANTA CRUZ COUNTY.

The new 100-ton concentrator at Washington camp is in operation.

The Cerro Prieto M. Co.'s 20-stamp mill is running daily on the company's mine in Magdalena district.

YAVAPAI COUNTY.

The Crown King road is graded 17 miles from Mayer; a bridge is being put in 3 miles from Mayer; there will be a 300-foot tunnel at the far end; there are five camps on the line and about 600 men in all are employed.

The Cumberland mine, near Pine Flat, will build a quartz mill to handle $5 ore.

A Cameron pump has been shipped to the Home Rule mine, on Groom creek.

Ore from the Fisher and Noble claims, Copper Basin district, gave an assay value of $13.50 per ton gold and 9% copper.

Supt. Kiley of the Oro M. Co. will have the 60-stamp mill in operation by June 1.

The Agua Fria district ore body is 3 feet wide.

Supt. Blauvelt is working forty-five men at the Cash mine and mill near Prescott. He has shipped the first carload of concentrates from this property.

Regarding the strike in the Cliff mine, Verde district, near Jerome, the ore runs 8% copper, with values in gold and silver.

The shaft at the Model mine, near Kirkland valley, is 300 feet deep, with drifts extending 100 feet each way. The ore body is 4 feet wide, and, it is stated, runs as high as $150 gold per ton. President F. Jager of the Model M. Co. has bought the Alta, Batchelor and Wolftone claims.

F. Jager of Chicago has bought the Bachelor, Alta and Wolftone gold mines for $150,000 for the Model G. M. Co.

A strike is reported in the Hudson mining group on Lynx creek.

The Dos Oris mine, 10 miles from Prescott, has been sold for $25,000.

YUMA COUNTY.

Work will be begun and the necessary machinery purchased to work the Darling and Bradshaw mines in the Quartzite mining district.

CALIFORNIA.

AMADOR COUNTY.

On the 800-foot level of the Bunker mine the drift has broken into ore estimated to be worth $10 a ton.

Twenty additional stamps have been started in the Central Eureka. The rock in sight is sufficient to keep forty stamps in constant operation.

The dumps of the Empire and Pacific mines at Plymouth have been leased by W. E. Dargie to Plymouth miners.

In the Montezuma mine at Nashville a ledge at the 300-foot level runs $64 to the ton.

Hayward & Lane have men prospecting the Ballard & Martin tract, near Plymouth.

At the Kennedy mine, Jackson, a new hoist will be put over the East shaft. A third boiler has been put in there and room for two more made. A second air compressor doubles the plant and makes everything ready for rapid mining when the ledge is reached from the 2400 and 2500-foot levels of the East shaft. These crosscuts have reached 500 feet from the shaft. A large mill is to be erected this year near the East shaft, and when completed the work of the mine will be done through the one shaft.

The Kretcher mine has been bonded to the Rhetta Con. M. Co. for $10,000, on which $2000 is paid.——The Edinburgh G. M. Co.'s tunnel is now underneath the shaft and an upraise has been started to make connection. Drifting continues along the ledge.——The Amador-Phœnix M. Co. is working on the 100-foot level ——The Horn mine tunnel is in 200 feet and within 100 feet of the ledge, which will be tapped 100 feet below water level. The vein is small but high grade, samples assaying as high as $300 per ton.——R. L. Chase is building the 20-stamp mill at the Mitchell mine, near Pine Grove.——At the Fremont mine, near Drytown, concrete supports for the new gallows-frame have been built and work is continued at the 750-foot level.——At the Gover mine foundations for the new air compressor is being built.——A shaft is being sunk on Indian creek, near Plymouth, and pumps started.——At the Bay State a bar of gold weighing twenty pounds is the result of ten stamps running twelve hours a day for two weeks.

Power is being supplied from the new plant at Electra to consumers in Amador and Calaveras counties.

The Lincoln shaft is 2036 feet deep.

Power drills have been introduced in the Del Monte, near Railroad Flat.

BUTTE COUNTY.

The Cherokee mine is being operated under a lease.

On the Braselton place, near Oroville, a tract of eighty acres has been leased to R. S. Grant. A hydraulic elevator will be built. Pipe for the work is being hauled.

CALAVERAS COUNTY.

The Stanislaus Water & Power Co. is incorporated in San Francisco to use water from the main or middle fork of the Stanislaus river. A water and power system will be constructed to divert the water at a point about 25 miles from Sonora from the intake carried by flume and ditch, capacity 15,000 inches, about 16 miles long, along the south side of the canyon to a point 6 miles east of Murphys, where a vertical fall of 1500 feet is available. Seven thousand inches utilized there at an electric power plant, generated 21,000 H. P., 6000 inches carried across the canyon through an inverted siphon 9000 feet long to take this amount of water across into Calaveras county for use in hydraulicing on the San Domingo mine principally, and other properties along the Central Hill and Cataract channels in the vicinity of Murphys, Douglas Flat, Vallecito and Angels.

G. Batten of Murphys has sold his interest in water rights on Stanislaus river to Beach Thompson of the Stanislaus Water & Power Co., which has been organized by Beach Thompson of the San Domingo G. M. Co., for $25,000.

The mill on the old Orchard mine in San Andreas is being moved to the Montana mine, Esperanza creek.

The Reliance, near West Point, has started up and the 4-stamp mill is running.

F. F. Carnduff, of Milton, and associates, are dredging for gold in the Calaveras river in the vicinity of Jenny Lind.

Owing to a scarcity of men, the Sierra branch railroad to Angels Camp may not be completed to Angels till September.

The Gluffra mine, near Mokelumne Hill, is running steadily and the plates show good returns; ten stamps are dropping.

The water in the Lamphear has been lowered over 100 feet.——Work continues at the Kiser-Maguire mine on French Hill, and results of exploration are encouraging.——Operations have begun at the Lancell mine at Buckeye. When ditches are dug and flumes and pipe laid, hydraulicking will commence.——J. D. Olson of San Francisco has bought the Calaveras group of eleven claims, between Murphys and Sheep Ranch. Work on the mines has begun. This property will be equipped with mining plant.

At the Gwin mine high-grade rock has been opened up. The strike was made at the 1750-foot level.

At the Dorroh mine at Central Hill a blind ledge was struck in the slate formation which contains rock running. it is said, several hundred dollars to the ton.

The Southern Pacific Co. will build an extension of the Railroad from Valley Springs to the Gwin mine.

EL DORADO COUNTY.

J. H. Zimmerman has bonded his gravel property at Pacific for $50,000.

The Langrage & Noyes stamp mill at Poverty Point has started up.——At the Atlantic, at Placerville, a fine body of ore has been struck in cross-cutting, free milling and sulphurets.——R. Smith is milling ore from the Ohio mine that is said to run $50 per ton.

A new mill will be erected at the Zentgraf mine to replace that destroyed by fire.

A. Harpending will sink the main shaft at the Union to the 2000 level.

P. Stingle, Supt. Golden Queen mine, Kelsey district, reports the tunnel still in diorite; it is now in 200 feet.

A large boiler and two sections of smokestack have arrived at Placerville for the Eureka slate quarry.

The California-Bangor slate quarry have commenced operations and will establish a slate yard below the proposed box factory site in Placerville.

INYO COUNTY.

The Golden Argus and Mineral Ranch M. Co.'s, in the Panamint range, will put tramways on their respective claims.

At the bottom of the main shaft at the Reward, near Bishop, a 14-foot ledge of high-grade ore has been developed. The ore carries coarse gold.

KERN COUNTY.

The old Keyes mine is being worked, twenty men are employed. Milling ore said to run $100 per ton is being milled in the 5-stamp Hooper mill.

From the Mammoth, near Keyesville, ore running $25 to $100 per ton is being taken out. The Pennsylvania is milling ore that goes $125.

On the placer claims in Mammoth and Keyes gulches a new water way 75 inches capacity has been built and the ground below is being worked, miners taking out $10 to $12 a day.

C. Teagle will put in a small cyanide plant at Searles to treat the ore from the Gold Bug, which mills 50% by amalgamation.

The Randsburg Miner reports in the Gold Coin mine at a depth of 75 feet a body of ore 7 feet wide and said to run $12 to the ton.

The Phœnix mill at Randsburg is running on Val Verde ore.——Ricker, Reeves & Lloyd have a 200-foot lease on south end Kinyon claim.——Carson & Wickard had a $650 cleanup from fifteen tons of ore, a month's work on the Sydney Annex.——The last run of Stanford ore at the Red Dog mill yielded a brick valued at $2600. ——From a milling of twenty-five tons from the Pearl wedge in the Stringer mine, Randsburg, the cleanup was $2400. ——Connection has been made between the Kinyon and Wedge claims at the 155-foot level. The hoisting is done through the Wedge shaft.——The Santa Paula Co.'s mill in Salt canyon is running on good ore hauled from the mine.

LAKE COUNTY.

Quicksilver is found on the east side at the Abbott mine, at the Sulphur banks on Clear lake and in the belt southwest of Middletown. Sulphur was mined extensively at Sulphur banks until it was found that underlying and in part mingled with it was cinnabar.

MARIPOSA COUNTY.

The Organite mine at Hornitos is in operation and have installed air drills. R. W. Dodds is Supt.

MONO COUNTY.

Supt. Pierce of the Crystal Lake M. Co. of Lundy reports 1000 tons of concentrates on hand, but will not be able to move half of it this year. The mines are 12,000 feet altitude.

NEVADA COUNTY.

The Empire mine has received a large air compressor.

The new stamp mill on the Ironclad mine below Rough and Ready has pounded up 250 tons ore from the drifts at a depth of 180 feet, under the superintendency of G. C. Hay.

The Union hears that the Allison Ranch M. Co. will soon commence the erection of a 20-stamp mill and a new hoist.

A hundred men are employed on the power plant at Alta and in fixing ditches and reservoirs preparatory to putting the system into operation.

In the Gold Hill or Nevada City mine the main or southern shaft is down 1000 feet; the northern shaft, where work is now being done, is down over 600 feet. The ore shoots range from 2 to 3 feet in width. The quartz is sulphureted and shows free gold, the sulphurets worth from $100 to $400 per ton, the quartz yielding from $8 to $40 per ton. A tunnel, nearly a mile long and emptying into Deer creek, drains the upper shaft to a depth of 500 feet. Over $600,000 has been produced by the Nevada City.

PLACER COUNTY.

W. F. Englebright, in charge of the construction work of the Central California Electric Co., says one hundred men are employed on the power plant at Alta and in fixing up ditches and reservoirs for the starting up of the system in September. Surveyors are mapping routes for pole lines, one to Auburn and the other to Grass Valley and Nevada City.

E. C. Gaylord is cleaning out the lower tunnel in the Haskell mine, near Auburn, and retimbering. A mill will be erected in the fall.——The Baltimore and Hope, at Forest Hill, has been bonded to Mr. Westhall.——At the Sellier mine the tunnel is in 1600 feet. H. T. Power is Supt. at Forest Hill.——The Boston Co. is operating a quartz mill on Dewey and Mayflower ground.

SACRAMENTO COUNTY.

The new gravel scouring mill at the Gray-Wing mine near Folsom is said to be a success. The gravel is left entirely clean after passing through the machine and the soft bedrock and clay are pulverized.

SAN BERNARDINO COUNTY.

The California Eastern railroad from Blake to Manvel, from Manvel, 14 milles, is sold to the Santa Fe. The road passes the mills at Vanderbilt and comes to an abrupt ending in the Ivanpah valley, 12 miles from the old Ivanpah mine.

SAN DIEGO COUNTY.

It is expected that the 200 men employed at the Picacho mines, near the Colorado river, will be doubled by next October. The railroad, 6 miles long from the mines to the Colorado river, is finished.

F. Salmons has sold a half interest in his lepidolite mines at Pala to Gay & Blakeley of Redlands for $10,000.

SHASTA COUNTY.

G. Miller's lighted cigarette blew up the Deltite powder works at Delta on the 22d, the explosion killing his wife and child and wrecking the works. He is real sorry about it.

At the Mt. Shasta the mill is running on waste accumulated before building the mill.

Miller & Spitzfadden have bonded the Lexington quartz mine in Shasta mining district for $2500.

The Mountain Copper Co., organized in London, England, in 1896, owning and operating the Iron Mountain copper mine and Keswick smelting plant, reorganized under the same name on the 10th inst. in London. All the land, properties, works, plants, tenements and machinery of the company in California and New Jersey, where it owns a refining plant, are transferred from the old company to the new. The consideration given is a nominal one; the instrument carries a value of $850 in revenue stamps, indicating a valuation of $1,700,000 on the property transferred. The reorganization provides for a capital of $1,250,000 in ordinary shares, par value $5 each, and $3,750,000 debentures, bearing 6% interest, or $15 each, in place of $6,250,000 in $25 shares, as provided for in the old corporation. The debentures are to be paid off gradually, eventually reducing the capital to $1,250,000. The present reserve fund of the company is $2,500,000, or 40% of the capital stock.

The Mt. Shasta Gold Mines Corporation will install power drills at the Mt. Shasta mine on Clear creek, near Shasta.

SIERRA COUNTY.

The Alta mine at Alleghany is sold to the Oriental G. M. Co.

G. Simmers has begun work at the Hilda

mine, near Downieville. There are several men employed.

A strike is reported in tho Golden Era, near Sierra City.

SISKIYOU COUNTY.

The Music property will erect a small mill. A strong ledge has been developed and stoping is under way.

The Mountain Lion, China gulch, is under bond to G. Gerken, nperatiug for Mr. Covode of New York. The ledge is uncovered for 200 feet and the ledge matter assays $10.

The Huntington mill at the Sheba mine on Patterson creok, being hauled to Humbug creek, will be erected on the O. N. Lawson mine.

B. A. Cardwell, Etna, has been investigating the coal deposits in the eastern part of the county along Willow creek. He is reported to have found three ledges of good coal 3 feet in width.

A strike is reported at the Enterprise mine at head of Deadwood.

Manager Trowbridge of the Maybell mine, near Scott Bar, has leased the stamp mill on the Columbia mine and will crush some of the Maybeli ore.

H. B. Kelly will start up the stamp mill recently erected on the Clifton mine on Dutch Gulch, near Gottville, July 1st. The ledge has been crosscut 35 feet and no hanging wall in sight. The vein consists of serpentine and quartz.

The dredger at Callahans has resumed work.——The Huntington mill at the Sheba, on Patterson creek, is being hauled to Humbug for the Lawson mine.—— H. Mattern of Cottonwood is putting up a quartz mill near Henley.

Humbug is looking better than ever hefore. At the Punch creek mine the shaft is down 350 feet, showing a 5-foot ledge of ore. McCook's mill is running night and day; the water supply will be sufficient this summer to keep the mill going.

TUOLUMNE COUNTY.

At Columbia the 10-stamp mill at the Riverside and the 15-stamp mill at the Keltz are in operation.

The Shoenberg M. & M. Co. has bought the Nichol mine, near Groveland. M. C. Dale will take charge and begin work at once. A vertical shaft will be sunk and a whim is now in use. A new hoist will shortly be placed in position.

At the Republican, near Sonora, a 10-stamp addition will be made to the mill and a chlorination plant built.

E. C. Holmes has bonded the Hard Tack group on Hunter creek, near Carters, for $40,000, payable within 2 years, $10,000 to be paid July 1st, the purchaser to pay 25% of the gross proceeds.

The Never Sweat mine, near Big Oak Flat, has closed down.

The Bell mine at Tuttletown is honded to W. J. Rule and G. Buell of Stockton.

H. Willey of Santa Cruz has sold the Olsen mine, near La Grange, to the Oak Hill M. Co. for $10.000.

The Mack Con. G. M. Co. have bought the Wooten mine adjoining the Mack, near Big Oak Flat, for $3500.

Thirty men are employed at the Draper mine, H. C. Converse, Supt.

The Black Oak, near Soulsbyville, will put in a new pump.

The Rawhide G. M. Co. has brought suit in the United States Circuit Court against the Tuolumne Water Co. and the Tuolumne County Electric Power and Light Co. to recover the plant owned and operated by the defendant corporations. The property is valued at $150.000. The complaint alleges that in 1898, Nevils, Martin & Ballard, then proprietors of the Rawhide mine, sold to the water company the Rawhide electric light plant for $150-000, and agreed with the defendants that payment should be made by furnishing power and light to the Rawhide and App mines. It was further stipulated that the water company should pay 40% of all receipts derived from outside sources to the Rawhide M. Co. The complaint alleges that this has not been done.

COLORADO.

CLEAR CREEK COUNTY.

J. G. Roberts, manager Jackson Concentrating Works, is running his mill day and night and has plenty of ore on hand. This mill has not been shut down in six years on account of scarcity of ore.

The new power plant at the Kelley tunnel will soon be in operation.

GILPIN COUNTY.

(Special Correspondence).—Many changes are being made in the Boston & Denver Con. M. & M. Co.'s mill at Black Hawk, putting in more hoilers, overhauling and changing their concentrating tables, and in about two weeks will have forty more stamps in operation. They are now operating forty stamps. This same company will commence in about one week to sink a three-compartment shaft about 500 feet on the Cook. O. B. Thompson is manager of the company.

D. H. Allen, general manager of the Miners' Ore Sampling Co. at Black Hawk, expects to have his sampler in operatinn June 15th. When completed he will be able to handle 100 tnns of ore per day.

The Saratoga mine in Russell gulch, F. R. Carpenter of Denver general manager, is running with about 110 men each day. This property was operated for a number of years at a loss, but is now on a paying basis. The ore is being sent to the Golden smelter at Golden for treatment. New machinery has been installed at the mine to the extent of several thousand dollars in the past few months. Preparations are being made to sink shaft from 910 to the 1100-foot level, making one lift of 200 feet. They will install a double deck cage. The Newhouse tunnel is about 1000 feet from the Saratoga vein. It is understood the tunnel work has stopped temporarily, but will commence again if negotiations under way with Saratoga company are successful; it will cut the vein on the Saratoga. The ore in the Saratoga is heavy sulphide, carrying a small percentage of coppe-.

W. J. Lewis, manager Hidden Treasure mill at Black Hawk, has all the custom work he can take care of. He is operating seventy-five stamps day and night.

Black Hawk, May 23.

GRAND COUNTY.

(Special Correspondence).—J. E. Kilduff, manager Louraine G. M. & M. Co. of Dexter, is doing placer work on Willow creek and saving about 30 cents per yard. As soon as the Moffat railroad goes through to Salt Lake City, Utah, this section will advance. They are now about 60 miles from the railroad, but the Moffat road will pass through this country, making it convenient to reach.

Dexter, May 24.

GUNNISON COUNTY.

H. C. Schimp, secretary Colorado Mines Con. Co. of Colorado Springs, will place a 10-stamp mill on the company's property in the Gunnison country. The mill will have 1000-pound stamps.

HINSDALE COUNTY.

At Lake City Supt. Nicholson of the Ute mine lately ran a crosscut from the main tunnel to the vein 500 feet back of where the vein was cut a year ago, tapping a body of ore 2 feet wide, assaying besides gold and silver, 45% lead.

LAKE COUNTY.

The Eclipse shaft of the Waswado Co. is down 1100 feet. Two drifts are being run. This property is on Bald mountain. ——The Home Extension has elected officers and subscribed $62,000 to pay off indebtedness and resume work June 1.—— The work of sinking has been resumed on No. 1 shaft of the Resurrection.——The Fortuna, in Iowa gulch, will start up about June 1. The property has produced $60,000 in gold.

The New Jersey G. & C. R. Co has leased the plant of the Harrison R. Co The company will handle the old dump. The dump contains a large amount of slag. The company will put up a pyritic smelter to treat sulphide ores.——Two hundred and fifty tons per day is the output of the Wolftone.——The Small Hopes M. Co. has arranged with the Rialto people and they will have charge of the pumping and prospecting. The Rialto has until the last part of the month to raise the funds and if it is done the Rialto Co. will proceed as before.——The Midas is turning out 200 tons daily.

At Leadville the Home M. Co. is reported abandoning work. There is plenty of ore in sight, but the low price of silver does not pay. The Midas may yet enter the property and operate the pump to drain its own ground.

The time for the Rialto M. Co. to redeem the property passed on the 17th, and the mine is now in the hands of S. W. Mudd. It is locally reported that it will require another $100,000 to put the property on a paying hasis. The Rialto people spent $225,000.

The Pelton lease on Breece hill has been driven out of the lower workings hy the flow of water and work was resumed a few feet from the surface, just below the wash, where several streaks of ore was found running from .62 to 1 ounce in gold.

Properties in Lake Park creek have resumed work. The Birdy has a 2-foot streak that runs 147 ounces silver and .93 ounces gold. The vein on the Birdy has been cut hy a crosscut tunnel 400 feet. The formation is granite traversed by a porphyry dike; the values lie in a talc seam alongside of the latter.

News-Dispatch: The future of Leadville is gradually resolving itself into one of two propositions, viz., that the low-grade ore must he treated hy a mill or cyanide process. The former seems the best adapted to the situation and several mines have already erected mills. The A. M. W. mill is said to be earning $8000 a month milling a lead-zinc product that could not be handled until it was concentrated. The Humholt mine has started a mill proposition that seems to be giving fair satisfaction. It is not saving all the ore, but it is making a fine lead product. Other mines are arranging to handle their low-grade ores by concentrating.

LA PLATA COUNTY.

At Durango the coal miners have rejected the operators' proposition tn return to work at $3 a day, or at the tonnage scale, and agreed to stand by the new scale adopted two months ago. It is now a question of endurance.

OURAY COUNTY.

At Ouray the Imogene Basin Co. is preparing for an active season. The property is adjaceut to the Camp Bird.

The ore of the reported strike in the Portland is a black manganese, assays showing 247 ounces silver, 1½ ounces gold and 7% copper.

A strike is reported in the Morning Star, in the Sneffels district. The tunnel has penetrated Stony mountain 400 feet. The ore is 16 inches in width in the breast and is widening. The leasers are running the main drift with three double-hand shifts, making 4½ feet per day.

The Blaine mine at Ouray has resumed. A tunnel is being driven tn cut the vein. The shaft on the Silver Link is down 400 feet. A strike has been made in the Portland.

PARK COUNTY.

Schlessinger Bros. of the Last Chance mine, near Fairplay, will incorporate the Cerusite M. & M. Co. The mine is opened by shafts and tunnels and about 10,000 tons of ore developed. The ores are lead-iron sulphide, carrying gold, silver and lead, and is a milling ore. A concentrating mill will be built. The postoffice at the mine is Doran.

SAN JUAN COUNTY.

Near Silverton men are running the Chattanooga tunnel. This will cut the Montana vein 2012 feet from the portal.

E. C. Condit, Supt. Sioux M. Co. at Silverton, will purchase new machinery.

J. B. Warner, manager the Ledge M. & M. Co. of Silverton, will huild a 200-ton concentrating mill; there will be Chili mills, crushers, rolls and twenty concentrators in the mill.

SAN MIGUEL COUNTY.

Two Camp Bird mining deeds were placed on record last week, one deeding seventy-nine claims to the Camp Bird M. Co. of Denver, consideration $75,000. The other conveyed thirty-seven claims to the Camp Bird, Ltd., of London, consideration $3,125,000; revenue stamps thereon amounted to $1561.25. The Examiner says: "This does not indicate the full purchase price of the properties, as the final transfer to the English syndicate will take place upon completion of the title, which will be after patents have heen secured."

Near Telluride, the Turkey Creek will have a new transformer house.

The Alta Mines Co. will install a new crusher.

The Peck cyanide plant, near the Smuggler mill, Pandora, has begun operations.

The Ophir Consolidated Mines Co. will huild a new mill at the Silver Bell and Butler mines.

At the Tom Boy property a new plant is being built. The new boarding-house will accommodate 300 men.

The new county road from Telluride to the Tom Boy and Smuggler-Union mines in Savage and Marshall basins will not be completed for a year.

The report of the treasurer of the Argentum-Juniata shows that during the last three months there were produced 3481 tons of ore containing 206,538 ounces of silver and 86,686 pounds of lead, the gross value of the silver being $107,915 54 and the lead $1886.88, making the total production of the mine $109,802 42. The railroad freight was $15,632 12, the smelter charges $8820.77. making the net proceeds on ore shipped $60,500.86. The mine and mill operating expenses, less shipping and selling expenses and the payment made to lessees, were $43,226 63, leaving net profits at mine over operating expenses of $17,-274 23. This is reduced about $3000 by local and other expenses.

A canvas tahle plant will he erected at the Alta, at Telluride, to treat the tailings. The slimes carry: Gold, 1.62 ounce; silver, 42 9 ounces, and 24 16% lead. The plant will be in operation in July, and will mill $7 ore. The concentrates run 3% copper, one-half ounce gold, thirty-nine ounces silver, 12% lead, 26% iron and 12% silica, the concentration being 5½ to 1.

SUMMIT COUNTY.

At the Robinson Con. M. & M. Co.'s plant one matting furnace will be blown in June 1st. It has a capacity of 100 tons per day. The mines produce a heavy iron sulphide and a highly siliceous ore, carrying gold values. F. W. Bulkley is manager, C. H. Doolittle smelter Supt.

McDougall Bros. are driving a tunnel in the Tylor at Swandyke, working on lease and bond. Their 10-stamp mill is at work. They are also working a concentrating plant.

The Breckenridge Deep M. Co., C. A. Finding general manager, operates near Breckenridge and is preparing to put down the deepest shaft in the county, with the expectation of encountering the Leadville contact.

TELLER COUNTY.

The hills north of Cripple Creek and to the west are being prospected. Carbonate, Rhyolite, Mineral and Copper mountains are reported alive with lessees and prospectors.

The Granite mine on Battle mountain is hoisting thirty tons of ore per day that averages $50 in gold. The hoist is 24x36, first motion, 300 H. P. steam plant of machinery capable of hoisting 300 tons a day. The ore is being taken from the fifth, sixth, ninth and tenth levels. The vein varies in width from 4 to 20 feet.

On the Coriolanus mine, near Victor, a body of ore 3 feet wide has been opened that ships 2 ounces to the ton. The vein carries a high-grade streak that runs 10 ounces to the ton.

Cutting a station at 1000 feet in the Findley shaft has been started. In the 900 level the ore body varies in width 8 inches to 3 feet. Twenty-five tons of $33 ore are being produced daily; sixty men are employed.

Ten tons of ore are produced daily from the McFarland and Owenby lease on the Pharmacist on Bull hill. The mineral is mined in the 600-foot level.

Hull City mine is cutting a station at 1050 feet. They have extended a drift to the side line of the Findley claim.

The Gold Hill, Cripple Creek, output for May will go above 50,000 tons.

At Cripple Creek the Metallic Tunnel Co. projects a 100-ton cyanide and chlorination mill to cost $25,000.

The Granite mine, on Battle mountain, shows a large ore body at the 1000-foot level. In the upraise at this point the ore body is 78 feet wide and it ships, with little sorting, at the rate of $50 a ton, thirty-five tons being shipped daily.

In the Pueblo the works are in good ore. A carload went $40 tn the ton.

An idea may he had of the remarkable values contained in some of the ores of the Cripple Creek district hy the returns of a small consignment sent from the Miller & Baker lease on the Gold Dollar, on Bescon hill. The lot contained twenty-seven pounds and was saved during the sorting of eighteen tons of $80 ore. The Eagle sampler made a settlement on a basis of 1664.765 ounces to the ton, or a cash value of $33,295 30 a ton.

Two bodies of ore are being developed from the 600-foot level of the Woods Morning Glory shaft, on Doctor-Jack Pot ground, Cripple Creek. Lessees are shipping forty tons a day of $40 ore.——Clark & Pinson, operating on the Anaconda, have returns on fifteen tons of $95.60 to the ton.

The Arequa reduction plant, below Elkton, is making a specialty of dump material that runs $4 to $15 per ton. The lessees are using the cyanide method and are treating seventy-five tons per day. Most of the dumps selected are of oxidized ore; those carrying considerable sulphides are not so profitably treated.

Shipments from Stratton's Independence average ten broad gauge cars daily. Development is being carried on in the levels at 1150 and 1450 feet. The exact status of this work is not known.

Stratton's Chicago and Cripple Creek tunnel, cutting Gold hill, has been driven 3700 feet from the mouth to the hreast. Thirty men, in two shifts, are at work and the rock is being broken with a machine in the breast. It is being driven to connect with the Plymouth Rock shaft, which is to be sunk 2000 feet. Some ore has been found while driving the tunnel. A vein 3 feet wide was cut in a crosscut 700 feet from the tunnel, 1300 feet from the mouth. Then a basalt dyke was cut, the ore being mined and from which shipments are being made, runs 3 ounces of gold to the ton. Three machines are driving from a distance of 800 from the tunnel mouth in a crosscut, which has been driven 600 feet to cut the basalt dyke.

IDAHO.

BOISE COUNTY.

Norman Gratz, general manager Basic Placer Co. at Centerville, says his company is handling 1500 cubic yards gravel daily. The Basic Co. this year has one dredger in operation.

CASSIA COUNTY.

The Gold Hill is one of the pioneer gold producers of Idaho, but on account of litigation has not been in operation for some time. The courts have decided that the Gold Hill is the property of George Grayson of Oakland, Cal.

IDAHO COUNTY.

Roosevelt, Thunder Mountain, reports

100 men on Monumental creek who have been on short allowances for a month. A supply point has been selected on the east side of this summit, on the Salmon river slope, which can be reached by the Salmon City route, and from this point the supplies will be packed on the backs of the purchasers. The trails are still blocked to horse travel. Both snow and high water are now encountered on all the trails. The blockade will last perhaps twenty days yet. It is now claimed that deposits of sylvanite exist. The placer deposits are on the summits. The richest ores are found on the combs of the divides.

Returning miners from Thunder mountain deny the published reports that pack trains or even horses are getting there over the Florence-Warren or any other road. More than one trail will be opened by next week.

SHOSHONE COUNTY.

At Wallace men are running the lower tunnel to cut the ledge 400 feet lower than the old shaft.

WASHINGTON COUNTY.

In the Meadows district an option has been secured by W. T. Herndon on the West Fork, Viola and other mines. A 3-stamp mill and concentrator will be erected.

MICHIGAN.

In the Lake district the copper output of the twelve leading mines for 1902 is estimated at over 200,000,000 pounds, an increase of nearly 50,000,000 pounds over 1901. Estimated: Calumet & Hecla. 90,000,000; Tamarack, 19,000,000. Quincy, 22,000,000; Osceola, 20,000,000; Trimountain, 10,000,000; Isle Royale, 6,000,000: Atlantic, 6,000,000; Wolverine, 7,000,000; Baltic, 9,000,000; Mass, 4,500,000; Franklin, 5,000,000; Champion, 4,000,000; Miscellaneous, 5,000,000. Total, 207,500,000.

MISSOURI.

TANEY COUNTY.

A deposit of zinc has been found in Taney county on the property of the Horton-Dunckel Lumber Co., in the bed of Turkey creek, near the Arkansas line. Samples of the rosin jack taken from this point assay 65%. The prospect has been acquired by a St. Louis company.

MONTANA.

FERGUS COUNTY.

In thirty-three deeds filed with the recorder, F. A. Heinze and a number of associates transferred their individual interests in mining properties to a number of corporations. The deeds are from F. A. Heinze, A. P. Heinze, J. H. Tresise, T. M. Hodgens, P. S. Dudley, M. M. Bacon and H. S. Lacey. The corporations to which the Nipper, Minnie Healy and a number of other mines were transferred were: Nipper Con. M. Co. of New York, Cora-Rock Island Purchasing Co., Minnie Healy and the Montana Ore Purchasing Co. The revenue stamps upon the deeds indicated a consideration of $3,000,000 in the transfers. The transfers are said to be along the line of consolidation that is in progress in the mining interests that are controlled by Mr. Heinze under the title of the United Copper Co.

The 350-ton mill of the Kendall G. M. Co. has started and is driven by electricity generated 6 miles from the mine. The water power is used to pump water 6 miles to the mill. The main mill building is 180x55 feet, in which are rock crushers, twelve 150-ton leaching tanks, sump tanks, gold tanks and the machinery for extracting gold by the cyanide process. The ore is mined through the tunnel by the caving process. There is a shaft 200 feet, with drifts running southwest 400 feet in ore. Crosscuts show the ore averages 90 feet width.

At Kendall the Barnes-King Co. cleanup last week produced four bars of gold bullion, $8000. The hoisting engine at the new shaft is in place.

FLATHEAD COUNTY.

(Special Correspondence) — The new mining camp of Cabinet has a postoffice, the Government contract for carrying the mail between Libby and Cabinet has been let, and regular stages will soon be running. This new camp is situated in the western part of Flathead county, in what is known as the West Fisher district. The ore is a free milling gold quartz.

Manager W. J. Beager of the American Kootenai M. & M. Co. is back from Cleveland and New York and will install electric drills.

The Libby M. Co., composed of Flathead county men, will soon have their new mill completed and in running order. The machinery was taken in on the snow last winter.

Cabinet, May 20.

JEFFERSON COUNTY.

The Armilda, on Ophir gulch, owned by J. B. Bousevitz, has been developed by drifting in the tunnel. Two carloads of green malachite ore were taken out which carried high values in copper, besides gold. A winze has been sunk 35 feet, which shows a vein 4 feet thick on the contact between lime and granite.

There is much activity in the Ophir Gulch district, near Blackfoot City, and considerable prospecting going on.

G. Green of Helena has a contract for a 10-stamp mill at Contact, Boulder district. It will be running June 15.

A 20-stamp mill will go on the Big Elk mine, 20 miles from Contact and 10 miles from Independence, on the Boulder river.

LEWIS AND CLARKE COUNTY.

The sapphire mines on Rock creek, south of Phillipsburg, owned by the New Mines Syndicate, are being worked.

The tunnel on the Argo claim, owned by the Argo G. & C. M. Co., is in 820 feet.

The tunnel on the Canyon G. & C. M. Co.'s property on Magpie gulch, 20 miles north of Helena, across the river from Canyon Ferry, is in 720 feet, of which 350 feet is on the pay shoot. A shipment is sacked, awaiting better roads. This is a test shipment of copper ore.

The tunnel on the Snowshoe, on Snowshoe gulch, near Elliston, is in 500 feet and looks well in the face.

At the Hird & Mitchell property on Tiger hill, in Ophir gulch, which is being developed by W. A. Clark, the shaft is down 200 feet. There is much water and the pumps have all they can handle. Work goes on with three shifts of men.

The final payment on the Surething group at Elliston has been made. The payment was $2500 cash, total price $20,000. The property was looking so well that payment was made in full four months before it was due. The mine is developed by a tunnel 700 feet on the vein. The whole length of the tunnel carries from 4½ to 10 feet of ore which nets $20 to $35 per ton. The rest is good concentrating grade. The ore carries gold, silver, copper and lead. Shipments have averaged twelve cars per month. P. Mack is Supt.

MADISON COUNTY.

The Fairweather M. Co., organized under the laws of South Dakota, will operate the U. S. Grant group of mines, a mile from Virginia City.

Supt. Pankey of the Easton mine started the mill last week. He will run the tramway and hoist the ore from the second-class dump to the mill for treatment.

The Big Show M Co. has bought eleven mining claims 7 miles from Twin Bridges. Two of the claims adjoin the Bilehaugh and Keynote groups. The Bilebaugh, Keynote and Lulu claims are included in the purchase.

SILVER BOW COUNTY.

The Anaconda Co. intends sinking a shaft 5000 feet deep on the flat in the southeastern part of Butte.

Danielsville is the latest scene of a "rush." There are 3 feet of snow, but this does not deter those interested in mining. The mine opened up there is an 18-foot ledge of free-milling ore, assaying $300 per ton. The distance from Anaconda to the new camp is 25 miles by stage.

NEVADA.

ESMERALDA COUNTY.

The new mining camp Weepah is 10 miles west of Lone Mountain, 12 miles from Silver Peak, 6 miles from the nearest water. A road is being built to the Peak.

LINCOLN COUNTY.

(Special Correspondence)—Como district is in the Como range. The townsite is about 15 miles south of the Comstock lode and has an altitude of 7040 feet. Dayton is 10 miles distant. The district is traversed by immense quartz ledges, the croppings of which varying from 60 to 200 feet in width are traceable 4 miles. Proximity to the Comstock, which at the time absorbed the entire interest of capital, made Como a poor man's camp, and its discoverers not having the means to cope with the water which was found almost at the surface, abandoned the district. The greatest depth attained was 275 feet, from which depth a 650-gallon-per-minute pumping plant was unable to hold the water. A tunnel 8000 feet in length would cut the ledge at a depth of 1450 feet and insure the absolute drainage of the district. The mouth of the tunnel would be on a flat 6 miles above Dayton. The drainage water is cold, pure and palatable, and the nature of the country would insure plenty of it for all purposes The geology of the district is similar to that of the Comstock. The country rock is dibasic. The ledge matter is mainly quartz, the clay and decomposed country rock deposits of the Comstock are apparently absent, as are also the Comstock characteristics of streaks and bunches of pay, with bonanzas and barren zones. The pay veins are from 8 to 160 feet in width and the ore continuous. The main lode bears north 37° east. Prospecting shows it to contain veins in which the gold value predominates over the silver value. The May Day vein crosses the main lode at nearly right angles.

Como, May 27.

The Quartette mill has started and is working on ores from the Dunn group at Searchlight. The company has constructed a narrow gauge road, 17 miles in length, from their 20-stamp mill on the Colorado river to their mines at Searchlight. A locomotive and eight cars of sixty tons capacity makes two trips per day.

A charter is granted at Dover, Del., to the Tonopah Water & Power Co. of Carson City to conduct power and water from Twin river, Nye county, 70 miles.

The Alps mine, a one time producer, is being worked on a lease at Pioche and a recent strike is reported in lower levels.

At Searchlight the railroad from mill to mine is finished.

E. C. Higginson has placed the Bingham & Welland group, 4 miles west of Pioche, with F. O. Richardson of British Columbia, price paid $20,000. Development has begun. The ores carry gold, silver and lead.

The Rambler group of claims has been sold and development work is going on.

The Quartette M. Co. own twenty claims in the Searchlight district and have been developing their properties for 3 years. They have a 20-stamp mill and cyanide plant erected on the Colorado river, 10,000 feet of underground development work on their claims and a narrow gauge railroad 16 miles in length, between the Copper King mine and the mill, tapping other claims en route. At the 500-foot level in the Copper King mine the ledge is 30 feet wide, averaging $17 per ton free gold.

The Southern Nevada M. Co. have purchased two properties. They are quarrying the ore and saving $15 per ton on the plates.

The Searchlight group has been purchased and operations are in progress; F. P. Swindler, manager. Foundations are completed for a 10-stamp mill. It will be running July 25th.

The North Rapidan tunnel at Como is in 2200 feet and has tapped the Mt. Como incline.——A 100-ton run from the Lizard mine was finished in the Pfeifer mill in Six Mile canyon last week. —— The Heather M. Co.'s cyanide plant in Six Mile canyon has begun operations on slimes and tailings, working forty tons per day.

NYE COUNTY.

There are in Tonapah sixteen companies putting down double compartment shafts on the line of the main veins.

STOREY COUNTY.

In the Gould & Curry mine, east crosscut No. 1, from the northwesterly drift on the 425 level, was advanced 11 feet last week; total distance, 21 feet. The face is in clay and quartz giving low assays.

In the Mexican mine the double-compartment upraise above the 1600 level is up 38 feet. The top is in porphyry and quartz.

On the 1600 level of the Union shaft the joint Sierra Nevada and Union crosscut from the main west drift and the Union Con. south drift are both in porphyry.

In the Utah Con. mine the south drift started in surface tunnel No. 2, at a point 797 feet in, is still in quartz and porphyry.

WASHOE COUNTY.

The Sparks mill at the Wedekind mine is ready to begin.

NEW MEXICO.

COLFAX COUNTY.

The Ora Dredge Co., operating on the Lynch placers near Elizabethtown, is working a full force.

GRANT COUNTY.

The Alessandro M. Co., operating in the Burros, has purchased the Red River mine, in White Signal district, to secure a water supply for its leaching plant.—— The American Con. C. Co. will begin development on the Copper Ring and Little Burro.——The South Side group, on Telleck mountain, White Signal district, is being thoroughly prospected.——A contract for 100 feet on the Silver Reef, in Bullard's Peak district, has been let. At a depth of 20 feet high silver values were struck.

The Hooper Milling Co. will build a 500-ton concentrator at Lordsburg if sufficient tonnage is assured.——The Aberdeen Co. has fifty men on the payroll and the plant has begun turning out concentrates.——The North American Co. will develop their mining properties in the Virginia district.——It is reported that the Volcano camp will start up next week.

The Hoosier Milling Co. has agreed to build a 500 ton concentrator at Lordsburg if sufficient tonnage is guaranteed.

The Aberdeen concentrator started up May 16 and has turned out some fine concentrates. As the rock is hard for the machinery more rock breakers will be put in.

The gold and silver mill at Volcano camp, near Lordsburg, will begin operations June 1st.

LINCOLN COUNTY.

The Eagle M. & I. Co. will build a cyanide plant before July 1. J. M. Rice is manager. The company has bought 200 mining claims. A dam will be constructed across the Bonito to furnish power.

SANTA FE COUNTY.

The recent strike of a 20-foot vein of lead, copper and silver in Macho canyon, on the Pecos forest reserve, shows a vein of galena 2 feet 8 inches wide.

SIERRA COUNTY.

The management of the Mamie Richmond mine at Hillsboro will erect reduction works and thoroughly open up the property.

SOCORRO COUNTY.

The Cooney mine has closed down temporarily on account of the high freight rates to Aguas Calientes, Mexico, that being the nearest smelter since the El Paso plant cannot take care of the ore.

TAOS COUNTY.

The Frazer Mountain C. Co., at Twining, has completed its new mill and smelter building. Five concentrators, two compressors, two water wheels, electric dynamos and the smelter apparatus are in the building. The pipe lines extending from the Hondo river are completed.

VALENCIA COUNTY.

A discovery of opals is reported from the Peralta canyon, Cochiti district.

Lithographic stone has been discovered in this county. Bavaria has been a source of supply. The Valencia county rock is clear and fine.

OREGON.

DOUGLAS COUNTY.

J. H. Booth has sold his interest in the Granite Hill mines of Louse creek district for $11,700. Supt. C. L. Mangum says that by August 1st a hoist and five additional stamps will be put in.

BAKER COUNTY.

(Special Correspondence).—Some good ore is being taken from the Blue Bird group, Red Boy district. A tunnel has been started to tap the ore bodies at depth. J. A. Hilliker, representing the Western Union M. & D. Co. of Minneapolis, has bought the Monte Cristo group of six claims for $60,000. The 5-stamp mill on the Clipper mine is completed and running. The Perry Rachel mill has made a test run and saved 80% of the values on the plates. The ore runs from $8 to $10 per ton. The tallings will be banked for the present.

Sumpter, May 23.

JACKSON COUNTY.

E. Briggs has bought the Big Foot mine west of Gold Hill, for $3000. H. A. Corliss and B Rush have bonded the Lucky Queen and Blue Rock to C. D. Crane.

JOSEPHINE COUNTY.

A company has been incorporated by Eureka, Cal., people to develop gravel ground at Althouse in Josephine county; capital stock $50,000.

SOUTH DAKOTA.

Black Hills plants are daily reducing 5970 tons as follows:

	Tons.
Homestake M. Co., 900 stamps, free milling	3,600
Clover Leaf M. Co, 60 stamps, free milling	240
Holy Terror M. Co., 20 stamps, free milling	80
Tycoon-Ranger M. Co., 10 stamps, free milling	40
North Star and other Southern Hills, free milling	100
National Smelter Co., smelter	300
Golden Reward M. Co., smelter	300
Golden Reward M. Co., cyanide mill	200
Wasp No. 2 M. Co, " "	100
Horseshoe M. Co., " "	100
Spearfish M. Co., " "	300
Deadwood-Standard Co., " "	200
Portland M. Co., " "	60
Dakota M. Co., " "	100
Imperial M. Co., " "	100
Highland Chief M. Co., " "	50
Alder Chief M. Co., " "	50
Rossiter (under lease), " "	50
Total	5,970

The National Smelting Co. has completed its smelter at Rapid City. The Horseshoe M. Co. is shipping 300 tons daily of smelting ore. The company will build a 300-stamp cyanide mill, capacity 1200 tons per day.

The Black Hills is now treating by home plants—stamp mills, smelters and cyanide mills—at the rate of 179,000 tons monthly, and shipping to outside smelters

10,500 tons per month, a total monthly production of gold ore of 189,500 tons.

LAWRENCE COUNTY.

The Spearfish M. & M. Co., at Spearfish, will resume operations with 100 men. The ore is a free milling and cyanide proposition.

UTAH.

BEAVER COUNTY.

A 100-ton smelter is to be built by the Majestic M. Co. at Milford; A. B. Lewis, manager.

W. A. Farish, in a report on the properties of the Majestic M. Co, recommends the erection of a smelter at Milford; he believes 1000 tons of ore can be supplied daily. The dump of the O. K. mine contains 20,000 tons, averaging in value 6.6% copper, four ounces silver and $1.60 gold.

IRON COUNTY.

The Johnny mine at Stateline will build a new mill. This mine has been well developed to 260 feet; grade of ore is high. W. J. Dunley, Stateline, Supt.

The Willowvale at Stateline is locally credited with having 20,000 tons free milling ore in the workings of the 600-foot level.

The Ophir has a mill of 100 tons capacity, and a leaching mill. The main shaft is 500 feet deep. Fifty men are employed.

JUAB COUNTY.

The 100-stamp mill on the property of the Eureka Hill M. Co. at Eureka may resume on custom ores.

SALT LAKE COUNTY.

The Highland Boy Con., Bingham, has ores showing 35% lead, ten ounces silver, 1.8% copper and $1.20 gold per ton in the Leonard tunnel. Supt. Smith reports 18 inches of this ore, which also shows an iron excess.

The U. S. M. Co. at Bingham will do nothing until the new smelter goes into operation next September.

SUMMIT COUNTY.

The Storey group of mining claims at Park City has passed into the control of N. Treweek, general manager for the Wabash M. Co., consideration $60,000. Prospect work will begin in the 600-foot level in the Wabash. The Storey group consists of the Storey, Alaska, Mammet Neptune, Franklin and Fraction, and adjoins the west line of the Wabash.

TOOELE COUNTY.

The Trapper's Pride will have a 75-ton mill; manager, C. F. Peterson, Kimberly.

The presence of quicksilver in commercial quality in the Sacramento of Mercur attracts attention.

UINTAH COUNTY.

Near Vernal the St. Louis Co. is figuring on a monopoly of the gilsonite business. At Fort Duchesne the company is now operating a mine, the material from which will be used to pave the World's Fair grounds at St. Louis, and from which thousands of tons of ore are being shipped 100 miles by wagon to Price. All teams loading freight for any point in Uintah county are loaded back to Price with gilsonite, as everything that is used at Fort Duchesne, the two Indian agencies and Vernal comes by wagon, employing many teams. The mine at Duchesne has a vein averaging 3 feet in thickness; the ore can be mined for $1 a ton. On White river there are veins of gilsonite 15 feet wide. These deposits will be almost directly on the line of the Denver, Northwestern & Pacific Railroad, as projected.

WASHINGTON COUNTY.

It is reported that copper ore has been discovered in the Last Chance mine.

WASHINGTON.

FERRY COUNTY.

W. Crummer of Republic has charge of the Quilp, Black Tail, San Poil, Gold Ledge and Silver Dollar mines, and will buy a complete set of machinery for the Silver Dollar mine. The property is being developed by a double-compartment shaft, to be sunk 300 feet, before crosscutting to the ledge.

It is expected that the Great Northern will be running trains into Republic by July 1st. The company is building spurs to the ore dumps in the various mines in the camp. The road will thus be ready to take out ore very shortly after reaching the camp.

The Quilp, Black Tail and the San Poil are all to ship ore when transportation facilities are perfected.

SNOHOMISH COUNTY.

At Index, the Siberia tunnel on Silver creek is in 316 feet. An assay of 7 feet in the face of the drift gave $20 per ton gold. It is a concentrating ore. The gold bearing minerals are arsenio-pyrite and yellow pyrites of iron.

The main tunnel of the Nonpareil, near Index, is in 300 feet and in ore.

WYOMING.

CARBON COUNTY.

At Cow creek, near Encampment, the Newton has a shaft 85 feet and shows a 5-foot vein carrying copper and gold. The Indianapolis is down 40 feet with a vein 9 feet wide. The shaft on the Blackfoot is 75 feet deep.

FOREIGN.

AUSTRALIA.

The gold yield of New South Wales during April was 30,701 ounces, valued at £108,132, as compared with 27,017 ounces, valued at £80,856, in the same month last year. The yield for the first four months of 1902 amounts to 110,650 ounces, valued at £390,663, as compared with 84,090 ounces, valued at £286,947, for the corresponding period of 1901.

BRITISH COLUMBIA.

The output of the Granby mines at Phœnix, now amounting to 1500 tons daily, is to be increased. Two additional compressor plants, each with a capacity of thirty drills, will be installed, permitting a daily production of from 2500 to 3000 tons to be steadily maintained. J. P. Graves, manager of the company, says: "Porter Bros., the railway contractors, have taken a contract for quarrying 100,000 tons of ore from the surface or glory holes of the Granby group, with the understanding that they will be ready to undertake the extraction of 5,000,000 tons of ore. Porter Bros. are to install derricks and steam shovels. The ledge across the Granby group has already been partially stripped, but it will be stripped for an additional length of 1500 feet and for a width averaging 200 feet. This is being done independent of the underground development work by the company. The Cascade Power Co. has contracted to supply 1500 H. P. and an extra 500 H. P. for proposed enlargements, including two additional furnaces for the smelter at Grand Forks as contemplated. When the new plant is installed the mine can produce a tonnage of from 2500 to 3000 tons daily."

The production of the silver-lead mines of British Columbia for four years past is as follows:

	Lead, lbs.	Silver, ozs.
1898	31,693,559	4,292,401
1899	21,862,436	2,937,413
1900	63,358,621	3,958,175
1901	50,529,260	2,624,002

ROSSLAND MINES' LIST.

Properties.	Men employed.
Le Roi mine	350
Centre Star	100
Josie	168
Velvet	100
War Eagle	90
Number One	35
Nickel Plate	22
White Bear	17
Columbia-Kootenay	15

Spitzee	6
Abe Lincoln	6
Total	921

Finch & Campbell, who control the Second Relief, near Ymir, will put in a cyanide mill, capacity 50 tons per day.

The Sunset mine, at Cody, paid a regular monthly dividend of $6000 on the 17th inst. A specimen of solid galena weighing 125 pounds, containing 185 ounces of silver, 82% lead, was recently taken from this property.

The Arlington mine shipped forty tons ore last week and the Enterprise shipped twenty tons concentrates. The total shipments from Slocan City for the year amount to 1450 tons. The aggregate of shipments for the year for the whole of the Slocan district, 18,467 tons.

Ore shipments through Kaslo for the past week were 333 tons, as follows:

	Pounds.
Rambler to Everett	131,000
Rambler to San Francisco	122,000
Whitewater to Trail	129,000
Slocan Star to Everett	85,000
American Boy to Everett	82,000
Sunset, Cody to Nelson	40,000
Sunset, Cody to Trail	37,000
Reco to Nelson	40,000
Total	666,000

Work on the Marysville smelter at East Kootenay is nearing completion and the smelter will be blown in July 1st. This smelter is being built by the Sullivan mine, in which there are 150,000 tons of ore blocked out.

The Ollala C. M. & S. Co. will develop their holdings in the Similkameen valley, consisting in part of sixty mineral claims, the townsite of Ollala, with a charter for the Similkameen & Koremeos railroad, telegraph and telephone franchises.

The Standard Oil Co. has bought for $52,000 the Mound and Copper Cliff claims adjoining their Nickel Plate property on Copper mountain in the Similkameen country.

In Cariboo indications are a short water season for hydraulic miners. Prospecting in the higher mountains for quartz and placers will be the order in Cariboo this summer.

The Mines Exchange at Nelson reports that at Lardeau, in running a crosscut tunnel on the Beatrice to tap the galena vein from which 221 tons of silver-lead ore, valued at $145 to the ton, has been shipped, a 4-foot vein of good gold-bearing quartz was struck.

In Boundary, W. Fowler, who holds a $10,000 bond on the Providence mine, 2 miles from Greenwood, has sold a half interest for $25,000—$8000 cash, $17,000 in three and six months. The purchasers are W. M. Law, H. F. Myttun, F. Whitwell of Greenwood and E. L. Tate of Spokane, Wash.

COSTA RICA.

In Costa Rica two groups of gold mines are being worked regularly, the Bella Vista group, near Miramar, 15 miles from Puntarenas, and the Abangares group, 18 miles from Puerto Yglesia, on the Gulf of Nicoya. The Bella Vista and Thayer mines adjoin, each have a 20-stamp mill of 850-pound stamps and cyanide plants. The ore is low grade. The mines have paid expenses. The Abangares gold fields of Costa Rica include the Tres Amigos, Tres Harmanos and Boston mines. The Abangares Co. is increasing its plant, substituting for steam power, water power (300 H. P.) with electrical transmision, enlarging its mill and cyanide plant and putting in air compressors for drilling. The ore gives on a general average 15 dwts. to the ton.

MEXICO.

I. C. Whiting of Oaxaca, Mex., says the district is in the State of Oaxaca, more than 300 miles south of Mexico City. There are about 2000 white men in the district, which lies on the Mexican Southern railway. Several American companies are interested there; mills are being built and the railroad is building a 25-mile extension to bring machinery into the district. The ore is gold bearing, principally, and the returns are so large that it pays to spend $80 Mexican money to send a carload of ore 300 miles to Mexico City. Then it has to be shipped to a smelting point.

The American Smelting & Refining Co. is reported to have closed a deal for the mine holdings and mills of A. Garcia, including the Refugio mine. The price paid is stated to be $3,000,000 gold.

SONORA.

C. Hopkins of Boston has bought for Eastern men a group of claims 35 miles east of Cos, Sonora, paying $40,000 for the property. The new owners will erect a 100-ton cyanide plant with pans and settlers. Plans will be made to increase the capacity later to 1000 tons.

Stibnite (sulphide of antimony) has been discovered 10 miles from Nogales. Forty pertenencias have been denounced by C. Cameron.

The Belene C. M. Co. has bought three holdings at Copete. They are La Union, La Esperanza and Reina de Cobre, aggregating eighty-two and one-half pertenencias. The holdings of the company are now 162½ pertenencias. At 150 feet depth the main shaft has penetrated a body of chalcopyrite ore.

NEW ZEALAND.

The gold output of New Zealand during April amounted to 43,052 ounces, valued at £164,741, as compared with 22,580 ounces, valued at £83,467, in April last year.

SOUTH AFRICA.

The gold output from Rhodesia for the year 1901 amounted to 180,880 ounces, an increase of 69,385 ounces over the total output of 1900.

Books Received.

"The Science of Mechanics," by Dr. Ernst Mach, Professor of History and Theory of Inductive Science, University of Vienna; translated from the German by T. J. McCormack; second revised and enlarged edition, 259 cuts and illustrations: 605 pages, 8vo., cloth, 1902. Dr. Mach has a pleasing way of introducing the problem by a personal introduction to the authors of the problem, whose names are familiar to all, but whose personality now becomes real. The mechanical processes, the principles of the lever, inclined plane, composition of forces, are endowed with a new charm, and the student may walk arm in arm with his old friends, Galileo and his pendulem, Huygens and his clocks, and Newton with his apple. The book is commended to all who desire a broader view of the science of mechanics than is obtained from some mathematical works of the day. Open Court Publishing Co., publishers, Chicago. Price, $2.

Personal.

JOHN T. GRAYSON has located in Boise, Idaho.

L. C. TRENT is returning to Utah from Tasmania.

J. A. BEST is Supt. Red Cross mine, Omega, Cal.

J. B. FRISBIE of Vallejo, Cal., has returned from Mexico.

P. STINGLE is superintendent Golden Queen at Kelsey, Cal.

C. CONNALLY is superintendent Hardtack mine, Carters, Cal.

C. E. PURRINGTON is Supt. Fremont Con. mines, Jackson, Cal.

G. W. HULL has returned to Jerome, Arizona, from New York.

J. R. RITCHIE has returned from San Francisco to Nevada City.

F. E. WILSON is general manager Friday group, Baker City, Or.

EDW. KEHOE has gone from Spokane, Wash., to Park City, Utah.

W. A. FARRISH has returned to Denver from Utah and Nevada.

A. C. HARMON is Supt. Campo Seco copper mine, Campo Seco, Cal.

CHAS. BUTTERS has left California for a six weeks' sojourn in London.

C. F. HORN is now in charge of the Terrible mine and mill, Ilse, Colo.

HORACE F. BROWN has returned from Groveland, Cal., to San Francisco.

F. M. CZARNOSKI is general manager Leviathan G. M. Co., Wickenberg.

W. H. STORMS, Supt. Baliol mine, Amador Co., Cal., is in San Francisco.

ANDREW DYATT takes charge of operations at the Bassick mine, Querida, Colo.

G. SIMMERS of San Francisco is superintendent Hilda mine, near Downieville, Cal.

T. B. MCKILLIGAN has been appointed inspector of mine revenue for British Columbia.

J. W. HOPKINS is superintending the Great Western mine, Steamboat Springs, Nevada.

COL. HAYWARD, W. HOBART, C. D. LANE AND W. A. NEVILLS are in Angels Camp, Cal.

SUPT. WOLFE of the Polaris M. Co., Clifton, Arizona, has returned from El Paso, Texas.

COL. W. H. HEUER, corps U. S. Engineers, has returned to San Francisco from Seattle, Wash.

W. SCALLON, general manager Amalgamated Co., has returned to Butte, Mont., from the East.

J. F. PARKS, Supt. Kennedy and South Eureka mines, Amador, Cal., has returned from the East.

P. W. GATES has been elected director of the Allis-Chalmers Co., succeeding the late W. L. Elkins, Jr.

CLARENCE HERSEY of Denver has returned from western Oregon, where he has been examining properties.

A. DRON has been appointed Supt. Dexter - Tuscarora mill, Elko, Nevada, succeeding H. O. Milner, resigned.

W. D. JAMESON, representing the Joshua Hendy Machine Works of San Francisco, Cal., is in Seattle, Wash.

F. A. JONES, formerly director School of Mines at Socorro, N. M., is making a geological survey of Grant county, N. M.

A. MORGAN, superintendent of the Beatrice mine at Murphys, Cal., has resigned; R. E. Ober has taken his place.

J. AUDLEY SMITH, general manager Boston & Seven Devils Co., has returned to Weiser, Idaho, from New York City.

E. S. WHITE, J. A. CORAM AND D. MCVICHIE of the Bingham, Con., Utah, are observing smelting operations in Montana.

MANAGER SHIPMAN of the Independence mine at Cripple Creek will be appointed manager of the Camp Bird at Ouray.

CAPT. E. O. C. ORD, U. S. A., president Crystal Lake G. M. Co., Meadow Lake, Cal., is in San Francisco, en route to Manilla under orders.

C. D. JAMESON, assistant manager National Smelting Co, Rapid City, S. Dakota, having completed his work at that plant, has resigned.

AT Houghton, Mich., R. Cocking, assistant mining captain of the Quincy, has resigned, and he goes to the Adventure as head mining captain.

ASSISTANT CHIEF MINING CAPTAIN JAMES HOATSON of the Calumet & Hecla, Houghton, Mich, has resigned, his resignation to take effect to-day.

E. A. WILTSEE has returned from San Francisco to Denver, Colo. While in California he, in company with J. H. Hobbs and J. S. Tucker, closed a deal for

2000 acres dredger placer ground in Stanislaus county, Cal.

RICHARD F. PEARCE, general manager of the Colorado smelter, Butte, Montana, has resigned to go into the brokerage business in New York City.

DANIEL MACLAREN, who has been inspecting mining properties at Cripple Creek district, has gone to Sydney, Australia, whence he goes to Chile.

E. C. ENGLEHARDT has assumed the position of superintendent the New Jersey Copper Gold Co., operating the old Harrison Reduction Works, Leadville, Colo.

R. HARDROP, formerly of the Esperanza mine, near Greenwood, El Dorado Co., Cal., is at that place engaged in mine examination in the interest of British investors.

N. S. SHALER, Dean Lawrence Sc. School, Harvard University, and Professor of Geology, is also manager of placer properties, Beaverhead county, Montana.

H. J. THOMAS has resigned as superintendent of the Hardtack, and accepted similar position near Grass Valley, Cal., for T. J. McAvoy, who owns the Standard group of mines.

WILFRED PROCTOR has returned to Oakland, Cal., for six months, from the U. S. of Colombia, S. A., where he is manager of a placer gold mine for an English company.

Catalogues Received.

The catalogue of the American Concentrator Co., Joplin, Mo., fully illustrates and intelligently describes the magnetic separator and the concentrator that that company makes and supplies. Sectional views and detailed statements make plain the workings of these devices.

In gold and green is the latest catalogue, No. 69, of the Jeffrey screening machinery, sent by the Jeffrey Mfg. Co., Columbus, Ohio. Those screens treat all sharp and gritty materials and elaborately illustrated descriptions are interspersed with testimonials from pleased patrons everywhere. Some space is also devoted to the Jeffrey sand and gravel excavating machinery. Frank Field, Equitable Bldg., Denver, or the home office will send this sumptuous booklet on request.

The Westinghouse Electric & Mfg. Co. has recently issued a circular describing "electric motor vehicle equipments." This company has for five years supplied motors to the electric vehicle industry and now offers a complete line of standard automobile equipments comprising everything of an electrical nature, except storage batteries, pertaining to the motive power of an electric vehicle of any type or size. This circular will be sent upon request. The San Francisco office is in the Mills Bldg.

Bound in red and hound to be read is the descriptive treatise on the Durkee electric drill, issued by the Mine & Smelter Supply Co. of Denver, Colo. Everything is judged largely by appearances, and the fine paper, handsome half-tones and intelligent description of the device would naturally create a favorable impression concerning this valuable mining appliance. There is a detailed description of how to handle the drill, of interest to all mining men, and the 124 parts of the drill are numbered, named and illustrated in detail. The catalogue will be sent on request by any of the company's offices at Denver, Salt Lake City, El Paso or City of Mexico.

The Holthoff Machinery Co., Cudahy, Wis., send section I of their mining machinery catalogue. This is the first catalogue they have issued, and is devoted to a general illustrated description of gold and silver mining and milling machinery; that is, equipment for ore reduction by milling and chemical processes. The typography is excellent, the descriptive matter brief and clear, and the portrayal of the different devices and apparatus equal in tone and treatment to the best magazine work. A request to the home office, Cudahy, Wis., Thos. Fielding, 1711 Tremont St., Denver, Colo., or Dederichs & Burke, 229 Atlas Block, Salt Lake City, Utah, will secure a copy of this handsome treatise.

Commercial Paragraphs.

THE Star Drilling Machine Co. of Akron, Ohio, will erect three additions to its plant.

WM. HOSKINS & CO., of Chicago, report a recent sale of their furnaces and blowpipes to the National Bureau of Standards of the Treasury Department, for use in studying the conditions of fusion, etc., of various alloys.

THE Ingersoll-Sergeant Drill Co. of New York City has established an office at 1212 Park building, Pittsburg. The company has received an order from the Gold Creek Con. M. Co. of Jersey City for a complete outfit to be used at the Mascot group.

Recently Declared Mining Dividends.

	Payable.
Bald Butte M. Co., Montana, 6 cents per share; $15,000	June 6
United G. M. Co., Colo, No. 1, 1 cent per share, $39,947.60	June 6
Magnolia G. M. Co., Colo., 1 cent per share, $11,000	June 5
Sunset M. Co, British Columbia, $6000	May 17

Latest Market Reports.

SAN FRANCISCO, May 29, 1902.

METALS.

SILVER.—Per oz., Troy: London, 23¾d (standard ounce, 925 fine); New York, bar silver. 51⅝c, refined (1000 fine); San Francisco, 51⅝c; Mexican dollars, 44½c San Francisco, 41⅝c New York.

COPPER. — New York: Standard, $11.75@12.00; Lake, 1 to 3 casks, $12.35; carload lots, $12.00; Electrolytic, 1 to 3 casks, $12.00; carload lots, $11.75; Casting, 1 to 3 casks, $12.25; carload lots, $11.25. San Francisco: $14.00. Mill copper plates, $17.00; bars, 18@24c. London: £52 17s 6d per ton.

LEAD.—New York, $4.12½; Salt Lake City, $3.60; St. Louis, $4.00; San Francisco $4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, $4.75. London, £11 10s per ton.

SPELTER. — New York, $4.60; St. Louis, $4.00; London, £18 10s per ton; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN. — New York, pig, $30.10; San Francisco, ton lots, 31½c; 1000 lbs., 31¾c; 500 lbs., 31¾c; 200 lbs., 32c; less, 32½c; bar tin, ℔, 37½c.

PLATINUM.—San Francisco, orude, $17 ℔ oz.; New York, $18 per Troy oz

QUICKSILVER. — New York, $50.00 large lots; London, £8 15s; San Francisco, local, $46.50 ℔ flask of 76½ lbs.; Denver, $50.50. Export, $44.50.

BABBITT METAL.— San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER. — Half-and-half, 100-lb. lots, 20c; San Francisco, Plumbers', 100-lb. lots, 16½c.

NICKEL.—New York, 50@60c ℔ lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $18.75; gray forge, $19.50; San Francisco, bar, 2.75 ℔ lb .,3c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $33.00; open hearth billets, $33.50; San Francisco, har, 7c to 12c per lb.

CEMENT.—Germania, $2.65; K. B. & S., $2.65; Hewmoor, $2.50; Trowell, $2.50 per hbl.

LIME.—Santa Cruz, $1.60; Roche Harbor, $1.60 per bbl.

LUMBER.—(Retail): Pine, ordinary sizes, $18.00@19 50; extra sizes higher; redwood, $19.00@20.00; lath, 4 feet, $3.90 @4.00; pickets, $19.00; shingles, $2.00 for No. 1 and $1.75 for No. 2; shakes, $13.00 for split and $14.00 for sawed; rustic, $25.00 @31.00.

GENERAL SUPPLIES.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.50; Cut, $3.50; 10d to 16d, Wire, $3.55; Cut, $3.55; 8d, Wire, $3.60; Cut, $3.60; 6d and 7d, Wire, $3.70; Cut, $3.70; 4d and 5d, Wire, $3.80; Cut, $3.80; 3d, Wire, $3.95; Cut, $3.95; 2d, Wire, $4.20; Cut, $4.20. Special rates for carload lots.

POWDER.—F. o. b. San Francisco: No 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one toss 15½c. No. 1** 50%, carload lots, 11¾c; led, than one ton, 13¾c. No. 2, 40%, carloan lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10o ℔ set; 14 oz., 40s., 9c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $6.50; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $9.56, long ton; Colorado Anthracite, $14.00. Coke, $15 per ton in bulk, $17 in sacks; Sunnyside, $11.75, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 29@30c ℔ lb.; carloads, 27@28c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66° B, 2c ℔ lb.; soda ash, $1.90 ℔ 100 lbs.; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5¾@6¼c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roil sulphur, 5c; alum, $1.90@2.00; flour sulphur, French, 2¼@ 2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.25 @1.50 ℔ 100 lbs.; sks, $1.05; chloride of lime, spot, $2.50@2.60; nitrate of potash, in bbls. 8c: caustic potash. 10c in 40-lb. tins.

OILS.—Linseed, boiled, bbl., 78c; cs., 83c; raw, bbl., 76c; cs., 81c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 68c; cs, 73c; raw, bhl., 66c; cs, 71c. Kerosene —Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bhls, 19c; wooden bhls., 22½c; cs, 25c; Mineral Sperm, cs, 26½c; Deodorized Stove Gasoline, bulk, 15½c; do., cs., 21½c; 86° Gasoline, bulk, 20c; do., cs., 26½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14c; do., in cs., 20½c: Lard Oil, No. 1 hbl., 60c; cs., 65c; Neatsfoot Oil, bbl., 70c; cs., 75c; No. 1 bbl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6¾c; 1 ton and less than 5 tons, per lb., 7c; 500 lbs. and less than 1 ton, per lb, 7¼c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6¾c; do. in kegs, 7½c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7¼c; less than 500 lbs., 7½c.

ASSAY LITHARGE.—Per lb., 9c.

BISMUTH.—Subnitrate, per lb., $1.60.

BONE ASH.—3c ℔ lb.

BORAX.—Crystal, 7c: calcined, 20c.

CHROMIUM.—(90% and over) per lb., $1.25.

COPPER.—Carbonate, 20c; Red oxide, ℔ lb., 60c.

MAGNESIUM.—Per lb., $3.00.

MANGANESE.—(90% and over) ℔ lb., $1.25.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—25c. ℔ gramme; 1000 grammes=2⅛ lbs.

PHOSPHORUS. — (American) ℔ lb., 80c.

SILVER.—Chloride, ℔ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ℔ lb., $1.00

URANIUM.—Oxide, ℔ lb., $3.50.

ZINC.—Metallic, chemically pure, ℔ lb., 50c.

ZINC.—Dust, ℔ lb, 10c.

ZINC.—Sulphate, ℔ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

WANTED.

Mine Blacksmith and Drill Sharpener to go to Hawaiian Islands—18 months. Unmarried man preferred; soher. Apply hy letter, with testimonials, to D. Y. Z, this office.

Wanted to Bond a Dry Placer Claim, One Rich in Flour Gold.

Must he a dry nroposition. Address "Placer Claim," care this office.

WANTED, for a developed mine in California, a competent mining engineer to look after development and exploration. Must he a full graduate of n recognized mining college and have had several years' practical experience in large iron, coal or copper mines, and he fully skilled in the engineering problems pertaining to extraction, haulage, ventilation, etc. Give full particulars of career, experience, age, etc, to "Vulcan," care of this paper.

WANTED.

Consulting Mining Engineer,

familiar with making examinations of mines, prospects and mineral lands. Address stating experience and references. Moderate salary to start, with advancement to competent man. Position permanent if found satisfactory. Address A., care of Mining and Scientific Press.

EXAMINATION OR SUPERVISION of Mines, Smelters and Mills.

Mining Engineer and Metallurgist, of unquestionable reputation and long experience, now permanently residing at Seattle, Wash., will examine or take general supervision of mines, smelters or mills, in Pacific Coast States, British Columbia or Alaska, as consulting engineer, for reliable parties. Is also reliable accountant to examine. Box 813, Seattle.

INVENTORS, Take Notice!

L. PETERSON, MODEL MAKER

544A MISSION STREET, bet. First and Second Sts., SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and braswork. All communications *strictly confidential*

HENRY CAREY BAIRD & CO.,

INDUSTRIAL PUBLISHERS, BOOKSELLERS & IMPORTERS,

810 Walnut St., Philadelphia, Pa., U. S. A.

☞ *Our New and Revised Catalogue of Practical and Scientific Books, 32 pages, 8vo.; a Catalogue of Books on Metallurgy, Mining, Prospecting, Mineralogy, Geology, Assaying, Analysis, etc.; a Catalogue of Books on Steam and the Steam Engine, Machinery, etc.; a Catalogue of Books on Sanitary Science, Gas Fitting, Plumbing, etc., and our other Catalogues and Circulars, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.*

SITUATIONS WANTED.

COPPER FURNACE FOREMAN with eight years' experience at matte and hiack copper work Best of references. Address V. H., care of Mining and Scientific Press.

PHYSICIAN AND SURGEON with three years' experience in hoth emergency and general hospitals, in addition to experience in mines and private practice, wishes position in a mine. Best of references. Address Box 126, care of this office.

CHEMIST AND ASSAYER, WITH TWENTY years' experience in mill and smelter work. Can run same. Address A. C., care of Mining and Scientific Press.

THUNDER MOUNTAIN.—A successful superintendent of over 15 years' experience and acquainted with this district, desires to take charge of property there for a good company. Address T. M., care of Mining and Scientific Press.

WANTED.—Position as Foreman or Superintendent of quartz proposition or developed mine. Timhering and air machine drills a specialty. Sixteen years' experience. No fake references furnished. Correspondence solicited. Present position not desirable. Address T. J. P., care of Mining and Scientific Press.

MINING ENGINEER, practical miner and mill man, assayer, etc., deeires position of superintendent or assistant manager of a hig property. Eleven years' experience. Best references. Now working in southern California. Address A. M. P., care of Mining and Scientific Press.

WANTED.—SITUATION AFTER MARCH 15, 1902, as Manager or Superintendent of mine. Have had five years' experience in manufacturing and constructing mining machinery and plants. Three years' experience in underground work. Four years' experience as manager and superintendent. Treatment of low grade ores a specialty. Practical in every detail. State location of mine and salary. Best of references. Address X. Y. Z., this office.

A technically educated Mining Engineer, at present employed as superintendent of mines for one of the largest corporations in Mexico, desires a change of position to the United States about July 1st. Has had 18 years' successful experience as engineer and superintendent, never having made a failure; 36 years of age; strictly temperate; a skilled designer, geologist and metallurgist, and a practical miner, as well as a hard worker and thorough business man. References of the highest order, including present employers. Address Supt., care this office.

FOR SALE.

Fifteen-Ton Locomotive for Sale.

In good condition. Boiler 34 in. diameter; cylinders 10 in. diameter hy 13 in. stroke; fire box 40 in. long, 30 in. wide and 26 in. high (crown sheet over bars); 136 tubes; four 34-in. drivers; air pump cylinder and brake shoes. Price $1150.00. JAS. A. McMAHON, 6 California St., San Francisco, Cal.

FOR SALE--A BARGAIN.

3 Practically New Five-Foot Huntington Mills with Extras. All in Al Condition.

Also, 2 New Four-Foot Vanners. Absolutely New. Perfect Condition.

Address FRICOT & MILLER, Entrohe, El Dorado Co., Cal.

Gold Mining Properties For Sale.

Two First-Class Placer Mines, one having 20 years' record as a producer. Both in good working condition. Terms reasonable. Address "Enquire," care this office.

The Mines Exchange, Ltd.

Mines and prospects in British Columhia, th Western States, and Mexico, for sale.
Free milling gold properties a specialty.
Write us for reports and information.
Bank references given.
Address THE MINES EXCHANGE, LTD., P. O. Box 700, Nelson, B. C.
Branch Office: P. O. Box 594, Salmon City, Idaho.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING MAY 20, 1902.

700,292.—SASH CORD FASTENER—P. Barnum, S. F.
700,477 —SKIRT AND DRAWERS —Lillian A. Burgard, S. F.
700,675.—MOP BEAN—E. B. Campbell, Bakersfield, Cal.
700,819.—MOVING HEAVY BODIES—C. V. Fowler, Los Angeles, Cal.
700,321 —CONVEYING APPARATUS.—F. R. French, S. F.
700,352.—CAN HOLDER—L. Funck, Farmington, Cal.
700,194.—WASHING MACHINE — E. D. Hamilton, Vancouver, Wash.
700,337.—COFFEE CLEANER—W. A. Hastings, S F.
700,685 —WEEDING TOOL—H. Havil, Los Angeles, Cal.
700,493.—GRAINING APPARATUS — G. A. Herzog, S. F.
700,501.—HOUSE—W C. James, Cucamonga, Cal.
700,430.—BIT AND REAMER—G. A. Lane, Lakeside, Cal.
700,349.—VEHICLE BRAKE AND BELL—S. H. Madsen, Haywards, Cal.
700,350.—BICYCLE BRAKE—A. Main, Poweiton, Cal.
700,353.—HAY DERRICK—G. G. Mayenschein, Sunnyside, Wash.
700,359.—WRENCH—J D. McFarland, Jr., S. F.
700,227.—DOOR LOCK—A. Newell, Pasadena, Cal.
700,362.—WINDOW SCREEN — O. Niehaus, West Berkeley, Cal
700,704.—TANK HOOP FASTENER—C. L. Parker, Los Angeles, Cal.
700,243.—LOCK—G. T. Roberts, Coronado Beach, Cal.
700,243.—ROTARY ENGINE—S. S Rose, Amador, Cal.
700 710.—FENCE MACHINE—F. Stehler, Riverside, Cal
700,581.—SNAP HOOK—A. J. Towner, Santa Ana, Cal.
700,596.—ROAD SCRAPER—T. Wilcon, Meyers Falls, Wash

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

RIDGING PLOWS —No. 699,826. May 13, 1902. J. C. Silveira, San Francisco, Cal. This invention is an improvement on that class of plows which are designed to throw up a ridge or hill while moving over the ground. It is intended especially for the cultivation of asparagus and that class of garden truck which is thus ridged or hilled up. It consists essentially of a plow having an extended land side, means by which the latter may be held in the line of draft, a plowshare and braces between said share and the land side to provide a rigid structure, and a moldboard pivotally secured to the share and capable of being inclined either vertically or horizontally so as to vary the height of the ridge or hill turned up, or to increase or decrease the width of the furrow The inclination of the pole with relation to the plow frame may be regulated by pivoting the pole intermediate to its ends.

PUMPING APPARATUS.—No. 699,829. May 13, 1902. J. Alhrefczenski, San Francisco, Cal. The object of this invention is to provide a means for pumping water and the like by the action of flowing water upon a journaled wheel, and in conjunction therewith of a windwheel with intermediate gearing, so that the two may act together or separately as desired. Fulcrumed levers have their upper ends connected with eccentrics driven by the wheel and links by which the intermediate portions of the levers are connected with the plunger rods of the pump cylinders. The water from these cylinders is conducted into a common discharge main through which it may be delivered to any desired point.

HYDROCARBON LAMP.—No. 699,912. May 13, 1902. C. H. De Voll, Oakland, Cal. In this invention the hydrocarbon liquid is contained in a reservoir from which it is carried to a burner with intermediate mechanism by which the hydrocarbon is vaporized and air mixed with it. The liquid in the reservoir is subjected to air under pressure so that a pipe extending from the bottom of the reservoir upward to a point above the burner will conduct the liquid, and as this pipe is carried across the burner chimney and filled with wire gauze, the liquid is subdivided and vaporized during its passage. It is discharged through a nozzle which is so disposed with relation to closing caps that a sufficient amount of air is drawn in and mixed with the vapor on its way to the burner.

CARBURETER.—No. 699,830. May 13, 1902. Daniel Best, San Leandro, Cal. This invention relates to apparatus for producing or generating vapor or gas from liquids containing the same. It comprises a closed casing having surfaces disposed within it over which the liquid is caused to flow; means for heating the interior of the casing and said surfaces so that the liquid flowing over them may be vaporized; a means for regulating the flow of the liquid through the apparatus and means for regulating the application of heat, introducing air to mix with the vapor and for superheating or drying the product before it leaves the apparatus.

ADJUSTABLE WINDOW SCREEN. — No. 790,362. May 20, 1902. Otto Niehaus, West Berkeley, Cal. This invention is designed for the screening of windows and similar like apertures. It comprises a flexible screening carried upon a spring roller, a casing upon which the roller is supported, means for attaching the casing in position on a window frame; a slot in the casing through which the screening is drawn, and means upon the opposite side of the frame engaging the screen, with adjustable lateral guides, and means for adjusting the tension of the spring in the roller so that the screen may be drawn across the window when opened or allowed to roll up within its containing casing.

BICYCLE BRAKE.—No. 700,350. May 20, 1902. A. Main, Powelton, Cal. In this brake for bicycles a rim independent of and interior to the felly of the wheel is secured and the brake shoe operates against this rim, engaging the latter at about right angles with the axis of the machine. The brake shoe is operated by a system of bell crank and hand levers with intermediate connecting rods, so that it may be pressed against the supplemental rim with any desired power, and thus check or stop the machine.

COMBINATION BIT AND REAMER.—No. 700,430. May 20, 1902. G. A. Lane, Lakeside, Cal. One-half assigned to J. S. Martin of same place. This device is especially adapted to well boring and is designed to remount the bore below the casing and is so constructed that it can be withdrawn through the casing at any time. The body portion has its lower end inclined, the rear of this inclined portion forming a flat heel and the toe portion having oppositely beveled surfaces forming a cutting edge which is adapted to project out below the bottom of the casing and be operated to enlarge the hole.

CONVEYING APPARATUS.—No. 700,321. May 20, 1902. F. R. French, San Francisco, Cal. This invention relates to an apparatus designed for transporting burdens in both horizontal and vertical directions, and comprises parallel suspended cables enclosing an area and adapted to operate between four supports. A transverse burden carrier is movable between these supports and it is also movable transversely between the cables and at any point between the supports so that the burden can be transferred to any point within the area and raised or lowered without an independent main fall line. The whole mechanism is operated by an engine conveniently situated at one end and to which the operated cables are connected.

WRENCH.—No. 700,359. May 20, 1902. J. D. McFarland Jr., San Francisco, Cal. One-half assigned to J. Bruckman of same place. This wrench is designed to be operated in small compass and to have a wide wrench for different sizes of pipe, the operation being carried on without re-engaging the object at each movement of the handle. The wrench has an enlarged head with a circular revoluble jaw set in the head and comprising members rotatable independently of each other. The jaw openings in said members are adapted to coincide, and means are provided for rotating one of the members to contract the jaw opening.

BRAKE AND BELL FOR VEHICLE.—No 700,349. May 20, 1902. S. H. Madsen, Haywards, Cal. This invention is designed to provide a combined brake and bell mechanism to be applied to vehicles and especially to bicycles. The brake consists of a roller journaled between forks, which fork is supported upon a plate on clamps secured to the head of the bicycle. The roller comprises a central inelastic core and an elastic sleeve surrounding it with metal bands upon the ends, and the elastic sleeve is provided with a spiral wrapping of cords to reduce the wear. A pressure plate has shoes adapted to press upon the metal end bands of the roll while a central cord-wound portion presses upon the tire. A spring acts to normally hold the shoes out of contact with the roller and a guided rod connects the plate with the brake lever so that the device may be operated. A bell is so located with relation to the brake roller that when the latter is brought into contact with the wheel tire or rim the revolution of the roller actuates the hammer of the bell and thus gives the warning.

Notice of Removal of Principal Place of Business of Corporation.

WHEREAS, at a special meeting duly called and noticed, of the Directors of the HASKELL GOLD MINING COMPANY, held at the office of Company in San Francisco, the 24th day of April, 1902, a resolution was duly adopted that the principal place of business of the Company be changed and removed from San Francisco, California, to the City of Auburn, County of Placer, State aforesaid, and that notice thereof be published at least once a week for three successive weeks in some newspaper published in the City and County of San Francisco; and

WHEREAS, at said meeting the consent in writing to said change and removal of Stockholders holding more than two-thirds of the capital stock of the company was obtained and filed in the office of the Company.

NOW THEREFORE, notice is hereby given that the HASKELL GOLD MINING COMPANY (a corporation organized and existing under and by virtue of the laws of the State of California) which has heretofore had its principal place of business at San Francisco, State of California, intends to change and remove its said principal place of business from the said City and County of San Francisco, State of California, to the City of Auburn, County of Placer, State of California.

HASKELL GOLD MINING COMPANY,
By HAROLD T. POWER, President.
By order of the Board of Directors.

DELINQUENT SALE NOTICE.

LITTLE STANDARD OIL COMPANY.—Location of principal place of business San Francisco, California; location of works, McKittrick District, Kern County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 8) levied on the 4th day of March, 1902, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
Geo. E. Whittaker, Truetee.....	5	5	$ 50
Edward McGarry.....109		333	33 30
Edward McGarry 129		423	42 30
W. A. C. Smith.....112		1,000	100 00
W. A. C. Smith.....124		213	21 30
W. A. C. Smith.....134		107	10 70
F. W. McNear.....118		215	21 50
W. B Donnelly..... 135		5	50
J. H. Spring, Truetee..... 126		1,262	126 20
J. H. Spring, Truetee.....127		1,262	126 20

And in accordance with law, and an order from the Board of Directors, made on the 4th day of March, 1902, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Room 40, Chronicle Building, San Francisco, California, on MONDAY, the 12th day of May, 1902, at the hour of 2:30 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. L. CHENEY, Secretary.

Office—Room 40, Chronicle Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors the day of sale of the above delinquent stock has been postponed to MONDAY, the 2nd day of June, 1902, at the same hour and place.

R. L. CHENEY, Secretary.

Office—Room 40, Chronicle Building, San Francisco, California.

HOWARD H. FIELDING,

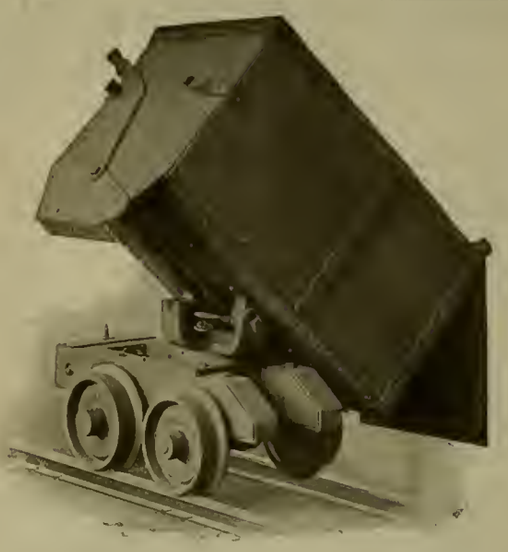
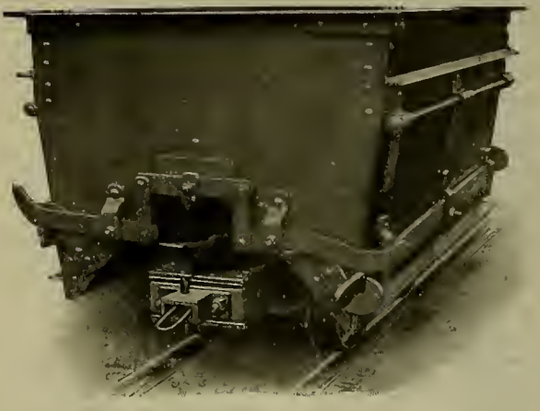
AMERICAN ENGINEERING WORKS,



No. 1 Standard Ore Car.

This car is now built with door hinge flush with top of car and rod protected by an angle.

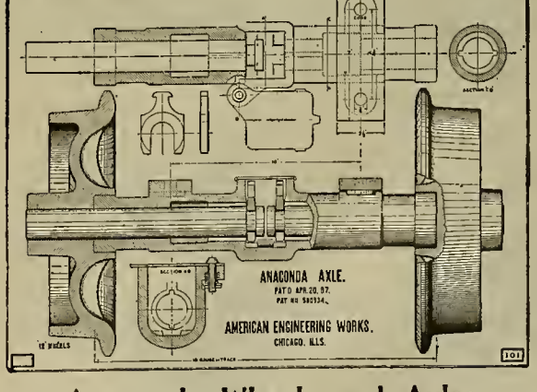
Capacity—16 cubic feet. Truck—Oak; body is supported by heavy malleable iron turntable resting on 4x6-inch oak truck timbers, heavily ironed and braced. Dumping side and end. Box—Inside dimensions, 44 in. long, 26 in. wide, 24 in. deep; bottom, 5/16 in. steel plate; sides and ends, 3/16 in. steel plates. Height—48 in. over all. Gauges from 18 to 24 in. Equipment—Anaconda wheels and axles. Weights—Car without wheels and axles, 690 lbs.; set of four 12-inch wheels, axles and sleeves for 18 in. gauge. 300 lbs; for 24 in. gauge, 350 lbs. Car complete, with wheels and axles for 18 in. gauge, 990 lbs.



No. 4 Gable Bottom Car.

This car is an excellent one for automatic operation. We can furnish it, if preferred, with Anaconda wheels and axles, and can make such variations in height and dimensions as will fit it for particular uses.

Capacity—50 cubic feet. Truck of steel beams. Discharge by releasing levers arranged for automatic operation. Body—Width inside, 50 in.; length inside, 66 in.; bottom, 3/8-inch steel plate; ends, 3/8-inch steel plate; doors, 5/16-inch steel plate; channels above doors. Height of car, 43¼ in. above track. Weight—Car complete, with wheels and axles, 2500 lbs. Size of wheels and gauge to meet requirements.



Anaconda Wheels and Axles

as made by the AMERICAN ENGINEERING WORKS are the best equipment for mining and ore cars in the market.

They pass curves easily, run easily and are economical of oil. There is not a piece of any kind to become loose or lost in service.

Over 5000 cars equipped with these axles are being used by the Anaconda Copper Mining Co., in Montana, and large numbers are in use in other mines in the Western States. Axles are made to suit any gauge from 18 in. to 48 in. Wheels of any type or size can be supplied. The wheels usually furnished are 12-inch in diameter, with chilled tread, of form as shown in cut. We always keep a number on hand for immediate shipment, and also keep all necessary parts for repairs.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the National Cons. Mining Company will be held at the office of the company, 773 Mission St., San Francisco, California, on MONDAY, the 2nd day of June, 1902, at the hour of 8 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting.

GEO. W. FLEISSNER, Secretary.
Office—773 Mission St., San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Sam Antye, in the Secret Diggings Mine, near Laporte, Plumas County, Cal., to deposit tailings in worked-out pit draining into Clark or Slate Creek, and from P. J. Sheridan and E. N. Ekel, in the Lancha Plana mine, at Lancha Plana, Amador County, Cal., to deposit tailings in worked-out pit draining into Mokelumne River, gives notice that a meeting will be held at Room 96, Flood Building, San Francisco, Cal., on June 16, 1902, at 1:30 P. M.

AUGUST SKOOG,
Contractor and Builder of Furnaces.
QUICKSILVER FURNACES a Specialty.

Mines and Metallurgy Building.

The Mines and Metallurgy Building at the forthcoming St. Louis Exposition forms part of the east wing of the ground plan of the show, and will be the last building on the south side of the avenue leading to the group of Government buildings. As part of the general scheme, it is not an important role. No attempt has been made to attract attention to it by towers or domes. The outside dimensions are 525x750 feet, divided into eight oblong parts almost equal in area by glass-covered and ventilated arcades from 30 to 50 feet wide, which makes possible abundant light from every side, no skylights being necessary directly over any of the exhibition spaces. At the intersection of the two principal arcades through the main axis a colonnaded rotunda is shown with an appropriate monument.

The ground floor will furnish an exhibition space of 250,000 square feet; 150,000 square feet may be gained by introduction of galleries. A sub-division of the exhibit space into numerous alcoves for each classification is suggested. The walls of the building are set back from the facade 20 feet, forming a covered loggia, which surrounds the entire building. The facade may be likened to a screen, bearing the same relation to the structure as do the colonnades of the adjoining buildings to their structures. The base of this screen consists of sculptured panels illustrating mining and metallurgical operations in symbolical representations, the background to the sculptured figures being of a rough, golden colored glass, which will be illuminated at night and show the figures in silhouette. The figures are more than life size. As a building for housing Exposition exhibits, it was argued that it should express externally as much friendly dignity as would be compatible with its brief existence; that it would be incongruous, however, to disguise its ephemeral character by the garb of severe and classic forms which are associated with the most lasting architectural monuments of antiquity; and that, furthermore, it undoubtedly should be novel, striking and full of life.

The postponement of the Fair one year will give better opportunity for proper mineral exhibits from the various States, giving a good chance for a fine showing. This paper suggests that an argument for the need of a Department of Mines and Mining could be thus made, besides securing a good advertisement of the country's mineral resources.

Mines and Metallurgy Building, St. Louis Exposition, 1904.

THE law will not hold the locator of a mining claim to a strict and technical observance of the statute in respect to the terms of his notice, so long as he substantially complies with its requirements, and if it appears that the location was made in good faith, and by any reasonable construction, in view of the surrounding circumstances, the language employed in the description will impart notice to subsequent locators, it is sufficient.

THAT the incorrect surveys made by careless and incompetent surveyors has been the source of confusion and litigation is well known. Much of such sectionizing and subdivision work is grossly inaccurate. Throughout many township and section corners are inaccurately located in some cases 500 and 600 feet from their true position. A resurvey in some cases by the Federal Government to establish missing, important corners would do much toward settling disputes; but this is difficult to obtain. This condition has come about largely through incompetence and in some cases where the actual work was not performed, but returns made thereof. While a majority of the U. S. deputy surveyors and many of the county and other surveyors are qualified for the work, yet there are many others whose bungling work is a disgrace to the calling and a source of much subsequent trouble. It would seem that State laws prohibiting the practice of engineering or surveying by incompetent persons, and requiring all surveyors to pass an examination and obtain a certificate from a State Board of Examiners, would do much toward remedying the evil.

SILVER contained in lead is easily freed and utilized. When the melted lead is mixed with zinc the silver forms an alloy and floats to the surface. When this mass is taken from the lead and heated in a retort, the zinc, being volatile, is freed and leaves a deposit so rich in silver that it is easily purified.

Mining and Metallurgical Patents, 311. Personal; Recently Declared Mining Dividends; New Patents; Notices of Recent Patents; Obituary, 315. Commercial Paragraphs; Books Received; Catalogues Received, 316.

IT is not fair to broadly state that a mining property which will not give net profit earnings is worthless. Were that accepted, literally, no mine or prospect not in pay would have any value—which is absurd.

WHAT the scientific man does to-day the manufacturer will do to-morrow. The laboratory experiment of to-day is the mining or metallurgical or manufacturing process of to-morrow. Science is simply organized common sense.

THE large dividends of the Standard Oil Company have attracted such attention that many conceive it to be the choicest of investments. When, however, a comparison is made between them and the dividends of some of the great producing mines, it will be seen that the mining industry possesses some attractive features, and that a well managed mining property is a profitable investment. The dividends of Standard Oil have been to date $49,485,000. The Calumet and Hecla, in Michigan, have paid to date $78,850,000; Amalgamated Copper, $18,117,800; the Ontario of Utah, $14,827,000; Homestake, South Dakota, $11,178,750. These are dividends from but four mining concerns. Many more examples might be offered, but these are sufficient to show that mining offers greater inducements to investment than any other business, and that the profits from a low-grade mine, operated on a large scale with business methods, whether gold, iron, silver, lead, copper or coal, are greater than those of any other business enterprise, and have made more millionaires.

THE Schilz process of gold extraction is based on the action of finely divided gold decomposing barium-peroxide, liberating the oxygen in nascent state, the powdered peroxide being intimately mixed in dry state with the ore so that each particle of gold shall come in contact with a particle of peroxide. The materials are mixed previous to applying the cyanide solution. The peroxide is decomposed by contact with the gold, the free gold dissolved, the pyrites oxidized to iron sulphate and the gold therein dissolved by the cyanide. The finer the ore the better the decomposition and the easier the oxidation of the pyrites, to liberate the gold. The use of the barium-perchloride is designed to do away with lime, and to render the pulp more porous, the liberation of the oxygen causing the pulp to swell and become spongy. The process has been successfully used: a gain of 13% in extraction being reported as obtained by the employment of the barium-perchloride, of which one-third to one-quarter pound per ton is consumed. The manipulation is carried on without heat, cold solutions only being used.

A Case of Supply and Demand.

The demand for producing mines is in excess of the supply. The interest in mining is growing. Mines that a few years ago could have been purchased for less than their value are not in the market to-day at any price. There are exceptions, but this is the rule. The owner of such a mine by holding it gets the advantage of its prospective value, while its present earnings will care for his investment handsomely. Why should he sell unless he gets a proper compensation for the prospective valuation of his mine? While this is true as to mines, it is also true that thousands of good prospects are awaiting the helping hand of capital. Mines are made, not found. It takes a modest fortune to equip a first-class mine. It costs a large sum of money to open up a mine to the extent that it may produce a tonnage which will employ its plant. In most instances the men who own the big mines to-day were poor men a few years ago. They have become wealthy by making mines of their prospects, and in most instances they have brought wealth to those who assisted in the operation. These are the great opportunities of to-day. They present greater possibilities than investment in producing mines. They exist in great numbers. The most of the great fortunes which will be made in mining during the years to come will be through such investments.

Regarding "foreign" investments in mining, it would be a good thing for this whole Western country if the sentiment of the investing public changed to a more favorable view of prospective mining where investments are made for the development of properties that otherwise would lie idle. There is nothing to be gained by a mere transfer of title from a local to a foreign company in the case of a developed and producing mine, except where the purchase money is subsequently reinvested in local enterprises. The great benefit to local interests comes when foreign capital is employed in developing prospects into mines. This is also the form of investment which, when successful, yields the largest profits. True, there is greater risk about it, and foreign—and for that matter domestic—capitalists hesitate to embark upon such ventures. It is difficult to place them in markets far removed from the locality of the prospects to be developed. It is difficult to make men believe it reasonable and safe to invest their money in the development of properties that may or may not contain mineral in paying quantities.

Yet, the safest form of a mining investment for a man who knows what he is doing is that of a prospect sufficiently developed to disclose the presence of pay ore. The purchase price of such a property is small in comparison with that of a dividend paying mine. The purchaser of a developed mine has to pay the owner a big price, for the latter is under no obligation to give his property away. Subsequently the new owner must extract from the mine enough ore to repay him the purchase price before he can begin to count on profits. The more extensively a mine is worked after it has been opened up the less becomes its value, and the purchaser of a developed mine may see his ore bodies exhausted before he has repaid himself the purchase price.

The situation is manifestly different in case of a prospect. There the purchaser has practically everything before him, and it takes him but a little while, if the property is really good, to extract enough ore to cover the few thousand dollars which constitute the purchase price.

It has been suggested that a way in which local capitalists could co-operate with foreign investors in the development of the mineral resources of the country is for the former to bring numerous prospects to a stage of development which would disclose their value while not making them fully developed mines. This might be done. Local capitalists would incur comparatively little risk, because they could give every prospect a careful examination. They could obtain a good profit upon their venture from sales to foreign investors, and the latter, by carrying development still further, would give employment to additional labor and place many new mines upon a producing basis.

The objections to this idea will so readily occur to the mind of every intelligent reader as to make discussion unnecessary.

The fact is that the men who made the most money in mining in this country did so by making the mines, for mines are "made." They used judgment, bought prospects, developed them, stayed with them, backed their judgment and won. Foreign investors prefer a "going" mine. That is the fashion, but fashions change.

"Export Trade."

Much is at present being said and sung to American manufacturers of mining machinery about "export trade," and in some instances the thing "is being worked for all it is worth." There is a suggestion of humbug about some of the efforts made to induce our manufacturers to go after the export trade, and an apparent forgetfulness on the part of some inducers of the greater value of the home trade. To American manufacturers, however, who want to compete for this much vaunted "export trade," a few homely hints may not be out of place. The success commensurate with merit that marks the production of the American manufacturer and the marked superiority of his manufactures makes it sometimes difficult for him to understand that foreign customers can not be secured without deference and reference to foreign ways, and that foreign customs must be catered to if foreign demand is expected to follow foreign advertising. The catalogues and trade treatises of the American manufacturer are the finest things of the kind in existence; the plated paper, the costly engravings, the elaborately illuminated covers, and the fine technical descriptions of the machinery offered for sale are recognized and valued in this country or wherever people do their thinking or their reading in the English language, but however elaborate and expensive such a catalogue may be it is a failure as a trade producer in a foreign country where those who see it are not familiar with weights, measures and values when expressed in pounds, feet and dollars. The writer has seen a superb catalogue which was printed in German, an exact translation of the American edition, intended for German use, but forgetful of the fact that the metric system and the German currency terms to one that is accustomed to use them make the dollars and inches of the American catalogue look strange even though the text appear in German characters. Then, again, foreign purchasers are just as set in their ways as the rest of mankind, and while it is patriotic and praiseworthy to attempt to educate them, yet the more immediately profitable way is to give them what they want, and in the way they want it. Hence it were unwise to fail in attention to detail in these catalogues: the exact weight, dimensions, capacity, and cost in marks or francs or other foreign currency, of the machinery should be set forth; the commercial traveler should understand the language of the country and be able to clearly explain everything in connection with what he proposes to sell, and not be too insistent on rigid compliance with all American business customs. Foreign customs are as sacred to those who observe them as ours are to us, and what might be thoroughly understood as between Chicago and San Francisco might arouse ill will and create grave misunderstanding as between Chicago and Havre, or Denver and Seoul. Above all everything must be precisely as represented; any other course causes a serious setback to any foreign trade in American machinery and the manner of packing and mode of delivery must be throughout more in accordance with foreign requirements than any American idea, however superior such idea may be. Some of these requirements may appear unnecessary and even ridiculous, but if one plays any game he must observe the rules, and the buyer in any land usually has most to say as to what these rules shall be.

THE man who needs medical or legal advice expects to pay for either, and yet this same type of man will often ask a mining or electrical engineer questions that require equal technical knowledge for correct answer. The engineer's education has been a costly one and it often constitutes his stock-in-trade. Consultation and advice should rightly be charged in the case of the engineer as in that of the doctor or lawyer, and while it is to be noted that advice is usually worth just what it costs, yet in the case cited, it is usual to give advice or information that is worthy of a substantial fee.

Concentrates.

THE present London price of niter is $1.75 per 100 pounds.

THE lift of a sipbon at sea level will not exceod in practice 24 feet.

MANY think that M. E. is the proper abbreviation for mechanical engineer and E. M. for engineer of mines.

LIQUEFIED AIR, when used for motive power purposes, producos about 5% of the force spent in producing it.

THE freigbt on a pole 25 feet long, 6 inches in diameter at tbe top, from Idabo to Chicago common points, is $1.80; on 35-foot 7-inch poles, $4.25.

CONSIDERABLE manganese is mined noar Santiago, Cuba, where "miners'" wages are 75 cents per day. The mine costs per ton aggregate about $2.

ALL logs cut on public land in British Columbia must be made into timber in tbe Province. If thls is not done lt may be seized and forfeited to the Government.

AT the sea level and a temperature of 32° F. one pound of dry air occuples a space of 12.386 cubic feet. At 60° F. the volume increases to 13.089 cubic feet per pound.

SOFT carbonate or cerussite is carbonic acid lead oxlde, a lead carbonate, lustrous and fusible. Hard carbonato is largely oxlde of iron with a little soft carbonate therein.

CAST IRON, STEEL, PLATINUM, BRASS AND WROUGHT IRON become cherry red at 1400° F. Cast iron melts at 2250° F.; steel, 2500°; platinum, 3500°; brass, 1500°; wrought iron, 2700°.

PNEUMATIC DRILLS range in weight from 14 to 35 pounds, and drill from ¼ to 2 inches with from 3 to 4 inches feed, requiring pressures from 80 to 100 pounds, using from 20 to 45 cubic feet of free air per mlnute.

THE English mile is 5280 feet, the nautical mile 6085 feet, Scotch mlle 5928 feet, Irish mile 6720 feet, German mile 24,318 feet, the Dutch and Prussian mile 18,440 feet, the Swedish mile 22,043 feet, the Vienna post mile 26,388 feet.

EIGHTEEN-CARAT GOLD has eighteen parts pure gold, three parts copper and three parts silver in its composition; twelve-carat gold is half gold, the rest made up of three and one-half parts silver and eight and one-half parts copper.

CADMIUM can be produced in quantities far exceeding the demand, which is limited, and the discovery of cadmium ore is not of much commercial importance. Silesia supplies cadmium cheaper than it can be furnished from domestic sources.

WITH a large quantity of water and a small head, the turbine class of water wheel might be used with good effect. Where there is a small amount of available water but a large head, the tangential or impulse wheel could be recommeuded.

CANNEL COAL is a hard, even-grained coal, which can be cut lnto blocks and strips, and will burn with a clear yellow flame; when first known, it was used as a substitute for candles; hence the name "cannel," a corruption of "candle" coal.

A WIRE with a tensile strength of 2000 pounds will weigh per mile 270 pounds. It would be possible to so adjust the catenary curve that the supports for such a wire could be 1 mile apart in such an extreme case as the crossing of a river.

CHARCOAL has been used with a fair degree of success ln a copper matte smelter, though it is not the ideal fuel for that purpose. Hard wood charcoal goes to pieces in the furnace, nut pine being better, though coke is generally deemed more desirable.

THE composition of typical anodes of refined blister copper is as follows: 99.25% copper, 0.338% silver, 0.001% gold, 0.3% oxygen, 0.054% antimony, 0.033% arsenic, 0.009% lead, 0.008% selenium and tellurium, 0.002% bismuth, 0.002% nickel, and a trace of iron.

THE mesh in wire cloth is the distance from the center to center of wire. It is the number of openings in a linear inch, measuring from center to center; 40 mesh would be wire No. 31, the diameter of the wire being .0132 inch and the diameter of the aperture .0118 inch.

FOR FILLING IN around the new mortar blocks, pulp from the battery containing a medium percentage of sulphurets is good material. But in using any materlal for tamping, the filling should be allowed to remain quiet for several days, that cementation may be established.

SODIUM AMALGAM is of common use, and for coalescing floured quicksilver phosphate of sodium may be used with good effect. An occasional pinch of it on the quicksilver assists in amalgamation. It forms no combination with quicksilver such as metallic sodium does.

PLATINUM MONEY was coined in Russia from 1828 to 1845, but, so far as "Concentrates" knows, it is not used anywhere for that purpose. Russia, New South Wales and the United States are the principal platinum-producing countries, its commercial production in this country being entirely confined to the Pacific coast.

THE low wages paid Mexicans in Mexico is deceptive. The Mexican accomplishes far less work than the American laborer, and as a result the cost of the work performed is about three times what it could be done for by American labor. A Mexican bricklayer will lay 200 to 300 bricks per day, while the American mason will lay 2000 to 2500 bricks. Tho former requires two tenders, while one American tender will attend to two American bricklayers.

A SERVICEABLE cold cutter may be mado of worn-out large three-cornered files. Draw the temper, break the file lnto 3-inch lengths. Lay the file on the anvil, place the article to be cut upon lt; striking with heavy hammer will cut nearly through; turn over and a light blow will finish the cut.

HONESTY in the promotion of any mine enterprise requires proof of the existence of a mine. Often the public dispense with tbis proof and gamble on a few samples and an assayer's certificate, so that the stock in trade of some promoters is not the value of the mine, but the credulity of people with money in their pockets.

THE Colorado Zinc Co. has a 100-ton plant near Denver, Colo., that successfully and profitably handles zinc-lead ore, the zinc, lead and magnetic iron being separated and rendered suitable for smelting. The ore comes from Leadville, and the concentrates that result from the automatic handling in the Denver plant are sent to Mineral Point, Wis., for smelting.

THE pressure of still water against a wall or dam is the same, whether the water extends 1 foot or 1 mile from the wall. The pressure in pounds against any vertical wall may be ascertained as follows: Multiply together the area in square feet of that portion of the wall in contact with the water, half the vertical depth of the water and the constant 62.5 pounds (the weight of 1 cubic foot of fresh water); tbis will give the total pressure which is always vertical to the upper or wetted surface.

IN the case where plaintiff in an action to quiet title to mineral land claims exclusive adverse possession from the date of his location, and the evidence shows that defendant had purchased an interest from prior locators, and had continued in possession with them until they leased it to a third party for a term of years, which expired after plaintiff's entry, the lease is competent evidence to show that defendant was in possession by his lessee when plaintiff was claiming exclusive possession.

A FISSURE VEIN may in general be regarded as a mineral mass, tabular in form, as a whole, though frequently irregular in detail, occupying or accompanying a fracture or a set of fractures in tbe enclosing rock. This mineral mass has been formed later than the country rock, and the fracture either through the filling of open spaces along the latter or through chemical alteration of the adjoining rocks. Such alteration does not, ordinarily, extend far from the fissure. There is no difference between a "fissure" and a "true fissure."

THE contract calls for 3556 squares of slate. In each square there are 100 square feet of slate—158⅜ slabs, each 11 by 22 inches. Every square weighs 650 pounds; the entire lot will weigh 2,313,630 pounds. The total number of pieces will be 564,300; were they laid side by side and end to end, they would cover an area of 21¾ acres. Allowing a burden of fifty pounds to the man, it would require an army of 46,273 men to carry them. If this army marched in single file and with intervals of 3 feet, the last straggler would be 26¼ miles behind the drum major.

GOLD AND SILVER ORES are often found abundantly in the immediate region of porphyry dikes. One commonly accepted theory is that the dynamic disturbances accompanying the formation of the dikes shattered and fractured the rock crust of the earth to great depths, and furnished deep fissures, cracks or fractures through which ascending metal-bearing waters, from which the metals were deposited, could freely circulate, these dynamic disturbances producing the structural conditions or deep fractures as a course for circulating waters.

IN the "mixing tank" system on a gold dredger the plant consists of a tank under a screen about 20 feet long, with two partitions beginning at both ends and inclined toward the center, forming a chute, which carries the water, sand, etc. Having passed the screen from each end to the center, the material drops into the well or tank. The sides of the tank near the bottom, being oval-shaped, cause a boiling and whirling motion in the water, which mixes the water, sand and gold. At a given distance from the bottom an overflow is arranged to draw off the mixture onto the tables. This is for fine gold.

A SIMILAR CASE to the one concerning which inquiry is received from White Hills, Ariz., was decided in the suit of the Empire M. & M. Co. vs. Tombstone M. & M. Co., and is found in 100 Fed. Rep., U. S., 910. In this case it was held that a single contract made by a corporation owning mining ground in a Territory by which it employs and agrees to pay a second party to exploit and develop the property does not constitute a carrying on of business in the Territory by the corporation, within the meaning of a statute requiring foreign corporations carrying on business within the Territory to file copies of their articles of incorporation, and providing that every act done by them prior to the filing thereof shall be void; and such statute does not affect the validity of the contract.

POTASSIUM CYANIDE can be regularly added to keep a solution steadily up to standard strength. At the cyanide plant of the Dexter G. M. Co. at Tuscarora, Nev., where the ore uniformly consumes 1½ pound cyanide per ton treated, an amount of cyanide equaling 1½ pound for each ton of ore in a tank newly charged and ready for its first wetting witb solution is placed in a perforated tin tray 24 inches square and 6 inches deep. This tray with its charge is placed on top of the ore charge and under the pipe that admits the solution, the flow being regulated so that the ore is submerged just when all tbe cyanide is dissolved. This allows for varying amounts of moisture that may bo retained in the sands, insuring a full strength of solution when the leaching begins. In this way the strength of stock solution is held uniform, varying only a few points from month to month.

IN determination of copper by aluminum foil, the copper is brought into solution as a sulpbate, the solution evaporated until free from nitric acid. Dilute witb 50 c. c. wator for each 10 c. c. sulpburic acid present. Add three pieces of sheet aluminum (25 gauge) 40 m. m. (1⅝ inches) square, with one corner turned up for convenience in bandling. Boil solution for five minutes and the copper will be precipitated. Instead of redissolving the deposited copper and titrating with oyanide solution, satisfactory results are obtained by washing the copper into a tarred Gooch crucible, giving a final wash with alcohol, burning off, drying and weighing as metallic copper, using only enough asbestos to produce a good filter. In washing with alcobol and burning, tbe same care is needed, as in the electrolytic metbod, that too much alcohol be not used.

IF a gold leaf be placed in a flask containing two or three ounces of water and a few grains of dissolved potassium cyanide, and a portion of the air be displaced by bromine vapor, the metal will be rapidly dissolved on shaking. Apparently the bromine displaces cyanogen, which, in the nascent condition, readily attacks the gold, while potassium bromate is formed. With an excess of bromine, potassium bromide and hydrocyanic acid are formed; but the loss of acid may be prevented by the addition of alkaline hydrates. The quantity of the cyanide required is less than in the ordinary process. The reagents should be added in the correct proportions, calculated after carefully assaying the ore. In use, the fine ore may be kept agitated, the requisite amount of bromine being admitted intermittently; or the solution may be caused to percolate through the ore in presence of bromine vapor; or air and bromine together may be blown through the ore in the leaching solution. The bromine may be recovered by concentrating the solution after it has passed the zinc boxes, and treating it with hydrochloric acid, the evolved bromine being condensed.

IT has been the common practice in setting the battery posts of a stamp mill to mortise the post in the streak sill, at a point opposite the end of tbe mortar block and between the front and back sills on which the "streak" rests, a space between supports of 4 feet to 5 feet. Notwithstanding a large cross section may be given to this streak sill, it is elastic under the weight and heavy blows of the stamps, and this point is one which often requires watching and attention, or jumping battery posts will result. As the tendency of mill construction practice is towards rigidity in all parts which it used to be considered necessary to cushion, it would seem good practice to make the battery posts as rigid as possible. A post the same size as the battery post should be set under the streak sill directly beneath the battery post, its lower end resting on the bottom of the excavation for mortar block, and the post wedged firmly in place. Where the mortar block is built up of planks, or where large timber is available, a shoulder may be made on the mortar block, on which the streak sill can be supported. Such a construction will afford a rigid foundation for the cam shaft. As was argued in favor of a rubber pad under the mortar, so it may be said that a cushion is required for the battery posts. As a fact, neither is required. Plane surfaces, square joints and snug, will give the best results.

AND now goes in great numbers the prospector, the avant courier of the miner, the promoter, the investor, the mining machinery man, the pioneer of mining industry. A prospector's life possesses the charm of always hoping to strike it big, and even should he not succeed he can enjoy himself as no city denizen can. The mountains are now delightful, and when one tires of prospecting he may try his hand at hunting or fishing. There is plenty of game to supply one with fresh meat all the time; the larger streams abound in fish, and the pure mountain air and water keep the prospector in the best of health. There is only one risk to run, and that is of accident, and so it is safer for two prospectors to go together, as a man may fall off some steep ledge and break a limb, while climbing around in search of croppings. Where two can agree for a whole season the prospector's life is the happiest one in existence. The successful prospector must be a man of intelligence and have at least a natural insight of the laws of geology. He must be able to judge on looking over the face of the country whether the formation is volcanic or alluvial; he must be a good guesser as to the pitch of a certain ledge, so as to know how far down the hill to start his tunnel, in order to crosscut; and he must never get tired or hungry. When he feels exhaustion or hunger coming on he must pitch his camp, unpack his horse and stake him out to grass. Then he can build a fire, cook some bacon, bread and coffee, and rest until he feels better. "Pocket hunting" is a fascinating occupation for some prospectors. The pocket hunter toils along the steep mountain sides, perhaps far from water, and carries a little in a can to wash a handful of dirt here and a handful tbere, following up colors until a pocket of decomposed quartz is found, which may yield several hundred dollars. The pocket hunter, however, is ordinarily fortunate who finds enough in one pocket to keep him going until he strikes the next.

The Production of Copper in the Boundary District, B. C.

By Dr. Albert R. Ledoux.

I may venture to generalize with the assertion that the ores of Phœnix camp are almost exclusively altered limestone. On the north side of the ravine which divides the town, the limestone cap is in place, massive and unaltered save by the pressure which has crystallized it, the outcrops of ore being largely at contacts between intrusive eruptive rocks and the body of the limestone. This is notably true of the outcrop at the Brooklyn mine, where the uplifting of the limestone by the intrusive igneous rock is very marked, and along the vertical crushing zone there has been a second flow of pasty porphyry (using the general term) forming in the most interesting manner a breccia containing sharp, angular pieces of unaltered limestone and of the older porphyry. In the mines on the north side I am informed that the ore bodies exist in irregular masses of great size in unaltered lime, largely resembling caves which have been refilled with the ore-bearing material. The average ore of the best developed mine, showing nearly 500,000 tons in sight, is said to contain 38% of silica, 16% of oxide of iron, 15% of lime, and about 4½% of sulphur, copper 1.80%, besides gold and silver.

In all of these claims on the north side of the ravine the ore is frequently cut off unexpectedly hy vertical dikes or horizontal floors of porphyry in a way which would he the despair of those whose duty it is to develop the property, were it not for the great size of the bodies when found. On the south side of the gulch of Phœnix I venture to affirm that the mountain was originally divided by a strong dike of fine-grained felsite, which crops out boldly in the railroad cut where it crosses the Victoria claim, and is traceahle for 4000 feet to the south, crossing the Ætna and disappearing on the War Eagle. This dike has not been cross-fissured by any subsequent geologic action, so far as can be observed hy its appearance on the surface and at depths attained at present, or hy the result of exploration with the diamond drill which has penetrated it for several hundred feet at various depths and in different directions from the westerly side. It seems to me probable that on both sides of this main dike, which forms a sort of wall, and for 1000 feet or more to the east and to the west, the limestones originally overlying the granite, shattered by innumerahle disturbances and cross-fissured by secondary intrusions, have been mineralized and entirely altered by the solutions following up the main igneous dike and spreading, until nowhere that I could observe was the limestone left unaltered, so practically all of the original limestone that was not eroded has heen mineralized to greater or less extent. There is everywhere a notable quantity of calcite, a secondary redeposit of the lime.

To the east of the dike which divided the Phœnix hill the same general characteristics are noted which I have outlined ahove, being observed on the Gold Drop and Snow Shoe claims, and on the Monarch, except that on the Knoh hill, Ironsides, and other westerly claims there is a large, altered, oxidized zone, in which the copper is carried hy magnetic iron oxide, while on the easterly side the iron cap is not so extensive.

The Ore.—I have already stated that the ore of the mines on the north side of the gulch of Phœnix is said to contain on an average 38% of silica, 16% of oxide of iron, 15% of lime and 4½% of sulphur, there heing little change hetween the surface and lower ores so far as the chief constituents are concerned. This is about the composition of the lower ore from the south side, although many other conditions are distinctly different. The upper ores are largely oxidized and, as stated, consist of massive magnetic iron ore carryiug copper sulphide and gold; this surface ore changing at an average depth of perhaps 25 feet to ore more nearly resemhling that of the Brooklyn, the iron heing largely combined with sulphur, or sesquioxide, rather than in the higher oxidized form. By mixing these surface ores with those from lower levels an ideal mixture is ohtained, enahling the furnaces to produce directly a 45% to 50% copper matte, carrying practically all of the gold and silver which the ore contains.

I have said something about the characteristics of these ore deposits at or near Phœnix, but nothing concerning the quantity of ore which may he depended upon. Of course "available" ore depends on cost of treatment and price of its valuahle constituents. With adequate railroad freights and fair charges for coke it is prohahle that there are reasonably in sight in the Phœnix camp to-day several million tons of ore, which with copper at 12½ cents per pound could be treated successfully. In Deadwood camp the ore deposits are also enormous, averaging over 130 feet wide, and so situated that surface working can be prosecuted hy quarry, a single drill dislodging a train-load of ore in a day. But the prohlem of mining the lower levels of all these mines without excessive cost of timher or the permanent ahandonment of one-half or one-third of the ore, necessarily left in pillars, must be causing serious thought. The tonnage that can be extracted from the mother lode is also up in the high figures, and cheap smelting a welcome fact.

There have been numerous published guesses as to the grade of these Boundary Creek ores, and this after all is the vital point from which all the others depend. On the north side of the Phœnix ravine the large amount of ore developed is estimated to run ahout 1.80% copper, $2.40 per ton in gold, and 25 cents per ton in silver. The workahle ores from the south side of the Phœnix ravine contain on an average copper 1.70%, gold $1.60 and silver 33 cents per ton. The ore from the easterly side of the main dike, dividing the Phœnix camp, as represented hy the Snow Shoe, Gold Drop, etc., probably runs by the carload as shipped about 1.60% of copper, $1.50 in gold and 30 cents in silver. The run of the mines in the Greenwood camp, as shown by the smelter returns, is probably 1.60% of copper, $1.80 in gold, and 50 cents in silver.

It may, therefore, be taken as a safe estimate that the very large amount of ore available in the Boundary district will vary from twenty-five pounds to thirty-five pounds of copper per ton of 2000 pounds, with from 25 cents to 40 cents of silver per ton, and from $1.50 to $2.50 per ton in gold. It may be stated that there are some mines, like the "B. C." near Eholt, whose ores as shipped contain considerably more copper than the ahove, hut the figures I have given are well within the limits for the average.

Next to the quantity and grade of ore, the all-important question is how cheaply can the values from these Boundary ores be extracted and marketed.

It is easy to disprove the statement that only surface ores have been treated, because the records at the smelters show from what portion of the working, as well as from what particular claims, shipments were made. For instance, take the Knob Hill mine as an example. During the year 1901 there were mined:

From the surface	6%
From the 200-foot level	57%
From the 250-foot level	19%
From the 300-foot level	18%
	100%

Taking the Ironsides and Knob Hill together for the years 1900 and 1901, the figures show that 74% was from helow ground and 26% from surface ore, varying with the time of year. In the summer time a great deal more ore was taken from the surface workings than from beneath; in the winter time surface mining was largely interrupted. The cost of mining these large ore bodies in the Boundary has varied from $1.66 per ton, to $2.10 per ton, the first mentioned figure being the more recent. It is a difficult problem, as I have already hinted, and the one uncertain element in the prosperity of this district, how to handle the very large ore hodies without the risk of caving and ruining the mine, on the one hand, or the necessary employment of excessive amounts of timbering, or leaving in the mine large blocks of pay ore as a support. The management of the companies have been studying the problem and the Granby Co. have commenced ore handling with steam shovels, and propose to still further decrease the cost of mining hy stripping from the surface down to the present level of the railroad track, and by the introduction of the caving system for lower workings.

Smelting Costs.—It has been seen that cost of mining in the district, even with high wages to miners, is very low, the conditions heing most favorahle. I come now to the all-important statement of these smelting costs.

The Boundary ore being self-fluxing, indeed rather basic in character, allows the admixture of a certain quantity of siliceous ores from the Republic camp or other districts whose ores carry gold and silver, and the sulphur being low permits of smelting without preliminary roasting. It may also be stated that the freedom of the ores from hismuth, arsenic and antimony renders it easy to obtain a ready market for the copper product.

In considering the cost of smelting it is also necessary to take into account the losses in slag and otherwise. I was allowed to sample the slag dumps and to take portions of weekly slag samples which had heen preserved in the laboratory. Before the establishment of bessemerizing the slag loss of the Boundary smelters averaged copper .46%, gold 12 cents per ton, and silver 3 cents per ton. With a consumption of ahout 11% of coke, and with freight charges as they exist to-day the cost of smelting at the most favorable location in the Boundary district, after charging against the semlter the costs of marketing the product, must be considerably under $2 per ton. Adding the present cost of mining, the total outlay for mining and smelting must be less than $3.66 per ton.—Condensed from Canadian Mining Review.

A German engineering journal describes a double boiler, one within the other. The inner one holds the water, while the outer one is filled with oil. The heat applied to the latter heats the oil and indirectly the water in the inner hoiler. The advantage consists in the much higher hoiling point of oil, which permits of a higher temperature and thicker boiler plates without danger of injury to the metal.

The Cost of Cyaniding.

The following is a table of the costs at the various cyanide plants in the Black Hills, South Dakota:

Name of Mill.	Method in Use.	Remarks.	Tons Treated per Day.	Total Cost per Ton.
Spearfish	Dry coarse crushing.	.....	125	$0.80
Cleopatra	Dry coarse crushing.	.....	40	0.86
Wasp No. 2.	Dry coarse crushing.	.....	105	0.83
Golden Gate	Dry fine crushing.	.....	65	3.95 4.10
Portland	Wet crushing and slimes treatment.	.....	60–65	1.75* 2.00*
Dakota	Wet crushing and slimes treatment.	.....	60	1.50* 1.75*
Clevenger	.....	Cyaniding chlorination tailings.	30	0.85 0.90
Allen Bros. & Soule	.....	Cyaniding silver mill tailings.	35	2.50
Homestake	.....	Cyaniding stamp mill tailings.	1300	0.50*

* Figures with a star are not official, but are estimates, which, however, closely approach the actual cost.

It will be noticed that the cost at the mills treating coarse crushing ores is about the same—85 cents per ton. This cost will undoubtedly be somewhat reduced at the plants of larger capacity, as certain improvements with that end in view are contemplated. Most of the figures given do not include interest on plant, insurance or general office expenses. These added to the cost per ton will make it somewhat higher. The cost at the Golden Gate mill will be seen to be disproportionately high; in fact, the cost sheet gives the figure above $5 for some months. This high cost is due to the limited quantity of ore treated, the high rent, and the fact that the mill is old and poorly arranged, necessitating high repair cost and high labor cost. A modern mill, arranged for dry fine crushing, with a capacity of 100 to 150 tons of ore per day, should be able to treat oxidized ores for from $1.25 to $1.50, and ores which have to be roasted for from $1.90 to $2.25. The cost of roasting should not be high, as the hlue ores are light in sulphur, averaging perhaps 8%.

No detailed figures are available for the wet crushing mills, the total cost varying hetween $1.50 and $2 per ton. This figure is obtained hy mills having a comparatively small capacity (60 tons), and in a larger mill this cost could prohahly be reduced to in the neighborhood of $1.25 per ton.—Bulletin No. 5, South Dakota School of Mines.

Atomic Weights.

The committee appointed by the German Chemical Society, consisting of Messrs. Landolt, Ostwald and Seuhert, to determine the values of the atomic weights that should be employed for purposes of analysis or assaying, recommend that the atomic weight of oxygen should be taken as 16.00, and on this hasis the values of atomic weights of other elements should be calculated. The following values are recommended for adoption for the elements usually dealt with in metallurgical practice:

Aluminum	27.1	Manganese	55.0
Antimony	120.0	Mercury	200 3
Arsenic	75.0	Molybdenum	96.0
Barium	137.4	Nickel	58.7
Bismuth	208 5	Nitrogen	14.04
Boron	11.0	Oxygen	16.0
Bromine	79 9	Phosphorus	31 0
Calcium	40.0	Platinum	194 8
Carbon	12 0	Potassium	39 15
Chlorine	35 45	Silicon	28 4
Chromium	52.1	Silver	107 93
Cobalt	59.0	Sodium	23 05
Copper	63 6	Strontium	87 6
Fluorine	19 0	Sulphur	32 06
Gold	197 2	Tin	118 5
Hydrogen	1.01	Titanium	48 1
Iodine	126 85	Tungsten	184 0
Iron	56 0	Vanadium	51.2
Lead	206 9	Zinc	65 4
Magnesium	24 36		

There is a constant class of pirates lying around big mining camps who have no other aim in life than to watch applications for patent, trump up a case, get some tinhorn attorney to file an adverse and thensell out to the applicant for the best price they can get. These fellows discourage operators and frequently spoil sales, as capital is scary and will pull out of the field rather than risk a lawsuit. They are a nuisance. One way to treat them is to apply for a patent as soon as sufficient work is done and before the claim becomes so old that it is impossible to hunt down the invalidity of the adverse claim.

Costs and Profits in Pyritic Smelting of Low-Grade Copper Ores.

NUMBER IV.

Written for the MINING AND SCIENTIFIC PRESS by F. H. PRENTISS, E. M.

The use of limestone as a flux adds to smelting costs as follows:

1st—Cost of the limestone itself.
2nd—Labor cost of handling it as flux.

zero line we have for certain ores their credit value in tons of limestone for excess of bases they carry, and on the left of the zero line the same facts for the same ores are set forth as deficits of silica. For example, ore of type A is self-fluxing for a 50% silica slag, as shown by the intersection of the 50% slag lines and the type A line as the zero line. The same ore requires fifteen tons for a 45% slag, thirty-five tons for a 40% slag, sixty tons for a 35% slag and ninety-six tons for a 30% slag, while for a 55% and a 60% slag it shows a deficit of silica and a consequent limestone credit. In making a 50% SiO_2 slag the

of mining and smelting various types of ores, using either hot or cold blast and making various types of slags. To mine and smelt, for example, an ore of type E, making a 50% SiO_2 slag would cost with hot blast $8 per ton and with cold blast $8 60 per ton, using a limestone flux, while for a 30% SiO_2 slag the costs would have been $15.20 and $16.40.

The line c d covers the range of self-fluxing ores and shows a cost from $4.80 to $5.80 as the slag varies in silica. Attention is again called to the fact that the lower cost accompanies the lower percentage of SiO_2 in the slag—just the reverse of what

3rd—Labor cost of handling it as slag.
4th—Extra coke required in smelting.
5th—Extra blast and power required.
6th—Extra loss of values due to increased blast.
7th—Extra loss of values due to increased slag.
8th—Reduced capacity of the furnace for ore.

The lower the percentage of silica in the slag the greater the amount of limestone that will be required. Diagram No. 6 gives the amount of limestone required for various types of ore and of slag. From c to d we find self-fluxing ores for slags ranging from 30% SiO_2 to 60% SiO_2. On the right of the

slag produced per 100 tons of ore would be seventy-two tons, as shown in diagram No. 7, while for a 30% silica slag the amount of slag would run up to 120 tons. It will be noticed in diagram No. 7 the line a b ranges between an ore self-fluxing for a 30% slag and an ore self-fluxing for a 60% slag. Attention was drawn previously to the uniform conditions of power, blast, etc., where the ore was fluxed by means of concentrates, and it will here be seen that the weight of slag produced varies only from sixty-six tons to seventy-four tons between a 30% and a 60% slag. In diagram No. 8 we have the total cost

would have been the case if a limestone flux were used.

Type C ore shows on the diagram a cost for mining and smelting with hot blast and making a 50% SiO_2 slag of $6.70 per ton (marked X on the diagram). The same results may be had from the tables (which are for a 50% slag) by adding together columns 11, 17, 18 and 26, and adding to the sum the cost of mining ($2.42), the results showing as follows:

Column 11—Cost of limestone	$ 50
" 17—Combined cost of hot blast and coke	1 39
" 18—Cost of power, labor and supplies	1 35

Column 26—Loss of Cu and Ag in smelting	1 06
Mining cost ($2 25) and general expenses ($0.17)....	2 42
	$6 72

Such ore, therefore, if smelted under the conditions assumed must have a matting value of more than $6.70 per ton in order to show a profit. This is shown on diagram No. 1 where the line h a e (line of no profit or loss in smelting) intersects the horizontal line c c at a point giving a matting value of $6.70 per ton.

Diagram No. 7 gives the cost of smelting one ton of silica with different percentages of SiO_2 in the slag, the curve a h for hot blast and the curve c d for cold blast. These curves are built up from the data and diagrams preceding them and carry all of the variables that bear upon the cost of smelting. It will be remembered that our constants were cost of coke and fuel and cost of limestone. The curves give the debit side of the ore while the line c i (diagram No. 5) gives the credit side, and by combining the two we may at once determine what the smelting cost will be. The credit side of the ore is a constant and depends upon the ore itself, while the debit side is made up of several variables and the amount of debit depends upon how we select our variables, that is how we treat the ore.

Taking the conditions we have just been considering, a 50% SiO_2 slag and the hot blast (at 1000° F.), we see by diagram No. 9 that the cost of smelting a ton of quartz (marked X on the diagram) will be $16.65. Now ore of type C carries 42% of silica, and therefore we have a cost amounting to 42% of $16.65, or $7, to which we will add the mining cost, making $9.42. By diagram No. 5 we find that the full credit line c i intersects the horizontal c c at a point (marked X), showing a credit value of $2.75, deducting which from $9.42 leaves $6.67 as the cost of mining and smelting an ore of type C, an agreement with the results previously obtained. Diagram No. 9 also shows clearly the advantage and profit of carefully throwing out worthless quartz whenever any limestone flux is employed. Part of the removable quartz will go directly in large sizes to the waste dump from the conveyor belt, where the ore is hand sorted, and the balance as worthless tailings from jigs, and as fine tailings from the tables.

In the smelting of heavy sulphide ores, quartz, of course, is necessary and must be obtained and used for a flux just as limestone is used for siliceous ores. In nearly every case, however, the quartz is not merely a flux, but an ore which not only carries enough value to pay its way through the smelter but to leave as well a good profit behind.

The cost of roughly eliminating the larger sizes of worthless quartz and gangue in the process of sorting the ore into high grade (to smelter) and low grade (to mill) is practically nothing. The cost of running it through the smelter is very high, as shown by diagram No. 9 (depending upon cost of coke and limestone, for which items, treated as variables, other curves similar to those of diagram No. 9 may be constructed), while the cost of eliminating the excess of silica by wet methods depends chiefly upon the losses sustained in fine concentration.

(TO BE CONTINUED.)

The Statistics of Copper.

The statistical position of copper for the first four months of 1902 is thus set forth by John Stanton:

Four months.	1902.	1901.	Decrease.
U. S. production....	196,996,800	198,466,240	1,469,440
U. S. exports.....	151,536,000	67,475,520	*84,060,480
Home consumption..	45,460,800	130,990,720	85,529,920

Percentage decrease, 4 months 1902.....	0.75
Percentage exports of 4 months' product, 1902.....	76 00
Percentage exports of 4 months' product, 1901.....	34.00
Percentage U. S. product for home consumption, 4 months, 1902.....	24.00
Percentage U. S. product for home consumption, 4 months, 1901.....	66.00

*Increase.

Foreign mines increased their April output 1190 tons over March and 1359 tons over April, 1901. The April copper production of these foreign mines is the largest of any month in at least five years.

"I HAVEN'T time to read the paper and I haven't time to give what I suppose is the requisite amount of attention to my advertising." How often one hears that! Then take time. You have all the time there is. Do that which is the most important. To say you "haven't time" to attend to your advertising or to read your trade paper is another way of saying that there are other things you daily do that you consider of more importance. But there are not. You take "time" enough out of the twenty-four hours, that you have in common with everybody else, to eat and sleep. Take enough "time" from matters of secondary importance to tend to things of value; use time as a precious opportunity to read the trade paper, and give attention to your advertisement commensurate with its importance. His trade paper and his advertisement in it are the two things of greater importance to the business man than any other two items in his business. Take "time" to rightly attend to them. It will pay.

Cyaniding Sulphide Gold Ores.

The natural bisulphide of iron FeS_2 shows considerable difference towards cyanide. Apart from any admixtures, the kind of FeS which crystallizes in the rhombic system, the marcasite, is always attacked by cyanide to a considerable degree, though the isometric iron pyrites is not at all, or very little, acted upon. In one extreme case where FeS_2 was present mostly in the form of marcasite, cyanidation of a gold ore was made impossible, both on account of low extraction, as well as very high consumption of cyanide; while in numbers of cases, where pyrite only was present, the consumption of cyanide was hardly noticeable. It is plain that the substance of the dimorphous FeS_2 can not be the same in the two different forms—a fact which might already be implied from the different behavior of the two kinds towards the oxygen of the atmosphere. It is well known that marcasite rapidly oxidizes into a protosulphate of iron, while the cubic pyrite withstands the influence of the atmosphere much longer and then usually forms ferric sulphates and oxides, besides ferrous sulphate. A. P. Brown proves that there exists a chemical difference between pyrite and marcasite, and proves the cause of the difference. As the main result of his investigations, he could state the real formula of the pyrite to be $Fe_{II}Se_2Fe_{III_4}S_8$, while the marcasite experimented upon corresponded to the formula $Fe_{II}S_2$. In the marcasite the iron is in its bivalent form as ferrosum only, while in pyrite four-fifths of it is trivalent, is present as ferricum, and only one-fifth as ferrosum. The difference of KCN acting on $Fe_{II}S_2$ or $Fe_{III}S_2$ seems to correspond with the difference of action on $Fe_{II}O$ and $Fe_{III_2}O_3$; the first is easily soluble, while the latter is insoluble. It is likely that the proportion of one-fifth and four-fifths in the pyrite is not stationary, and that other combined proportions of the two substances occur, which will explain fully all the differences of solubility of FeS_2 in KCN.

Sulphide ores show pronounced differences in their behavior toward cyanide solution. Neither the same mineralogical character nor the same chemical composition as proven by analysis can be taken as guidance to foretell the actual behavior of natural sulphides toward cyanide solution. We have to experiment with the ore from every new locality before we are entitled to say if the decomposition of cyanide by the metallic sulphides will or will not allow the use of the cyanide process. To know that iron pyrite ores in nine different cases were only slightly acted upon by cyanide does not warrant our saying that in the tenth case the same action would result, nor are we entitled to state dogmatically that copper pyrites will always be acted on by cyanide to such a degree as to exclude cyanidation, because we know that this has been observed in a number of cases.

The main practical question in regard to cyanidation of sulphide ores is whether we have any means of obviating or removing the causes which otherwise prevent its application. Leaving out the simpler cases where a finer pulverization might better extraction, and also the possible case where gold is in insoluble compounds, the question is narrowed down as to how we can prevent cyanide from being decomposed by soluble sulphides. The answer can only be to turn them into insoluble sulphides or change their chemical composition into an indifferent compound. Even if the first condition be possible, we have at present no known means of achieving such a change, and therefore it may remain undiscussed.

Regarding the second proposition, a radical remedy is known, to turn soluble and insoluble sulphides into insoluble oxides by roasting them, and an intermediate stage would be roasting to sulphates and removing by water the soluble sulphates previous to cyanidation.

It is, of course, not impossible that a means could be discovered by which in a cheap and efficient way the soluble sulphides could only be removed previous to cyanidation, and where the harmless insoluble sulphides would remain unaltered. This would have to be a compound possessing very similar qualities to cyanide, but much cheaper. Strong bases, as caustic alkalies, which one might think fit to achieve the desired effect, will not answer.

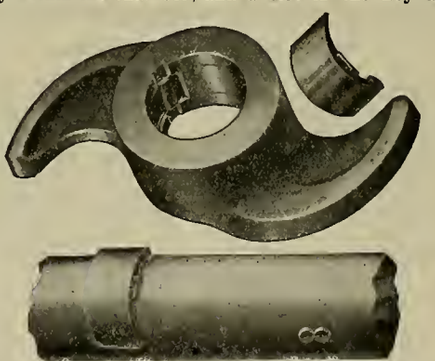
In some cases, where the consumption of cyanide was not too high to prevent cyanidation, and where also the percentage of extraction was satisfactory in the beginning, cyanidation had to be abandoned on account of a gradual falling off in extraction. One case came under observation where the percentage of extraction fell within a short time from 80% to about 30% of the value. It was apparent that this result was due to an accumulation of products of decomposition of sulphides and cyanide. With every new operation a fresh quantity of sulphide of potassium was formed, which, being a precipitant for the precious metals, gradually prevented their solution by cyanide. Soluble lead or zinc salts could be used in such instances to remove the sulphur from the working solutions by causing it to form an insoluble metallic sulphide.

The soluble sulphates could be easily removed by a water wash, and the considerable gain in time and saving of fuel over a dead roast would speak much in favor of such a method, and the inconvenience caused by the constant gaining in volume of working solution would not be such a serious drawback as to make the process impracticable. However, the fact is that, especially with sulphide ores, not concentrates, the complete oxidation of sulphides into sulphates is an ideal state, and the nearest approach to it is only gained in the course of a thorough dead roast. If roasting is interrupted when the bulk of the sulphides has been turned into sulphates, an appreciable amount of sulphides in the finest state of division, enclosed by gangue or sulphates and oxides, remains unaltered, and in the subsequent leaching by cyanide it will be found not only that the consumption of cyanide will be higher, but also that the percentage of extraction will not be as high as with dead-roasted ore. In one case, where the writer had changed from a dead-roasting to a roasting for sulphates, in order to increase the capacity of a mill and to reduce roasting expenses, he had to go back to a thorough roasting on account of the reason stated.

It seems to hold true that dead-roasted sulphide ores and concentrates are amenable to cyanidation, and that the consumption of cyanide is always low. If it were not for the reasons incidental to all roasting operations, cost of fuel and labor and partial loss of the precious metals, we would have in roasting and cyanidation a process which would be rapidly adopted with a great many ores which now remain unworked. Unlike the chlorination process, cyanidation of roasted ores is always cheap. As it is, cyanidation of roasted material will be the process of sulphide ores of lower grade than hitherto could be worked by chlorination, and, besides, be more economical with some kind of concentrates or sulphide ores worked hitherto by chlorination. What would be the lowest grade ore which could be treated in that way is impossible to say, depending, as it does, on local conditions. If the material is high grade enough to be treated either by chlorination or cyanidation, experiments will have to decide which process should be adopted. It seems that the extraction by chlorination is usually somewhat higher than by cyanidation, most likely because of the gaseous state and, therefore, greater penetrative power of the reagent. It will, therefore, depend on the relation between the difference in extraction and the difference in working expenses as to which process is the more economical, and, all other conditions being the same, it will be found that the lower grade sulphides now treated by chlorination are more adapted to cyanidation, whereas the higher grade concentrates will remain to be the especial domain of the chlorination process.

Canda Self-Locking Cam.

The illustration herewith is of the Canda self-locking cam for fastening cams to the cam shafts. The idea is to fit into the bore of the cam an eccentric wedge chamber formed by the continuous revolution of a boring tool, the chamber occupying only a part of the width of the hub of the cam, a circular wedge key within the chamber, and a slot in the key and



The Canda Self-Locking Cam.

the cam, to let the studs engage the wedge key and thus hold it in position. These cams are interchangeable; the fastening is self-tightening and the frictional adhesion between the shaft and the concentric face of the circular wedge is sufficiently great to keep the wedge practically in compression. The cams may be loosened by striking the arm a light blow on the reverse side. The cam can be readily adjusted to the ordinary cam shaft, by hand, or, if necessary, with a ratchet drill, after which the studs may be driven into place.

These cams are made by the Chrome Steel Works, Brooklyn, N. Y. Their Pacific coast representative is G. W. Myers, Hayward Bldg., San Francisco, Cal.

THE quantity of fine ore which can be smelted in the blast furnace is limited by its tendency to pass through the fuel, and therefore descend without being completely reduced. But it may be made into briquettes or turned into spongy iron. Briquettes made from fine ore cemented by quick or slacked lime, with water necessary to make a thick paste, harden sufficiently when dried in air. Ore coke is made by mixing fine ore with tar or bituminous coal, 30% of the latter to 70% of iron, and highly heating the whole, which yields a hard and compact product.

Mining Industry of Clear Creek Co., Colorado.

Many of the mines of this section, though profitable and developed on an extensive scale, are comparatively unknown. It is a district composed of individual mine owners and close mining corporations.

The almost universal stock proposition is unknown here, and so the district gets along quietly and conservatively, increasing in volume of shipments steadily and progressively.

The mines of the Con. Stanley Mining & Milling Co. have over 7 miles of underground work. The shaft of this property is over 1200 feet in depth, equipped with a perfect hoisting plant. This property has a record of production running into the millions, goes along in a steady routine of production and profit, giving constant employment to a large number of men. It is managed by James Bowden.

The Monarch tunnel, driving into the Freeland district, and the Central tunnel, on its way through Clear Creek county into Gilpin county, cut the veins of both sections at a depth varying from 1000 to 2000 feet.

The Sun and Moon mines, under the management of H. N. Sims, employ nearly 200 men in the various workings, with an average daily shipment of nearly 100 tons of ore. They are working both through the Newhouse tunnel and a shaft nearly 1000 feet in depth.

The John Owen Mining Co., under the management of Mr. Riley, is another example of perseverance and practical mining judgment. This property is a regular shipper of high and medium-grade ore.

The Gem and Gem Extension mines are heavy producers, getting out a large tonnage through their shaft and through the Newhouse tunnel, where this vein is cut at a depth of over 2000 feet. This property is under the management of W. E. Renshaw. Mr. Renshaw is also the organizer of the Seaton Mountain Electric Light, Heat & Power Co. and the manager of the same.

The Bertha Mining & Milling Co., under the management of M. W. Tanner, is being extensively developed.

The Seaton Mining & Milling Co. has one of the most extensively developed and thoroughly equipped properties on Seaton mountain. This part of the Idaho Springs mining district has been consecutively prospected, mined and developed for a period covering fifty years of uninterrupted work. The Seaton mine is now over 900 feet deep and work is progressing day and night. In the development of this property over 1000 tons per month are being extracted, no stoping being done in the extraction of this quantity of ore. When the present extensive work, as now outlined by F. S. Goldsmith, the manager of the property, is completed, it promises to be one of the heaviest producers of the camp. The mine is electrically equipped throughout and affords a good example of modern mining methods.

The Shafter mine, under the management of Mr. Roller, the Con. Franklin mine, under the management of Mr. Bane, the Joe Reynolds and the Tropic mines, owned, operated and managed by R. B. Morton, also come under the head of successful mining institutions.

The Lamartine mine, managed by Lafe Hanchett, is a continuous producer of high-grade ore in large and continuous quantities, with a crosscut tunnel, developed under an expense of more than half a million dollars. Mr. Hanchett is also the manager of the Newhouse tunnel enterprise.

The Freeland Extension mine, a close neighbor of the Lamartine property, under the supervision of W. A. Haggott, also comes under the head of our successful mining propositions.

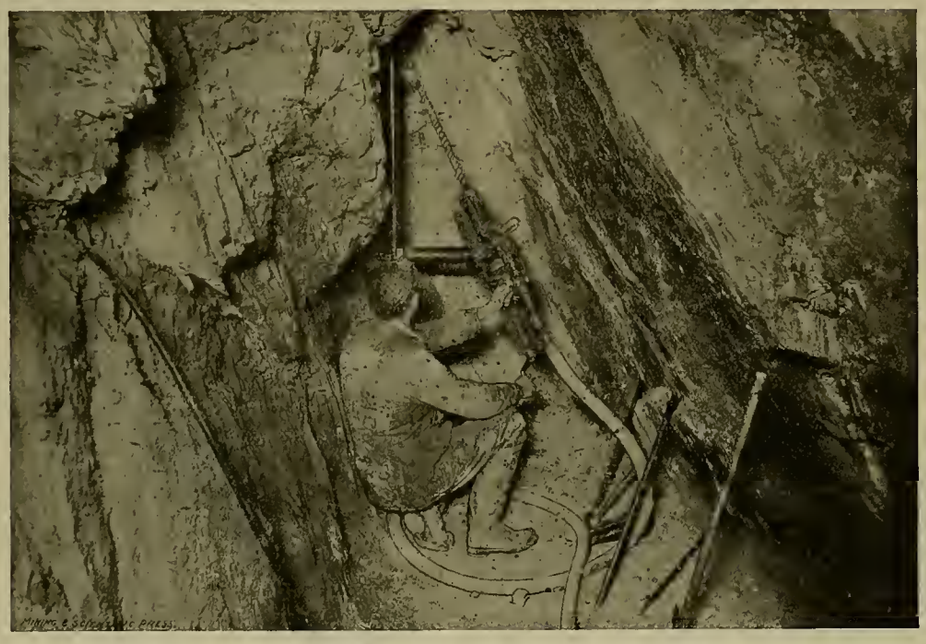
To mine in Clear Creek county means to produce ore, with our modern, up-to-date mills and with the constant improvement in the various methods of wet concentration. The accessibility of this district, being thoroughly equipped from a milling standpoint, within easy reach of a large city, with supply houses whose volume of business enables them to handle and sell their material at a low margin of profit, gives the miner and mine operator of Clear Creek county advantages not always within the reach of ordinary mining communities.

The Jackson, Newton, Silver Age Mills Nos. 1 and 2, the Mixsell and Allen mills, the combined concentrating and cyaniding plant of the American Gold Mining & Extraction Co., the Mattie and the Stanley mills are congested at all times with more ore than they can handle, showing without douht that, even with our enormous mining facilities, we are behind the ore production of the camp in point of milling capacity.

The ores of this district are auriferous and argentiferous galenas, the average value of the smelting product being about $50 per ton. On account of the high percentage of lead that these ores contain, the smelting charge is minimum, making a marketahle product the smelters must necessarily have. The ores of the camp carry from 5% to 15% copper and in most instances the gold values exceed the value of the silver. The veins of the district are fissures in granite.

COLORADO.

Idaho Springs, May 29.



Compressed Air Drill in Stope Sun and Moon Mine, Seaton Mountain, Idaho Springs, Colo.

THE electric furnace is, as a rule, only of commercial value in carrying out processes or producing results that can not be obtained in any other way. The enormous consumption and cost of horse power required for chemical work and the consumption of carbon electrodes are items of serious expense. There are, however, a number of instances in which it is of advantage to introduce the electric furnace to replace the ordinary means of bringing about chemical reactions that take place at high temperatures, since it not only shortens the time required for the reactions, and thus increases the yield for a given time, but the reactions in many cases take place much more completely. It also offers the additional advantage of placing the heat at the point required. The substitution of the electric furnace for the ordinary means of bringing about heat reactions is, as a rule, merely a problem of economic engineering.

IN a test of a new gasoline oil pumping plant at Austin, Texas, the contents of two full loaded oil cars were forced through the pipe from the railroad tracks to the asylum, 6700 feet, in two hours. Ten gallons of gasoline, costing $1.35, were used. Each car contained 3200 gallons. The building is on a hill, which made the work more difficult. One gallon of gasoline, costing 13½ cents, was used in moving 540 gallons (16 barrels) of oil more than 1¼ mile up hill. In addition, there was a saving as compared with the former system of drayage and a more expeditious and satisfactory handling of the oil.

Prehistoric Gold Mining.

Some glimpses of mining when the world was young are afforded by reports of ancient gold mining in Mashonaland, Matabeleland and Maricaland, British South Africa, where 330 miles of reefs lately located cover prehistoric workings. These workings are generally several hundred yards in extent and continuous on the surface. The depth attained rarely exceeds 100 feet, averaging 30 feet. When and by whom these ancient workings were made is a matter of uncertainty. That an enormous amount of gold has been obtained from these workings in the past is unquestionable. Millions of dollars worth of gold were derived from these sources. The methods of mining and the reduction of the ores were, of course, crude. Various theories have been advanced as to the causes of the discontinuance of mining upon the ancient workings. It has been asserted that the veins pinched out in depth, and were in consequence abandoned by the ancients. It is undouhtedly true that in some instances the veins did pinch, and that the ancients, like some of the moderns, ignorant of the fact that such pinching was but temporary in occurrence, abandoned the workings. The tendency to pinch and to open out is a characteristic feature of fissure veins. The fact that levels have been recently driven upon many of the veins below the ancient workings was due to the fact that the veins pinched out in depth. Irrespective of the geological evidence upon this point, controverting the theory of the pinching out of the veins in depth, is the demonstration of the continuance of the veins below the ancient workings. Though the theory of impoverishment in depth explains the abandonment of some of the workings, it has only a limited application. It is probable in many instances the ancients encountered in their exploitations poor zones, and, in consequence, abandoned the veins. The occurrence of poor zones is a characteristic feature of gold mining, and it is not unlikely that had the explorations been sufficiently extended richer zones would have been again encountered. The cessation of mining operations was doubtless ascribable to the incapacity of the miners to cope with the difficulties attending deep mining—increased hardness of the rock, influx of water, inadequate methods of timbering and retaining the ground, refractory condition of the ore and lack of metallurgical knowledge. Any one or all of these conditions might have obtained with the result that deeper mining would have been rendered impossible under the primitive methods in vogue. It is not improbable that these reefs have in most cases been worked at different periods.

Publications on Ore Deposits in Colorado.

The United States Geological Survey has recently published the following reports upon mining districts in Colorado: (1) A Report on the Economic Geology of the Silverton Quadrangle, Colorado. By F. L. Ransome. Bulletin No. 182. 258 pp., xvi plates and 23 text figures. The bulletin describes an area of about 250 square miles in the San Juan mountains, with particular reference to the geological relationships of the ore bodies, including those of the Camp Bird, Tomboy, Yankee Girl, Guston, Gold King, Silver Lake and Iowa mines. The ore deposits, which embrace lead, silver-lead, silver-copper and free-gold ores, are fully described and classified and their origins discussed. Special attention is given to variations in the ores with depth and to the causes of these changes. The memoir contains a chapter on the general geology by Mr. Whitman Cross. (2) The Ore Deposits of the Rico Mountains, Colorado. By F. L. Ransome. Extract from the Twenty-second Annual Report of the Survey, Part II, pp. 229–397, plates xxvi–xli (including map in pocket), text figures 39–71. This report contains full descriptions of the remarkable lode and blanket deposits of silver ores worked in the Enterprise and other well-known mines near Rico. The geological relations of these deposits are treated with abundant illustrations, the origin of the ores is discussed and the future of the district is considered. The above memoirs are obtainable on application until the supply is exhausted. All communications should be addressed to The Director, United States Geological Survey, Washington, D. C.

THE latest large California electric company is the Feather River Power Co., which has bought the property of the Big Bend Tunnel Co., on the Feather river. The idea is to dispense with the ordinary flumes, ditches, etc., and depend solely on the volume of water from the tunnel to generate power. The intention is to supply power to San Francisco. C. W. Howard is president and F. McLaughlin manager. They propose to spend $2,000,000 and have the works in operation in less than two years.

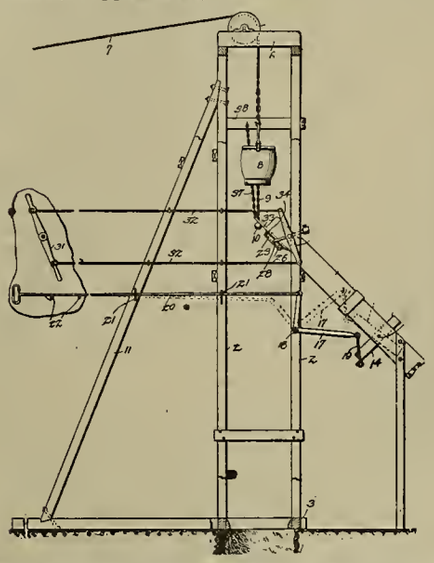
AT the annual dinner of the old students of the Royal School of Mines, London, Chairman McNeill stated: "Hennen Jennings told us that the figure of the total production of the Transvaal to date was some £80,000,000; but he estimated that the cyanide process had been responsible for 90% of the profits, and without that process very few of the Transvaal mines indeed could possibly have been made to pay."

Mining and Metallurgical Patents.

Patents Issued May 27, 1902.

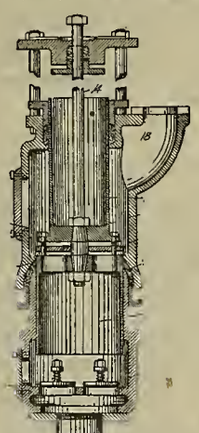
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ORE BUCKET, DUMPER AND CHUTE.—No. 700,741; L. Collier, Cripple Creek, Colo.



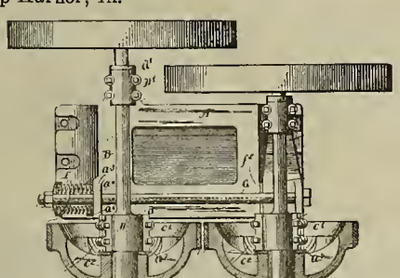
Tilting bucket raised, lowered therehy, chute, dump section pivotally mounted at upper end of chute, dump section and bucket having coacting means to tilt latter, dump contents into chute, rock shaft having crank connected to dump section, weighted arm to normally turn dump section out of path of bucket, means connecting dump section to fixed point, to limit play of dump section.

PUMP.—No. 700,936; A. E. Johnson, Victor, Colo.



Combination of cylinder composed of two overlapping. parts shaped to form cavity, inner portion curved communicates with cylinder chamber, outer extremity exposed, packing gland adapted to enter cavity hetween cylinder parts, plunger stem, hollow lower plunger connected with stem, plunger provided at upper extremity with valve seat having openings separated by ribs, closed upper plunger connected with valve stem, holts attached to upper plunger forming valve stems independent of plunger stem, valve composed of sections slidable vertically on stems, dividing lines hetween valve parts arranged to coincide with ribs of valve seat, to prevent leakage when valve is seated, upper part of cylinder provided with opening to permit access to mechanism for purpose of repairs, door detachahly connected with cylinder for closing opening.

ORE CRUSHER.—No. 701,001; R. H. Aiken, Winthrop Harhor, Ill.

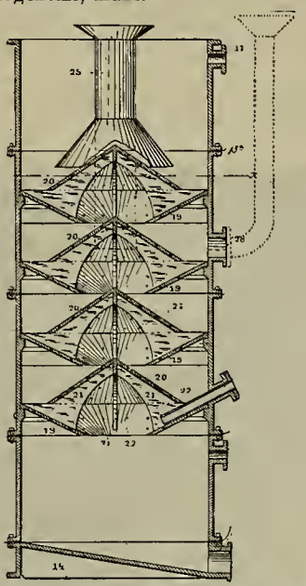


Ore crusher, comprising main frame, dished or recessed crushing rolls, shafts to which rolls are attached, hearing for one shaft mounted on main frame, hearing for other shaft movahle upon frame, means for yieldingly holding shafts and rolls in working relation to each other, working faces of rolls in alignment with hearings of shafts.

ORE CHUTE AND TRAP DOOR.—No. 700,789; J. A. Lindall and N. Mattson, Two Harbors, Minn.

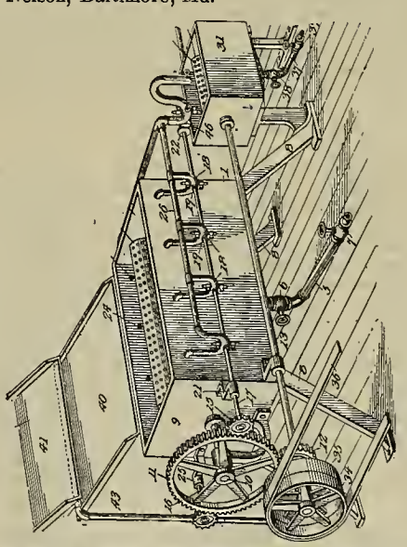
Regulating flow of ore or materials in transporting from one receptacle to another, combination two rods extending from top of pocket to lower end there secured, suitahle trap doors secured on rods, doors provided with projections, cog wheels secured on upper end of rods, cog wheels intermeshing, suitahle lever secured on one of rods, suitahle stopper to engage lever, smaller cog wheel intermeshing with one of main cog wheels secured on rods, smaller cog wheel actuated by lever.

APPARATUS FOR LIXIVIATING ORES.—No. 700,972; P. Naef, Argentine, Kans.



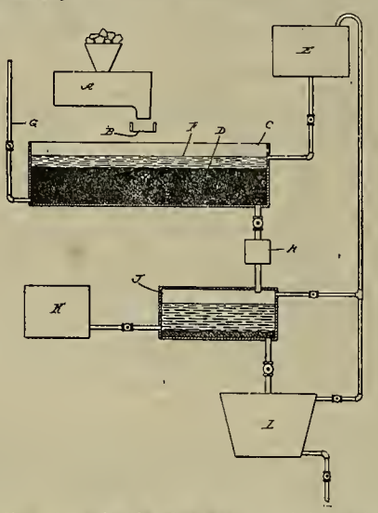
Lixiviating column having series of superimposed inclined surfaces, means for feeding ore at top, withdrawing sludge at hottom, inclined surfaces having numerous perforations to permit upward flow of gas, with inflow for liquor at hottom; its discharge at top, an air or gas injecting device admitting air or gas to column helow; perforated surfaces, wherehy there is down feed of ore over perforated inclined surfaces within leaching solution, and uprising of air or gas through perforations of inclined surfaces, and successive passage of same through layers of ore within leaching solution.

AMALGAMATOR.—No. 701,212; J. S. Marquette and P. J. Nelson, Baltimore, Md.



In an amalgamator combination with tank having converging bottom provided with central discharge opening, pipe communicating with opening provided with two independent valves, revoluhle main shaft extending through tank, perforated agitator hlades projecting from shaft, series of overflow traps communicating with rear side of tank, another series of overflow traps communicating with front side of tank, shaft extending through each series of traps carrying agitators within traps, means for revolving shafts from main shaft, pipes connecting all traps with discharge trap, inlet and outlet cocks for traps, auxiliary tank provided with agitator and discharge pipe having two independent valves.

PROCESS OF TREATING ORES.—No. 701,134; C. J. Best, Denver, Colo.



Grinding to suitahle fineness, supplying solution, consisting of large proportion of water, small proportion of acid and salt mixture, consisting approximately of two parts common salt, one and one-quarter parts niter, one and one-quarter parts alum, one and one-half parts nitric acid, hoiling whole for proper length of time, filtering solution, precipitating metallic portions by sulphureted hydrogen until sulphide precipitate is formed, heating precipitate with fluxes to drive off vapors, then drawing off metals.

STAMP STEM.—No. 701,077; W. S. McKinney, Chicago, Ill.

Stem for stamps and analogous drop hammers, consisting of two or more sections adapted to he united in extension of each other, each section adapted for connection with hammer or stamp head and adapted at opposite end for engagement with similar stem section, wherehy said stem sections may be interchangeahly arranged.

FUSE IGNITER.—No. 701,203; C. K. Jenkins and H. J. McDonald, South Butte, Mont.

Fuse igniter, comprising shell having upper ends closed, provided with annular groove on inner surface, containing mass of fusible substance, disk of open-work material fitting within groove retaining fusible substance in place, attaching means connecting shell to ends of hunch of fuses, wherehy same are protected and simultaneously ignited.

SAFETY DEVICE FOR BLASTING PURPOSES.—No. 701,173; J. M. Doyle, Denver, Colo.

Combination with a cap and fuse, wire fastened to cap end of fuse, fastening or knot in wire inside the cap when latter is applied to fuse end, wire carried along fuse endwise and connected therewith, tuhular sheath through which fuse and wire may he passed, permitting removal of reinforced fuse and cap after hole has heen filled and tamped.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

W. Meredith, of San Francisco, is in chargo of construction of the plant of the Vancouver Power Co., to cost $1,000,000 and to provide electric power and light. It is projected to cut a tunnel 2 miles to connect two lakes and give a water supply which will never fail.

The steamer Centennial, en route to Nome, has on board a submarine plow—an ordinary open sluice box mounted on wheels and bottomed with long iron riffles. The box, wheels and riffles are all of iron and weigh about two tons. The machine is operated from the shore by means of endless ropes passing through pulleys set in anchors far out at sea, from 1 to 2 miles distant, and a powerful steam engine on the beach, by which the box or plow is dragged along the bottom of the sea. When in operation it moves at the rate of 7 or 8 miles an hour, thus creating in the box a moving current of water that washes the dirt or sand through the box as fast as plowed or scraped up.

COPPER RIVER DISTRICT.

R. Biel has given an option on his Copper river mines for $500,000, and has offered thirty-five claims on Latouche island, Prince William sound, for $600,000 to same parties. Experts will leave on the next steamer to examine the two groups. The copper river claims number ten and are near the junction of the Copper and Kotsena rivers, 160 miles from the coast. They adjoin the Big Bonanza group, owned by the parties who have taken the option on the Biel ground. The claims contain copper and are on the line of the proposed Valdez-Eagle railway.

SKAGUAY.

The steamer Amur reports navigation through Lake Leharge started and all the Yukon clear.

ARIZONA.

COCHISE COUNTY.

The electric light plant at the big shaft of the Tombstone Con. Mines Co. is in operation.

The Bunker Hill M. Co., of Tombstone, will work their properties.

COCONINO COUNTY.

The Coconino M. Co., at Ryan, has installed a leaching plant and has it in successful operation. The success of this manner of handling the ores of the limesandstone belt is important.

GILA COUNTY.

At the Black Warrior, near Globe, 100 tons of ore are treated daily; the company has fifty tons of copper bullion on hand. Mr. Benson is general manager.

The Verde Smelting, Developing & Ore Purchasing Co. has been incorporated, and is the successor of the Grand Prize Co., which operated in Tonto basin. It has acquired all the interests of the Grand Prize Co. in twenty claims in Tonto basin. The property has development work aggregating 4500 feet; has a 90-ton smelter, hoist, buildings, pumps, etc. The smelter will be in operation July 1.

GRAHAM COUNTY.

At the Lone Star the strike of gold is reported to be principally copper glance.

The Blake & Williams Leaching Co. will enlarge the plant to double its present capacity. The Graham County M. & S. Co. will try to have their ores treated at the leacher. If this fails then a company will be formed to which these mines will be turned over and another leaching plant erected with sufficient capacity to treat all such ore that may he mined in the Lone Star district.

MARICOPA COUNTY.

Another strike of gold is reported in the Oro Grande at Wickenburg on the 200-foot level in the south drift.

PIMA COUNTY.

Tucson is to have a 50-ton smelter by Oct. 1, 1902.

PINAL COUNTY.

The Lobb properties have been sold to Denver parties for $35,000, $1000 cash and eighteen months' bond. These properties are on Queen creek, 3 miles from Silver King. They are a cyaniding proposition.

YAVAPAI COUNTY.

The Iron Mask mine in Eugene gulch, above Big Bug, has been bonded to J. Canovan.

M. R. Parker has sold the Alto group of seven claims on Eugene gulch to the American M. & D. Co. for $50,000 and 300 shares of stock. The purchase money has been paid. Mr Parker will remain in charge as Supt. Work will begin at once.

E. D. Treadwell has returned to Prescott from the Iron Queen, near Mayer. He has finished surveying the pipe line from Wolf creek to the mine. The water supply will be 10 inches and the fall 1500 feet; the length of pipe will be about 9 miles. Work progresses on the smelter site below Mayer.

Work has again begun in the main shaft of the Brookshire, near Jerome. From the 100-foot level they are taking out ore said to run three ounces to the ton in gold. Several tons of this rock are sacked for shipment.

YUMA COUNTY.

L. F. Bradshaw of Quartzsite has sold the Valenzuela to St. Louis and Chicago people, who will erect hoisting machinery and a 100-ton smelter. The ore runs 14% copper, with some gold and silver. He is about to close a deal with St. Louis parties for the Lena D at a good price. The sale lacks only the consent of Mrs. Bradshaw, who owns a half interest. This will very likely be arranged as soon as Mr. Bradshaw returns.

F. Meyers has received the first payment on the Eureka, which is sold for $20,000.

G. U. Ingersoll will sink 500 feet on the Guadalupe.

At Harrisburg men are working on the Harqua Hala mine. Eastern men have taken hold of the property.

In the Mountain Chief group in the Harqua Halas water has been found at a depth of 100 feet in the shaft on the North Star claim. At the 100-foot level 3 feet of copper gold ore shows in the shaft. The ore runs well in gold and carries more than usual copper values in glance and malachite. The shaft will be sunk 200 feet.

CALIFORNIA.

Could all the water be conserved, the snowfall of the past winter in California would guarantee a plentiful water supply through the coming summer. The depth of snow on the western slope of the Sierras has been, if not less, at least no greater than the fall during the winter of 1900 1901. But more than two-thirds of this fell after the close of January. It has generally obtained that the late-falling snow has most rapidly melted, especially when it has fallen on bare ground, with no old snow to rest upon, as was the case this winter. There being no storage capacity in the rocky surface, the snows now covering the ground to a depth of 5 feet or more would, under usual conditions, melt and the water have found its way to the coast probably two weeks earlier in June than last year. Such conditions would point to a shortage in the water supply the coming summer, but they may be offset by the low temperatures which have prevailed during part of April and May, which would delay the melting, prolong the life of the snow and extend the duration of the water supply.

AMADOR COUNTY.

On the Ballard & Martin ground, near Plymouth, Hayward & Lane have men prospecting. It is said they will put in an electric plant on the Cosumnes river, where a fall of 500 feet can he obtained. W. J. Smart, Plymouth, is Supt.

In the Plymouth Rock at Amador City the tunnel is in 520 feet. This will cut the main lead in 190 feet.

The Shenandoah shaft is down 600 feet.

The Bay State ore shoots have been cut at the 700 and 800-foot levels. Milling has begun.

C. H. Shields intends installing a 5-stamp mill on his mine south of Plymouth.——At the Argonaut the shaft is down 2200 feet and sinking continues; it may be put down to the 2400-foot level.——The Hercules quartz mine at Plymouth, recently bought by C. H. Shields and G. Noe of Plymouth, is being developed.

The 10-stamp mill at the George Upton mine, near Plymouth, will soon he in operation. Drifting and opening up the stopes continue.

At the Montezuma mine, at Nashville, many additions have been made to the pay roll. Rock is being mined that averages $7 per ton in the 6-foot vein.

A station pump has been installed at the 1250-foot level in the Oneida which throws 200 gallons a minute.

A streak of rich ore is reported at the Amador-Phœnix mine at the 100-foot level in the drift east.

C. H. Shields will put a 5-stamp mill on his mine near Plymouth.

The Moore mine, near Jackson, will be sold at public auction on the 18th inst.

The Argonaut shaft is 2230 feet deep.

The new mill on the Fremont and Gover ground will soon be started.

BUTTE COUNTY.

Near Nimshew the Bay Counties Power Co. will build a dam, which will be the head of the pipe line to the new power plant to he built on Butte creek. Sixty men are working under the direction of E. W. Slater. The dam will be 40 feet high, a reservoir for water from the Cherokee ditch. Pipe lines will carry the water to Butte creek, a vertical fall of 1600 feet, and a power plant built, capacity 1200 H. P., located above the point where the water now used by the company at the Centerville plant is diverted from Butte creek. Sixty men under U. W. Hupp are enlarging an old ditch that water may he taken from the Cherokee ditch to Centerville. It will take two years to build the dam and install the new plant.

At Garden Ranch, 3 miles southeast of Oroville, eighty acres has been leased to R. S. Grant. An hydraulic elevator will he built. Pipe is being hauled from Cherokee.

CALAVERAS COUNTY.

Work has begun on the Ohio mine at Albany Flat, sinking a two-compartment shaft. M. C. Meeker of Angels is the owner.

At Jenny Lind two companies are prospecting, one operating in the bed of the Calaveras river, the other on the upland. The prospectors in the bed of the channel have a portable steam drilling apparatus. Holes are drilled 40 feet deep to bedrock, the earth removed is run through a rocker to note the quantity of gold therein.

EL DORADO COUNTY.

Work at the Mammoth Bar mine, above Georgetown, will he resumed next month. H. W. Davis is Supt.

The 15-stamp mill at the Boulder mine on Webber creek has been started.

Unwatering the Union mine, near Diamond Spring, has begun and will be finished July 15.

At the Montezuma mine at Nashville a ledge has been struck at the 300-foot level. About 3 inches of the streak runs $64 to the ton. The vein is 4 feet wide of average milling rock.

The tunnel at the Golconda, near Rescue, is being driven and is now in 400 feet. This property is being developed by the Golden Gate M. Co. of Bridgeport, Conn.

The unwatering of the Crown Point, near Diamond Springs, by Lane & Hayward, is completed.

The new map of El Dorado county mines is completed; proofs have been submitted to the State Mining Bureau, for which the map was made.

At the Pyramid mine, near Green Valley, the mill has started; much ore has been taken out, sufficient to insure a steady supply for several months of good milling grade.

The 15-stamp mill at the Boulder mine, on Webber creek, is in operation.

A tract near Green Valley belonging to S. F. Dormody has been bonded to Sacramento parties, who will erect dredging machinery to work the ground.

The new air compressor for the Eureka slate quarry at Kelsey is in place.

Work on the tunnel at the Golconda mine, near Rescue, is going ahead day and night. The tunnel is in 400 feet. The property is being developed by the Golden Gate M. Co.

The James-Beckman M. Co. will build a 5-stamp mill for the Patton mine, near Placerville.

INYO COUNTY.

The Inyo Gold Co. has been incorporated in Los Angeles. The company owns seven claims in Tuher canyon in the Panamint mountains, 8 miles from Ballarat. The principal claim of the group is the O Be Joyful, on which 1400 feet of work has been done.

At the Mineral Ranch group a 5-stamp mill is running. L. H. Mitchell of Los Angeles is general manager.

At the Ratcliff mine, near Ballarat, fifty men are employed at the mine, mill and cyanide plant. Twenty stamps are running and the cyanide plant is in operation.

The Havilah M. Co. of Los Angeles has bought six claims in the Ballarat district. Eight men are employed. A 10-stamp mill will he built.

R. H. Van Camp of Los Angeles represents a company which owns property at Anvil Springs, Ballarat district. Within two months a 10-stamp mill and smelter will be erected.

KERN COUNTY.

The Standard Co.'s pipe line is laid from Bakersfield to the Kern county line. Several hundred men are pushing work toward San Francisco. The pipe is strung out all through Kings county. The line will he finished September 1.

The Producers' M. Co., organized by G. Brown, is opening up the old Sam Blade mine at the western foot of Mt. Breckenridge, near Mojave. The two varieties of ore compel the installing of a stamp mill and a cyanide plant.

A 2-foot vein has been opened in the Minnehaha mine which pans $20 to $25 per ton at 200 feet from the surface.

The Butte Lode Co. during May treated ninety-five tons, which milled $65 to the ton, yielding $6200. For this year up to May 31 the production has been $30,500, against $27.500 the first five months of last year. In the past two years the mine has produced $120,000, to which add 520 tons of tailings at the Red Dog mill at $8 per ton. P. H. McMahon of Johannesburg is Supt.

G. W. Lloyd has a lease on the Nancy Hanks mine, near Stringer. Teams are hauling the ore to the Val Verde mill.

Baney & Van Meter are developing the Pearl Wedge mine in the Stringer district, and are drifting in ore at a depth of 100 feet. On the arrival of the air compressor they will begin sinking.

The Chicago Guarantee Oil Co., leasing on 18, 11-23, from Jewett & Blodgett, is about to drill the deepest well in Kern county. The company is now down 1580 feet with No. 2, and has long since passed through the known oil strata, no oil having been discovered beyond 1100 feet. It is believed that underlying the Sunset district is a stratum of green oil, and it is this that the Chicago Guarantee is after. At 1200 feet a considerable flow of water was encountered, but it is thought this will be shut off without difficulty. At 1580 feet the casing is 7⅝, but it is proposed to put in 6-inch pipe. With the water shut off, the company intends to go 3000 feet, if necessary, to test its theory. In the event of nothing being developed at the greater depth the well will be plugged at 1100 feet, and with the oil sand that has been penetrated at that depth will become a fair producer.

MARIPOSA COUNTY.

(Special Correspondence).—The Mariposa Commercial & M. Co. have completed the electric power plant at Mariposa. The current is brought from the station on the Merced river to the transformer house at the mine under a pressure of 15,000 volts; this is reduced to 440 volts, the strength of the distributed current, which drives one motor at the mine and one at the mill, which has been running since May 27th. An extra compressor has been put in at the mine and run by an electric motor. Lights will be put in both mine and drill. The hoist is run by compressed air.

Mariposa, May 31.

MONO COUNTY.

At the Standard Con. mine at Bodie, for the week ending May 24th, the mill crushed 431 tons of ore. Average assay vanner tailings, $5.63. Concentrates produced 1.38 ton; assay value, $109.04. Amalgam produced, 1461 ounces; assay value, $2.23 per ounce.

NEVADA COUNTY.

The W. Y. O. D., the Gold Hill and the Coe mines are considering the use of oil for fuel.

At the Pine Hill mine, in the Lime Kiln district, work is going on under Supt. Rosenthal, consisting of concrete foundations for new machinery and setting two boilers.

Development work is going on at the Mars Con. at Italian Bar. There are two tunnels, one 300 feet, in which good milling ore has been struck.

The new air compressor and pumps at the Gold Tunnel mine, near Nevada City, are in successful operation.

F. Duhois has bought the Manhattan and other claims on the Baldwin ranch and will buy machinery to work the claims.

In New York, on May 16, sales of 1000 shares of Brunswick Con. (Grass Valley) mining stock were made at 12 cents per share.

At the Allison Ranch mine work is begun on the 20-stamp mill by W. C. D. Body. R. Robinson is Supt.

In the Independence mine at Wolf Creek ore has been found which shows free gold. The 8-stamp mill is running. A new hoist is being put in. C. M. Root of Wolf Creek is Supt.

The Menlo G. M. Co. has sued J. M. Lakenan for $30,000. He was president of the company. The Menlo M. Co. is incorporated with 150,000 shares. Part of this capital stock was given in exchange for the Homeward Bound mine by the president. The Homeward Bound mine was sold for the company for $33,000. This amount was divided among the stockholders, J. M. Lakenan receiving $13,500 as his share. It is now alleged that as this was a part of the capital stock and not profits, the distribution of the $33,000 was illegal.

The Coe mine of Grass Valley, which shut down some months ago, owing considerable money to miners, has liquidated all its indebtedness.

A. J. McCone has a contract for a 50-stamp mill at Allison Ranch mine, near Grass Valley.

Work was resumed at the Golden Gate

mine, June 2 under the direction of Supt. G. R. Tuttle.

The Spanish mine has closed indefinitely.

PLACER COUNTY.

At the Three Stars eighty-five tons is being crushed a day, and much rock is being stored for the smelter.

The Gold Blossom will begin operations soon.

The Baltimore & Hope mine at Forest Hill has been bonded to J. R. Westhall.

The Hancock & Watson mine at Bath has been bonded to G. D. Emery of Boston.

The Haskell & Gaylord claim, near Auburn, is being worked by E. C. Gaylord, who is locally credited with intention to build a mill.

G. Knutsen has bonded the Sacramento gravel mine at Forest Hill and development has begun.

The Black Canyon quartz mine, above Westville, will install a 20-stamp mill. G. Strong is Supt.

SAN BERNARDINO COUNTY.

A strike of gold is reported in the Snowball mining district by John Burke and two companions.

At Camp Rochester, near Bagdad, where the Bagdad mines are, the survey of the railroad is completed. At the mines 150 tons of ore are taken out daily in developing. Twenty-five tons are sent to the mill at Barstow.

Los Angeles parties have secured twenty-one claims in the Black Buttes district, 40 miles northwest of Manvel. Ore from this district is said to run from $100 to $500 in gold per ton.

SAN DIEGO COUNTY.

(Special Correspondence).—The lepidolite mines here are sold to the People's Mutual M. Co. for $50,000. The mineral carries 20% lithia and 40% phosphorus. The purchasers project a chemical works here to make lithia and fertilizer.

Pala, May 29.

SHASTA COUNTY.

The De Lamar smelter has run twelve months without interruption. The average amount of ore treated monthly has been 5000 tons, the monthly product being 500 tons of bessemerized copper. This is shipped via Galveston and the Gulf of Mexico to De Lamar's New Jersey copper refinery. The gold and silver in the copper in the Bully Hill mine and in the ingots are supposed to equal the copper in value.

The Detroit & California M. Co. will dredge the Wynne placer ground on Clear creek, near Horsetown.

Redding reports that the iron deposits on the Pit river, 30 miles northeast of that point, are to be developed this summer by St. Louis, Mo., men.

A 10-stamp mill will be erected on the Fairview mine, near Redding; J. Porter is Supt.

The Great Western G. Co. is erecting a 100-ton smelter near Copley.

The Bully Hill M. Co. owns the Winthrop mine at Copper City, 2 miles from the Bully Hill mine. For several months shafts have been going down at intervals and crosscuts made. The ledge in the Bully Hill mine carries copper; 100 men are at work in the mine.

The Oro Fino mine, on Clear creek, is sold to a company of Santa Rosa men for $12,500—$2500 to be paid cash. The first ore will be shipped to the smelter. If the returns are satisfactory, a large plant will be built.

On Sardine creek, near Gold Hill, G. W. Lane has bonded his claim to Montana men for $10,000.

SIERRA COUNTY.

At the Lecompton mine, near Downieville, the lessees are working in high-grade ore, ten tons of which shipped to the Selby Co. returned $340 per ton. The shaft is 370 feet deep.

R. Phelan of Sierra City has miners working a gravel claim 3 miles from Milton Dam, on the Middle Yuba river. He is reported to have sold the claim to Zellerbach & Sons of San Francisco for $6000.

At Alleghany the Balsam M. &. M. Co. have been developing their property. The tunnel is in 200 feet, an upraise driven 86 feet. The tunnel is in gravel 4 feet deep, which pans well. J. W. Morrell, Alleghany, is Supt.

SISKIYOU COUNTY.

The Journal says that at Oro Fino, Muggins ville, Patterson creek, Quartz valley and other diggings in the Scott valley there is abundance of water for the giants and hydraulic elevators in washing the pay gravel on an extensive scale, and the quartz mills are running day and night.

The Ironside mine, on Cherry creek, is shipping ore.

At the McKinley mine, on Deadwood, work in the tunnel is going on; the ledge is 2 feet wide and shows free gold. The quartz is ribbon rock in character, and the ledge is widening as the tunnel work progresses.——The Deadwood hydraulic mine is running night and day with plenty of water.——Ground sluicing on Spring gulch, a small tributary of Deadwood, has been carried on, and recently there was picked up a $65 nugget.

At Dutch creek, Virginia Bar district, paying quartz is found in the mine of Kelly & Co., who are putting in improvements at mill for crushing.

TRINITY COUNTY.

At the Gold Dollar hydraulic mine, Canon creek, 6 miles above Junction City, from a partial cleanup made after a 200-hour run, with an 11-inch pipe and a 4-inch nozzle under 250-foot pressure, 125 ounces of unquicksilvered gold was obtained. The gold assays $18 47 to the ounce. The gold is mostly coarse, pieces worth $23 being in the lot mentioned.

TUOLUMNE COUNTY.

At the Old Soulsby mine sinking has been resumed in the shaft at a depth of 220 feet. New pumps have been installed, capable of handling all the water.

The Draper mine at Soulsbyville has started up again.

The Sisty Leasing Co. will put in a cyanide plant at the Soulsby mine, Soulsbyville.

It is stated that Ballard & Martin will reopen the New Albany mine at Carters.

J. Oldman, near Crimea House, has an asbestos mine on his ranch The ledge is 1 foot wide and is down 14 feet.

The Mansfield claims, near Jamestown, have been bonded. It is intended to hydraulic some old sinks, which, if profitable, will determine extensive operations.

The Ripperdan quartz mine, near Jamestown, has been bonded to D. J. Lindsay.

At Sebastopol Hill a hydraulic system has been installed and hydraulicking begun.

Hydraulic operations have begun on the Peterson, near Jamestown. This property has produced over $100,000 to date.

All of the stamp mills on the mother lode which are operated by power from the plant of the Tuolumne County Electric Co. have been compelled to shut down owing to a break in the pipe line which supplies the water for the power machinery. This includes the majority of the big gold producers in the county. While the crushing of ore has been stopped, most of the mines are still being worked, as the majority of them have steam power to operate their hoists in case of such accidents, and the miners will continue to take out ore.

Felix Chappelet Jr. has bought the La Preciasa claim.

YUBA COUNTY.

Three Keystone drills are at work on the O'Brien land, near the Yuba river.

COLORADO.

BOULDER COUNTY.

W. E. Alexander of Denver, manager Copper Ranch M. & M. Co., is operating the Kate property and will put in a matte smelter.

C. L. Tripp of the Clara Bell M. & R. Co. of Boulder will put in $30,000 worth of mining machinery for the new mines at Allen's park, 30 miles northwest of Boulder, almost at the foot of Long's peak.

CHAFFEE COUNTY.

At Turret the Vivandiere has a shaft 540 feet deep. At the 500-foot level several hundred feet of drifting has been done, extending in both directions from the shaft, and each drift has opened a body of shipping ore.

CLEAR CREEK COUNTY.

Georgetown reports a strike in the Santiago mine, in the Argentine district, indicating the existence of a continuous ore body 800 feet in length and 3 to 5 feet in width, which will average $100 per ton. The new opening was made in the third level and samples from it assayed ninety ounces silver, three ounces gold and 13% copper. The property is owned by William Rogers.

Lawson mining men want a mill in that district.

At Empire the Waylusing mine has been leased and bonded to Cutting & Co., an association of working miners, who will develop the property on practical lines.

Emerson & Hammack have bought an interest in the Atlantic mill at Empire. The new owners are putting in a turbine wheel.

FREMONT COUNTY.

Low-grade ore has been opened at a depth of 200 feet in the Valley mine, south of Florence.

Florence reports that Secretary Whitney of the Rocky Mountain S. Co. states that E. J. Seeley of Denver and associates has made an offer to lease the smelter for ten years.

GILPIN COUNTY.

During the third week of May the ore shipments and tailings from the Black Hawk depot to the Denver and Golden smelters, and to the concentrators at Idaho Springs, amounted to 97 cars or 1795 tons; total shipments for the first three weeks were 330 cars or 6155 tons.

LA PLATA COUNTY.

Coal miners on a strike at Durango have refused $3 per day of eight hours.

LAKE COUNTY.

J. D. Bartlett, Supt. Twin Lakes G. M. Co., reports on Mount Elbert, at timber line, they have a tunnel 2300 feet cutting a vein that assays silver and gold. The vein lies against a porphyry dike, the streak varies from 1 to 3½ feet. The lower grades are free milling, but the better material is a smelting ore. Along the porphyry dike the tunnel has followed the mineral streak 200 feet. Two upraises have been made 50 feet apart and carried up for 55 feet.

At Leadville the A. M. W. combination employs 200 men and daily ships 350 tons. The Wolftone ships 250 tons daily of crude sulphides; a hundred tons daily of crude material for the mill goes through the Adams shaft.

The output for the month of May for Leadville will foot up 75,000 tons of all classes of ore, an increase over the record for April.

OURAY COUNTY.

The report on the Camp Bird mine, at Ouray, is dated April 26 and was presented in London to the men who bought the property from T. F. Walsh, the owner. The Camp Bird mine is 11,300 feet above sea level, 8 miles from the town of Ouray, the terminus of one of the branches of the Denver & Rio Grande railway system. The 60-stamp mill, cyanide and other plants are 2 miles from the mine, connected by an aerial tramway, by which ore is transported to the mill, and the mining supplies carried from the mill to the mine. The mine has produced to January, 1902, 127,700 tons, having a gross value (recovered) of $4,536,885. The profits during this period were $2,994,778, of which about $650,000 were expended in the erection of the plant and in the purchase of mining ground, etc., the balance having been paid to the owner, T. F. Walsh, as dividends. The ore is gold-bearing quartz, which thus far has yielded an average value of $34 75 per ton of ore treated. About $1 of this value has been derived from the lead and silver contents of the ore. The ore occurs in a complex of fissure veins, having an easterly and westerly general strike, with a steep southerly dip. These veins vary in width from 3 to 15 feet, traced for miles through the country penetrating all the geological formations from the overlying rhyolite, and continuing into the lowest visible geological horizons, i. e., the sedimentaries. The most favorable of the geographical series seems to be the andesitic breccia, which has a thickness of about 3000 feet. It is in this formation that the developments of the mine have been made, and in which the present ore reserves occur. While developments have not been carried on with the view of opening up ore reserves, it is conservative to state that there is practically in sight ore having a gross value of about $5,000,000, and a net value of about $2,400,000. This includes the ore broken and left in the stopes. The result of past workings and the estimated value of the unworked ground shows that each 100 feet vertically of payable ore bearing ground yields $1,000,000 profit. The mine is in active operation, producing at the rate of about $775,000 profit per annum.

SUMMIT COUNTY.

The French Gulch Co. (formerly the Mecca) is working two Evans elevators. Thirty-five men are employed. The elevators are operated night and day.

At the Oro Grande Co., below Dillon, the Evans hydraulic elevators are in operation.

The Mountain Pride mine has started up its concentrating mill.

At Dillon Mgr. Harris has the Oro Grande Placer Co.'s mine in full operation.

Burkley & Crofford, of Denver, are figuring on a concentrator at Montezuma.

The smelter at Robinson is in operation.

TELLER COUNTY.

For drainage of Cripple Creek district one project is to drain the mines by a long tunnel with laterals to all the big mines, the other to sink two or more deep shafts in different sections, to be equipped with powerful pumping plants. The tunnel scheme adherents claim that all that would be asked would be an agreement to pay a certain fixed rate for drainage as soon as the tunnel could be put in operation, or its equivalent in mining concession. The shaft proposition would require immediate assessment of the mining corporations. This expense of sinking would undoubtedly have to be borne by the large operators from the start.

W. S. Stratton, in reply to a request for a lease on a block of his now idle property, says that his superintendents have been instructed to branch out gradually, so that in time his entire estate will be under active development. There are nearly 500 miners on Mr. Stratton's pay rolls at the present time.

The May output for Cripple Creek district amounts to $2,033,600; gross tonnage, 56,200 tons; an increase over April of $101,350, and in gross tonnage of 2300 tons. Following are figures given out by mills and smelters:

Mill—	Tons.	Av. Val.	Total.
Union	13,000	$32	$416,000
Dorcas	2,400	31	74,400
Colorado City	7.000	27	189,000
Standard	14,000	25	350,000
Economic	3,700	36	133,200
Arequa	2.100	10	21,000
Smelters	14,000	60	840,000
Total	56,200	$32	2,033,600

The Metallic Tunnel Co., which is running a tunnel into Copper mountain, is locally credited with intent to erect a $60,000 mill. A vein 41 feet wide has been discovered.

In the annual report of the Last Dollar G. M. Co. Supt. Walden reports that the total amount of development during the year was 4570 feet; 120,884 cubic feet of stoping was done. The company produced 9196 tons during the year, carrying 13,674.10 ounces of gold; the lessees produced 135 tons, carrying 304 ounces. The mine has produced to date $891,479 86

The Mt. Rosa M., M. & Land Co. has transferred survey No. 7407, 15,434 acres, to the Mt. Rosa M. Co. for $77,500.

Development on the Granite mine on Battle mountain is progressing with sixty men. The company ships daily 45 tons ore to Colorado City smelters.

The federal Government will next year make a re-survey of Cripple Creek district.

On the Colorado Boss of the Cripple Creek Con. fifty tons of two-ounce ore is ready for shipment. The ore is obtained at the depth of 100 feet, where an ore shoot 6 to 7 feet in width is found.

In the Accident claim, on Gold hill, good ore was recently cut in the extension of the Pointer vein. An electric hoist will be installed.

The Cripple Creek M. Co., operating the Hull City placer, has completed its new ore house and washer and will have it in operation next month.

In the Trachyte, on Bull hill, a six-drill air compressor is installed. The shaft is being sunk and regular shipments are made from the lease.

IDAHO.

BLAINE COUNTY.

A 600-ton smelter is being erected at Mackay, in Lava Creek district.

J. A. Noggle of Soldier reports active work on the Rosetta M. Co.'s fifteen claims. While development is going on the company will put in a 20-stamp mill.

BOISE COUNTY.

In the Last Chance group at Quartzburg the vein has been encountered on the 250-foot level and the ores present the characteristics of that being profitably milled from the levels above, which averages $25 per ton. It is understood that the mill will be increased and orders for additional machinery will be placed at once J. W. Burton of Salt Lake City, Utah, is secretary.

LATAH COUNTY.

The Black Lead group of copper claims, near Moscow, has been bonded for $100,000, $5000 to be paid July 1, $20,000 January 1, 1903, and $75,000 one year later. This property is in the Bitter Root mountains.

OWYHEE COUNTY.

G. A. Sonneman is at Boise arranging for work on the South Mountain property.

SHOSHONE COUNTY.

The Bunker Hill extralateral case, involving mining property at Wardner estimated to be worth from $250.000 to $1,000,000, has begun before the Federal Court. The suit is brought by the Bunker Hill & Sullivan M. Co. against the Empire State-Idaho Co., to quite title to the ore body having its apex on the Bunker Hill ground. The case is the result of the uncertainty over title to mineral properties located under the present mining laws, which give extralateral rights. The Bunker Hill was one of the first locations in the camp. It is practically a full

claim, 600x1500 feet in size, and it lies upon the main lode of the camp. The present struggle has arisen on account of the manner in which the claim was staked relative to the ore body. Instead of being parallel along its length with the outcrop of the lode, it lies transversely across it. Thus there is about 700 feet of the ledge within the surface of the claim, but the lode passes through the lines which normally would be the side lines of the claim. The lode does not pass out through the normal end lines of the claim. The question, therefore, hinges on the extent of the extralateral rights, if any, to which the Bunker Hill is entitled. Relying upon decisions of the federal courts, the Bunker Hill claims that its side lines really become its end lines under circumstances such as exist in this case. The Bunker Hill, therefore, claims the right to extend its normal side lines in the same manner as if they were end lines and to exercise its extralateral rights by following the ore body westward on its dip out of the Bunker Hill claim past the normal end line.

The Gold Creek Con. M. Co., operating the Bi-Metallic group northeast of Orofino, is working twenty men and will add thereto as fast as room can be made for them. Nine stamps are running. The ore is free milling and runs $8 per ton gold. The ledge on which work is being done is 30 feet wide. There are 2500 feet of tunnel in the mine. All of the tunneling in the mines is steel tracked. Fifteen more stamps will be added to the plant as soon as the new boiler can be installed. The stamps are 850 pounds each.

KENTUCKY.

PULASKI COUNTY.

A. C. Sine, in sinking a shaft near Preachersville for lead, found zinc ore at 20 feet.

MARYLAND.

MONTGOMERY COUNTY.

(Special Correspondence). — At this place, 16 miles from the national capital, is the Potomac gold mine, owned by A. Russ, who is experimenting on various processes for the reduction of his ore, which goes about $10 per ton. There are three shafts, the deepest 125 feet. The ground adjoining the mill has been worked by panning for years. There have been washed from placer ground near by approximately $100,000.

Potomac, May 27.

MICHIGAN.

The Native Copper Times, in its current issue, says that recent estimates that the Lake copper production this year would show an increase of 50,000,000 pounds are excessive. It believes the gain will not be over 30,000,000 pounds, and perhaps not that.

MONTANA.

DALY COUNTY.

The new Amalgamated plant at Anaconda has been successfully operated since the power was turned on. During the first month of its operation it is reported to have effected a saving of nearly $1 per ton on all ore treated over the old plant. The cost of handling Anaconda ore may be reduced 1¼@½ cent per pound to 9 cents.

FERGUS COUNTY.

The Sweeney sapphire mines at Yogo, near Lewistown, have been sold for $50,000.

The plant of the Kendall G. M. Co., South Moccasin district, beyond Lewistown, is completed and running.

The Abbey Cyanide G. M., M. & D. Co., in the North Moccasin, has opened on the Abbey claim a 30-foot lead of cyaniding ore. Samples taken run $2 50 to $6 gold. A 300-foot shaft will be sunk this summer and a small mill erected.

In the Barnes-King ore has been struck. On the 100 level the drift is in 100 feet. Work in other parts of the mine continues and the mill is running steadily.

GRANITE COUNTY.

The Dorothy M. Co. of Phillipsburg will build a quartz mill this summer.

The new Danielsville district is attracting considerable attention. It is 16 miles from Phillipsburg, close to the line between Granite and Powell counties and near the head of Race Track creek. In the Daniels claim, the Golden Leaf, the ledge is 12 feet wide; the ore is free milling and assays have shown values of $30 to $100 per ton. There are 300 tons of ore on the dump to be shipped as soon as snow disappears. A 20-stamp mill will be erected this summer. Tests made show that 80% of the gold can be saved by amalgamation. T. D Daniels, Danielsville, via Phillipsburg, is in charge.

R. S. Levirdge has secured a lease on the Nonpareil property, near Princeton, and will begin work immediately. The Nonpareil is a silver-lead mine. The ore will be concentrated by hand jigs. The product will be shipped to the smelters.

JEFFERSON COUNTY.

A strike was made in the Gray Eagle mine, 5 miles from Basin, disclosing a body of free-milling ore showing wire gold and native silver.

MADISON COUNTY.

At Norris twenty men are at work in the Revenue mine. Manager Knox reports a strike of rich ore in the lower workings.

The Old Red Bluff mine is being developed under the supervision of Mr. Austin.

The Norris M. Co. has been organized. A. Bartes, local manager, has bought the Comstock group of five claims. The vein is from 4 to 9 feet wide; the ore is a cyaniding proposition.

The old Montana Boy property is bought by Minnesota men. The new company will add a concentrator and cyanide tank to its plant.

B. T. Hickman of Rochester and C. W. Cooper of Butte have a lease and bond on the Ahlie Alice mine, 1 mile from Rochester. The bond is $30,000 and runs one year. The shaft is 238 feet deep and levels have been run at 100 and 150 feet. The pay shoot is 20 inches to 3 feet wide. The ore is gold bearing; there are on the dump 250 sacks of ore worth $50 per ton; shipments are made to the Colorado smelter, Butte.

The Basin & Bay State M. Co. will sell its smelter at Basin.

SILVER BOW COUNTY.

The West Stewart mine, owned by W. A. Clark, is to be equipped with steel gallows frame and power plant.

The Butte Copper M. Co. has leased and bonded the Amazon claim on the foothills of the Eastern mountain range for $75,000 to May 1, 1903. The company will extend the old shaft, now down 180 feet, to a depth of 380 feet.

NEVADA.

CHURCHILL COUNTY.

The Bell Mare and other copper mines in Cottonwood district are to be consolidated and incorporated with $5,000,000 capital.

ELKO COUNTY.

Statistics show that the total bullion product of Tuscarora to date is $34,893,306. Of this total $29,415,750 was silver and $5,477,556 gold—a total coinage value of $34,893,306.

The machinery of the Grand Prize & Union mill in Tuscarora is being demolished and shipped to Sacramento as scrap iron.

ESMERALDA COUNTY.

(Special Correspondence) — The Haggerty-Jordan Copper M. Co. of Caribou, Wyo., has a working bond on twenty-five copper claims in Gillis mountains, 35 miles southeast of here, for $75,000, and $500 a month to be expended for six months, a cash bonus to be paid July 1.

Hawthorne, June 1.

Messrs. Fagin & Gilloon report a discovery of cinnabar east of Luning.

The Sweetwater Con. M. & M. Co. at Sweetwater has twenty men at work.

EUREKA COUNTY.

The Eureka & Palisade Railroad is reported to be negotiating with the Southern Pacific as to a reduced rate on low-grade ores shipped from the Eureka district.

LINCOLN COUNTY.

(Special Correspondence.)—The Mendha group, near Pioche, has been bonded to E. C. Higgioson for $80,000. This property was operated by the Pioche Con. M. Co. years ago and yielded many dividends, until the decline in silver closed it down. There is on the old dump 3000 tons of ore that will, it is said, average $48 gold, 18% lead and 15 ounces silver to the ton. This can be profitably treated at the Bristol smelter.

The Bingham and Welland group, 4 miles from Pioche, have been sold to F. O. Richardson of British Columbia for $20,000. Development is going on. The ore carries gold, silver and lead.

Pioche, May 25.

Smith & Ryan have sold the Pennsylvania to J. Adams of Bingham, Utah. The claim is near Meadow valley, Pennsylvania district. Samples taken assay $21 gold, 60 ounces silver, 15% copper. A 10-stamp mill will be built.

LYON COUNTY.

The only Silver City mines producing ore are the Oest and Silver City. Active prospecting work is in progress on other locations. Three companies are prospecting in the Silver City mines, two having leases and the other working on a privilege. Fifty-five tons of ore from the mine returned over $1000 in gold bullion, the lessees netting about miners' wages.

NYE COUNTY.

(Special Correspondence.)—A strong effort is being made to reach the Salt Lake furnaces with the Tonopah ores. Salt Lake ore buyers have sampled several lots and have offered working charges lower than those offered by some coast smelters. As the railroads can be guaranteed a tonnage to Salt Lake valley probably in excess of the capacity of Pacific Coast smelters to treat, the higher rates due to the longer haul may be sufficiently reduced by the railroad to make feasible the shipments of Tonopah ores to Salt Lake valley smelters. Trial shipments will be made shortly.

Tonopah, June 1.

Analysis of Tonopah ores shows: Insoluble residue (silica). 86.08%; ferric chloride and alumina, 4 85%; manganic oxide, 2 95%; silver and gold, 1.06%; lime, trace; magnesia, trace; lead, trace; sulphur, 0; loss by ignition, 2.70%; total, 99.64%.

J. A Yerington of Carson is reported organizing a company with $1,000,000 capital to pipe water 60 miles into Tonopah.

The G. & H. tunnel is sold to Arthur Brock, president Tonopah M. Co., for $250,000—$30,000 down, $100,000 in eight months, $120,000 in ten months.

STOREY COUNTY.

The latest reported sales of Comstock Tunnel Co.'s (Sutro tunnel) stock in the New York market were 1500 shares at 5½ and 6 cents per share, May 20 and 21.

The output of ore from the Con. Cal. & Va. for the current week amounted to 92 cars, assaying $50.34 per ton, and 138 cars assaying $19 38 per ton.

WHITE PINE COUNTY.

Local reports are to the effect that from the grass roots at Cherry Creek prospectors are extracting gold ore of the value of $70 to $200 per ton. The Glasgow & Western Co.'s Star mill is aiding in development.

E. L. Giroux of Denver, Colo., and associates were in Pioche en route to Ely to inspect the Pilot Knob copper claims which they have been developing. Their option expired June 1st. The present visit to Ely is regarding the purchase of the property. The Pilot Knob copper mines consist of fifty claims 10 miles from Ely.

Water has been encountered in the Aultman shaft at Ely and the work of sinking has been abandoned for the present. A station is being cut above the water level, and when this is completed drifting to the south will be commenced. At a depth of 285 feet ore was cut, carrying gold values of $4.40 and a trace of copper; on this the drift will be extended.

NEW MEXICO.

SANTA FE COUNTY.

A $45,000 plant for the Baird M. Co. at Golden will be put in. This property consists of a bed of cement, some places 30 feet deep, carrying free gold.

OREGON.

BAKER COUNTY.

Manager J. M. McPhee, Golden Wizard mine, Minersville district, states that his company is considering the installation of a large treating plant. The shaft is down 130 feet; 60 feet of this is in ore that assays $18 a ton.

JOSEPHINE COUNTY.

San Francisco capitalists will utilize the power of Applegate falls, on Applegate river, western Josephine county. Electric power will be generated to operate stamp mills, mining machinery and factories in Josephine county, as well as a portion of Jackson. Power will also be generated for a line from Grants Pass to Waldo, the copper district of southwestern Josephine county.

The ledges on Grave creek, in the Mt. Reuben district, are being worked extensively.

W. H. Brevoort of New York and E. Smith of Los Angeles, stockholders of the Victor Junior mine, in the Grave Creek district, announce that they will add twenty stamps, a number of new concentrators, a cyanide plant and a quantity of other machinery to their mine.

The property of the Big Yank M. & M. Co., in the Galice mining district, has been bonded to L. Y. Keady of Portland.

At the Greenhack mine, Grave creek, the work proposed consists of a shaft to be sunk 500 feet below the 800-foot level and the erection of a 20-stamp mill, to handle fifty tons a day. The stamps are to be 1000 pounds; an 80 H. P. power compressor will be put in to run six machine drills. The mine will be equipped with electric lights. A cyanide mill will be erected.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The contract for building the new reduction works of the Hidden Fortune G. M. Co. will be awarded at the Denver, Colo., office next week. The mill will be 1 mile below Deadwood, on Whitewood creek, and will have 100 stamps to start with. It will be built with a view to turning it into a combination amalgamation and cyanide plant; for the first few months it will be run as a wet crushing cyanide, the ore to be crushed with stamps in a solution of cyanide, because the company has a large amount of siliceous ore on which amalgamation would be an entire loss. The amalgamation feature will be added after the company is ready to begin treating its free-milling ores.

The capital stock of the Homestake M. Co. has been increased $840,000, making $22,840,000 listed to date.

UTAH.

Utah mines produced $1,905,960 in May.

BEAVER COUNTY.

At the Old Hickory mine, near Beaver, a working shaft will be sunk. The vein will be developed on the surface by open cuts. The old workings have developed the vein 90 feet deep, showing 10 feet of ore which assays 12% to 16% copper and good values in gold and silver.

The vertical shaft at the Sheep Rock is down 90 feet and will be sunk to the 300-foot level.

BINGHAM COUNTY.

The Montana Coal & Coke Co., controlled by the Bingham Con. M. & S. Co., has a daily output of 700 tons of coal and 200 tons coke.

IRON COUNTY.

Hematite and specular iron have been discovered at Red creek.

B. C. McDonald, assistant manager the Johnny at Stateline, says the new strike in the Willowvale group is proving satisfactory and that ore is being sacked that will average .0260 gold per ton, or $10 a day to the man. The new mill plans are in the hands of Dederichs and Burke.

JUAB COUNTY.

The Sunbeam M. Co., Silver City, will put in a station pump, 500 to 700 gallons per minute capacity. T. Walden, Supt.

At the Bullion-Beck at Eureka sixty persons are on the payroll. Manager Farnsworth, it is said, has obtained from the American S. & R. Co. a working charge that will enable him to move the siliceous ores.

If negotiations are successful, the Annandale will be able to open territory through the 500 foot level of the Emerald shaft. This level will tap the Annandale vein at a vertical depth of 800 feet.

At the Emerald, at Tintic, a winze is going down on $10 ore below the 700-foot level. The vein, a strong one, is showing much quartz—2% copper in a red oxide and gold and silver.

Ore shipments from the Tintic district for the week ending May 31 amounted to sixty-eight carloads, as follows: Bullion-Beck, 8; Gemini, 10; Godiva, 2; Yankee Con, 6; Ajax, 1; Carisa, 5; Dragon (iron mine), 15; Grand Central, 3; Mammoth, 1; Lower Mammoth, 4; Sioux Utah, 3; South Swansea, 10.

SUMMIT COUNTY.

The final payment on the West Ontario group at Park City has been made and the property, consisting of twenty-two locations, is in the custody of a Tennessee company; $120,000 has been paid for the property.

Following are shipments of ore from Park City for week ending May 31:

Daly West	3,576,000
Ontario	1,516,000
Anchor Con	433,000
Total number of pounds	5,525,000
Silver King	1,877,189
Grand total	7,402,189

SALT LAKE COUNTY.

In the Highland Boy Con., at Bingham, an 18-inch streak of ore has been cut in the Leonard tunnel. Assays show 2% copper, 35% lead, ten ounces silver and $1.20 gold per ton, and an excess of iron.

Grading for the towers of the United States bucket tramway is completed.

Work on the Congor mine, near Bingham, has been resumed. The Congor has copper-bearing milling ore in sight.

From the Highland Boy Con. three carloads of ore sold to the Bingham Con. smelter showed assays of 25% copper, 10 ounces silver and $3.50 gold per ton, with an excess of 30% iron, which latter earns $4.50 per ton.

At the Bingham Con. during the month of May there was put through the furnaces 7528 tons of ore, the greater percentage of which came from the company's holdings at Bingham. The electric tramway has been started. The smelter has

since the converters went into commission on May 6 produced 222 tons of copper bullion carrying gold and silver, valuation $550 per ton.

TOOELE COUNTY.

(Special Correspondence.)—The stated intention of the W. A. Clark management in Ophir canyon, near Ophir, is received with great interest, and its bearing on larger undertakings that are likely to follow the installation of the electric plant is fully recognized. The establishing of such plant would not only furnish power to the Clark mines and concentrator and the tramway between the two and light to Stockton, but there would naturally follow the constructing of furnaces to produce high-grade matte from the product of the concentrator, and the consequent doubling the capacity of the same.

Ophir, June 1.

(Special Correspondence).—Cinnabar in commercial quantity has been discovered on the property of the Sacramento M. Co. here. A furnace for reducing the ore will be included in the plant now building for the company. Cinnabar has been previously found in small quantities in the Marion and Mercur mines. In the Sacramento the ore has been opened up 15 feet along the strike of the vein; assays show 25% quicksilver and $8 gold per ton. The discovery was made in crosscut off main tunnel, along a porphyry dike. This dike has pitched the main ore bodies from the normal dip of 15° to an angle of 65°. The extent of this ore body is undetermined at depth of 150 feet below the surface, but it appears above and below the drift and indicates a permanent channel following the dike which serves as the hanging wall, limestone foot wall; between the two there is 25 feet of gold-bearing ore and this cinnabar. The gold ore has been continuous for 250 feet depth. By June 15 milling will be under way again. The agitation method will be used in the cyanide process.

Mercur, June 1.

At Mercur during the month af May the output from the Con. Mercur exceeded 30,000 tons of gold-bearing ore. In addition to this crude ore, which was leached in a set of thirty-six tanks of a capacity of 250 tons each, there was treated at the Manning mill 500 tons of tailings daily in eighteen tanks of 136 tons each. The product at the two plants is known to have reached $160,000.

WASHINGTON.

FERRY COUNTY.

At the Trade Dollar, in Nespelim district, cutting out station for the 300-foot level has begun.

At Republic the Silver Dollar shaft is timbered 60 feet; sinking will be continued. After machinery is installed the shaft will be sunk to 200-foot level. W. H. Crummer will install machinery. Two 24 H. P. hoists are decided on.

The station at 300 level in Trade Dollar, at Republic, is made; crosscutting has begun.

A steam hoist will be put in by the Silver Dollar, which will handle ore and water from 600 level.

In the Mountain Boy adit tunnel a 5-foot vein has been opened and followed 40 feet. Averages across 4 feet gave $40.50 in gold, silver and copper.

STEVENS COUNTY.

O. Szontagh, manager LeRoi smelter, Northport, says that, so far as he is aware, the smelter will continue its operations without any close down except such as may be necessary for repairs.

FOREIGN.

AUSTRALIA.

The gold yield of the State of Victoria for the last four months amounted to 211,413 ounces, the yield for April being 48,946 ounces.

Scarcity of water interferes with operations in the Mount Morgan mine. Owing to the diminishing richness of the ore, greater attention is being paid to the metallurgical expenses. Considerable improvements are being made in the chlorination works. The manager and metallurgist have returned from an extensive visit to leading gold reduction works throughout the world.

BRITISH COLUMBIA.

T. W. Gibson, director Bureau of Mines, furnishes a table showing the output of the Ontario mines for the first three months of this year. The figures are supplied by the mining operators and companies. The aggregate value of the production for the first quarter of 1902 was $1,254,685 as against $824,076 for the first quarter of 1901, an increase of $430,609. The value of the gold taken out this year as against last was $77,068 to $54,820. Gains—Gold, $22,548; silver, $4954; nickel, $355,498; copper, $121,545; arsenic, $2238.

Finch & Campbell, who control the Second Relief, near Ymir, will put in a cyanide mill at the property with a capacity of fifty tons a day.

The Queen mine, 14 miles from Salmo, operated by the Holmes syndicate, has paid for its development, stamp mill and all mining machinery. The Yellowstone mill was secured. A shipment of three cars of ore to the Hall Mines smelter returned $3441.02. The mill is handling twenty-five tons of gold ore a day.

At Ymir the Broken Hill M. & D. Co., operating the Wilcox mine, has decided to erect a stamp mill.

At Rossland the Rambler-Cariboo mine has resumed operations with over 100 men. A boiler plant will replace the water power. The ore concentrates 6 to 1. The company is figuring on shipping concentrates carrying 200 ounces silver and about 55% lead.

CHINA.

In the mines of the Provinces of Shansi, Shantung, Feng-tien, Hunan, Szecbuen, Yunnan and Kyao-chau the employed, and generally the miners, are paid on shares. The usual rate is about one-third of the product to the miners and the remaining two-thirds to the owners of the mines. An entirely different system of paying the miners was adopted by the Mo-ho G. M. Co., whose extensive mining rights were situated between Mongolia and Asiatic Russia, embracing hundreds of square miles of rich alluvial and placer deposits. For the successful exploiting of this vast mineral wealth, it was necessary to overcome the tremendous obstacles arising from distance, severity of climate and total lack of labor. To settle the latter question, it was resolved by the company to inaugurate a regime which would induce the laboring classes of Shantung and Chihli to try their fortunes in the Mo-ho El Dorado. The company offered a complete outfit to every able-bodied man, besides advancing a substantial sum for traveling and other expenses incidental to the journey from Tientsin or Chefoo to Mo-ho. Upon arrival, each miner was assigned a large area for his exclusive exploitation. Stations were established at different points throughout the whole region, guarded and protected by the military police furnished by the Chinese government. Ostensibly, the miner enjoyed the entire product of his labor, and the company exercised no control over his mining operations, provided he kept within his allotted area. It was stipulated, however, that the miner should sell all his dust to the company, at a price fixed by the latter, and obtain all supplies from the company's stores. By this arrangement the company was able to recoup the original outlay, which was very heavy, and the miner was given an incentive to work. Many of the miners after the first two years became independently rich, while on various occasions the company declared an annual dividend of 150%. Up to the Boxer uprising of 1900 the Mo-ho G. M. Co. was the most profitable mining enterprise in China. Since the Russians have acquired control of this territory, all mining operations have ceased.

Minister Conger transmits to the State Department the details of new regulations for mining in China. They are so onerous as practically to preclude the development of the empire's mineral resources by outside capital. A tax is levied on mineral products as follows: Coal, iron, borax, alum, etc., 5%; kerosene, copper, lead, tin, suiphur, 10%; gold, silver, spelter, quicksilver, 15%; diamonds, crystals, 25%. This is in addition to the export duty to be fixed by the customs authorities. One per cent of the capital stock is to be paid upon issuance of the permit to mine. Each company must begin work within one year and must establish a mining school. Accounts shall be made up each year, and of the net gain 25% must be paid as royalty to the Chinese Government.

LOWER CALIFORNIA.

The People's Mutual M. Co. of New York City have bought the Valladares gold mine and propose putting up a 100-stamp mill.

MEXICO.

The Nopal mine, near Parral, has been sold by D. M. Evans to W. V. Pettit.

SONORA.

Nine miles from Alta the Veta Grande M. Co. has completed a quartz mill, capacity 100 tons daily.

The United States M. & S. Co., organized in New York, has bought the Ahogado mine, 20 miles from Hermosillo. T. B. Johnson, El Paso, is general manager.

ZACATECAS.

The Bote mine at Zacatecas has been paying dividends fifty years. Four-fifths of the stock is owned by R. Kerrigan of England. The pay roll is $30,000 per month; the mine pays a net dividend of $50,000 per month. The San Rafael mine has paid large dividends and is now paying expenses. The pay roll is $40,000 per month. The Veta Grande is paying expenses and doing development work on a pay roll of $20,000 per month.

SOUTH AFRICA.

At the Rand mines the number of stamps running is estimated at 2000, out of a total of 6000.

The peace proclamation that the Boer war is at last ended starts renewed interest in the Rand.

The number of stamps crushing in March was 1540, 1260 in February. The output was: From the mill, 65,927 ounces; concentrates, 2093 ounces; tailings, 33,513 ounces; slimes, 2594 ounces.

The following shows the results from each individual mine:

Name.	Tons crushed.	Output. Ounces.
Angelo	6,755	4,154
Bonanza	7,912	7,072
City and Suburban	8 650	4,410
Crown Deep	9,487	4,094
Crown Reef	11,378	6,175
Driefontein	7,243	3,802
Durban Rood	6,125	3,982
Ferreira Deep	5.270	2,674
Geldenhuis Deep	16,880	7,829
Geldenhuis Estate	8,715	4,128
Ginsberg	5,409	3,138
Glen Deep	3.940	670
Henry Nourse	6,835	3,169
Jubilee	3,990	1,234
Jumpers Deep	10,488	2,341
Lancaster W	5,077	900
Langlaate D	10,286	3,980
May Cons	8,441	4,204
Meyer and Charlton	5,674	2,675
New Heriot	1,467	380
Nourse Deep	4,564	1,511
Rietfontein A	4,835	2,417
Robinson D	5,270	2,380
Rose Deep	11,200	4 795
Robinson	8.305	8.015
Salisbury	3.541	1,046
Treasury	8,310	4,181
Village M. R.	9,480	4,440
Wemmer	6,600	4,316

From Jan. 1 to April 1 value of the output of the Rand trebled.

The total gold output of companies making returns to the Rhodesian Chamber of Mines at Buiawayo for March was 17,559 ounces. The montbly returns since 1899 have been as follows: 1902, 63,609 ounces; 1901, 172,060 ounces; 1900, 91,816 ounces; 1899, 65,303 ounces.

At Johannesburg, more than 2000 stamps are in operation, and it is believed that more than half the gold mines and mills will be working by July.

SOUTH AMERICA.

Silver ore is being shipped from Chile to Pueblo, Colo., consigned to the American Smelting & Refining Co., which has been receiving cars of this silver ore from Chile since March 17th. This ore is shipped by steamer to Galveston, Texas, and there is transferred to Colorado & Southern cars and sent to Pueblo by that route. The total amount of the ore consigned to Pueblo smelters this year from Chile is about 400 carloads.

Commercial Paragraphs.

THE Colorado Zinc Co, Denver, Colo., are putting in another separator and will double their zinc output. They are also adding two more Wilfley tables and one Dimmick classifier.

THE California Electrical Works, San Francisco, Cal., are placing on the market their new type Sunbeam incandescent lamp, which they carry in all candle powers, voltages and efficiencies.

THE Crocker-Wheeler Co. is making extensive preparations to accommodate the increasing business which during the past year has pushed the present shops to their utmost. A new building is under construction which will enlarge the present floor space by 60,000 square feet and be occupied by the winding department, a part of the office force, and additional machine shop space.

MGR. GEO. H. ISMON, of the American Steel & Wire Co.'s Pacific Works in San Francisco, Cal., has chosen a site for the new establishment, Sixteenth and Folsom streets, where a new plant will be erected, with a frontage of 180 feet on Sixteenth, 520 on Folsom and 460 on Fifteenth, covering 129,000 square feet. On the Fifteenth street side will be the Pacific Wire Rope Works and the Cal. Wire Cloth Co. Woven wire fencing will also be manufactured.

THE Colorado Iron Works Co., Denver, Colo., have orders for two sets 40x16-inch crushing rolls, and two Bartlett concentrators for the Montezuma Lead Co., Mexico; one 42x120-inch blast furnace for the New Jersey Gold Copper Reduction Co., Leadville, Colo.; four impact screens for Velordena M. & S. Co., Mexico; ten 90 cubic feet capacity side roll dump cars for Compania Metalurgica Mexicana, San Luis Potosi; eight lead cars for Ohio & Colorado S. & R. Co., Salida, Colo.

THE Salt Lake, Utah, office of the Allis-Chalmers Co. reports the following sales in May: Two converters for the United States M. Co.; power plant for the Troy Laundry, Salt Lake City, consisting of 12x36-inch Reynolds engine, Reynolds heater, shafting, pulleys, etc.; 500-ton sampling works for the Park City Sampling Co., of Park City, Utah; four matte ladles for the Bingham Con. M. & S. Co.; one 150 H. P. return tubular boiler, for the Honorine M. Co., at Stockton, Utah; elevator material for the Utah Fuel Co.; two converters for the Bingham Con. M. & S. Co., Salt Lake City; one No. 6 Gates style "D" crusher, for the Lime King M. Co.

THE Boston & Montana Con. C. & S. M. Co. is making additions to the electrical equipment of its smelters and refineries at Great Falls, Mont., having recently bought eleven 15 H. P. and three 40 H. P. Westinghouse, 500-volt, shunt wound, direct current motors. Four years ago this company installed a number of Westinghouse 180-volt electrolytic generators and at the same time put in a large number of Westinghouse and other motors for driving ventilating fans and other machinery about the smelters. Although the smelters are filled with sulphur dust and are dirty, the Westinghouse motors have given satisfaction. The Boston & Montana Co. states that the commutators of the Westinghouse motors are the only ones which are sufficiently insulated between bars to prevent bad grounds.

THE Hidden Fortune G. M. Co., operating low grade gold-bearing ore near Lead City, S. D., has closed a contract with the Colorado Iron Works Co for reduction, cyaniding, refining, power and lighting equipment that will cost $200,000. There will be six 10-stamp mills, 1050-pound stamps, ninety drops per minute. The cyanide plant includes two steel solution tanks, 20 feet in diameter, 6 feet deep; five leaching tanks, 40 feet diameter, 6 feet deep; three steel slime tanks, 12 feet diameter, 16 feet deep; two steel gold tanks, 12 feet diameter, 8 feet deep; three steel sump tanks, 30 feet diameter, 8 feet deep. The refining plant includes a full equipment. The crusher for the plant is 15x30; the ore grizzly, 4x8; principal engine, cross-compound, non-condensing, Corliss, high pressure 18x48, low pressure cylinder 34x18. The engine to drive the dynamo for electric light purposes is a 12x16 70 H. P., with sufficient power to drive a 120-stamp mill plant. The electric light plant generator will supply 50 arc lamps and 220 16-candle power incandescent lamps. There are two boilers, 175 H. P. each, a low-pressure Leyner air compressor, capacity 700 cubic feet of free air per minute at thirty pounds, steam driven. This equipment will handle 250 tons ore every twenty-four hours.

Books Received.

On the "Study and Difficulties of Mathematics," by Augustus De Morgan, Chicago; Open Court Publishing Co., London, Kegan, Paul, Trench Trubner & Co., Ltd.; pp, 288. Price, $1.25.

"Handbook for Street Railway Engineers," by H. B. Andrews, C. E.; 3x5 inches; 202 pp., 41 figures. Published by John Wiley & Sons, New York. Price $1.25. A handy pocketbook of tables and useful data for street-railway engineers, containing mensuration, trigonometrical formulæ, curves, strength of materials; also, much electrical information in its application to street railways; bound in convenient form; clear typography and good paper.

Catalogues Received.

The Jeanesville Pump Co, Jeanesville, Pa., send an "advance sheet" that portrays pumps and incidentally furnishes considerable advance information. It is of interest in this regard to note that for every ton of anthracite coal mined there is pumped from nine to twelve tons of water. (It is also interesting to know that there are $10,000,000 invested in mine pumps in this west half of America.) The trade treatise is got up in the usual good style of this company, and is worthy the attention of men interested in this subject. A request sent to A. Middlebrook, 1328 Seventeenth street, Denver, Colo, to the Joshua Hendy Machine Works, 38-44 Fremont street, San Francisco, Cal., or the company's home office, will bring a copy of this booklet by return mail.

Catalogue No. 51 of the Christensen Engineering Co., Milwaukee, Wis., describes their electrically operated, stationary and portable air compressors, which are not steam-driven compressors

with a motor attached, but self-contained units. The detail parts are made from jigs and templets and are interchangeable. The working parts operate in a bath of oil.

"Catalogue B, 1902, Leyner Air Compressors, and herein incidental mention of other machinery, articles and things done at our works," is the taking title of a sumptuous brochure from J. George Leyner, Denver, Colo., which is deserving of notice because of its style and contents. There is a little introductory treatise on air compression which tells in plain United States, air compressors are good things. There is a further discussion of mechanically actuated air valves, which is a little more technical, and which gives more real information than some pretentious text books on that subject. Then as a good business proposition a description of the Leyner straight-line simple steam actuated air compressor, which brings out several good points clearly. This is followed by several pages of description of various other styles of compressors made by the Leyner people. On page 58 is a picture that is a trade winner for a mining country where transportation hasn't yet got to the palace car stage. Then comes some remarkably fine tables of compressor efficiencies and capacities at various altitudes, after which the water Leyner rock drill receives deserved attention. Altogether there are 69 subjects described and there isn't a dull page in the entire 82 to any man that is interested in these things. Five-dollar books are sold with less valuable information on these subjects than that in this handsome publication which is as far ahead of the old style catalogue as a decapod engine is ahead of a handcar. The book is superbly produced and will be sent anywhere on request. Address J. George Leyner, 1033 Seventeenth street, Denver, Colo.

Personal.

H. A. COHEN is visiting De Lamar, Cal.

J. MCCHRYSTAL is Supt. Gemini mine, Tintic, Utah.

O. B. PEASLEY is Supt. Havilah mine, Nashville, Cal.

C. T. DUDLEY is Supt. Sellier mine at Forest Hill, Cal.

J. T. KENNEY is Supt. Mineral Ranch mine, Ballarat, Cal.

C. H. BLAKE is Supt. Fannie Marie mine, Glencoe, Cal.

J. A. BRENT is superintendent Red Cross mine, Omega, Cal.

A. MAYBERRY is superintendent U. S. smelter, Bingham, Utah.

T. WALDEN is superintendent Sunbeam M. Co., Silver City, Utah.

E. D. MOOERS, of Randsburg, Cal., will spend two years in Japan.

D. A. MCDONALD of San Francisco has gone to Golovin bay, Alaska.

E. W. CAMP is manager Victory mine, Glendale, Douglas county, Or.

A. L. HEASTON is superintendent Telluride M. Co, Bingham, Utah.

A. CARTER is Supt. Blue Eagle mine, Jawbone, Mariposa county, Cal.

A. MAYBERRY is Supt. U. S. Co.'s Bingham properties, Bingham, Utah.

C. E. SEYMOUR is superintendent Vandalia mine, Shingle Springs, Cal.

JAS. CALLBREATH is in charge of the Puzzle mine, Breckenridge, Colo.

J. W. MORRELL is superintendent Balsam M. & M. Co., Alleghany, Cal.

FRED ZEITLER has returned to San Francisco from Nevada City, Cal.

S. H. BROCKUNIER, E. M., of Butte, Mont., is in Salt Lake City, Utah.

WM. LEWIS of Stent, Cal., is now foreman of the Republican mine there.

V. M. CLEMENT has returned from New York to Salt Lake City, Utah.

P. J. NEVINS is now manager French Gulch G. M. Co., Breckenridge, Colo.

FRANK R. WEHE has moved from Sierra Co., Cal., to San Andreas, Cal.

THOS. SHELTON of Leadville, Colo., has returned there from Denver, Colo.

C. K. MCCORNICK has returned from Kingman, Ariz., to Salt Lake City, Utah.

B. F. HOOK has returned to San Francisco from an extended trip through Mexico.

G. J. C. DONALDSON, C. E., engineer Merced G. M. Co., has located at Carters, Cal.

L. W. MORGAN is smelter superintendent for the Troy Copper Co, Troy, Arizona.

JOHN MCCOLL of Leadville, Colo., is the new Supt. Lucania Co., Idaho Springs, Colo.

H. K. MASTERS has been appointed superintendent U. S. smelter, Bingham, Utah.

R. F. JONES of Leadville, Colo., is now foreman Dakota mill, Deadwood, South Dakota.

W. J. BELCHER is superintendent White Bear M. Co, Monte Cristo, Nevada Co., Cal.

DANIEL DE CORTAZAR has been appointed director of the Geological Survey of Spain.

A. B. HARMON is now general manager Gilpin - Cripple Creek M. Co., Altman, Colorado.

S. A. HARSH of Denver, Colo., has spent several weeks among the mines in Wyoming.

W. H. FERGUSON is Supt. Hurricane mines, near Thumb Butte, Yavapai county, Ariz.

JAS. HANLEY is now superintendent Cerro Colorado mine, Altar district, Sonora, Mexico.

SUPT. JNO. BOYLE of the Lenore M. Co. has returned from St. Louis, Mo., to Kingman, Ariz.

H. Z. OSBORNE has returned from the Dorleska mine, Trinity county, Cal., to Los Angeles, Cal.

A. F. ROSENBERGER of the Nelson, B. C., Mine Exchange, is establishing a branch in Chicago.

A. H. BROWN, general manager Trinity Copper Co., Kennet, Cal., has returned there from Boston.

R. V. ELLIS of San Francisco is erecting three new rigs for the A. & P. Oil Co., Spring Valley, Wyo.

F. MONAGHAN of Needles, Cal., succeeds W. S. Keyes as trustee California State Mining Bureau.

L. L. MYERS, Supt. Malakoff mine, Nevada county, Cal., is examining mines in Plumas county, Cal.

ARTHUR HENDY, superintendent Copper Chief M. Co., has returned from Mexico to Jerome, Arizona.

F. R. BYRNES, manager Penobscot M. Co, Deadwood, S. D., has established an assay office in that city.

L. W. TATUM of Chicago has returned from Negaunee, Mich., where he had been examining iron deposits.

ROBT. ROBINSON, Supt. Allison Ranch mine, has returned to Nevada county, Cal., from San Francisco.

CHAS. D. LANE and party left Seattle, Wash., on the 5th inst. on the steamer Oregon for Nome, Alaska.

BERT DELERAY has resigned as Supt. Republican mine, Tuolumne county, Cal., and goes to Nome, Alaska.

F. B. KING, representing Douglas, Lacey & Co., is visiting the California properties of the company.

J. W. NEILL, who has been examining the De Lamar mine, De Lamar, Nev., has returned to Salt Lake City, Utah.

C. H. HAND, E. M., of Montana, has been at Pioche, Nev., inspecting mining properties in which he is interested.

F. R. BLOUNT, president Oro Grande Placer M. Co., is in Breckenridge, Colo., inspecting the company's property.

C. E. ALLEN, manager Centennial-Eureka, Tintic, Utah, has returned to Salt Lake City from Bingham, Utah.

P. O. PERLEY has been appointed manager New England M. Co., Bingham, Utah, in place of S. W. West, resigned.

E. H. MACDONALD of Anaconda, Mont., succeeds A. B. Knight as professor mining engineering, Montana School of Mines.

D. B. HEARD, former superintendent Hull City placer, is now superintendent Odessa M. Co.'s properties, Odessa, Utah.

ALTON L. DICKEMAN, of Colorado Springs, Colo., is in charge of the Mayne & Leonard zinc plant at Park City, Utah.

ALVIN PHILLIPS of Denver, Colo., has returned from Lake City, Colo, where he had been examining some mining properties.

A. CHESTER BEATTY has returned to Denver, Colo., from Old Mexico, where he had been examining some mining properties.

GEO. S. OLIVER is chief engineer of the Nevada-California-Oregon Railway, headquarters at Reno, Nev., succeeding C. P. Keyser.

A. M. WELLES, consulting engineer, of Denver, is making a trip through Idaho and Montana, examining some mining properties.

C. C. BRAYTON of California has gone to Dawson, Yukon Territory, to begin dredging work on the bars of the upper Yukon river.

T. L. ODDIE, general manager Tonopah M. Co., accompanied by President Brock, has arrived at Tonopah, Nevada, from Philadelphia.

HENRY KEY, construction superintendent Adventure mill, Houghton, Mich., has declined a similar position with the Victoria mill.

G. W. FRANKLIN of Durango, Colo., an owner in the Fannie Marie at Glencoe, Cal., is in Mokelumne Hill, Cal., inspecting the property.

W. J. PRISK, formerly Supt. Guffey mines, Nova Scotia, is the new Supt. Sinker tunnel, Silver City, Idaho, succeeding Fred Irwin.

M. BRADLEY is now manager of the Lion G. M. Co., operating the Bradshaw mining group, Cherry Creek district, Yavapai county, Ariz.

JULIAN SONNTAG, manager Giant Powder Co. of San Francisco, has returned from Salt Lake City, Utah, where he established a local agency.

A. M. SQUIRE of Sonora, Cal., is locally representing recent Los Angeles purchasers of quartz and placer claims near Columbia, Tuolumne Co., Cal.

J. M. GRAOG has returned to Dillon, Mont., from the U. S. of Colombia, S. A. He got considerable gold and a fever there, and is getting rid of both, preparatory to returning.

FRED IRWIN is now Supt. Dewey mine, Thunder Mountain, Idaho. J. B. Mattenson, formerly foreman Sinker tunnel, Silver City, Idaho, takes the same position with Mr. Irwin.

C. M. FUELLER, mining engineer of Denver, Colo., has returned from a trip to Macon, Georgia, and the South. He reports everything in a prosperous condition through the South.

PROF. PALMER of the Colorado State Mining School, at Golden, is expected to be the choice of the trustees to fill the vacancy occasioned by the recent resignation of President Chauvenet.

B. W. BEGEER of Denver, Colo., is now superintendent of the Last Chance mill, at Mogollon, Socorro county, N. M. He is going to adopt "Begeer's improvement of cyanide process" at the mill.

E. E. BYRON, manager Summit M. & S. Co., Kokomo, Colo., has returned from a two months trip to San Domingo islands. He also spent several weeks in Arizona examining mining properties.

JNO. HOFFMAN AND JNO. CRAIG, University of Cal. mine graduates, left Oakland, Cal., for Kimberly, South Africa, this week, each having secured a $3000 position in the De Beers diamond mines.

B. C. RIBLET has returned from Denver to resume charge of the construction work of the aerial tramway now being erected between Grand Encampment and the Ferris Haggerty mines, Rawlins, Wyoming.

JNO. A. REED, late assistant in metallurgy at the California State University, Berkeley, Cal., has resigned and goes as assayer for an American company in Honduras. Arthur Nahl, another assistant, goes to San Salvador.

C. P. PERRIN AND H. L. SMYTH left for Berners bay, Alaska, on the 4th inst., to examine the Johnson mine. Should their report be favorable, it is probable the $1,000,000 option of the Mine Securities Corporation of New York on that property will be closed.

Obituary.

Jno. Taylor, an old and respected resident of San Francisco, Cal., died at his home on the 2nd inst., in the 76th year of his age. Mr. Taylor was born at Westport, Conn., in 1826. He arrived in California in 1849. During the course of his long and useful life he was identified with the mining industry. He founded the well-known establishment of John Taylor & Co., and was prominent in municipal affairs for many years.

Latest Market Reports.

SAN FRANCISCO, June 6, 1902

METALS.

SILVER.—Per oz., Troy: London, 24d (standard ounce, 925 fine); New York, bar silver, 52½c, refined (1000 fine); San Francisco, 52½c; Mexican dollars, 44½c San Francisco, 42c New York.

COPPER. — New York: Standard, $11.75@12.00; Lake, 1 to 3 casks, $12.25; carload lots, $12.00; Electrolytic, 1 to 3 casks, $12.00; carload lots, $11.75; Casting, 1 to 3 casks, $12.25; carload lots, $11.25. San Francisco: $14.00. Mill copper plates, $17.00; bars, 18@24c. London: £54 per ton.

LEAD.—New York, $4.12½; Salt Lake City, $3.60; St. Louis, $4.00; San Francisco $4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, $4.75. London, £11 6s 3d per ton.

SPELTER. — New York, $4.87; St. Louis, $4.00; London, £18 5s per ton; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN. — New York, pig, $30.00: San Francisco, ton lots, 31½c; 1000 lbs., 31½c; 500 lbs., 31¾c; 200 lbs., 32c; less, 32½c; bar tin, ℔ lb, 37½c.

PLATINUM.—San Francisco, crude, $17 ℔ oz.; New York, $18 per Troy oz.

QUICKSILVER. — New York, $50.00 large lots; London, £8 15s; San Francisco, local, $46 50 ℔ flask of 76½ lbs.; Denver, $50.50. Export, $44.50.

BABBITT METAL.— San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER. — Half-and-half, 100-lb. lots, 20c; San Francisco, Plumbers', 100-lb. lots, 16½c.

NICKEL.—New York, 50@60c ℔ lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $19.00; gray forge, $20.00; San Francisco, bar, 2.75 ℔ lb.,3c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $33 50; open hearth billets, $34.00; San Francisco, bar, 7c to 12c per lb.

CEMENT.—Germania, $2.65; K. B. & S., $2.65; Hewmoor, $2.50; Trowell, $2.50 per bbl.

LIME.—Santa Cruz, $1.60; Roche Harbor, $1.60 per bbl.

LUMBER.—(Retail): Pine, ordinary sizes, $18.00@19.50; extra sizes higher; redwood, $19.00@20.00; lath, 4 feet, $3.90 @4.00; pickets, $19.00; shingles, $2.00 for No. 1 and $1.75 for No. 2; shakes, $13.00 for split and $14.00 for sawed; rustic, $25.00 @31.00.

GENERAL SUPPLIES.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.50; Cut, $3.50; 10d to 16d, Wire, $3.55; Cut, $3.55; 8d, Wire, $3.60; Cut, $3.60; 6d and 7d, Wire, $3.70; Cut, $3.70; 4d and 5d, Wire, $3.80; Cut, $3.80; 3d, Wire, $3.95; Cut, $3.95; 2d, Wire, $4.20; Cut, $4.20. Special rates for carload lots.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one toss 15½c. No. 1** 50%, carload lots, 11½c; led, than one ton, 13½c. No. 2, 40%, carloan lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ℔ set; 14 oz., 40s., 9c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $6.50; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $9.56, long ton; Colorado Anthracite, $14.00. Coke, $15 per ton in bulk, $17 in sacks; Sunnyside, $11 75, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 29@30c ℔ lb.; carloads, 27@28c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c ℔ lb.; soda ash, $1.90 ℔ 100 lbs.; hyposulphite of soda, 2½@3c ℔ lb.; blue vitriol, 5½@6½c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 5c; alum, $1.90@2.00; flour sulphur, French, 2½@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.25 @1.50 ℔ 100 lbs.; sks, $1.05; chloride of lime, spot, $2.50@2.60; nitrate of potash, in bbls, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 65c; cs, 70c; raw, bbl., 63c; cs, 68c. Kerosene —Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bbls, 19c; wooden bbls., 22½c; cs, 25c; Mineral Sperm, cs, 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 21½c; 86° Gasoline, bulk, 20c; do., cs., 26½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14½c; do., in cs., 21c; Lard Oil, No. 1 bbl., 60c; cs., 65c; Neatsfoot Oil, bbl., 70c; cs., 75c; No. 1 bbl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6¾c; 1 ton and less than 5 tons, per lb., 7c; 500 lbs. and less than 1 ton, per lb, 7¼c; less than 500 lbs., per lb, 7½c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb.

above keg price. Dry Lead—In bbls., 1 ton and over, 6¾c; do. in kegs, 7¼c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7¼c; less than 500 lbs., 7½c.

ASSAY LITHARGE.—Per lb., 9c.

BISMUTH.—Subnitrate, per lb., $1.60.

BONE ASH.—3c ℔ lb.

BORAX.—Crystal, 7c; calcined, 20c.

CHROMIUM.—(90% and over) per lb., $1.25.

COPPER.—Carbonate, 20c; Red oxide, ℔ lb., 60c.

MAGNESIUM.—Per lb., $3.00.

MANGANESE.—(90% and over) ℔ lb., $1.25.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—25c. ℔ gramme; 1000 grammes=2⅛ lbs.

PHOSPHORUS. — (American) ℔ lb., 80c.

SILVER.—Chloride, ℔ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ℔ lb., $1.00

URANIUM.—Oxide, ℔ lb., $3.50.

ZINC.—Metallic, chemically pure, ℔ lb., 50c.

ZINC.—Dust, ℔ lb., 10c.

ZINC.—Sulphate, ℔ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING MAY 27, 1902.

701,242.—PROPELLER—J. Aegerter, S. F.
701,124.—SYRINGE—C. F. Allen, Hueneme, Cal.
700,720.—REFRIGERATOR CASE—W. H. Ames, Watsonville, Cal.
700,721.—REFRIGERATOR CASE—W. H. Ames, Watsonville, Cal.
701,009.—LIFE BOAT LAUNCHING DEVICE—J. W. Bedford, S. F.
700,889.—REFINING ASPHALTUM—A. F. L. Bell, Carpenteria, Cal.
701,253.—BATTERY—G. S. Bennett, S. F.
700,890.—CAN SOLDERING MACHINE—H. C. Black, Oakland, Cal.
700,891.—CAN TESTING MACHINE—H. C. Black, Oakland, Cal.
700,724.—SWAGE BLOCK—B. F. Blood, Forest Grove, Or.
700,725.—FOOD CUTTER—J. A. Bone, Mayger, Or.
700,734.—BURIAL VAULT—A. B. Buren, Salem, Or.
701,149.—PICTURE HANGER—G. H. Chance, Portland, Or.
701,151.—MUFFLER—C. E. Christman, San Jose, Cal.
701,154.—NECKTIE FRAME—A. Cole, Hood River, Or.
701,258.—PEANUT ROASTER—W. P. Crane, S. F.
701,177.—OIL BURNER—E. W. Dunn, San Jose, Cal.
700,921.—SUSPENDERS—H. T. Hazard, Los Angeles, Cal.
700,928.—TRAIN ORDER BOX—I. C. Hoag, Los Angeles, Cal.
700,929.—BED BOTTOM—J. Hoey, S. F.
701,207.—CAR—R. A. Ludlow, Hanford, Cal.
700,970.—SPEED GEAR—J. D. McFarland, Jr., S. F.
701,071.—MARKING MACHINE—R. N. Moody, Aberdeen, Wash.
700,799.—UNLOADING SHIPS—A. Mullen, S. F.
700,841.—BICYCLE PUMP—E. F. Smith, Stockton, Cal.
701,098.—CHEESE CUTTER—W. J. Spillman, Pullman, Wash.
701,232.—DRAWER GUARD—Martha O. Teel, The Dalles, Or.
700,867.—LOOSE LEAF HOLDER—R. G. Whitlock, Los Angeles, Cal.
701,239.—WORKING ORES—F. D. Wood, S. F.
701,121.—POULTRY FEEDER—Z. Xevers, Santa Cruz, Cal.
701,241.—HEATER—J. N. Young, Alameda, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BED BOTTOMS.—No. 700,929 May 27, 1902. John Hoey, San Francisco. This invention relates to improvements in hed hottome of that class in which a woven wire or equivalent support for the upper mattress is attached to a frame work, which is in turn supported upon a hedstead. It consists of a frame having side and end hars, the latter projecting over or heyond the eide rails of the hedstead, and supporting hlocks rest upon the hedstead rails, these hlocks having their outer ends flush with those of the end hars. The eide hars are holed through the end hars, and these hlocks, and the woven wire fabric stretched longitudinally over the end hars and unconneoted with the side bars, hae ite edges flush with the end hars and overhanging the hedstead rails. Elaetio cahles extend in pairs hetween the ends of the frame and linke, and draw the memhers of each pair toward each other, the memhers of adjacent paire overlapping and crossing to form eupplemental supports.

BRAKE AND BELL FOR VEHICLE.—No. 700,349. May 20, 1902. S. H. Madsen, Haywards, Cal. This invention is designed to provide a comhined hrake and heil mechanism to he applied to vehiclee and especially to hicyoles. The hrake coneists of a roller journaled hetween forke, which fork ie eupported upon a plate on clamps secured to the head of the hicycle. The roller comprises a central inelaetio oore and an elaatio eleeve surrounding it with metal hands upon the ends, and the elastic sleeve is provided with a spiral wrapping of cords to reduce the wear. A pressure plate has shoes adapted to press upon the metal end hands of the roll while a central cord-wound portion presses upon the tire. A spring acts to normally hold the shoes out of contact with the roller and a guided rod connects the plate with the hrake lever so that the device may he operated. A heli is so located with relation to the hrake roller that when the latter is hrought into contaot with the wheel tire or rim the revolution of the roller actuates the hammer of the heli and thus gives the warning.

LIFE BOAT LAUNCHING DEVICE.—No. 701,009. May 27, 1902. J. W. Bedford, San Francieco. The object of this invention ie to provide a series of horizontal tracks suitahly supported and generally disposed athwart-ehip, and having hinged sections adapted to project heyond the sides of the ship, these sections heing folded hack upon the main trank when not in use. Pivoted frames support the sections when extended, and tro ley sheaves upon the track and section, and a shifting lever swiveled upon the track sheaves serve for the purpose of moving the hoat outwardly and into position for launching.

ADJUSTABLE SPEED GEAR.—No. 700,970. May 27, 1902. J. D. McFarland, Jr., assignor of one-half to J. Bruckman of San Francisco. This invention is designed to provide a variable speed from a source of constant power. It consists of a shaft, and a sleeve slidahle longitudinally thereon, helical grooves or tongues varying in pitch form upon the periphery of the sleeve, a clutch mechanism adapted to reciprocate upon the sleeve, a meane hy which said clutch engages the tongues or grooves so as to impart a more rotary motion to the latter. Means are also provided for shifting the sleeve along the shaft so as to hring any portion of the grooves or tongues into engagement with the clutch.

CYANIDE PROCESS FOR WORKING ORE.—No. 701,239. May 27, 1902. F. D. Wood, San Francisco. This apparatus is designed to expedite the ordinarily slow process of lixiviation. The apparatus consists of a trough or containing tank through which an endless conveyor is adapted to travel, said conveyor heing transversely concaved so that the ore may he held in the concavity. A series of roliers are journaled within the trough so that the conveyor moving over the rollers is given an undulatory movement which allowe the solution within the trough to have free access to all the particies of ore oarried hy the conveyor, and there are means for suhjecting the ore to the oxidizing actin n of the air as it passes from one conveyor to another.

OIL BURNER.—No. 701,177. May 27, 1902. E. W. Dunn, San Jose, Cal. This apparatus is deeigned for hurning oil, and is especially adapted for furnaces of any description where heat is required, and may he modified to suit cooking or other stoves. It consists of a table having openinge made through the surface with flanges surrounding the openings and projecting above the table eurface. Upon the top fuel supply pipes extend above the surface and hoods are fixed above these pipes, these hoods heing closed at the top and open at the hottom, so that the vapor or oil will he discharged downwardly toward the table. Beneath the table is a closed chamher and a pipe located within thie chamher has upwardly extending pipes which discharge through openings in the hurner plate.

FOR SALE.

Fifteen-Ton Locomotive for Sale.

In good condition. Boiler 34 in. diameter; cylinders 10 in. diameter hy 13 in. stroke; fire hox 40 in. long, 30 in. wide and 26 in. high (crown sheet over hars); 136 tuhes; four 34-in. drivers; air pump, cylinder and hrake shoes. Price $1150.00. JAS. A. MCMAHON, 6 California St., San Francieco, Cal.

FOR SALE.
Large Deposits of Graphite.
Address F. W. CARTER,
Tenth and Cedar Streets,
SAN DIEGO, CAL.

FOR SALE--A BARGAIN.
3 Practically New Five-Foot Huntington Mills with Extras. All in A1 Condition.
Also, 2 New Four-Foot Frue Vanners. Absolutely New. Perfect Condition.
Address FRICOT & MILLER,
Latrohe, El Dorado Co., Cal.

Gold Mining Properties For Sale.
Two First-Class Placer Mines,
one having 20 years' record ae a producer. Both in good working condition. Terms reasonahle.
Addrese "Enquire," care this office.

The Mines Exchange, Ltd.
Minee and prospects in British Columhia, th Western States, and Mexico, for sale.
Free milling gold properties a specialty.
Write us for reports and information.
Bank references given.
Address THE MINES EXCHANGE, LTD.,
P. O. Box 700, Neleon, B. C.
Branch Office: P. O. Box 594, Salmon City, Idaho.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine hy the hydraulic process from Sam Ahtye, in the Secret Diggings Mine, near Laporte, Plumas County, Cal., to deposit tailings in worked-out pit draining into Clark or Slate Creek, and from P. J. Sheridan and E. N. Ekel, in the Lancha Plana mine, at Lancha Plana, Amador County, Cal., to deposit tailings in worked-out pit draining into Mokelumne River, gives notice that a meeting will he held at Room 96, Flood Building, San Francisco, Cal., on June 16, 1902, at 1:30 P. M.

SINCERITY pays in advertising. Tell the truth. The truth is good enough, and most people believe it.

SITUATIONS WANTED.

WANTED.—Position ae Assayer and Bookkeeper in a mine; experienced in underground work; good references; present position not deeirahle. Address Box No. 127, care of this office.

COMPETENT ASSAYER with knowledge of cysniding seeks engagement. Speake Spanieh, French, German and Italian, and will go anywhere. Address C, oare of Childs & Hansen, Aesayers, 127 W. 1st St, Los Angeles, Cal.

CHEMIST AND ASSAYER, Johns Hopkine University graduate, lately chief assayer and chemist for large mining and smelting company in Arizona, wants position anywhere as aseayer, or will partly assay and partly work in or about mine or smelter. Address O. S. W., care of Mining and Scientific Prees, San Francisco, Cal.

WANTED.—Position in mine or mill hy young man now employed in the credit dept. of office of large company in Chicago, Ill. Am quick and accurate at figures; strictly temperate, honest and industrious. Desire hy work and study to learn the mining husinese. First-clase references and full information cheerfully furnished. Address E. P. W., care of this paper.

COPPER FURNACE FOREMAN with eight years' experience at matte and hlack copper work. Best of references. Address V. H., care of Mining and Scientifio Press.

PHYSICIAN AND SURGEON with three yeare' experience in hoth emergency and general hospitale, in addition to experience in mines and private practice, wishes position in a mine. Best of referenoes. Addrees Box 126, care of this office.

CHEMIST AND ASSAYER, WITH TWENTY years' experience in mill and smelter work. Can run same. Address A. C., care of Mining and Scientific Press.

THUNDER MOUNTAIN.—A succeseful superintendent of over 15 years' experience and acquainted with this district, deeires to take charge of property there for a good company. Addrese T. M., care of Mining and Scientific Press.

MINING ENGINEER, practical miner and mill man, aceayer, etc., deeires poeition of superintendent or aesistant manager of a hig property. Eleven yeare' experience. Beet references. Now working in southern California. Address A. M. P., care of Mining and Scientific Press.

WANTED.—SITUATION AFTER MARCH 15, 1902, ae Manager or Superintendent of mine. Have had five yeare' experience in manufacturing and constructing mining machinery and plants. Three years' experience in underground work. Four yeare' experienoe as manager and superintendent. Treatment of low grade ores a epecialty. Practical in every detail. State iocation of mine and salary. Beet of references. Addrese X. Y. Z., thie office.

A technically educated Mining Engineer, at preeent employed ae superintendent of mines for one of the largeet corporatione in Mexico, desiree a change of position to the United States ahout July 1st. Has had 18 years' euccessful experience ae engineer and superintendent, never having made a failure; 36 yeare of age; strictly temperate; a skilled deeigner, geologist and metallurgist, and a practical miner, as well as a hard worker and thorough husiness man. Referenoee of the highest order, including present employere. Address Supt., care this office.

WANTED.

Mine Blacksmith and Drill Sharpener to go to Hawaiian Islande—18 months. Unmarried man preferred; soher. Apply hy letter, with testimonials, to D. Y. Z., this office.

Wanted to Bond a Dry Placer Claim, One Rich in Flour Gold.

Muet he a dry proposition. Address "Placer Claim," care this office.

WANTED, for a developed mine in California, a competent mining engineer to look after development and exploration. Must he a full graduate of a recognized mining college and have had eeveral years' practioal experience in large iron, coal or copper mines, and he fully skilled in the engineering problems pertaining to extraction, haulage, ventilation, etc. Give full particulare of career, experience, age, etc, to "Vulcan," care of this paper.

WANTED.

Consulting Mining Engineer,

familiar with making examinations of mines, prospects and mineral lands. Address stating experience and referencee. Moderate salary to start, with advancement to competent man. Position permanent if found eatisfactory. Addreee A., care of Mining and Scientifio Press.

EXAMINATION OR SUPERVISION of Mines, Smelters and Mills.

Mining Engineer and Metallurgist, of unquestionable reputation and long experience, now permanently residing at Seattle, Wash., will examine or take general supervision of mines, smelters or mills, in Pacific Coast States, British Columbia or Alaska, as consulting engineer, for reliable parties. Ie also reliable accountant to examine. Box 813, Seattle.

ASSESSMENT NOTICES.

REWARD GOLD MINING COMPANY.—Location of principal place of hueineee, San Francieco, California; location of works, Pine Grove, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of May, 1902, an assessment (No. 10) of two (2) cents per share was levied upon the capital stock of the corporation, payahle immediately in United States gold coin, to the secretary, at the office of the company, Room 56, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this aeeeeement shall remain unpaid on the 30th day of June, 1902, will he delinquent, and advertised for eale at puhlic auction; and unleee payment ie made hefore, will he eold on MONDAY, the 21st day of July, 1902, to pay the delinquent assessment, together with the coete of advertieing and expenses of sale.

By order of the Board of Directors.

J. STADTFELD JR., Secretary.

Office—Room 56, No. 309 Montgomery street, San Francisco, California

NATIONAL CONS. MINING COMPANY.—Location of principal plsce of hueineee, San Francisco, California; location of worke, Rich Gulch, Shasta County, Ca if rnia.

Notice ie hereby given, that at a meeting of the Board of Directors, held on the 2nd day of June, 1902, an aeeeeement (No. 16) of five cente per ehare wae levied upon the capital stock of the corporation, payahle immediately in United States gold coin to the secretary, at the office of the company, 773 Miesion street, San Francisco, California.

Any etock upon which this aeeeement shall remain unpaid on the 15th day of July, 1902, will he delinquent and advertised for sale at puhlic auction; and unless payment is made hefore, will he eold on MONDAY, the 18th day of Auguet, 1902, to pay the delinquent assessment, together with the costs of sdvertising and expeneee of eale.

By order of the Board of Directore.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission street, San Francisco, California.

DELINQUENT SALE NOTICE.

SILVER KING MINING COMPANY.—Location of principal place of hueineee, San Francieco, California; location of worke, Pioneer Mining District, Pinal County, Arizoca Territory.

Notice.—There are delinquent upon the following deecribed etock, on account of asseeement (No. 24) levied on the 17th day of April, 1902, the several amounts eet oppoeite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
J. O'B. Gunn	3679	350	$350 00
Michael Levy	7352	100	100 00
Michael Levy	7354	100	100 00
F. Avery, Truetee	7415	100	100 00
New York Issue.			
James Entwistle	1010	100	100 00
Jamee Entwistle	1011	100	100 00
Jamee Entwistle	1012	100	100 00
Jamee Entwistle	1013	100	100 00
Jamee Entwistle	1014	100	100 00
Nathan May	1016	100	100 00
Nathan May	1017	100	100 00

And in accordance with law, and an order from the Board of Directors, made on the 17th day of April, 1902, eo many shares of each parcel of such stock ae may be necessary, will he sold at public auction, at the office of the company, No. 310 Pine street, Room 36, San Francisco, California, on TUESDAY, the 24th day of June, 1902, at the hour of 1 o'clock P. M. of said day, to pay said delinquent asseeement thereon, together with coets of advertising and expeneee of sale.

J. W. PEW, Secretary.

Office—No. 310 Pine street, Room 36, San Francisco, California.

MICHIGAN COLLEGE OF MINES.

An Engineering School with unique location, giving it unusual facilities. Distinctive methods of instruction. Special courses. Field and laboratory courses in regular summer term. For catalogue giving list of graduates and their occupatione, addrees

MINING AND SCIENTIFIC PRESS.

Whole No. 2186.—VOLUME LXXXIV. Number 24. SAN FRANCISCO, CAL., SATURDAY, JUNE 14, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Improved Automatic Tailings Sampler.

Herewith are illustrations of a device for cutting out samples coming from tailings from wet crushing stamp or other pulverizing mills, concentration works, any system of ore treatment where the tailings are sluiced from the mill.

Figs. 1 and 2 represent the sampler as used in mills treating free milling ore, the sampler being placed below and receiving the overflow from an ordinary amalgam trap.

The advantage of having an accurate and systematic sampling, with subsequent analysis, of the tailings discharged from any mill is obvious. It is an absolute necessity in working many low-grade ores where the margin of profit is so limited that the utmost skill and vigilance are required in order to enter the returns upon the proper side of the balance sheet. The character of accurately obtained samples is a true exhibit of the efficiency of the methods of ore treatment employed. It goes without saying that the average mine owner knows to a nicety the values that are recovered and the approximate values originally contained in the ore, but it is of equal importance for him to know how much of this latter amount is lost through any incompetency or carelessness of mill employes, from changes in the character of the ore coming from different levels, from the employment of hattery screens of improper mesh, or from unsuspected causes. The employment of an efficient sampling device furnishes a means of accurately recording these fluctuations, in many cases indicating the remedy and enahling the superintendent to present a more comprehensive record of the mill run.

The device herein described consists primarily of a hopper containing a narrow trough-shaped hox, deeper at one end and attached to an oscillating tipple actuated by means of a small stream of water discharged through a ¾-inch pipe at low head. With each oscillation of the tipple the box passes laterally through the constant flow of tailings coming from the amalgam trap, sluice box or other means of discharge, thus receiving the entire flow for a brief period of time and discharging the same through a pipe projecting from the side and leading into a pail or other convenient receptacle. The tipple rests on knife edges similar to those employed in the mechanism of the ordinary weighing scales, and is divided into two compartments hy means of a central partition forming a part of the casting.

In operation, the water flows into one of the compartments until the sheer weight of the accumulated water causes the tipple to gravitate towards that side, the water siphons out and is discharged into the tailings hopper, while the other compartment receives the flow of water until the operation described is repeated. The interval of time elapsing between the taking of each sample is regulated solely hy the flow of the water into the compartments, and can be adjusted to suit any requirement. Several samples may be taken every minute, or samples may be taken every hour or fractions thereof, at the will of the operator. This is a feature of the device that will commend itself to practical mill men.

This sampler is fully protected by letters patent and has heen placed on the market by the Union Iron Works of San Francisco, sole manufacturers thereof.

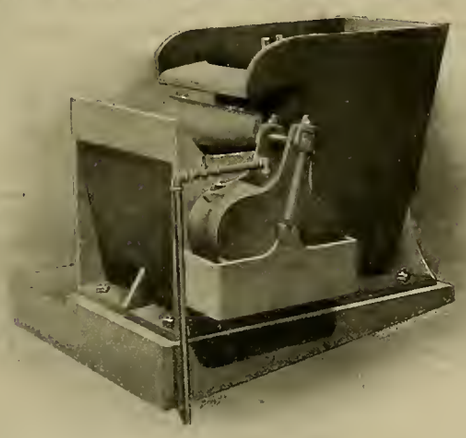

Fig. 1.—Improved Automatic Tailings Sampler.

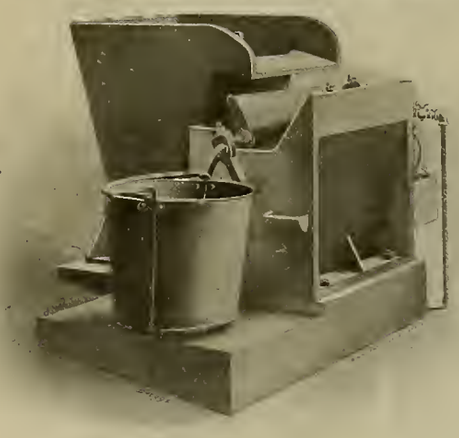

Fig. 2.—Improved Automatic Tailings Sampler.

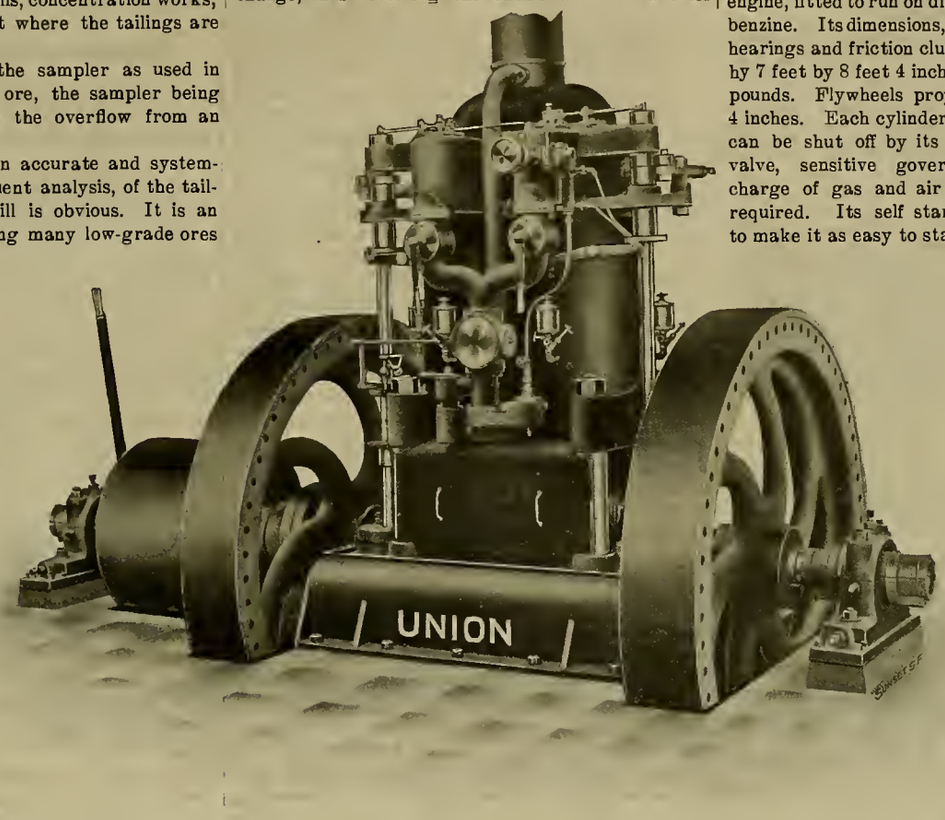
Eighty-Five H. P. Union Gasoline Engine.

The accompanying illustration shows the latest type of 85 H. P. double cylinder Union stationary engine, fitted to run on distillate, naphtha, gasoline or benzine. Its dimensions, including flywheel, outboard hearings and friction clutch pulley are 15 feet 5 inches hy 7 feet by 8 feet 4 inches high; total weight, 29,600 pounds. Flywheels project helow engine hed 2 feet 4 inches. Each cylinder is independent, and either can be shut off by its throttle. It has a douhle valve, sensitive governor, which graduates the charge of gas and air in proportion to the power required. Its self starting apparatus is designed to make it as easy to start as any steam engine, compressed air being used through the valve shown on the head of engine. A small centrifugal pump is used for circulating water from a tank around the cylinders and heads, which are completely water-jacketed, and hack to the tank. The inlet and exhaust valves are opened mechanically hy cams and levers. The fuel is pumped by a small hrass plunger pump, operated by an eccentric on one of the side shafts, and is supplied to the vaporizer only as needed hy the engine. Any surplus fuel pumped returns to the oil tank. The crank throws are at angles of 180°, so that the pistons and connections are perfectly halanced. One of these engines is running a 40-stamp mill of the Progresso M. Co., Triunfo, Lower California; another is operating a rice mill in Honolulu, and another, with marine attachments, is just completed for Messrs. Vail & Vickers of Los Angeles, Cal., who are building a vessel in which to install it. The speed of this engine is 250 revolutions per minute. It is a fine electric light engine.



Eighty-Five H. P. Union Gasoline Engine

These engines are huilt by the Union Gas Engine Co., offices and works at First and Clementina streets, San Francisco, Cal.

THE amount of capital invested in electrical enterprises reaches totals that are noticeable. The progress of electrical science during the past twenty years excels that of any other industry. The capital invested in electric lighting aggregates $750,000,000; in telephones, $400,000,000; in telegraph, $250,000,000; in electric railroads, $2,000,000,000, a total of $3,400,000,000 in the United States alone. Over 500,000 employes are on the pay rolls.

IT does not follow that because the number of stamps in a quartz mill is doubled that the gold output value will likewise be doubled. Doubling the number of stamps will rarely increase the gold output more than one and three-quarter times what it was when one-half the number were dropping. Usually this is because there is less selection of ore; more is fed to the stamps, but it is not of so good quality. Where ore fed to a 10-stamp mill will go $20, when the stamps are increased in number to twenty, the same mine will ordinarily send ore that goes about $15. On the other hand, doubling the number of stamps will often insure decreased cost. Where with a 10-stamp mill the cost of mining per ton is, say, $2.50; of milling, 85 cents; of general superintendence, 60 cents; of maintenance and repairs, 10 cents; of general office, taxes, etc., 24 cents, with a 20-stamp mill these same items would be about $1.50, 60 cents, 30 cents, 8 cents and 5 cents, respectively—$4.29 : $2.53.

IN Congress on the 11th inst. Senator Kearns of Utah, from the Committee on Mines and Mining, reported a bill amending the laws relating to the location of mineral lands. The amendment gives locators the exclusive right to possession of all the surface land within their lines, and of "all veins, lodes, etc.," throughout the entire depth which lie within such surface lines extending downward vertically. Locations are to be 1500 feet square in all cases in which previous locations do not prevent. The existing legal provision concerning tunnels is repealed. The present law in regard to locations gives an area of 600 by 1500 feet, but permits owners to follow the vein outside the lines. The effect of the proposed amendment would be to extend the area and to confine mining within the surface lines vertically extended. It would sweep away all extralateral rights, and is in line with the requirements of modern economy, but will not be likely to pass while Stewart of Nevada is in the Senate. He long since arrogated to himself the right to say what should and what should not constitute change in mining law, and "senatorial courtesy" has continued to concede the privilege that he has so often abused.

The Point of View.

The value of the services of a mine manager depends somewhat on his own estimate. If one can establish his value the world is ready to pay him the price he sets on himself. Just what to charge is often relative and comparative. Last week a California mine manager who is now paid $5000 per year was discussing with the writer the advisability of accepting a $9000 offer to go to South Africa. He figured it out this way: "What I am getting now is about my limit. I don't think I am worth more, that is, here in California; to go to South Africa means increased risk, it means greater effort; it should be worth more. The question is, Am I equal to the adventure? Then, five years in South Africa will age me more than ten years in California, and I ought to take that into account." This man had things "sized up" about right. A Colorado miner whom the writer met in Denver last April viewed the same matter from a different standpoint. He was paid $400 per month, and had an offer to go to Chile at $750 per month. He said: "To stay here means just that much, right along, and probably no more; to go to Chile means increased expense, poorer living, possible privation at times, a sort of exile from much that is agreeable, and the question is, Does the extra $350 per month justify the extra effort?" He also had the main idea. In such cases the possibilities of the future enter largely into one's thought even without his knowing it. The chance of there being something more than the mere salary, the consciousness that he may seize the skirts of happy chance and climb to fortune often impels one to accept a foreign offer when the salary in itself would not be a sufficient set-off to the added risk. Then comes the innate wish of every competent man to have a wider field of action, and comes, also, that strange and irresistible attraction that has ever impelled men to seek fortune in newer lands. And comes to mind in many such cases, the princely pay that many eminent American mining engineers have received in other lands, coupled with the thought, "I am as competent as So-and-So, who got $35,000 per year, or So-and-So who got $60,000. Pull or influence may get a place, but merit alone can hold it. I'll take it, and, perhaps, in two or three years, I, too, may demonstrate my ability and be able to get as big a salary." And right here we come back to the idea or fact stated in the first two lines. For the value that one sets on himself is often just the value in which he is held by the world, or that small part of it with which he is concerned. "I am offered $6000 a year and expenses and a two years' contract to go to Rhodesia," said a mining engineer to two of his friends some years ago. "Ask just double that; they'll think all the more of you," was the advice of one of them. He did so, and got it. There's something in that, and it is not solely confined to the ranks of mining engineers.

PEOPLE who turn their eyes away from an article where they see a line of chemical signs or symbols, and who duh such things "scientific gibberish," little think how chemistry contributes to their safety and comfort and profit. No department of practical science, not even metallurgy or electricity, shows greater progress in value than chemistry. If "beauty is its own excuse for being," then chemistry needs no excuse. It is the foremost factor in engineering and fills the field in many important daily duties. Mining and metallurgy of to-day are founded on chemical discovery; railroading, bridge building and manufactures in general depend upon chemistry as a base. The science of chemistry ministers to the daily wants of the miner and metallurgist, helps him to make money and preserves him from the perils of his occupation. Chemistry has made progress possible, and without chemistry the geography of the twentieth century would differ little from that of the eighteenth. In any large establishment the chemist has now a place recognized as of prime importance. Upon his skill and judgment depends many times whether the concern shall run at a profit or a loss. To make one illustration: In railroads of this country what is known as the Burlington system is prominent. It is a good road skillfully handled. Mr. Clark, the superintendent of motive power, writes that in the chemical laboratory of the road in Chicago during 1901 there were chemically tested and analyzed samples of axles to the number of 13,259. That may seem an unnecessary number of chemical analyses of axles, but anyone who has ever seen a railway disaster caused by a broken car axle will not think so. If these 13,259 chemical analyses of axles designed for railway use prevented one railway horror, it was time and money and skill well spent. During the year the same laboratory made chemical tests of cement 171 in number; of copper, 34; iron, 501; lead, 12; oil, 17; phosphor-bronze, 28; soda ash, 2; steel, 1817; coal, 33; paints, 24; water, 46—all this, of course, as a business proposition, illustrating the wide scope of railway management and the recognition of the economic importance of the chemist. Similar illustrations could be given in other departments of business throughout the country.

Assessing Unpatented Claims.

In our February 15 and April 26 issues the taxation of possessory claims was treated editorially. While any opinion this journal may give will not alter existing law, it may have effect in calling attention to a law unpopular, if not unjust. While the amount of the tax may be small in individual instances, it is large enough in others to be a burden on the prospector. The amount is dependent upon the valuation fixed by the assessor and the rate of taxation. In one California county, a valuation of an unproductive and undeveloped location was $500, the tax rate $2.50, the tax $12 50; in another county a claim, similarly undeveloped, was valued at $200, which with the rate of $2 made $4 tax. California possessory claims are taxed under the State law, but it seems it is not universally done, in fact it is not of common occurrence. From this it is concluded it is largely a matter resting for action with the assessor. It certainly is an unpopular measure, and possibly few of the assessors care to so offend their constituents as to enforce collection, as the payment of the tax is more often refused than made.

Within the last few weeks, several locations delinquent for taxes have been sold by the sheriff to the highest bidder; the State will give the buyer a deed to the claim. It will be the duty of the State to place purchaser in possession. Should the original locator forcibly oppose the attempt to place the purchaser in possession, it is not easy to say to what extent he would be justified in such opposition, nor how far the federal Government would protect the rights derived therefrom. It is difficult to see what rights or titles are thus conveyed by the State. The purchaser is presumed to take possession and acquire the same rights as were held by the late owner. But none of these rights have been conferred by the State. The federal Government agrees with the locator of a claim to sustain his possessory rights as long as he shall perform certain acts, and guarantee his right as against all comers. The U. S. Government conveys no title, it simply gives the protected privilege or sole right to prospect, develop and receive all benefits therefrom. Title rests in the United States and the claim is Government property until the further requirements for patent shall have been complied with, when title is transferred to the locator; the property then becomes real estate, and as such is liable to taxation.

The State may make laws relating to mining rights, but such laws may not conflict with the federal laws. Here certainly there would seem to be conflict. As the possessory right is derived from the U. S. Government, it is not plain how such right can be impaired or jeopardized by other than that Government.

As has been suggested in this journal, it is more than probable, if any person should make a test of this State law, the decision would be adverse to the law as it now stands.

THE consumption of copper has never been so large as at present, and every pound bought in New York as well as all that has been shipped abroad during the past six months has been actually consumed. The last week in May one firm sold 8,000,000 pounds; of this probably a very small quantity only went into speculative hands. Eastern opinion is that the U. S. Metals Selling Co. is trying to hold the price under 13 cents. It is asserted that it sold its entire output to June 1st at 11 cents; for July at 12 cents, and the output for August for 12½ cents.

Concentrates.

THE bucket elevator gold dredger originated in New Zealand twenty years ago.

THE addition of nickel to steel is to prevent crystallization.

THREE candles to a shift is the average, though four or even more would be required in draughty places.

THERE is no material advantage in having the exciter for an alternate generator run by a separate water motor.

MINERAL LANDS in forest reserves are subject to location and entry under the general mining laws in the usual manner.

A CYLINDRICAL wooden dam, with a radius of curvature of 30 feet, to resist a maximum water head of 200 feet should be 7 feet thick.

A LODE, LEAD, LEDGE OR VEIN is a plane of mineralized rock traversing a rock formation, but formed at a later period than the rock formation.

THERE is no silver mine being worked at present in California. Much of the gold produced, however, would involve the production of from 5% to 8% silver, if it were saved.

OF the three constituents of granite—feldspar, quartz and mica—the first named is the great clay maker. It disintegrates readily, loses soda and potash and soon becomes clay.

CHROME has been and can be produced in any desired quantity in California, but its slight demand and its coming as ballast in Atlantic vessels precludes profitable development.

A MACHINE DRILL will drill a 1 to 1½-inch hole 4 to 7 feet deep in one hour, depending upon the character of the rock, at a cost of 30 to 50 cents per lineal foot, labor $2 50 per day.

TAKING the standard of air compressor at sea level as 100, the barometer standing at 30 inches, at an altitude of 9000 feet, the efficiency would be 75.1%, the barometer standing at 21.22 inches.

A PIPE LINE with an area of 144 square inches, 2000 feet long, on a slope of a 10% grade, when full of water, would have a pressure of 86.8 pounds per square inch at the bottom of the pipe when full of water.

THE Government bonus for the manufacture of pig lead from Canadian ore in Canadian territory is $5 for each ton of refined lead so produced during 1902; $4 during 1903; $3 in 1904; $2 in 1905, and $1 in 1906.

"WRITE-UPS" of mining properties are valueless. They are ordinarily fulsome and unreliable, pleasing only those who want notoriety. The truth is generally good enough, and an exact statement of facts is more effective in every way.

BOILED LINSEED OIL can be made "at home." Boil the raw oil in open iron kettles, raising the temperature of the boiling oil to 450° F. If without a pyrometer to determine that degree of heat, stop boiling the oil when it is hot enough to scorch a feather.

THERE is practically no difference between electrical "generators" and "dynamos," except the first term is reserved for the larger sizes of machines such as are used in power station work, while any electro-magnetic machine producing electricity is a dynamo.

TO ASCERTAIN the diameter, speed or power to be transmitted in wrought iron shafting, D = diameter in inches, H = horse power to be transmitted, r = revolutions per minute: Diameter $D = \sqrt[3]{\frac{H \times 125}{r}}$.

OWNERS of valid mining locations made and held in good faith under the mining laws of the United States are authorized to fell and remove from such mining claims any timber growing thereon for actual mining purposes in connection with the particular claim from which the timber is felled or removed.

THERE are about 2000 different "minerals," but only about forty are of any likely importance to the miner or metallurgist. A "mineral" may be considered as an inorganic substance with a definite chemical composition, being composed of a single element or of several elements united in the form of a compound.

THE average rate of drilling with a diamond drill may be taken as 7 feet per hour, at a cost of $1 per foot, depending upon the character of the rock and depth to which boring is carried. These figures are based on average depths of 180 feet; for deeper holes in ordinary rocks 3 feet to 5 feet per hour and $1 to $2 per foot.

IF the cable splicer should find that his hands perspire too much for handling the paper-covered conductors, he can obtain dry hands by washing them in alum water. Where the weather is extremely hot, a mixture of paraffin and beeswax, in about equal proportions, will make a harder mixture and prove more satisfactory than paraffin alone.

BLUE PRINTS can be made waterproof by being immersed in melted refined paraffine. A good way to fix that kind of work is to get a dozen or so pieces of absorbent cloth, about 12 or 14 inches square, immerse them in melted paraffine until saturated, and after cooling they are ready for use. When it is required to waterproof a blue print spread one of the pieces of saturated clothe on a smooth surface, lay the dry blue print on it, put another saturated cloth on top and go over it with a moderately hot flatiron. The blue print will absorb the paraffine, will become translucent and thoroughly waterproof.

A CHARGE for galena and carbonate ore in fire assays could consist of a flux composed as follows: Pot. carb., K_2CO_3, 16 parts; sod. bicarb., $NaHCO_3$, 16 parts; flour, 5 parts; borax glass, $Na_2B_4O_7$, 8 parts; 5 grams ore mixed with 20 grams this flux in a 5 or 10 crucible and 20 grams more flux added as a cover with two or three nails for the galena ore.

THE words "chute," "shoot" and "shute," while nearly synonymous, are variously but confusedly used. "Chute" is a French word meaning shoot. "Shoot" is more commonly used to denote the pay rock or ore shoot; "chute" a wooden channel or box or a raise through which rock or timber (in the first case) are sent down to a bin or other convenient place; "shute" is rather uncommon.

THE word "banket," often used in referring to South Africa and Australia mines, is an auriferous alluvial conglomerate, in which the gold is said to have been precipitated from percolating waters. "Banquet" or "banket" is primarily a place of deposit of precious metals, which is probably the origin of the term. "Blanket" vein is generally applied to veins or deposits lying flatter than 45°.

ANY salt of soda is soluble in water, especially so in warm water. Soda salts precipitate only from saturated solutions, are not volatile, and hence soda may be found in the condensation, the cylinder and entire steam system, though dry steam does not contain nor carry soda, it being the moisture that holds the soda in solution. Tannate of soda is probably the best salt of soda for steam boiler use, when mixed with about four times its weight of tannin.

CHLORIDIZE and chlorinate are synonymous in that the ultimate result is the same, the combining of chlorine with a base forming a chloride. The term "chloridize" is applied to that operation where a chlorine compound, as salt, is added to an ore and the mixture roasted or otherwise treated, in contradistinction to chlorinate, where chlorine gas or chlorine water is caused to pass through the roasted ore, combining with the gold, forming chloride of gold.

IN such a coal mine explosion as that at Fernie, B. C., the change that takes place in the air of the mine at the moment of the explosion is as follows: The oxygen of the air is consumed, and immediately large quantities of carbonic oxide gas (CO) and carbonic acid gas (CO_2) and moisture are produced. The nitrogen of the air remains unchanged. All these gases form a deadly mixture, which is the afterdamp of the explosion. This is more destructive to life than the force of the explosion itself, as it suffocates all animal life.

DISCOVERY is the source of the miner's title. There can be no valid mine location without actual discovery of the vein or lode. A placer claim can not be "maintained by location on a porphyry dike." When the locator of a quartz lode finds rock in place containing mineral he has made a discovery within the meaning of the statute, whether assaying high or low. As to the tunnel site, the court decisions thereon are so conflicting that it is impossible to make any statement that could not be successfully contradicted. The better way is to go strictly by Sec. 2323, United States Revised Statutes.

GAS ENGINES are governed in two ways: First, by missing one or more working strokes, and, second, by varying the proportion of air and gas composing the explosive mixture, so that the explosions will become subdued as the speed of the engine increases, and heavier when the speed is decreased. The latter method is capable of producing a uniform speed with somewhat better economy and less weight in the flywheels, and is being given considerable attention by inventors. The throttling of the gas is performed by a governor driven from the main or auxiliary shaft and operating a suitable gas valve. The governor is frequently of the flyball type.

THE Tonopah, Nev., ledges are covered by a lava flow and, with possibly a few exceptions, there is no outcrop. Discoveries of the ledge are made by sinking through lava; 100 to 175 feet is the general thickness of this flow. In order to make a location, notices are posted announcing the intentions of the claimant. Should another sink on the same ground and discover the ledge first, he is entitled to the ground by right of first discovery. The first claimant must take such chances. Generally, the first comer's rights or presence are recognized and due diligence in his work is respected. In such a formation claims can not be located as placers nor as quartz locations are ordinarily located. Discovery alone gives a clear title. After the course and dip of the ledge are ascertained, the same may be extended to the surface and the boundaries of the claim marked.

IN modern manufacture of sulphuric acid sulphur or pyrites is burned in suitably constructed furnaces, the gases from the sulphur being brought in contact with nitric acid and then condensed in large lead-lined rooms, making the sulphuric acid of commerce. Production of muriatic acid is carried on by adding sulphuric acid to salt, which evolves gas, which is passed through earthen vessels partially filled with water, which absorbs the gas and gives the commercial muriatic or hydrochloric acid. Further distillation of the commercial hydrochloric acid gives C. P. muriatic acid, used by chemists and assayers. Manufacture of nitric acid is difficult and dangerous. It is carried on in sealed retorts, wherein sulphuric acid and nitrate of soda are charged, and by direct fire heated up until the gases are driven off in the form of nitric acid vapor, passing through earthen jars where the same is cooled off, the gases condensed, leaving the jars commercial nitric acid.

TO DETERMINE the amount of lead in an ore where because of an unusual percentage of copper the ordinary fire assay is not satisfactory, the ore or matte is first treated with nitric acid, the solution then diluted and filtered, precipitation effected by sulphuric acid, throwing down sulphate of lead, sulphate of baryta, sulphate of strontia and sulphate of lime. The precipitate is then washed down to the point of the filter with water, to which two drops of sulphuric acid are added, then dried. The dry precipitate is placed in a small clay annealing cup, the filter ignited, the ashes added to the precipitate in the cup. Cyanide of potassium equal to about five times the weight of the precipitate is then added and the whole of the contents of the cup fused at a low heat over a spirit lamp. The lead sulphate is soon reduced to metallic lead, settling in the bottom of the cup. The cup is allowed to cool, and then, with the contents, placed in a porcelain dish with water. The cyanides then dissolve, leaving the metallic lead, which is dried and weighed.

IN the North Queensland, Australia, slimes treatment, the slimes are trucked down to the works, and the required quantity of quicklime to neutralize the acid contained in them is added as the trucks are emptied into a hopper discharging into a disintegrator. The lime required per ton of dry slimes varies from twenty to sixty pounds. After passing through the disintegrator, the powdered mass is raised by a bucket elevator to a top hopper, which discharges into side-tip trucks running over the tops of the vats. Over each vat is a 6-inch centrifugal pump, the suction pipe of which descends at an angle to within 2 feet of the bottom of the vat, the discharge pipe continued down to the floor of the vat, where it terminates by a right angle bend on a swivel point, so that the flow can be directed across to any part of the vat. The vat being filled with solution of cyanide, the centrifugal pump is started, and in a few minutes the whole mass of liquor is in violent agitation. Into this agitated liquor the powdered slime is dropped, truck by truck, until the whole charge, amounting to ten tons, is delivered, the agitation being maintained the whole time. A few minutes after the last truck is dropped in the pump is stopped and the whole mass allowed to settle; this occupies twenty minutes, the solution being left absolutely clear on top. A pipe, mounted with swivel joint, and connected with the pipe service leading to the zinc extractor boxes, is then gradually lowered till the whole of the supernatant solution is drawn off. The vat is then filled with the weak solution, and the pump again set in motion; in a few minutes the whole mass is once more stirred up and the first process repeated. After the second solution has been drawn off clean water is added, and after the mass is thoroughly worked a plug in the bottom of the vat is opened and the thin stuff run off in wooden launders, whence it is raised and delivered away by a large centrifugal pump.

FEET multiplied by .00019 equals miles; yards multiplied by .00063 equals miles; square inches multiplied by .00695 equals square feet; circular inches multiplied by .00546 equals square feet; square feet multiplied by .111 equals square yards; acres multiplied by .4840 equals square yards; square yards multiplied by .0002066 equals acres; width in chains multiplied by .8 equals acres per mile; cubic feet multiplied by .03704 equals cubic yards; pounds multiplied by .009 equals hundredweight; pounds multiplied by .00045 equals tons; cubic foot of water multiplied by 62.5 equals pounds avoirdupois; cubic inch of water multiplied by .03608 equals pounds avoirdupois; cylindrical inch of water multiplied by .02842 equals pounds avoirdupois; cylindrical foot of water multiplied by 49.1 equals pounds avoirdupois; cubic inches multiplied by .004329 equals U. S. gallons: cylindrical feet multiplied by 5 874 equals U. S. gallons; U. S. gallons of water multiplied by 13.44 equals one hundredweight; U. S. gallons of water multiplied by 268 8 equals one ton; cubic feet of water multiplied by 1.8 equals one hundredweight; cubic feet of water multiplied by 35.88 equals one ton; cylindrical foot of water multiplied by 5 875 equals U. S. gallons; diameter of a circle multiplied by 3 14159265 equals circumference; diameter of a circle multiplied by .8862 equals side of an equal square; diameter of a circle multiplied by .7071 equals side of an inscribed square; square of a diameter multiplied by .7854 equals area of circle; circumference of a circle multiplied by .31831 equals diameter; side of a square multiplied by 1.128 equals diameter of equal circle; square foot of an area multiplied by 1.12837 equals diameter of equal circle; square of the diameter of a sphere multiplied by 3.1416 equals convex surface; cube of the diameter of a sphere multiplied by .5236 equals solidity; diameter of a sphere multiplied by .806 equals dimensions of equal cube; diameter of a sphere multiplied by .6667 equals length of equal cylinder; cylindrical inches multiplied by .0004546 equals cubic feet; cylindrical feet multiplied by .02909 equals cubic yards; lineal feet multiplied by .00019 equals statute miles; lineal yards multiplied by .000568 equals statute miles; column of water 12 inches high, 1 inch diameter, equals .341 pound; 183 346 circular inches equals 1 square foot; 2200 cylindrical inches equal 1 cubic foot; French metres multiplied by 3.28 equals feet; kilograms multiplied by 2.205 equals avoirdupois pounds; grams multiplied by .002205 equals avoirdupois pounds; square of diameter of cylinder in feet multiplied by depth in feet and by .14 equals barrels of 42 gallons.

Auriferous Gravels and Hydraulic Mining.*

By W. S. WELTON.

Cemented gravel, although hard, will disintegrate in water; its hardness is evidently due to compression. It is generally richer in gold than in other gravels. The hydraulic method has been found to be economical for working gravel deposits when of considerable depth and sufficiently above the level of a valley to admit of a discharge for the tailings. A supply of water, not less than 500 miners' inches, with a head of not less than 200 feet, is required; with an increased water supply and greater fall the advantages of the hydraulic system are more notable. An economical deposit for working is one having a depth of 150 to 200 feet. Beyond this depth it is necessary to work the deposit in two benches; when the bank is low, the cost of working is increased by the necessity of frequently advancing the sluice and pipe lines to reach fresh ground. It is advantageous to carry the working face the full width of the channel, that there may be considerable space of cleaned-up bedrock behind the hydraulic monitor for the deposit of debris, and thus obviate the necessity of having to handle these a second time. With a wide face the cost of advancing the sluice is less in proportion to the amount of gravel washed.

With the hydraulic jet a certain amount of skill is required in the pipe man to make the best use of it, some men piping down and washing twice as much dirt as others, working with the same monitor. The main objects to have in view are to keep the sluice continually running with the full amount of dirt that it will carry, and, at the same time, to combine the fine dirt with the boulders, as the stream will then run off boulders which would not move with clear water, and the continued running of gravel is considered to prevent the loss of gold in the sluice.

To those accustomed to dressing operations in the concentration of minerals and the necessity of sizing the particles of ore to obtain the best results, it may appear impossible that small grains of gold should remain in a sluice through which so large a supply of water is running with a velocity powerful enough to carry down boulders; but, under the above conditions, a sluice with wooden blocks will catch a large proportion of the finest grains of gold; the boulders, in rolling down the sluice, keep the material in a constant tremor by striking the blocks as they rapidly turn over; this apparently produces an effect in the sluice similar to that of the hammers on a packing sieve (a large tub used by Cornish miners for the final concentration of tin ores), and the belief of some hydraulic miners that, when the sluice runs clear water, or no boulders, a loss takes place by the water boiling the gold out of the riffles, appears to confirm the above theory.

With respect to the smallness of the grains of gold recovered in a sluice, it may be mentioned that, after a second straining of the quicksilver through double unbleached calico, a sediment of amalgam will be found in the quicksilver tanks after these have been stored a few weeks.

With regard to the sluice, a grade of 6 inches in 12 feet is the most usual; but, if the water supply is large, this may be reduced. The rule appears to be that the grade must not be so small as to allow of the riffles being rapidly filled with black sand, as the gold will then float over them.

The author has obtained a better result from cleaning up the head of the sluice every four weeks than by running a longer period; and he attributes the relatively inferior results from long runs to the riffles filling with heavy sand, in consequence of which a portion of the gold is carried down to the lower portion of the sluice and undercurrents.

The best extraction of gold will depend upon the condition of the sluice and the manner of blocking it. The sluice may be either paved with square blocks, cut across grain, or with the slightly flat quartz boulders found in the gravel. Blocks may be of any size and from 8 to 12 inches long. They are placed on end in the sluice in parallel rows, set apart from 1 to 1½ inch by means of strips of wood 2x1½ inches, squarely placed upon the bottom of the sluice, with their ends secured under the sluice lining, which is kept 1½ inch above the bottom for this purpose. The cross-channels thus formed are termed riffles. In rock pavement the interstices between the rocks form the riffles, and the rocks are placed on end and inclined about 70° up stream, then wedged by driving small pebbles into any vacant spaces. A trial of the relative advantages of rocks and blocks, and the distribution of gold in the sluices, was made at the Colombian Hydraulic Co.'s mines, South America, the sluice being paved alternately with rocks and blocks, and the gold-amalgam collected from each section separately on cleaning up the entire length of sluices. There were no undercurrents, as they require a fall of about 8 feet each, and there was no grade to spare. The sluice generally had a grade of 6 inches to 12 feet. The following are the results which were obtained:

Feet.	Distance From Head of Sluice.	Amalgam Obtained. Ounces	Equal to Per 10 Feet of Sluice. Ounces.
216	rocked, grade 6 inches	137	6.342
163	blocked "	300	18.405
502	cut in rock, without sluice, but cleaned down	...	.....
436	rocked, grade 6 inches	120	2.752
310	blocked "	305	9.838
1,135	rocked, grade 9 inches	23	0.202
579	blocked, "	20½	0.354
3,341		905½	

A quantity of free gold, some of which was rusty, was found in the upper portion of the sluice; less in the blocked portion below; then a much larger portion—probably one-third—below this; and in the last 1714 feet nearly all the gold was free and in thin scales, as if much worn.

The result of the experiment was in favor of blocking the sluice, the relative value for catching the gold being: Blocks, 75.4%; rocks, 24.6%.

Rocks, however, used in a sluice for carrying off tailings may prove economical for this purpose, as they last a long time. A rocked sluice should have 50% more grade than a blocked one, if required to carry the same quantity of dirt.

The undercurrents receive the gravel minus the boulders which have been separated from the dirt by the grizzly. It might appear well to give these less grade than the sluices, to allow the light gold to settle. This is not the practice, however, and undercurrents have double the grade of the sluice; but, taking into account their extra width and relatively diminished force of water, they may be considered to be working under similar conditions to the sluices. Only the heavier sands remain on the undercurrents, and these would quickly fill up the riffles and allow the gold to flow over them if the grade were less than it is. Fortunately, the heavy sands are in small cubes, which roll faster than the gold, which is in thin scales, and this appears to allow of the concentration of the gold in the riffles with small loss. Then, the riffles being shallow, the quicksilver remains more on the surface in contact with the gold than in the deep riffles of the sluices.

From the small proportion of gold found amalgamated in sluices, it may be inferred that the riffles are instrumental in collecting it. It is difficult to prevent quicksilver settling down to the bottom of the riffles, and a trial was made of inserting shallow troughs of quicksilver into the riffle spaces; these collected most of the gold in a short distance from the head, but the wear and tear of the troughs was so great that they had to be abandoned.

In gravel deposits the gold is accompanied by a quantity of black magnetic iron sands. Pebbles of ironstone are also found, called by South American miners madre de oro, because their presence is said to indicate increased richness of the gravels.

The greatest difficulty in panning is to get rid of the black sand without loss of the smaller particles of gold; the last cleaning of the dust is generally carried out with a magnet, or the dry blowing-out of the last of this sand. In a sluice the separation of the black sand appears to be more easy than in the pan, owing to the boiling movement of the water in the riffles. The reason why rocks do not catch the gold as well as blocks is that they do not form a continuous bar across the sluices, and the gold in consequence escapes through the depressions between the points of the boulders.

It is noted that amalgamated gold is much less easy to retain or collect in a pan than gold dust, and this is possibly due to the tendency of dry amalgam to form into rounder grains. At many hydraulic mines people make wages by cleaning the bedrock and gullies formed in the tailings by floods; and it is notable that the gold so obtained is invariably a dry amalgam, and not free gold. Dry amalgam may be found in the sands of rivers miles below the outlet of a hydraulic mine. The gold must have been retained for some period in the riffles of the sluices to be so amalgamated, and then, in all probability, it escaped through the filling up of the riffles with black sand. Beyond this the author has been unable to find any evidence of the loss of gold in the extraction as practiced at hydraulic mines.

The proportion of gold recovered in the upper portion of a sluice to the total gold recovered will depend on and vary with the size of the grains of gold. At some California mines 80% of the total yield was recovered in the first 200 feet of blocked sluice. At the Colombian Hydraulic Co.'s mine the gold was in very small grains; hence it traveled a greater distance. The author has found that at most mines, with 500 feet of blocked sluice and two undercurrents, all the gold that it will pay to collect may be recovered. The undercurrents, with this length of sluice, give from 10% to 15% of the total.

At a run at Gardner's Point, Cal., of 100 days, with a clean-up of $64,000, the first 150 feet of sluice produced $54,000, or 85.72% of the total; then 640 feet of sluice produced $6000, or 9.53%; and, finally, three undercurrents produced $4000, or 4.75%.

At the North Bloomfield mine, Cal., 2,919,000 cubic yards of gravel gave the following results: From the sump, 0.80%; 1800 feet of sluice, 92%; the tunnel below the sluice, 3.75%; 300 feet of tail sluice, 0.95%; and the undercurrents, 2.50%.

Taking the above examples, and the run at the Colombian Hydraulic Co.'s mines, it will be noted that only a small percentage of the gross yield in gold reached the tail sluices, and from this it may be inferred that the loss of gold was small, unless the gravels contained a large portion of float gold—a point very difficult to determine, as pan tests have not led to its discovery in any quantity.

A test made by F. S. MacArthur upon a sample of auriferous gravel may, however, throw some light upon this subject. The sample, dissolved in water and agitated with quicksilver, yielded 90.963% of the total gold contents; it was then dried and treated with cyanide solution, yielding 0.593%; it was then ground and reamalgamated with quicksilver, yielding 7.413%; and, finally, it was dried and again treated with cyanide solution, yielding 1.031%. The residues were then assayed for gold, and were reported to have given a trace of gold. The total gold obtained by amalgamation was 98.376%, and by cyaniding 1.624%.

At Gardner's Point, Cal., 448,000 cubic yards of dirt were run off, yielding $140,000, and the tailings were caught and confined in a ravine below the claim. The length of sluice at the mine was 1378 feet, with three undercurrents; the ravine, supposed by many to be exceedingly rich, was cleaned up and the gross yield was $1168, or not 1% of the total receipts from the washings.

Probably no gravel deposit has had so much prospecting as the property of the North Bloomfield Gravel M. Co., California; $63,956.20 was expended in these operations. Four shafts were sunk. No. 1 shaft struck bedrock at a depth of 207 feet, and drifts were driven from the bottom of this shaft a distance of 1200 feet on the course of the channel, and the width was estimated at 500 feet. The aggregate length of the channel explorations was over 2000 feet. The samples of the various drifts indicated a value of $2.01 per cubic yard. The actual yield of 21,644 tons of gravel extracted from these drifts was about $2.75 per cubic yard, but it must be noted that this was bedrock gravel. The average yield per cubic yard of the entire gravel appears to have been as follows: 1894–95, 3.99 cents; 1895–96, 6.60 cents; 1896–97, 12.68 cents; 30,000,000 cubic yards of gravel washed gave an average yield of 8.7 cents per cubic yard.

*5 to 20 cents per pan of dirt.

From Table I a rough indication of the varying richness of the gravels is obtained, and some idea may be formed of the difficulty of obtaining a correct estimate of the average richness of the deposit. It will be seen that the upper 195 feet of gravel contained little gold as compared with the last 12 feet. Consequently, the yield of the gravel from the drifts could not be considered a test of the value of the whole deposit, and, taking into consideration the circumstance of the very unequal distribution of the gold, together with the fact that for some considerable period the runs would have a much larger proportion of the top dirt to bedrock cleaned than a perpendicular section would give, the results do not appear to indicate a considerable loss of gold in the extraction.

Table II gives details of an auriferous gravel deposit in the United States of Colombia, S. A., in which the gold was also unequally distributed and over 33% of the ground was barren.

In pan tests of auriferous gravels no account is taken of large boulders and beds of unproductive

*Condensed from a paper read before the Inst. Min. Engineers.

sand, and these not infrequently form a large proportion of the deposit; hence a great reduction should be made upon a valuation based upon such tests. Even an estimate based upon the working of a portion of a gravel deposit by hand requires considerable reductions to be made, because in this case the overburden and poorer portion of the deposit is first stripped and got rid of by what are termed "booms" of water before any attempt is made to break into the auriferous portion of the gravel—this being the most economical way of getting rid of the worthless dirt, which, if broken with the gravel, would undoubtedly carry off a portion of the gold. Finally, the most reliable test of a gravel deposit appears to be the averaging of the results obtained by means of a number of boreholes.

TABLE II.—SECTION OF AN AURIFEROUS GRAVEL DEPOSIT IN THE UNITED STATES OF COLOMBIA, SOUTH AMERICA.

No.	Description of Strata.	Thickness of Strata. Ft.	In.	Depth From Surface. Ft.	In.
1.	Red earth. Without gold	34	0	34	0
2.	Fine red gravel. Poor	22	6	56	6
3.	Red sand; soft. No gold	5	6	62	0
4.	Coarse red gravel, with boulders 50 lbs. in weight. Rich streak near upper portion; rest is poor.	90	0	152	0
5.	Yellow sand. Hard. No gold	4	0	156	0
6.	Yellow and blue gravel. Coarse. Moderately rich	15	0	171	0
7.	Blue sandstone. Moderately soft. No gold	4	6	175	6
8.	Blue gravel. Moderately rich	22	0	197	6
9.	Blue sandstone. Hard	7	0	204	6
10.	Blue gravel. Hard. Moderately rich	11	0	215	6
11.	Lava bed, with angular grains of quartz	2	6	218	0
12.	Hard blue gravel. Richer than last	6	0	224	0
13.	Bed of fine, dark sand, with carbonized wood	7	0	231	0
14.	Lava	4	6	235	6
15.	Hard blue gravel; blasting ground. Rich	4	0	239	6
16.	Lava	5	0	244	6
17.	Hard blue gravel; blasting ground. Rich	5	0	249	6
18.	Lava	12	0	261	6
19.	Hard blue gravel; moderately coarse. Rich	9	0	270	6
20.	Lava	11	0	281	6
21.	Bedrock gravel; moderately coarse. Rich	7	6	289	0

NOTE.—The total depth comprises 97 feet of unproductive strata and 192 feet of productive gravel.

That results obtained at gold washings are sometimes less than reports upon the property would appear to indicate is true; the same may be said of vein mines, not necessarily on account of bad extraction, but probably on account of the manner of taking average samples of the material. The method of testing gravel deposits by boreholes should give much more reliable data than the old system of testing the outcrop and sinking a few shallow pits, as the outcrop of a gravel deposit is generally a concentration of the broken gravels, from which the less rich portion has been washed off in the course of ages, and the pits very rarely reach the bedrock before the amount of water encountered becomes too great to deal with.

Without doubt, hydraulic mining is the cheapest class of mining known, and, with abundance of water and gravel, large profits may be made from very poor ground. There are, however, other gravel deposits, rather more costly to work, but much more abundant in gold—namely, deep leads and shallow placers—which merit the attention of miners.

Fire Assay of Lead.

When the fire assay of lead is rendered unreliable by the buttons being alloyed with copper, the following method has met with success:

The lead ore or matte is treated with nitric acid, and the solution is diluted and filtered; precipitation is effected by sulphuric acid, throwing down $PbSO_4$, $BaSo_4$, $SrSo_4$, and $CaSo_4$. The precipitate is washed down to the point of the filter with water, to which a drop or two of sulphuric acid is added, and then dried. The dry precipitate is placed in a small annealing cup of clay and the filter is ignited; the ashes are added to the precipitate in the cup. Cyanide of potassium equal to about five times the weight of the precipitate is then added; a larger quantity will do no harm. The whole of the contents of the cup are fused at a gentle heat over a spirit lamp. The lead sulphate in a few minutes is reduced to metallic lead —C.P.—which settles in the bottom of the cup. The cup is allowed to cool, and then, with contents, is placed in a porcelain dish with water. The cyanides readily dissolve, leaving the metallic lead, which is dried and weighed.

NEGOTIATIONS are in progress to combine all the soft coal mines of Ohio, Pennsylvania, Indiana and Illinois into one corporation with a capital approximating $300,000,000.

Treatment of Highly Acidic Tailings by Cyanide.

By F. B. STEVENS.

The Rand batteries are almost all situated on a gentle southward slope, and the tailings have been accumulated in earthwork or sandbag dams. The tailings settled in one dam and overflowed into a second, where the last of the slimes settled, and the comparatively clean water was pumped back to the battery. The tailings, entering the dam in most cases at the shallow end, deposited the bulk of the heavy pyrites that had escaped the vanners and the coarsest of the sand at that end; toward the middle of the dam medium sands and finer pyrites, and at the end and deepest part the slimes and very fine sand and pyrites settled. The first tailings accumulated, being from the free milling ore, gave good extraction, with low consumption of cyanide, owing to their freedom from sulphates and sulphuric acid. In some cases, however, they had been dammed in watercourses where there had been a considerable growth of grass and rushes, and the decay of this vegetable matter generated such an amount of humic acids that all attempts to profitably treat such tailings ended in failure. The African Gold Recovery Co. acquired the rights over tailings deposited over 3 miles of the Natal creek, but the enormous consumption of cyanide and the low extraction, combined with bad precipitation, left little if any profit, although the tailings were fairly rich. In the treatment the ore was mixed with lime after a preliminary water washing, and washed with caustic soda solution till quite alkaline, but still the consumption of cyanide was high. The solution came through the boxes an earthy brown color, and quite thick, very often with organic compounds formed from the action of the vegetable acids on the cyanide. This brown matter coated the zinc to such an extent that precipitation almost ceased, and nothing but continual stirring would keep the zinc clean. The precipitate, when cleaned up from the zinc boxes, was very poor in gold, and was troublesome and expensive to smelt.

When I was appointed manager of a company that was working the tailings of the Wemmer Gold Mining Co., Johannesburg, the extractions were bad, the consumption of cyanide and caustic soda was high, and the precipitation of the gold bad. The solutions, after running through the boxes, assayed over an ounce of gold to the ton of solution, and the bottoms of all the solution sumps were caked to a depth of a foot with solid iron hydrate. The tailings were highly pyritic, and the pyrites oxidized in a remarkably short time, owing to the pyrites being largely marcasite. The tailings were heavily charged with ferrous and ferric sulphates and free sulphuric acid, and if put into a funnel and leached with water the solution came off deep red in color. This color had nothing to do with the action of potassium sulphocyanate on salts of higher iron. Shovels only lasted a fortnight on these tailings, becoming as thin as paper in that time. The works had always shown a large discrepancy between the extraction as shown by assays and the actual extraction, in spite of very careful sampling. The sampling was done by taking a sample from each truck going to the works and from each truck leaving the vats, by means of an ordinary hollow rod. Moisture assays were continually made to get the correct dry weight of the tailings. (Sampling a treated vat with a rod is a very bad method, as the ore is generally poorer on top than down below, and the rod filling at the top with poor sand goes down to the bottom filled, and the result is a lower assay and a higher extraction than is really the case.) It had been the practice to leach these tailings with water in the same vats that cyanide treatment was being carried on in. Mr. W. R. Feldtmann, who was a director of the company, suggested that gold was being lost during the water washing, owing to sufficient cyanide remaining in the wood and filter bottom to react with acid and generate cyanogen, which would rise through the ore, forming soda-cyanide with the caustic soda in the water washes. On assaying the tailings before and after washing, as high a loss as 1 dwt. of gold per ton was found. Mr. Feldtmann then suggested that water washing should be carried out in a separate vat, and the sands transferred to another vat for cyanide treatment. This course was adopted and the loss of gold ceased. The process as then carried out was as follows: After twelve hours' washing with water only the sands were transferred to another vat and mixed with lime and given a wash of caustic soda. All these washes were run to waste. To prevent iron hydrate from getting into the zinc boxes, it was found a good plan to fill the vat to a depth of 3 inches with sand, and then spread over it a layer of lime. In spite of all the water washing, there would be as much as 3 inches of iron hydrate over the layer of lime in some very acid vats, owing to the proportion of insoluble basic iron sulphate in the sand being high. After the washes began to come off distinctly alkaline the ordinary cyanide treatment was carried out.

Before the prolonged water washing treatment was carried out it was no uncommon thing, I believe, for the solution to come off sky blue, from the formation of prussian blue by the action of basic iron sulphate on cyanide of potassium. This acid solution was run through the zinc boxes just as it was causing a great consumption of zinc with very little precipitation of gold, and after that, probably, run into a sump containing cyanide solution, the result being wholesale decomposition of cyanide according to the following equation:

$$H_2SO_4 + 2KCy = K_2SO_4 + 2HCy.$$

So charged were the solutions with HCy that they were positively dangerous, and two cows that managed to get only one lick each at a vat tumbled over dead without a quiver. Once or twice afterwards, owing to insufficient washing, prussian blue came down, but we took care to run on caustic soda, which broke it up according to the equation:

$$3FeCy_2\ 12Fe_2Cy_6 + 12NaOH = 3Na_4FeCy_6 + 2Fe_2(OH)_6,$$

and any free acid was neutralized at the same time. The solution was then strengthened with fresh KCy and run through the zinc boxes.

We never succeeded in reaching a normal consumption of KCy, owing to the fact that the ferrous hydrate precipitated in the vat by the caustic soda acted on the cyanide to form caustic potash,

$$Fe(HO)_2 + 6KCy = 2KHO = K_4FeCy_2,$$

and this difficulty could not be got over. The ferric hydrate has no action on cyanide, and, fortunately, ferric sulphate is the principal sulphate formed when iron pyrites undergoes oxidization. Covering the bottom of the tailings vats with a layer of lime effectually stopped the iron hydrate from reaching the zinc boxes, and the solution came through quite clear. The slimes in many dams were far more acid than the tailings, not through their containing more pyrites, but owing to the fact that the rain water washed the iron salts out of the tailings, and they were absorbed by the slimes, which, after a stretch of dry weather, became ready to absorb more acid; and no matter how heavy the rain was, it never washed any acid out of the slimes. The lumps of slime that got into the vats along with the tailings invariably went out richer than they went in. The slime lumps went into the vat comparatively dry and absorbed gold-carrying cyanide solution, and no amount of washing would wash that solution out. Such lumps of slime when broken showed concentric rings of prussian blue, which, however, very seldom penetrated more than 1 inch. Some managers used to break up the slime into fine lumps and mix with clean tailings. This might answer where the slime was dry and consisted of very fine quartz sand, but with clayey slimes I doubt very much whether it is not a waste of time, owing to the absorption of solution by such material.

The Contact Vein.

The contact vein is one lying between two distinct kinds of rock—two dissimilar rocks—in which the dissimilarity has a genetic relation to the deposit. The contact lode may there be variously produced. It is found between sedimentary rocks; between sedimentary and igneous rocks; between two igneous rocks, or between a dike and the various sedimentary or igneous rocks it traverses. It may, therefore, at times be difficult to distinguish from an irregular deposit a bedded or even a fissure vein. For it may exist in irregular masses filling the spaces between the junction of two dissimilar rocks, or it may have been deposited parallel to the stratification between stratified rocks, or it may be scarcely distinguishable from a fissure vein, which by reason of a heavy throw has two walls of rock of different kind and age.

While subject to defects—common also to the fissure vein—the contact lode has certain favorable idiosyncrasies. Like the former, it follows the irregularities imparted to the rock faces in upheaval; it may also suffer from sliding and faulting; but, on the other hand, as it retains a constant relation to the enclosing rock, it is likely to be more uniform in structure and filling. Another peculiarity of the contact lode between sedimentary rocks or sedimentary and igneous rocks is its certainty to flatten out with depth. This follows from the fact that no stratified bed can continue to descend indefinitely. This feature, more pronounced as the inclination or dip of the contact more closely approaches the horizontal, is of importance in mining. It obviates the necessity of deep sinking, with its attendant costs and limitations, and it enables cheap and shallow shafts to exploit large lode areas. Far from being a class of deposit from which the mining investor should shrink, it is one that may, if the required conditions are found to be present, be exploited with as much confidence as the fissure vein. As instances of valuable lodes of this nature may be mentioned the deposits of red oxide of copper between limestone, granite and slate in Arizona; the copper pyrites between clay-slate and diorite at the Tanokuchi mines, Tosa, Japan; the sheets and strings of copper concentrated at the junction of trap and sandstone on the south shore of Lake Superior; the series of deposits at Leadville, Colorado; the auriferous deposits in Ouray county, Colorado; the Comstock lode, Nevada, and the copper pyrites at Sulitelma, Norway.

Costs and Profits in Pyritic Smelting of Low-Grade Copper Ores.

NUMBER V.

Written for the MINING AND SCIENTIFIC PRESS by F. H. PRENTISS, E. M.

Diagram No. 11 is designed to show the effect of varying losses of copper, gold and silver in concentrating when the high grade ore is fluxed by means of the concentrates, and the resulting slag carries 50% SiO_2. As in the first diagram, the line a d is the line of no profit when barren limestone is used as a flux. Were it possible to concentrate without any loss of gold, silver or copper, all of the ore falling below the line a c and to the left of the line a b would be more profitable to concentrate than to smelt direct, provided, of course, that the concentrates were utilized to replace the limestone. The diagonal line below a c and marked 20 at its termination, is the line for 20% loss in concentrating where it begins to be more profitable to concentrate and to sustain a loss of 20% rather than to smelt with limestone, and similarly for the lines below marked 25, 30, 35, etc. The line immediately to the left of a b, marked 20 at its terminal, is the division between concentrating and waste dump ore on a loss of 20%, and similarly for other percentages; the remaining lines to the left designate the type and value of ore where concentrating ceases to pay for the particular loss shown. It is clear that with a high coke cost there is a very large percentage of ore which it is more profitable to concentrate than to smelt, even though sustaining a heavy loss in the concentrating. Diagrams for a 40% SiO_2 and a 30% SiO_2 slag would show results still more favorable to concentration. The average ore of the mine examined was of type I and its matting value about $12 per ton. The intersection of the horizontal line for type I and the vertical line for matting value $12 (marked X) shows a profit on the diagram for smelting of $1.20 per ton—the lines parallel to a d showing profit by smelting. Measuring from point x horizontally to the right to line of 20% loss, and reading the length on the appended scale along the line of 20% loss, shows a concentrating profit of $7.20 per ton; and measuring

similarly from x to the diagonal lines of other losses and applying to the scale, we find the corresponding profits.

Smelting with limestone.....$1.20
Concentrating with 20% loss and replacing limestone with concentrates..... 7.20
Concentrating with 30% loss and replacing limestone with concentrates..... 5.90
Concentrating with 40% loss and replacing limestone with concentrates..... 4.70
Concentrating with 50% loss and replacing limestone with concentrates..... 3.60
Concentrating with 60% loss and replacing limestone with concentrates..... 2.40

The necessity of concentrating part of the ore in order to flux the balance is clearly shown—even a high loss in concentrating is preferable to direct smelting with barren flux. In diagram No. 10 we have the means of determining at a glance the amount of ore of one type that must be concentrated to flux a given amount of another type to form slags of varying percentages of silica. Take, for example, 100 tons of type C and it will be seen that to flux it to a 40% SiO_2 slag will require 250 tons of ore of type G. Starting where the lines converge at 40%, follow the right-hand line (A) down to horizontal line C and read to the left A B C D E F G (point marked X) and at bottom of diagram result is shown. Let us make a 50% SiO_2 slag by fluxing ore of type E with itself. Point y shows that to every ton smelted there must be 1.35 ton concentrated. Suppose the ore to have $12 matting value and to sustain a loss of 25% in concentrating. On diagram No. 11 the ore is shown by point y and the smelting profit is given at $4 and the concentrating at $6.80. The profit therefore is ($4 + 1.35 × $6.80) ÷ 2 35 = $5 61 per ton. This is shown in diagram No. 12 at the intersection of the horizontal line of type E with the line (nearly vertical) connecting point h with the diagonal dotted line of 50% SiO_2 slag.

This diagram No. 12 is made in the manner just indicated and covers any type of ore of matting value of $12 which is made self-fluxing by the concentration of the right proportion to form slags of 30%, 40%, 50% and 60% SiO_2. The nearly vertical lines radiating from h terminate in the dotted lines where the ores become self-fluxing for that particular slag. It is to be noted that ore of type I, which is the average of the mine, only varies from a profit of $5.60 for a 30% slag to $5.85 for a 60% slag, showing how little is the effect upon the profit, of the silica percentage in the slag, provided barren limestone flux is omitted—in fact, the type of ore itself has but little to do with the profit question, as is readily seen by the diagram. The greatest variations (in the diagram) are from 24% SiO_2 to 67% SiO_2 in the ore, and from 30% SiO_2 to 60% SiO_2 in the slag, while the greatest variation in profit is from $5.40 to $6. This covers a matting value of $12 per ton and a concentrating loss of 25%. It is obvious that by sorting the ore less silica will go to the smelter, and that the concentrating loss will fall upon a lower grade of ore. In this manner an additional profit of from 25 cents to $1 (25 cents on a low concentrating loss and $1 on a high concentrating loss) per ton may be secured on all the ore mined, thus making a total of $6 profit under the poorest conditions.

However desirable it may be to concentrate a part of the ore, a loss in the mill is not to be neglected. Diagram 13 shows the effect of this loss per ton of ore mined. In this diagram, to avoid a multiplicity of lines, only two slags (40% and 50%) have been calculated, but the concentrator losses range from 10% up to 40%. Each type of ore is fluxed with itself, and therefore sorting would show better results. Take ore of the type I as before and the profit per ton of ore mined is $4.40 with a 40% mill loss and $7.20 with a 10% mill loss. Ores like type C (which shows a range from $4 90 to $6 70) having less silica are less affected by variations in concentrating loss, since a large proportion can go direct to the smelter. Where concentrating loss is high (40%) the less siliceous ores show better profit, while a low loss in concentrating (10%) shows a better profit for the ores high in silica, since it is the cheaper method of eliminating the silica, providing the loss in values is kept down. With a 20% loss the advantages are about balanced.

The average ore of this mine corresponds to type I with matting value of $12, and it is interesting to note how the profit and loss varies with the treatment.

Ore sorted, concentrating loss 10%, any slag—profit.$7.50
Ore not sorted, concentrating loss 10%, any slag—profit..... 7.20
Ore not sorted, concentrating loss 15%, any slag—profit..... 6.70
Ore not sorted, concentrating loss 20%, any slag—profit..... 6.20
Ore not sorted, concentrating loss 25%, any slag—profit..... 5.70
Ore not sorted, concentrating loss 30%, any slag—profit..... 5.20
Ore not sorted, concentrating loss 35%, any slag—profit..... 4.80
Ore not sorted, concentrating loss 40%, any slag—profit..... 4 35
Ore smelted direct with limestone, 60% SiO_2 slag—profit..... 3.50
Ore smelted direct with limestone, 55% SiO_2 slag—profit..... 2.40
Ore smelted direct with limestone, 50% SiO_2 slag—profit..... 1,20
Ore smelted direct with limestone, 45% SiO_2 slag—loss..... .30
Ore smelted direct with limestone, 40% SiO_2 slag—loss..... 1.90
Ore smelted direct with limestone, 35% SiO_2 slag—loss..... 4.30
Ore smelted direct with limestone, 30% SiO_2 slag—loss..... 7.80
Ore smelted direct with limestone (cold blast) 30% SiO_2 slag—loss..... 9.00

By sorting the ore, using hot blast for smelting and with fair efficiency in concentrating, it is obvious that a $12 ore (matting value) will readily yield a profit of $6 per ton.

In one part of the mine there are evidences of heavy sulphide ore (type U), though much less abundant than the remaining ore (type I), yet to the extent it exists the former may be used as a flux for the latter. Diagram 6 shows that to make a 50% SiO_2 slag type U has a deficit of 30% of silica, and since type I has an excess of 40% of SiO_2 (Col. 6) it will require four tons of the former to flux three tons of the latter. Diagram 8 shows cost of mining and smelting (hot blast and 50% SiO_2 slag) type U to be $1.30 and type I $10 80, making total cost $1.30 × 4 + $10.80 × 3 = $37.60, or $5.37 per ton. With a matting value of $12 the profit per ton is $6.63. For other percentages of SiO_2 in the slag the result would be the same.

(TO BE CONTINUED.)

Compressed Air for Pumping Plants.

For convenience in figuring on large pumping plants to be operated by compressed air, there is given herewith a table by which the pressure and volume of air required for any size pump can be readily ascertained. Reasonable allowances have been made for loss due to clearances in pump and friction in pipe.

To find the amount of air and pressure required to pump a given quantity of water a given height, find the ratio of diameters between water and air cylinders and multiply the number of gallons of water by the figure found in the column for the required lift. The result is the number of cubic feet of free air. The pressure required on the pump will be found directly above in the same column.

For example: The ratio between cylinders being 2 to 1. Required to pump 100 gallons, height of lift 250 feet. We find under 250 feet at ratio 2 to 1 the figures 2.11; 2.11 x 100 = 211 cubic feet of free air. The pressure required is 34.38 pounds.

Ratio of Diameters.	PERPENDICULAR HEIGHT, IN FEET, TO WHICH THE WATER IS TO BE PUMPED.

—Compressed Air.

Zinc as a Preventive of Boiler Corrosion.

Zinc is often used in boilers and hot water tanks to prevent the corrosive action of the water on the metal of which the tank or boiler is composed. The action appears to be an electrical one, the iron being one pole of the battery and the zinc being the other. Under the action of the current of electricity so produced, the water in the tank is slowly decomposed into its elements, oxygen and hydrogen. The hydrogen is deposited on the iron shell, where it remains. It will not unite with iron to form a new compound, but if any iron rust is present it will remove the oxygen from this and deposit the metallic iron on the plates. The oxygen of the water that is decomposed, instead of going to the iron, goes to the zinc, and forms oxide of zinc, and in the course of time the zinc will be found to be almost entirely converted into oxide. On account of the action outlined, it is generally believed that zinc is always a good thing to prevent corrosion, and that it cannot be harmful to the boiler or tank under any circumstances. Some experiences go to disprove this belief, and there are cases in which zinc has not only been of no use, but has even been harmful. In one peculiarly marked case a 100 H. P. horizontal tubular boiler had been troubled with a deposit of scale consisting chiefly of organic matter and lime, and zinc was recommended as a preventive. When an inspection was made, large amounts of detached scale from the shell and tubes were found in the bottom of the boiler, and the iron surfaces from which they had been detached showed markedly the action of the zinc, the crystals of which, deposited upon the iron, gave it the appearance of frosted silver work. On the rear portions of the tubes, the scale being much heavier and more obstinate, they partially remained; but it was easily loosened and detached, and when it was removed the same frosted appearance of the iron was observed. The beneficial action of the zinc was so obvious that its continued use was advised, with frequent opening of the boiler and cleaning out of detached scale until all the old scale should be removed and the boiler become clean. Eight or ten months later the water supply was changed, it being now obtained from another stream, supposed to be free from lime, and to contain only organic matter. This change of feed water was unknown to the inspector, who two or three months after its introduction opened the boiler for inspection and was greatly surprised at its condition. The tubes and shells were coated with an obstinate, adhesive scale, clinging tenaciously to the iron, and composed of zinc oxide and the organic matter or sediment of the water used. The deposit had become so heavy in places as to cause overheating and bulging of the plates over the fire. It was with difficulty that these patches were separated and removed by the use of long chisels made specially for the purpose. This action of zinc when the water supply is changed has been noted in many cases, but in no other case has the contrast between its beneficial action at first and its injurious action afterward, in the same boiler, been so marked. From these experiences it is manifest that in making use of zinc the boiler should be frequently opened and the action carefully watched, so that if any undesirable effects show themselves they may be checked in time to prevent serious trouble.

Market Value of Ores.

The question of disposing of ores for their market value is one that confronts miners in any region. Metal-bearing ores have a market value the same as wheat, corn or oats; but the method for determining the value of the product of a mine is necessarily not as simple a process as determining the value of a horse or a pound of wool.

The prospector or miner may be a suspicious individual—always on the lookout for fear some one will get the best of him—but would not be suspicious naturally unless he had some fancied cause to be so. Miners sometimes say that it is no use to develop their property, because there is no fair market for their product. "Suppose," they say, "our ore has an assay value of $50 per ton, gold and silver, with 20% lead besides, and we have had many assays from our ore showing that value, do you suppose we can get anywhere near that figure when we come to sell it? Not a bit of it! We are playing in great luck if we realize $3 or $4 per ton out of it."

Ores are shipped direct from a mine to a smelter or a custom sampling establishment, whose business it is to sample the shipment and to furnish a sample to the owner of the ore, and, in the case of a public sampling works, also to those who may wish to purchase. An assay of that sample determines the value. If a sample carefully taken from a carload of ore before it leaves the mine will repeatedly return an assay value of $50 silver and gold and 20% lead, it should come very close to that figure after being honestly sampled and offered for sale. The product of a mine from which it is impossible to obtain a lower assay from samples along the vein or from each sack of ore shipped, than $50 per ton gold and silver, and 20% lead, ought to pay its owners handsomely, and it should also pay the smelter a fair profit.

The Late Mr. John Taylor.

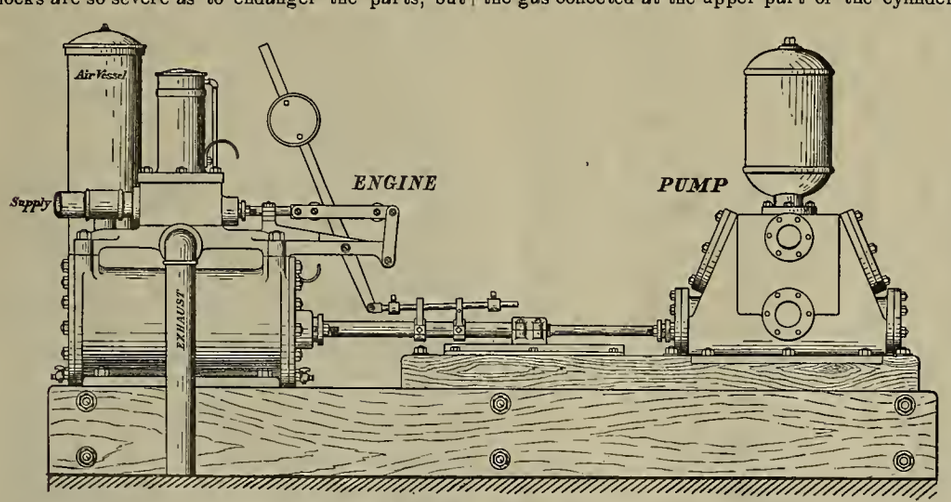
Herewith is a good portrait of John Taylor, one of the pioneers of California and a prominent mining man, who died in San Francisco on the morning of June 2. Mr. Taylor came to California in 1849, brought thither by the report of the discovery of gold. He was born in Westport, Conn., Aug. 13, 1826. When twenty-one years old he engaged in manufacturing in New York City, but at the news of the discovery of gold in California he joined the throng which left New York for the Pacific coast, taking passage around the Horn on the ship Orpheus. Shortly after his arrival he left for the mines on the American river, joining his brother Chauncey, who had preceded him. Mr. Taylor's mercantile tendencies soon induced him to return to a commercial life, and accordingly he engaged in general merchandising in Sacramento. In 1852 he moved to San Francisco and founded the firm of John Taylor & Co.

Mr. Taylor was a member of the California Society of Pioneers and a member of the Pacific Union Club.

The funeral services, held in the First Congregational Church of San Francisco, June 4, were conducted by the pastor, Rev. George C. Adams, who paid tribute to the character of the deceased. Rev. Samuel H. Willey, a friend from the early '50s, gave some reminiscences of those trying days. A quartette of male voices rendered several selections, and the flower-laden casket was borne to its resting place in Mt. View Cemetery by the employes of the mercantile house, some of whom had been in its service for two generations, the honorary pallbearers being Messrs. John F. Merrill, D. E. Hayes, William R. Sherwood, Edson Adams, E. C. Hutchinson, Geo. B. Crooks, Henry Palmer and G. Phillips, the two latter representing the Society of California Pioneers.

Hydraulic Pumping Engine.

In cases where a supply of water is to be raised by water pressure and the head is too great for hydraulic rams, water power engines are a suitable means for such duty. A hydraulic ram will operate well with driving heads up to 40 feet or so; but beyond this the pulsations become slow and the shocks are so severe as to endanger the parts; but



Hydraulic Pumping Engine.

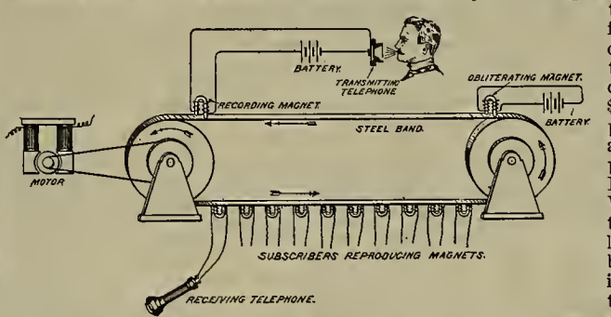
an engine may operate at any head or pressure without any loss of effect, except such as is normally due to the friction of the water and the pistons.

An engine to operate by water power requires a good many points of difference from steam engines. The distributing valves must be balanced and must be moved independent of the piston, or after the piston stops, or to be more exact, must move in advance of the piston's stroke. This is accomplished in various ways, by water pressure, springs, or by a descending weight, the last being the most simple and the device adopted in the drawing above. The weight on the lever is raised to a vertical position each way by the tappets on the piston rod and then falls by gravity through an arc of about 30°, striking the valve gearing near the end of its descent, moving the valve right and left. To enable this to be done with but little force the valve, a plain slide, is balanced by a piston seen on top of the valve box.

The machine shown is arranged as four to one—that is to raise water 400 feet with a head of 100 feet, or in that proportion. There is no limit of pressure or heads, except that the castings or other parts have to be made stronger as the head is increased. The frame, here shown of wood, can be made of cast or wrought iron, or the pump and engine can be connected by strut rods and a frame dispensed with. The drawing was furnished by the Water Supply Association, of 22 California street, San Francisco, Cal.

A Talking Newspaper.

It is now proposed to utilize the telephonograph as a talking newspaper. In the figure is shown a method which it is projected to employ. As the steel ribbon, which in this particular form is endless, and which is receiving the record, passes from one reel to the other, as indicated by the arrows, it passes consecutively before each of the receiving magnets, which are shown in horseshoe form, but which may



also be single pole, and the subscribers, whose telephones are attached to these magnets, are thus constantly being supplied with the latest news of the day, stock quotations, etc. After the ribbon or band has passed before these magnets, the obliterating magnet wipes out all of the magnetic lines of force stored up in the steel band, and it then passes on to receive fresh impressions from the recording magnet and telephone. In Budapest a talking newspaper system is run in connection with the supplying of music, and talking from the theatres by means of the "theatrophone." During the day the subscribers were constantly being informed of the latest news of importance. This service, which supplies many thousands of subscribers, is independent of the regular telephone service.

EXPERIMENTS to determine the liability of liquid and compressed acetylene to explode have been made at Berlin. Cylinders loaded with liquid acetylene were placed in position, a valve being at the top, and the gas collected at the upper part of the cylinders being under a pressure of 725 pounds per square inch. A cartridge of picric acid was applied and exploded by electricity, with the result of blowing off the top of the cylinder. The acetylene was not detonated, the cylinder emptying itself on the gaseous acetylene. A second cylinder was charged with the liquid, a cartridge placed in the bottom. An electric current was passed through this, the liquid acetylene exploding, destroying the cylinder. A third cylinder was fired at with a rifle without resulting explosion, nor was a further cylinder of acetylene disturbed by the explosion of a quantity of picric acid quite near. The conclusion arrived at was acetylene is undisturbed by sympathetic discharges, but that detonator being in contact therewith the liquid will invariably explode.

When Duty Is Not Paid.

Following is the form of oath required respecting mining machinery upon a free entry in Canada:

I, ..., the undersigned, importer of the mining machinery mentioned in this entry, do solemnly swear that it is mining machinery within the true meaning of the word and that at the time of its importation was of a class and kind not manufactured in Canada, and that it is imported for use in ..... mining only, at the ..... mine, situated ....., in the Province of ....., and will be used for no other purpose whatever.

Upon such machinery only as is covered by the above form can a Canadian miner secure exemption.

Bismuth.

The production of bismuth ore in the United States in 1901, says Dr. Struthers, amounted to 319 short tons, as compared with 220 short tons in 1900. Colorado supplied the entire output, Lake county contributing 254 tons and Ouray county 65 tons. All of the ore contained gold and silver values, for which producers were paid. The price of the bismuth contained varied from $8 to $11 per unit. As nearly as can be ascertained, the value of the 319 tons was $25,488, less the deductions of transportation and treatment charges, or an average of $80 per ton. The ore was purchased by the Leadville Sampler, at Leadville, the State Ore Sampling Works, at Denver, or was shipped direct to Johnson, Matthey & Co., Ltd., England. The world's supply of metallic bismuth is controlled by the combined interests of Johnson, Matthey & Co. and the Saxon government, who regulate absolutely the production and the prices of the metal and its ores. The importation of bismuth into the United States in 1901 was 165,182 pounds, valued at $239.061, against 180,433 pounds, valued at $246,597, in 1900. In addition to this, there was a small importation of bismuth in medicinal preparations. The occurrence of bismuth is widespread; it is found both in the combined and in the free state in many of the mining States.

Thunder Mountain District.

TO THE EDITOR:—There is an inclination to doubt the riches of the Thunder Mountain region. I will say, as I am in a position to know, that there is high-grade ore in Thunder Mountain district, and some very low. The average is higher grade than any camp I ever assayed from, considering it is nearly all surface rock. The prospectors do not yet understand the rock. Some of them have everything assayed, and we find gold as high as from $13 to $20 a ton in light, white porphyry. A few months more will tell more, but it is my opinion that the Thunder Mountain district will prove to be a rich and extensive gold mining country. T. H. MANNING.

Boise, Idaho, June 8.

FOR volumetric determination of copper, F. Repiton (Monit. Scient., 1902, 16,287) recommends the use of potassium ferro cyanide, instead of potassium cyanide. A N-10 solution is added from a burette to a boiling neutral solution of the copper as sulphate, until test drops on a porcelain plate show a blue coloration with ferrous sulphate. The application of this method to other metals is being investigated. Exact results are also obtained if a neutral solution of the copper as sulphate, chloride or acetate is precipitated with an excess of standard oxalic acid solution. Set aside for three hours, then add a little sulphuric acid and titrate excess of oxalic acid with permanganate solution of known relative value, the amount of oxalic acid combined with the copper being calculated by difference. The value of this, in terms of copper, is decided by repeating the process on a copper solution of known strength.

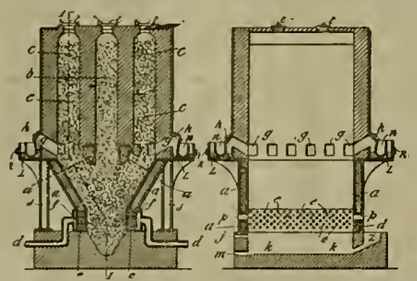
THE Pacific Oil Co., constructing for the Standard, will build ten brick pumping stations along the route of its 280-mile pipe line from Bakersfield to Pt. Richmond, Cal. Fifteen miles of 8-inch pipe have been laid at the Bakersfield end. There will be 600 carloads of pipe in the system. The oil will be pumped under a pressure of 600 pounds to the square inch. The company has a tankage capacity of 350,000 barrels at Pt. Richmond. In Bakersfield the present capacity is 2,000,000 barrels; five more tanks now being constructed will increase the tankage capacity to 2,405,000 barrels; the cost of the entire storage and pipe line system is figured to be $5,000,000. Supt. F. M. Towle says that if the materials were not delayed, the pipe line would be in operation by Jan. 1, 1903.

Mining and Metallurgical Patents.

Patents Issued June 3, 1902.

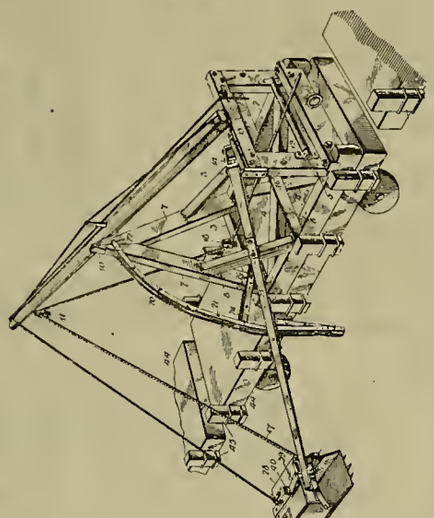
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR OBTAINING ZINC OR OTHER VOLATILE METALS FROM ORES OR MATTES.—No. 701,457; J. Armstrong, London, England.



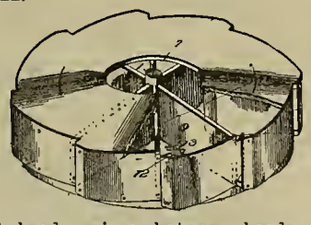
In furnace for reducing volatile metals, combination of central column for charge of mixed ore and fuel, side columns for fuel, reduction chamber below into which they all converge, large number of twyers or blast-orifices around reduction chamber whereby blast is broken into minute streams, quickly dioxidized, condensing device and exit passages for effluent gases direct to condenser close adjoining, whereby blast attacks evenly layer of fuel below part intermediate between charge and condenser, raises fuel above to high heat, effluent gases pass through this incandescent fuel above hottest heating zone on their way to condensers, carbonic dioxide is changed to carbon monoxide before it is cooled.

EXCAVATING AND LOADING MACHINE.—No. 701,593; D. H. Mahoney, Vincennes, Ind.



The combination of support, boom swiveled thereto, means for raising and lowering boom, guide for boom, scoop pivoted at open end to boom, adjustable arm on boom engaging adjustable stop on scoop to prevent tilting of latter during excavating, cord attached to closed end of scoop, adapted to right latter at end of its downward movement.

WATER WHEEL.—No. 701,355; J. M. King, Rochester, Minn.



Spaced heads, wings between heads joined at edges thereto, peripheral plates joined at the edges to heads having proximal ends passing by each other spaced apart, inner end of each plate attached to wing short distance from extremity, having projecting portion bent inward, outer end of each plate bent inward, overlapped end portions of adjacent plates outwardly converged.

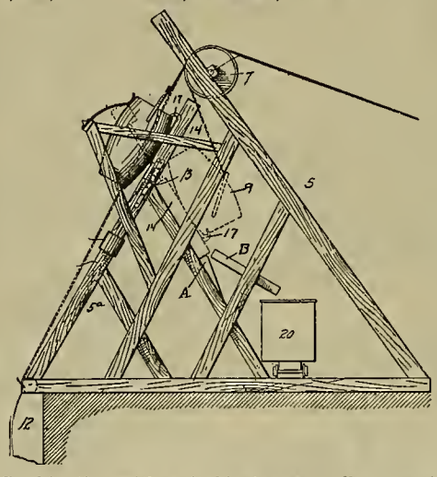
PROCESS OF HARDENING COPPER.—No. 701,429; S. L. Walter and F. W. Keiner, Ekastown, Pa.

Placing aluminum and charcoal in crucible, supplying crucible superposed mass of copper, then applying heat to cause combustion of charcoal and generation of carbonic-acid gas which passes upward through copper, carrying off any contained moisture in metals, time preventing oxidation thereof, whereby upon fusion of metals, copper, owing to its superior specific gravity, will intimately combine with aluminum presenting thereby hardened copper alloy.

DRILL.—No. 701,792; E. E. Atkinson, Ada, Ohio.

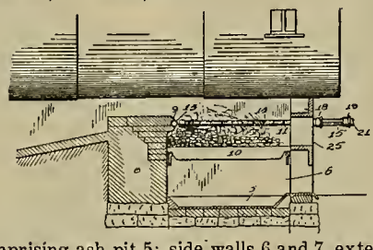
Stem and bit having interlocked portions provided with transversely disposed aligned openings, key located within openings, block having journal bearing, wedge movable upon block, actuating device journaled in bearing of block held against longitudinal movement therein, having an engagement with wedge to move it toward journal upon rotation of actuating device.

AUTOMATIC BUCKET DUMPING APPARATUS.—No. 701,812; T. N. Jones, Crisman, Colo.



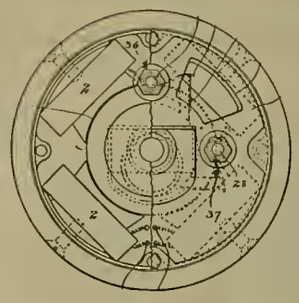
Combination with suitable frame, pulley mounted on upper part of frame, arranged to be engaged by bucket cable, inclined track mounted on frame, hinged dumping device normally forming continuation of bucket guide track, spring-held bucket-retaining device mounted on dumping device, arrangement being such that as bucket is drawn up inclined track, and landed on dumping device and cable slackened, gravity of bucket tips dumping device and throws bucket to inverted position.

SMOKE CONSUMER.—No. 701,296; D. Clump and W. Hofmeister, St. Louis, Mo.



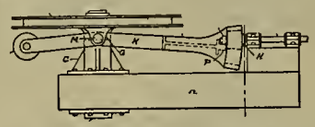
Comprising ash pit 5; side walls 6 and 7 extending upwardly from ash pit; bridge wall 8 extending upwardly behind ash pit, having forwardly projecting portion 9 at upper end; grate mounted above ash pit; perforated injector pipes 11 and 12 mounted in side walls suitable distance above grate; perforated injector pipe 13 mounted in forwardly extending projection 9 of bridge wall; steam air injectors 15, 16 and 17 connected to injector pipes 11, 12 and 13, being independently rotatable in their bearings, each comprising nipple 20 connected to steam pipes, having reduced discharge opening 22, nipple 23 formed integrally with nipple 20 in alinement therewith, nipple 24 formed integrally with nipples 20 and 23, nipple 24 extending backwardly and outwardly at angle of 45°.

ELECTRIC MOTOR.—No. 701,341; A. B. Holson, Chicago, Ill.



Combination of relatively stationary frame, main drive shaft journaled in frame provided with pair of driving pinions, armature mounted upon drive shaft between pinions, series of field pieces upon frame in co-operative relation to armature, driven member comprising duplex parallel annular racks encircling armature exteriorly of stationary frame, having its racks operatively engaged with respective pinions of drive shaft in diametrically opposite relation whereby driving moment of armature is imparted to driven member through both pinions simultaneously and in same direction.

PUMPING POWER FOR OIL WELLS.—No. 701,497; G. D. Newton, Cleveland, Ohio.



Suitable base, vertical pull wheel shaft, horizontal shaft mounted thereon, pull wheel journaled on former shaft, provided with lugs on lower side as shown, bevel pinion on latter shaft, endless internal bevel rack driven by pinion, arms attached to rack, hinged near center to above mentioned lugs on pull wheel, counterweight in outer ends of arms, small wheel on end of horizontal shaft to travel on an oblong ledge centrally located on rack.

PROCESS OF MAKING CYANIDES.—No. 701,604; G. Ottermann, Vienna, Austria.

Process of producing cyanogen compounds from waste household substances and similar organic substances containing nitrogen, consists in first subjecting substances to destructive distillation, then bringing resulting gases into contact with heated neutral material, then bringing gas into contact with heated carbonaceous material, finally bringing gases into contact with heated nitrogen-absorbing material.

TREATMENT OF COMPLEX AND REFRACTORY ORES.—No. 700,311; F. Ellershausen, London.

Process of treating complex and refractory ores containing lead, silver and zinc, smelting raw ores, churning fumes and gases with water to condense and mix them with water, settling out lead, silver and part of zinc compounds from resulting liquor as sludge, separating and drying sludge, fusing dried sludge with caustic alkali, thereby precipitating lead in metallic form, treating molten residue after separation of lead, to recover caustic soda and zinc sulphide, treating liquor from which sludge was separated with caustic soda to deposit zinc.

Treatment of Burns.

In treating burns of a serious nature, the first thing to be done after the fire is extinguished is to remove the clothing. The greatest care must be exercised, as anything like pulling will bring the skin away, too; so, if the clothing is not thoroughly wet, be sure to saturate it before attempting to remove it. If portions of clothing will not drop off, allow them to remain. Then make a thick solution of common baking soda and water, dip soft cloths in it and lay them over the injured parts; bandage them lightly to keep them in position. Have the solution by you, and the instant any part of the cloth shows signs of dryness squeeze some of the solution on that part. Do not remove the cloth, as a total exclusion of the air is necessary, and little, if any, pain will be felt as long as the cloths are kept saturated. This may be kept up for several days, after which soft cloths dipped in oil may be applied and covered with cotton batting. If the feet are cold, apply heat and give hot water to drink, and, if the burns are very serious, send for a doctor as soon as possible. The presence of pain is a good sign, showing that vitality is present.

MCKINLEY COUNTY has the only live volcano in New Mexico. It is 18 miles northeast of Gallup. Smoke arises all the time and the ground is very hot in the vicinity.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

The Treadwell mine during the year 1901 handled 457,802 tons of ore, an average yield of 1254 tons every twenty-four hours. The average yield of ore was $1.88 per ton, making a total for the year's production of $860,737. Working expenses, etc., amounted to $545.968, leaving a net profit of $352 559, or about $1.10 per ton. Since operations began 3,802,133 tons have been treated, yielding $18 531,627. The ledge is 500 feet wide; there are 880 stamps at work.

E. T. Leland reports results of deep diggings on Anvil creek at Specimen gulch, his foreman on Shaw gulch at Glacier creek, mentioning a visit to Specimen over the divide, to the Backus properties, which are No. 1 on Specimen and Anvil benches, adjoining same. When last season closed, arrangements were made for drifting during the winter. This has been prosecuted successfully and a large amount of dirt is ready for the spring washing. Eight miners' cars had been washed, which yielded $600—$75 to the car. These cars are three-fourths cubic yard capacity. He also states that the overhanging dirt in the drift ran 15 cents to the pan.

The Juneau Dispatch says the Sheep Creek mine is sold to O. Meyer of New York for $350,000. F. C. Hammond is Supt.

ARIZONA.

COCHISE COUNTY.

The new town of Douglas is a busy part of Cochise county. The entire plant of the Exposed Reef M. Co. has been totally destroyed by fire. Besides other buildings and machinery, the plant included a 10-stamp mill. The company was preparing to increase to forty stamps.

COCONINO COUNTY.

At the Coconino M. Co., at Ryan, the copper leaching plant is to be enlarged to 250 tons daily. A pipe line 14 miles in length will transmit the waters of Big Springs to the plant and properties below.

For $300,000 A. Nebeker has sold a quarter interest in the properties of the Coconino M. Co. to Miles Finlen.

GRAHAM COUNTY.

A contract has been let on the Summit group, near Metcalf, for driving an 80-foot tunnel for $2.50 per foot, which is cheap mining. Summit mines have produced ore averaging 40% at the smelters.

MARICOPA COUNTY.

At Wickenberg a new double compartment shaft being sunk at the O'Brien mine is down over 100 feet and is timbered with Oregon pine.

The Garcia mine has resumed. It is 8 miles from Wickenburg. The company has a pumping plant on the river that supplies water for camp use, 20-stamp mill and concentrators.

Near Wickenburg the Oro Grande, since its discovery last year, has 2000 feet of work, mostly in a 300-foot shaft, drifts and crosscuts. The ore is free-milling and assays run from $8 to $50 per ton; forty men are employed. Engineers are now on plans for a 400-ton plant. The mine is under the management of G. B Upton.

The miners in the O'Brien mine, near Wickenburg, are on a strike for $3.50 a day. They were receiving $3.

MOHAVE COUNTY.

Near Kingman the C. O. D. mine has been worked for silver alone. In the drift on the 300-foot level, 410 feet from the main shaft, an ore body carrying two ounces in gold has been found. In the east drift from the same level a body of ruby and native silver ore has been broken into. The mill is turning out four tons of concentrates every twelve hours. The mine shows the longest unbroken ore shoot opened up in Mohave county. The ore is of a milling grade.

At Gold Basin Supt. Aubrey has eleven men handling ore for his cyaniding tanks from the Cyclopics mine.

F. Dewey has a streak of ore in the Prince Albert mine at White Hills assaying 8000 ounces silver per ton.

The O. K. mill, in Gold Basin, operated by the Minnesota & Arizona Co., is working on ore from the El Dorado mine.

Six hundred tons ore from the Katherine mine, New Comstock group, gave $3826—$6 per ton. The ore was crushed to pass a 40-mesh screen; the saving on the plates and battery was $2 50 per ton. After this a 20 mesh screen was used and the battery amalgamation abandoned. The saving on the plates was equally as good as with the finer screens and the crushing capacity was raised from 1½ to 2 tons in twelve hours. The tailings were run to the cyanide tanks, after remaining twenty-four hours in the pits; the saving there was 85%, with a twenty-four-hour percolation. The cost of mining and milling the ore was as follows: Mining, per ton, 60 cents; hauling, 50 cents; milling, 60 cents; wood, 65 cents; cyaniding, 90 cents; total, $3 25.

Near Kingman, J. W. Gerritt has bonded to Chicago men his Oro Plata group of mines, Todd Basin. Work goes on in his charge.

PINAL COUNTY.

The Troy smelter is in charge of L. W. Morgan. The iron ore used at the smelter comes from the Buckeye and Beehive mines and carries from 4% to 5% copper. The lime ore will be taken from the Idaho mine.

Kelvin hears that an Omaha company will work the McSherry property and put a working tunnel from the Gila river into the mountain, to crosscut rich mineral, and will connect a tramway with the Phœnix & Eastern Railroad.

The Bryan group of mines, opposite Kelvin, has 3000 feet of development work.

SANTA CRUZ COUNTY.

(Special Correspondence).—The Harshaw mines are prosperous. The Hermosa has been bonded. There is a body of horn silver ore that will average 30 ounces per ton. They have 500 tons ore in sight. The Hardshell mine, owned by R. R. Richardson of Patagonia, has galena ore that assays 400 ounces per ton. This mine has a shaft 400 feet deep.

Patagonia, June 7.

YAVAPAI COUNTY.

The Val Verde smelter is running steadily. Three cars of matte were shipped last week. There is an abundance of ore on hand.

Near Prescott the Briganza Co. has fifty men at work on its Henrietta mine.

W. A. Clark has reduced the day force on the Iron King mine, 2½ miles from Jerome, and will explore the ore bodies with a diamond drill.

T. J. Randal has men at work on the properties of the Verde S., D. & O. P. Co., in Tonto Basin. A tunnel to be driven 500 feet has been started 200 feet below the present workings—to open up a body of sulphide ore, the use of which in the smelter will do away with a previous long haul of iron ore for fluxing purposes.

W. Theising of Cordes has sold four mines to E. A. Frankie of Chicago. Ore from the vein is said to average $25 gold and eight ounces silver per ton, with 10% lead. Mr. Frankie will build a mill.

The sale of the Dos Oris mine, near Prescott, to P. Williams, for $25,000, is reported.

YUMA COUNTY.

The Darling and Bradshaw mines, Quartzsite, will have new machinery and will be extensively developed this summer.

CALIFORNIA.

AMADOR COUNTY.

Following is a detailed statement by Supt. E. C. Voorhies showing time and cost of sinking the Lincoln shaft, Sutter Creek, from a depth of 1260 feet to 2000 feet, 740 feet of incline shaft at 62½° incline, size of excavation 8x17 feet. Work was done by three miners working eight-hour shifts, or nine miners per day, with a day and night foreman, making eleven men employed per day. The work occupied 350 days:

2956 days labor at $2 75	$ 7,129 00
350 days labor day foreman at $4.	1,400.00
282 days labor night foreman at $3.25	916.50
Total labor cost	$ 9,445 50
22.450 lbs. powder used, cost	1,307 25
35,800 feet fuse, cost	125 30
46 boxes caps, cost	46.00
2400 lbs. candles, cost	288.00
148 sets timbers, 207,200 feet lumber, cost	3,729 60
Total	$14,941.65
Cost per foot of shaft for labor of drilling, putting in timbers and shoveling waste into skips.	$12 764
Cost of powder per foot of shaft.	1.766
Cost of fuse per foot of shaft.	.170
Cost of caps per foot of shaft.	.060
Cost of candles per foot of shaft.	.390
Cost of timbers, lumber, per foot of shaft.	5 040
Cost per foot of shaft.	$20.190

Three thousand eight hundred and sixty-four blasting holes were drilled an average depth of 6½ feet each, or $5\frac{2}{10}$ holes per foot of shaft; $3\frac{2}{100}$ pounds 35% and 40% powder were used to each blasting hole, or $16\frac{74}{100}$ pounds per foot of shaft; 9456 tons of rock were broken and hoisted to the surface, being 12 77 tons per foot of shaft. During the time of sinking 14,406,200 gallons of water were hoisted to the surface.

The Live Oak, in Pioneer district, is being worked by Trackwell & Harmon. The ledge is 6 feet thick, with a seam of sulphureted ore 18 inches wide, over $20 per ton.

F. B. Joyce of the Defender mine, Pioneer district, says the shaft is down 350 feet; drifting is in progress. A 10-stamp mill will be built.

The old Gover shaft will be unwatered to the bottom (1500 feet) by July 15. The new shaft at the Fremont mine will then be 1000 feet deep. New hoisting machinery will then be installed at the Fremont shaft.

The Bay State mill, near Plymouth, has closed until stoping is completed.

A strike is reported from the Bunker Hill mine, Amador City, on the 1400 level.

Six men are at work on the old dumps of the Empire and Pacific mines at Plymouth. Four roller mills will be in operation next week.

The west crosscut from the new shaft at the Kennedy mine, from the 2500-foot level, has entered the vein.

Sinking the South Eureka shaft from the 2000-foot level progresses. A level may be opened at the 2200-foot station.

At the Sargent mine, near Middle Bar, a three-compartment incline shaft has been begun on the vein.

BUTTE COUNTY.

F. H. Dakin will visit mines in this county for data as to the depth reached and what is shown by the st ata, to be used in compiling a map to show portions of the ancient river channels, which, it is believed, will afford mines in the same state as the Sweepstake bonanza in the old channel near Weaverville, Trinity county. It is the theory that the fine gold now dredged along the river at Oroville left the ancient channels as nuggets which were broken and ground up in transmission. The Cherokee mine, from which thirteen millions has been taken by washing down a bank with streams from pipes, comprised 4000 feet of an ancient channel. The Magalia mine, which has yielded two millions, was in a lateral channel running iuto that of tbe Cherokee. Here the peculiar pebbles were followed into the hank and a shaft was then sunk through the lava from ahove.

At Berry creek, owing to the failure of water, the Romer & Nordyke mine will be closed until next winter.

Near Magalia the Bader mine has been put in shape for working. It is hoped to acquire sufficient water to wash the gravel.

The Golden Summit mine, the property of Goodall-Perkins Co., is leased to Weaver & Reece, who believe they are in a body of ore.

At the Matheson mine (quartz), near Nimshew, a capping of lava has been penetrated and the ledge exposed.

At the Snow mine work was resumed June 10th.

The mines of the Nimshew G. M. Co., G. L. Smith Supt., employ several men.

H. P. Sophy is reopening the Crystal Peak mines, near Enterprise.

J. M. McClung has men at work on the Lydia mine, near Enterprise.

CALAVERAS COUNTY.

Sloan Bros. of Vallicita are operating the Sloan hydraulic mine and are enlarging their reservoirs.

At the Beatrice mine Supt. Ober is pushing 70 feet a week of tunneling toward the Rohles vein.

The Calaveras mine is being unwatered.

The What Cheer mine will be reopened under the superintendency of J. J. McSorley. A new incline shaft will be run and new machinery put in.

DEL NORTE COUNTY.

A. Quitzow is manager of the Smith River copper mine, 10 miles from Crescent City.

EL DORADO COUNTY.

(Special Correspondence).—The California Jack mine, near Georgetown, is preparing to begin operations under J. T. Wiggins of Los Angeles

C. M. Eye, at the Alpine mine, near Georgetown, is pushing development work. Concentrates and bullion are being shipped to San Francisco.

The Gold Bug mine, near Georgetown, closed down recently.

Georgetown, June 11.

The Bangor Slate Co. at Kelsey is shipping slate. A 5-stamp mill will be erected by the Jas. Beckman Co. on the Patten place, Diamond district.

M. Hughes at the Lucania mine is preparing the lineway for 5000 feet pipe.

The Montezuma mine at Nashville has increased its force of men at work. The rock will average $10 per ton in the 6-foot vein.

C. H. Dunton, manager Eureka Slate Co., says the company expects to spend $50,000 developing the property this summer.

A map and register of the county has just been issued by the State Mining Bureau. With the register is an economic geological map to supply miners and investors with knowledge of the mineral-bearing zone.

INYO COUNTY.

At Camp Lyon, near Ballarat, the 5-stamp mill will be in operation by August 15th.

In the Panamint country the Ratcliff Co. is working forty men and the Mineral Ranch thirty.

The Havilah Co. has ten men at work on the Santa Rosa.

Dean & Jones have thirty men at work on the Argus.

KERN COUNTY.

That the McKittrick sands extend to the southeast for a mile has been demonstrated by the success of the Monarch, the Belgium and the "1901." These sands retain their richness as far as they are now known to reach. A test of this producer shows that the well is capable of yielding at the rate of 170 barrels a day of settled oil. The gravity is light and the quantity of gas contained in the oil is sufficient to cause it to flow continually when the pump is not in operation.

Chief Engineer F. C. Finkle of the California Power Co. will soon start the work of driving the tunnels at the site selected on Kern river; 300 men will be employed at wages varying from $2 to $3 per day.

Bakersfield and Randshurg will have electric light and power. The Kern River Co. will build a canal 12 miles long, capacity 30,000 miner's inches. The line will begin at Kernville and follow the Kern river south 12 miles, where a station of 15,000 H. P. will be built, thence to Los Angeles two lines, capahle of delivering there 10,000 H. P.; length of each line 110 miles.

The Keyes mine at Keyesville has notice that the cutting of wood in the neighborhood of the mine, located in the forest reserve, would be permitted no longer. An appeal was telegraphed to Washington, a statement of the conditions made, and permission granted to continue until some other fuel supply could be obtained.

The Lady Belle mine at Keyesvllle has started. The Hooper custom mill is running on full time.

January 1, 1902, Kern river field had 184 oil wells producing monthly average 322,500 barrels. Last month Kern river field had 241 wells, producing 422,473 barrels per month. In addition are 320 wells "shut in," that is, they could produce if there was a sale for the oil. These wells "shut in" are locally credited with ability to produce an average of 560,960 barrels a month, or 6,731,520 barrels a year.

MARIPOSA COUNTY.

The Cataract & Wide West Co., W. B. Lake Supt., is adding more pipe to increase the pressure, as the gravel is of the cement order.

MONO COUNTY.

The Bodie Miner-Index reports the power scraper at the slum pond of the Standard Co. to be a success. It drags the slimes from places where horses could not stand to firmer ground, where, after drying, it can he taken away. It will save valuable tailings.

In the case of J. B Haggin et al. against J. A. Kelly et al., and the granting of a new trial to the latter, the decision of the Superior Court has been reversed in favor of the plaintiffs. The case involves the title to the North Noonday mining claim, in Bodie district.

NEVADA COUNTY.

The quartz mill at Meadow Lake, which blew down last February, will be rebuilt, ten more stamps and other new mill machinery added.

The mortgage on the Grey Eagle mine, near Nevada City, has been paid. The company will develop the mine.

Good ore is being taken from the Tilley mine, on Deer creek, and crushed at the Nevada County mill.

New buildings are being erected at the Independence mine, Bloomfield district.

Good rock is now being taken from the ledge of the Gold Deposit M. Co.'s claim, Montezuma Hill.

F. G. Drum, general manager of the Union blue gravel mine at North Bloomfield, recently made an examination of the property and found everything working satisfactorily. When the main channel is struck the working force, now fifty men, will be increased.

PLACER COUNTY.

At the Gold Blossom mine, near Auburn, twenty men are at work.

PLUMAS COUNTY.

J. Gruss, at the Gruss mine, Genessee, intends to add fifteen stamps to his mill.

The Cataract M. Co. has twenty men digging a new ditch to lower Indian bar. C. L. Adams, Supt., is rapidly pushing the work to completion.

At Chipps Creek bar, owned by W. M. Cleveland, a water ditch has been added and development begun. At Long bar Cook & Co. are working steadily. An

elevator of home construction is being used.

SHASTA COUNTY.

Berkeley men will form a corporation to develop the Oro Fino, near Shasta; J. T. Mabey president, W. C. Jenkins secretary and W. Moran mine Supt. Six hundred feet of tunnel have been driven, intersecting the vein at a depth of 200 feet. First payment on the property has been made and preparations are being made to put in a 30-stamp mill.

The Great Western G. Co. at Coploy say it is going to put in a 500-ton smelter. Surface ore assays $7.57 per ton.

The Uncle Sam gold mine, near Kennet, is bonded to the Trinity Copper Co., who are reopening the property to use as a flux ore which carries gold.

Two gold bricks worth $27,000 were shipped from the Midas mine, Harrison gulch, this week.

The Port Huron Drodging Co. is at work in the Sacramento river, near Middlo Creek, after a long wait because of high water. Manager A. S. Martin returns from Port Huron July 1st. F. Houlo is in charge during his absence.

SIERRA COUNTY.

The Bellevue tunnel is being run to tap the Thistle Shaft gravel channel below the old works and is going ahead at the rate of 70 feet a week. The tunnel is now in 2700 feet, is in hard slate rock, which requires no timbering, and is of sufficient width for a double track. It is being run by two power drills with compressed air as motive power. The company is employing fifty men under the management of C. B. Wingate.

SISKIYOU COUNTY.

The Porphyry Dike, near Hooperville, has been bonded to the Sheba M. Co. for $10,000. The company will put up a 3-stamp mill.

B. A. Cardwell of the Siskiyou M. & D. Co. of Scott Valley is opening a coal mine near Ager.

H. Matterm is building a 10-stamp mill on Rocky gulch, near Hornbrook.

At Little Humbug the miners are busy, with plenty of water.

C. W. Tyrer & Co. are running their mill near Hornbrook and intend sinking on the ledge.

The dredger at Callahans is worked by an electric dynamo. The company has 5 miles of river bottom. Another dredger may be built to help out the cleaning of the channel clear into the hanks for some distance on each side of the river.

The Keene quartz mine on Boulder creek, south fork of Scott river, is operated hy the cyanide process, leaching sixty tons every twenty-four hours and saving 85% of the gold.

The Greenhorn blue gravel mine is to be reopened.

TRINITY COUNTY.

M. Jones and W. L. Patton, who, with T. O'Keefe sold the Fairview mine to the Altoona Q. M. Co. for $60,000, are traveling. Jones goes to New York and Patton to Nevada. Jones and Patton got $12,000 apiece, O'Keefe $15,000, the remainder being divided between five others.

TUOLUMNE COUNTY.

The Pioneer-Lynn M. Co. is operating the Clio property at Jacksonville.

Seven carloads of ore are being shipped from Cooperstown.

At the Doyle mine at Columhia operations have been suspended until a pump is put in.

D. C. Demarest has bonded the Neuebaumer mine at Tuttletown.

The Equitahle M. Co. Is preparing to resume operations at the Arbona mine. A small furnace for reducing sulphurets is being built.

Drifting at the Bell mine, Tuttletown, has heen resumed since the mine was unwatered.

The Horse Shoe Bend G. M. Co. will drive a tunnel 500 feet on their property near Columbia.

COLORADO.

The Colorado Bureau of Mines has Issued a production bulletin in which the total gold output for 1901 Is given at $27,679 445. Of this sum Teller county contributed $17,232,682, San Miguel county $2 049,471, Lake $1,776,131, Gilpin $1,638,965, Ouray $1,546,322 and twenty-six other counties the remainder. The silver output was $10,901,365. The lead output was 148,111,020 pounds, valued at $6,419,131. The copper product was 7,872,529 pounds, valued at $1,303,297. Other mineral products were: Bismuth 637,200 pounds, or 318.6 tons worth $25,488 at an estimated average of $80 per ton, less transportation and treatment charges. The coal output was 5,928,410 tons. The Colorado Fuel & Iron Co. of Pueblo report 704,737,735 pounds of iron handled, and an output including 330,364,725 pounds of pig iron and 309,092,982 pounds of steel rails. Nine counties produced 26,843,731 pounds of zinc, worth $1,095,225. Lake county produced 23.167,140 pounds of this. A comparative table gives the total gold product to date of $279.568,211, and that of silver as $363.644,403. Lead production began in 1872 and has amounted to 2.575,958,388 pounds, valuod at $107,491,511. The copper product amounts to 108,982,515 pounds, valued at $14,634,087. The total value of the gold, silver, lead and copper products to the end of 1901 is given at $765,338,253.

BOULDER COUNTY.

Near Boulder the Logan mine, operated by the Clinton Co., in the lower tunnel, 900 feet deep, has ore worth ten ounces gold per ton.

Tho old American mine at Sunshine has a body of ore. A part of it leased by the Vinango M. & Red. Co. to Hendrick & Co. is showing ore.

It is locally reported that a cash offer of $60,000 has been made for the Balley chlorination works at Eldora.

CHAFFEE COUNTY.

At Buena Vista Manager Morley has laid off all the men at the smelter, closing the plant. He has sent his resignation in to the company at Philadelphia to take effect immediately. It is reported that the American S. & R. Co. has control of the plant and closed it. As the plant stands to-day it represents $150,000. It was completed in 1897 and has been in almost constant operation. Last December it was burned to the ground and was rebuilt at a cost of about $60,000 and only been running a few weeks. The closing of the plant throws fifty men out of employment.

At Manoa the Sunset Con. Co., C. Higham manager, expects to put on machinery. A shaft is being sunk at the intersection of two veins which cross each other at an angle of thirty degrees. The company owns 5000 feet of these veins, showing sulphides.

CLEAR CREEK COUNTY.

The Freeland Extension mine, at Idaho Springs, recently sold for $100,000 to South Dakota mining men, will be extensively worked this season.

At Georgetown, the new plant at the Capital Prize tunnel has been installed under the supervision of G. J. Hite and is in operation.

At Empire new concentrators and added power at the old mills will give the Empress, Conqueror, Atlantic and Clear Creek chance to daily handle 180 tons. Erection of private works by the Republic group of owners in Lyon gulch, the Woodbury Co. on Breckenridge mountain and the new Republic Con. near the Empire station would provide treatment for 150 tons that would otherwise require transportation to outside mills. The Gold Fissure output is going to the Clear Creek plant, thirty tons per day.

The Freeland Extension mine at Freeland is sold to South Dakota men for $100,000. The shaft has been sunk 400 feet.

The new independent sampler at Black Hawk is locally credited with intention to evade the trust by shipping their product to the Black Hills smelter, and the Burlington railroad have made the company rates that will make it profitable. The shipping distance is 400 miles.

Georgetown reports the Santiago strike of ore shows three to seven ounces gold per ton. There are 3 feet of yellow copper ore that runs three ounces gold, ninety ounces silver and 15% copper.

Manager Yeager of the M. & M. Co., Idaho Springs, contemplates the erection of a larger plant of machinery this summer.

The management of the Central tunnel furnishes the Georgetown Courier the following figures on last month's work of 161 feet labor and expense account:

Drill crew (three drill runners, two helpers)	$17 00
Powder crew	6.50
Muckers and trammers (five)	13 75
Foreman (one)	3 50
Engineer (one)	3 50
Blacksmith and helper	7.00
Total	$51.25

Twenty-four shifts drove 161 feet; average 6.7 feet per day; cost per foot $7.85.

Sinking the Mendota shaft goes on. In the west drift in the hottom is a 4-foot streak of solid lead ore that runs over 60% lead and thirty-five ounces silver. This is taken out and shipped without sorting.

Georgetown reports an important gold strike from the Santiago, a comparatlvely new mine, near Georgetown. At a depth of 200 feet an experimental shot is said to have disclosed a 14-inch vein of decomposed mineral which gives assays of $675 per ton. In addition is 2 feet of mineral carrying a value of from $140 to $190 per ton. The Santiago has shipped 2-ounce to 4-ounce ore from its second level.

Matters are still at a deadlock regarding resumption of work on the Newhouse tunnel, which, starting near Idaho Springs, extends 14,000 feet into the mountains and cuts the formation at a depth of 2000 feet. It will be extended no farther, unless an agreement is reached with the owners of mines and those benefited by the work to pay the tunnel company for its services. It was the intention to push the tunnol 1 mile farther than it has yet penetrated. In the aggregate it would cut about 300 veins. All such properties would be drained, and thus the cost of pumping water and a part of the expense of bringing ore to the surface would be saved.

At Empire, work that had been suspended on the Covode Mountain Co.'s property awaiting completion of surveys and patents upon the groups owned by it on the east slope of the mountain has been resumed.

Lindsay & Co. are shipping surface quartz from the Comet property, Silver mountain, to the Atlantic mill, where the method of treatment combines amalgamation and concentration, the saving of the coated gold that has hitherto proved refractory to amalgamation being effected by chemically prepared quicksilver.

The Freeland Extension mine is turned over to the Freeland Extension M. & M. Co., headquarters Mitchell, S. D., consideration $100,000, one-third cash. J. A. Wilson will be Supt.

CUSTER COUNTY.

Custer City, a full-grown town, with all the trimmings, has been formally opened near the Bassick and Hector mines, 8 miles east of Silver Cliff. The houses were built in sections, shipped by rail to West Cliff and tben by teams. Speeches, music and feasting were the features of the opening celebration, the principal speaker being ex-Governor A. Adams. A. A. Pope of Boston, Mass., is a backer of the new town.

EL PASO COUNTY.

The Telluride Reduction Co., at Colorado City, is receiving ores. C. D. Grave is superintendent. The process is hromination.

General Manager Fullerton says the Telluride Reduction Co. has opened its mill at Colorado City.

FREMONT COUNTY.

At Florence the Beam mill will resume operations. It was owned by a Chicago stock company, has a capacity of seventy-five tons per day, and will be sold to Cripple Creek men, who will change it to a cyanide plant and increase its capacity.

At Canyon City the old American zinc-lead smelter, recently bought by the United States Reduction Co., is being enlarged. The new laboratory will be equipped for assaying and experimental work. D. Jackling is manager, A. R. Nicholls Supt.

Near Canyon City an English organization, capitalized at $2,500 000, has forty-eight claims, the old Montezuma territory. The members of the old Montezuma company are to receive a cash bonus and an allotment of shares in the new company.

At Florence the United States Reduction & Refining Co., which owns the Union mill, has declared a dividend of $120,000. The plant resumed operations last August, and since that time $300,000 in dividends have been declared.

GILPIN COUNTY.

Central City hears that work is to be resumed in the breast of the Newhouse tunnel.

In future all work at the Gregory-Bobtail, Cook and Fisk will he on day's pay or by contract. The leasers are accordingly getting out ore fast. The Boston & Denver Con. M. & M. Co. has men arranging for the tramway which carries the ore from the Cook property through the Bobtail and Bates tunnels to the new mill. The lower levels of the Fisk and Gregory workings will be connected with the Cook shaft; the latter now 900 feet will be made 300 feet deeper. The mill has forty stamps running on the ores of the group.

Drifting is going on in the 190-foot level of the Hayes & Wheeler mine at Spring Gulch, where the leasers have opened up a 2-foot crevice and are making a trial shipment to the Hidden Treasure mill; also will ship a carload to the Golden smelter.

In the 240-foot east and west levels the Gauntlet G. M. Co. are taking out ores carrying copper and lead. The product is shipped to Golden. The shaft will be sunk 100 feet to the 400-foot level.

GUNNISON COUNTY.

At Pitkin, in the Gold Cup mine, there are 500 acres patented ground on Gold hill. The workings consist of an incline shaft sunk 900 feet at an angle of 30°, with levels run every 100 feet. A contract has been let for 200 feet of drifting and crosscutting from the ninth level.

Near Gunnison the Ruby King mine is sold to the International M. Co., Providence, R. I. S. I. Tingley is in charge and has begun work.

H. C. Shump, secretary Colorado Mines Con. Co., at Parlyn, will work that property this summer.

HINSDALE COUNTY.

Work is resumed at the Hidden Treasure mine and mill, near Lake City. J. McCombe is manager.

At the Moro mill Manager Carr will soon resume. B. N. Ramsey has resumed operations on the Little Chief.

LAKE COUNTY.

A recent shipment of ore from the St. Kevin mine brought $22 per ton; treatment, $9; hauling, $2 25.

The Fanchon mine has considerable ore in the bins that assays fifty ounces silver and one fourth ounce gold.

E. C. Englehardt will have charge of the metallurgical operations of the Harrison Reduction Co., which will work over some old dumps at the foot of Harrison Ave, Leadville.

In '79 and '80 smelting was crude; recovery not as good as to-day. All that was looked for was ore that run $30 per ton and 20% lead. All under this was thrown over the dump. The smelting charges were $30 per ton, less 10% on the New York price of silver; lead brought 50 cents for each per cent over 30, with a reduction of 50 cents for each per cent under 30. Ore that ran fifty ounces silver and 40% lead would hring at the smelter $24 50 net per ton. Nothing was allowed for gold, and the moisture ran from 20% to 50%. In 1879 the output for Leadville was 110,483 tons, value $10,504,106, or a value in pure silver and metallic lead of $95 per ton. Many thousands of tons of ore that could not stand the enormous cost of smelting were thrown over the dump.

At Leadville, W. H. Jones of the Cloud City Co. says as soon as macbinery can be secured and placed in position that property will resume operations.

By Sept. 1 Leadville expects that the Colorado Fuel & Iron Co. of Pueblo will be in a position to take a large amount of manganese for steel and iron from the Leadville mines.

At Twin Lakes the Blaine Electric Mining & Power Co., W. H. Applegate manager, A. Simons Supt., project development of thirty veins in the Willis gulch country, the building of a new town, etc.

LAS ANIMAS COUNTY.

At Rincon the Colorado Fuel & Iron Co. has put in 1200 new coke ovens. It has a railroad to Primero, 16 miles up the river, recently completed to Rincon, 20 miles farther, at the foot of the Sangre de Christo range. At Primero the daily output is 5000 tons. The camp has now a population of 700. At Segundo, 2 miles away, 900 coke ovens have been built and are in operation. From Rincon a railroad survey has been made 20 miles farther west into Ponil park.

MESA COUNTY.

The Western Slope Copper M. & S. Co. will erect a smelter at Grand Junction.

OURAY COUNTY.

At Ouray the Camp Bird Extension Co. proposes to put in a new concentrating mill.

Ouray reports prospects for starting up the Home Pyritic smelter in the latter part of this month.

PARK COUNTY.

Near Alma, the Alma Safe Deposit, Rhodus and Cincinnati placers are working. The Snowstorm Hydraulic Co. is employing sixty men on new ditch and flume work, to get a head of water at the Snowstorm and Beaver Park placers.

A new mill will be built to treat Kentucky Belle ore, up near the head of Buckskin gulch.

Work is to be resumed on the old Russia mine, Mt. Lincoln, and an aerial tramway built to bring the ore down.

A two years lease has been secured on the Champaign mine hy J. Moynahan, B. F. Shoemaker and C. S. Elliott, of Alma, and work has already started.

SAGUACHE COUNTY.

The Goldmont M. & M. Co., owning the Chicago group of lodes near Idaho Springs, forty-two in number, is consolidated with the Goldmont Co.'s holdings near Alder, on the Denver & Rio Grande Railroad, 20 miles from Salida, where the company has twenty-seven lode claims and 320 acres of placer ground. The placer property has been platted into a town site. On the lode claims $10,500 has been spent since January.

SAN JUAN COUNTY.

Mgr. Kendrick of the Oliver Reduction Co., Picayune gulch, Silverton, says that the Mexia vein is 24 feet wide, and carries a concentrating ore that is worth $12 a ton.

Near Silverton a 500-foot contract was let on the Highland Mary property to run a tunnel from Cunningham to cut the Lookout vein. A new mill will be built.

The Eureka Exploration Co. is working the Silver Wing mill, 2 miles above

Eureka. The product of the Silver Wing mine and Frederica mine is being concentrated.

F. McGuire and associates are running a tunnel on Tower mountain near Eureka to cut the Skookem vein.

A 600-foot tunnel will be driven on the Climax vein under direction of M. S. Beach.

J. L. Estey has bought a millsite and will erect a concentrating plant.

The new addition to the Judge Terry mill in Eureka will cover twenty extra stamps.

SAN MIGUEL COUNTY.

Near Telluride a canvas table plant will be operated at the Alta mine for treating tailings from the mill. These tailings carry gold, silver and lead, the determined assay valuation being 1 62 ounce gold, 42.9 ounces silver and 24 16% lead. This plant will mill $7 ore. The concentrate products of the Gold King, one of the Alta properties, run about ¾ ounce gold, 39 ounces silver, 26% iron, 12% lead, 12% silica and 3% copper, the concentration being five and one-half to one.

At the Silver Bell mine are framed timbers for the 30-stamp addition to the mill at Ophir loop. The Liberty Bell has 200 men at work in the mine. The mill is working eighty stamps.

At the Liberty Bell mine, near Telluride, as a safeguard against further slides, Superintendent Chase is building a big snowslide crib to turn the embryo avalanche down the gulch. The crib is of heavy logs and filled with rock, is 80 feet long, 12 feet wide, 14 feet high.

The Smuggler-Union Co. has 400 men on the pay roll at the Bullion tunnel and Sheridan workings.

SUMMIT COUNTY.

The American Gold Dredging Co. is operating a Bucyrus dredger in the Swan valley and has begun work at the mouth of Galena gulch with giants and sluices.

The Oro Grand G. M. Co. is putting down a pit to the bedrock in the Blue river valley near Dillon.

The French Gulch Placer M. Co. is operating a double hydraulic elevator.

The Peabody placer, in the Gold Run district, a large producer of nugget and coarse gold, is operating with hydraulic giants and sluices.

TELLER COUNTY.

In the Cripple Creek district the volume of water flowing from the Standard tunnel has been accurately measured. There flowed 7500 gallons a minute for two years—450,000 gallons an hour and 10,800,000 gallons in twenty-four hours for two years, 7,884,000,000 gallons.

Sulphide roasters are in action in the Cripple Creek district at the Economic mill, controlled by the Woods Investment Co., on an experimental run.

At Colorado Springs answer has been filed by the Strong G. M. Co. to the complaint of the Stratton's Independence, Ltd., which is suing to recover $1,750,000 for ore alleged to have been extracted from the Independence grounds. The answer alleges that the apex of the Strong vein is located between certain planes and lines on the Strong claim; and that all ore which has been extracted from Stratton's Independence ground has been taken legitimately in following the vein on its dip.

E. M. De la Vergne, general manager Isabella mine, thinks that the deep drainage canal proposed for Cripple Creek is taking definite form and should be built. It is proposed to run a tunnel from the southwest under Grouse mountain, starting 3 miles southwest of the Elkton mine, near where Cripple creek joins Four-Mile creek. Such a tunnel would cost approximately $300,000 and would take five years to construct. It would cut through the Elkton and several other mines at great depth. An original survey has been made and movement made to raise the capital.

At Independence the Glorietta lease on the Hull City placer made a production of 140 tons of ore in May; average value $35.

The Hannah Britt, west slope Bull hill, operated by the Practical G. M. Co., has reached the depth of 525 feet in the shaft. The upper levels have produced rich ore.

Manager Bainbridge of the El Paso Con. Co., on Beacon hill, is daily producing thirty tons ore. On Sept. 15 the new machinery goes in.

C. Waldon has a two-year lease on the Chickenhawk, August Flower and Hobo claims of the Katinka G. M. Co., adjoining the Mary McKinney on the south. He agrees to sink a 4x12 shaft, in the clear, to a depth of 700 feet. It will reach the vein at 600 feet.

Supt. McCarthy of the Granite mine on Battle mountain reports ore on the 1000-foot level that will go $100 gold to the ton.

The Isabella Co. of Cripple Creek has sold its Snow Bird fraction for $7500 to C. W. Kurie of Colorado Springs.

The Oneida mill, 1½ mile southeast of Victor, was destroyed by fire on the 7th inst. It was built three years ago by a New York firm at a cost of $100,000, to treat low-grade ore. It was only operated for a short time after its completion and had been idle ever since.

IDAHO.

ADA COUNTY.

Connection has been made with the vein on the Last Chance group, Boise City, at a depth of 250 feet. The company will double the capacity of the mill.

BINGHAM COUNTY.

In the Fort Hall Indian reservation 500,000 acres are to be opened for public entry June 17. Ninety-seven thousand acres are classed as agricultural, the balance being classed as grazing, but being a hilly and mountainous region known to be seamed with mineral veins carrying copper, gold and lead. Under the President's proclamation all the lands except those within 5 miles of Pocatello will be opened to public entry under the homestead, town site, mining, stone and timber laws of the United States, except that the agricultural lands will be entered at $2.50 per acre, the grazing at $1.25 and the mineral at $10 per acre. The opening will occur at noon on Tuesday, June 17.

BLAINE COUNTY.

Dowe & Beekman of New York had a lease and bond upon the holdings of the Hollister syndicate on the Hailey gold-copper belt—the Crœsus, the Big Camas, the Hattie, the Golden Star, and the Montana groups, which the Hollister syndicate had control of under options to purchase, and upon some of which it had made payments and spent $50,000. The Hollister people were to pay $350,000 for the Crœsus. Dowe & Beekman did no work except to grade and build the masonry for a 40-stamp mill. They have quit. The Hollister syndicate will probably resume operations.

CASSIA COUNTY.

A dredger is in operation at Basalt and considerable sand is being raised.

IDAHO COUNTY.

In Florence placer miners are running day and night, taking advantage of the present abundant water supply, and the output of dust will exceed that for many years past. On the Banner properties a small crew is at work. Florence is nearly depopulated consequent upon reports of rich ledges of free gold bearing quartz in the Marshall Lake country south of Salmon river. The present excitement is confined to Bear creek. The Marshall Lake country is a part of Florence mining district.

The Purdum Co. will put in a 40-stamp mill.

OWYHEE COUNTY.

At Silver City, work on the extension of the De Lamar mine is resumed. R. D. Morkill is in charge.

SHOSHONE COUNTY.

At Mullan the Snowstorm M. & M. Co. has let a contract for an additional 600 feet of development work.

The Monarch M. Co., near Murray, has 40 feet of ore, 7 of which is galena, the remainder concentrating ore.

The War King tunnel, to tap the lead at a depth of 200 feet below the old tunnel, is in 351 feet.

MICHIGAN.

HOUGHTON COUNTY.

The Calumet & Hecla Co.'s secretary, G. A. Flagg, has finished a report in which he states that the product of the mine has been generally rated at 93,000,000 pounds, while it was really producing about 70,000,000 pounds per year. Last year the Calumet & Hecla produced 74,510,557 pounds of copper; the previous year, 77,761,382 pounds.

MONTANA.

FERGUS COUNTY.

Ore is reported in the drift from the shaft on the Barnes-King mine at Kendall.

Satisfactory work is being done by the hoisting and pumping plant of the Kendall G. M. Co.

The Burke & Sweeney sapphire properties on Yogo creek are bought by the American Gem Mining Syndicate for $50,000.

FLATHEAD COUNTY.

There are 300 men in the camp of Cabinet on Fisher creek, 40 miles south of Libby.

Kalispell reports a strike in one of the Sullivan mines on the Stillwater river. Prospectors and others have gone over from Great Falls, and claims will be taken up in the vicinity.

GRANITE COUNTY.

The properties of the Montana G. M. Co., near Princeton, are in charge of C. F. Chapin of Butte.

In Garnet, the Mussighrod mill is running steadily and the mines being operated by the same company are being developed constantly and continue to yield well. The Grant & Hartley claims are being developed on a more extensive scale.

LEWIS AND CLARKE COUNTY.

The U. S. Supreme Court has decided in favor of the St. Louis M. & M. Co in the suit with the Montana M. Co. The properties are at Marysville. The litigation between the two companies is of years' standing. The St. Louis Co. filed suit against the Montana Co., alleging that the Drum Lummon vein apexed in its ground, and asked value of the ore extracted by the Montana Co. There are two causes of action, though they were each based on the same claim. In one it was set forth that the value of the ore extracted was $23 000. In the other it was claimed that the value of the ore was $230,000. The two causes were based on the fact that the vein broke on the side line of the St. Louis claim. In the trial in the Circuit Court, before Judge Knowles, the jury found in favor of the St. Louis Co. on the $23,000 claim, and Judge Knowles found for the Montana Co. on the larger claim. The Montana Co appealed to the Circuit Court of Appeals from the decision against it, and the St. Louis Co. appealed from the one adverse to it. The Circuit Court of Appeals decided both cases in favor of the St. Louis Co. In one it affirmed the judgment for $23,000 and in the other it directed that the lower court give a rehearing in the suit for larger damages, for the purpose of fixing the value of the ore extracted. From both of these decisions the Montana Co. appealed to the United States Supreme Court. The question at issue was, Was there a federal question involved, so that the Supreme Court had no jurisdiction? The counsel for the St. Louis Co. held that no federal question was involved. The Supreme Court has decided in their favor, and holds that the court of last resort is the Federal Court of Appeals suit at San Francisco.

MADISON COUNTY.

The Montana C. & G. M. Co., which has been doing extensive development work at Ballarat, near the forks of Stone creek, has consolidated with the International C. & G. Co., a corporation organized under the laws of Arizona, capitalized for $3,000,000.

Near Norris Manager Knox has twenty men at work in the Revenue mine.

Ore is being shipped from the Boar worth $50 per ton in gold.

The Red Bluff mine is being developed under the supervision of T. G. Austin, who has sixteen men at work.

The Norris M. Co. has been organized by Baltimore and New York men who have bought the Comstock group of five claims, 2 miles east of Norris. They intend to erect a 10-stamp combination mill and sink the shaft to the 300-foot level.

The Montana Boy property is to go to the Boston M. Co., composed of Minnesota men. It has on it a 20-stamp mill and hoisting plant. The new company will add a concentrator and cyanide tank to its plant.

At the Galena mine twelve men are employed.

Assays running $147 a ton have been produced by the Lehigh mine at Virginia City, the property of H. Elliott.

In the Revenue mine at Richmond Flat, near Virginia City, forty-two miners are employed, the vein is 2 feet wide, and runs $128 per ton.

At Stateline, on the Big Fourteen group, G. H. Smith has a $42,000 option.

MISSOULA COUNTY.

W. E. R. McDonald, Supt. Vermillion Placer M. Co., says the company is working its ground and taking out gold. He has constructed a pipe line 3825 feet long, through which water runs from Cataract creek to the ground. The company owns the water of Cataract creek, which during the dry season carries 1800 miners' inches of water per minute. The pipe line has a fall of 125 feet and furnishes enough water to run two No. 2 monitors. It cost $4000.

SILVER BOW COUNTY.

The reason given for the closing down of the Anaconda mine is that the old fire in the St. Lawrence mine, which has been smouldering for thirteen years, has broken out afresh and created so much sulphur fume and gas as to compel a temporary suspension of work in the Anaconda.

At Butte, on the 7th, J. E. Moen, a shoveler at the Rarus mine, while at work on the sill floor of the 1100-foot level, was instantly killed by the explosion of a stick of giant powder, which he struck with his pick while loosening a quantity of rock before shoveling into a car.

NEVADA.

DOUGLAS COUNTY.

T. F. Phelan of Bridgeport, Conn., principal owner of the Sayers mine at Sweetwater, will complete the mill now on the ground and expects to begin July 1.

ELKO COUNTY.

The Dexter M. Co 's report from Tuscarora the output for May to be $14,000 gold.

EUREKA COUNTY.

There is talk in eastern Nevada of a plan to extend the Eureka & Palisade railroad from Eureka via Hot Creek, Nye county, to Tonopah, 150 miles, and to build a smelter at Hot Creek, 90 miles south of Eureka.

The shipments of ore by rail from the mines of Eureka district for the week ending June 6 were as follows: Bullwhacker, 45,650 pounds; Diamond, 139.140; Eureka Con., 178 500; Jackson, 36,430; McGarry, 22,420; Richmond, 30,000. From Hamilton: Rocco-Homestake, 274,640.

LINCOLN COUNTY.

The Rambler and Emma mines, in Searchlight district, are reported sold so G. Baker for $20,000.

"A local mining man" tells the Salt Lake Tribune that a consummation of the million-dollar De Lamar deal would be followed by contracts for a mill that will equal the big plant operated by the Con. Mercur. The site, according to this authority, is to be that occupied by the present mill, the outlet for all the ores to be fed to the mill, the No. 10 tunnel, through which the reorganized company's entire holdings will be ultimately tapped.

An $80,000 option has been given on the Mendha group, near Pioche. There are 1000 tons of ore on the dumps that will yield $28 in gold, 18% lead and ten ounces of silver per ton.

The April Fool Co. has bought the Pat Ryan interest in the Gold Cup claim, an extension of the April Fool. This gives the company over two-thirds interest in that claim. The mine contains large bodies of low-grade ore, and tests made by the process which is now being adopted has demonstrated that the ore can be worked at a profit.

The railroad of the Quartette Co. at Searchlight is completed; trains make two trips daily from mine to mill.

NYE COUNTY.

Tonopah reports a strike 6 miles south of the camp, in which the ores assay $800 gold per ton.

The Tonopah Bonanza reports work begun on a 500-foot deep double-compartment shaft on the ground belonging to the North Star Co., J. McCambridge Supt.

Manager Curtis of the Fraction is sinking a triple-compartment shaft, one in the center of the company's group.

The double-compartment shaft on the Silver State, the property of the newly formed G. & H. Tunnel Co., is being sunk by three shifts of miners to a depth of 600 feet.

The Tonopah Water Co. is piping water. J. R. Duffield is manager.

STOREY COUNTY.

At the Savage mine, on the 425 level, from the Gould & Curry tunnel, they are cutting out for chutes, airway and manway in the raise above the north drift from No. 2 east crosscut. This work will be completed during the coming week and raising resumed. In this work there have been saved twenty-seven mining cars of low-grade ore, which has been placed in the dumps of the Best & Belcher mill. The average car sample assay was $6.27 per ton.

F. Leonard Jr. says he will make final arrangements for the extension of the Sutro tunnel south lateral branch to Silver City.

Supt. Gorham of the Chollar, Potosi and Savage mines will put on two more shifts of men at the drilling plant in Potosi ground, on the Brunswick lode.

At Virginia City the drill on the Brunswick has reached a depth of 670 feet and is in clay.

WASHOE COUNTY.

Since J. Sparks has owned the Wedekind mine he has had thirty men locking out ore to run through a leaching mill with a daily capacity of thirty tons. The mill is ready to start up. It will be run by electrical power.

The Sparks M. Co. will give a fiesta at the mine next week to celebrate the opening of the new mill. Cattle and sheep will be slaughtered for a big barbecue.

NEW MEXICO.

GRANT COUNTY.

C. P. Laughlin is at Silver City to superintend work on the Whitewater group, Burros district.

The Santa Rita M. Co. is working on the long cross-country drifts, northerly from the Santa Rita shaft, near Santa Rita. The company is shipping thirty cars copper ore per month. The leasers are running out forty cars per month.

LINCOLN COUNTY.

The New Mexico Development Co. is organized by W. A. McIvers of Nogal to drill for oil. The company owns nearly

1000 acres of oil lands in Lincoln county and will operate a steam drill, capable of drilling 3000 feet.

SANTA FE COUNTY.

The smelter at Cerrillos has shut down temporarily on account of lack of ore.

SOCORRO COUNTY.

E. Cralg, owner and manager Last Chance property in the Cooney district, will take personal charge of the oporations on his property. He will increase capacity of pulp tanks so that mill will have capacity of seventy tons per day.

OREGON.

BAKER COUNTY.

Near Sumpter, a 20-foot blind lead has been cut by the crosscut of the Alamo mine, 700 feet from the mouth.

Manager McPhee, of the Golden Wizard, Minersville, property, is estimating the cost of a mill to treat the ores. The shaft at the mine is being sunk.

An electric plant for power and lighting the Copperopolis has been put in on Dixie creek by the Copperopolis Co. It is used for operating a Durkee electric drill.

Work has begun on the Yankee Boy property, near the Copperopolis, a gold-copper property. It is the purpose to drive 500 feet without stopping.

The new town of Greenhorn has sprung up in the Greenhorn mountains and is absorbing the old town of Robinsonville.

GRANT COUNTY.

Johnson and Jarvin at Granite are examining the Climax and Scandia Tunnel properties to choose a tunnel site for a 600-foot tunnel to be run on the Climax group, near Granite. The Scandia tunnel is now in Quebec hill 1600 feet and has reached a depth of 770 feet. It has 250 feet yet to go.

JOSEPHINE COUNTY.

Stewart & Banfield at Boland creek report another strike on their quartz property.

C. L. Mangum, Supt. Granite Hill mines, Louse Creek district, says he has resumed operations. Specimens from the Granite Hill mines received the bronze medal award at the Charleston exposition.

Grant's Pass reports a rich copper strike in the upper Chetco district, in the southern part of the county, extending across the line into Del Norte county, Cal. Much of the rock carries copper values of 30%. The ore was taken from the claims of J. S. Crawford of Denver and associates.

LANE COUNTY.

The present stamp capacity of the Bohemia district is 63 stamps: Noonday 20, Helena 10, Musick 10, Champion 10, Star 5, Stocks & Harlow 5, Tom Johnson 3.

New machinery will be put in at the Helena, Star and Musick mills for concentration of ores; the capacity of the latter will be increased from thirty tons a day to fifty. P. J. Jennings, Helena M. Co., is manager.

SOUTH DAKOTA.

CLARK COUNTY.

Work is under way on several properties in the Garden City district. The Penobscot M. Co. has started considerable work. The Garden City M. Co., owner of 100 acres of ground, will continue work.

The Gold Hill M. Co.'s shaft shows ore. It is the intention to catch it at depth.

The Minneapolis M. Co. will ship ore from a long incline.

LAWRENCE COUNTY.

At Lead the new Ellison hoist is the largest in that region. Eight boilers furnish 2000 H. P. There is a 300 H. P. engine to run the four rock crushers and an air compressor capable of driving 300 machine drills. The ores will be drawn by air motors from the holst over a trestle which extends across the gulch to the mills. The trestle is steel, ¼ mile long, 100 feet above the ground.

PENNINGTON COUNTY.

A free gold strike is reported near Keystone, owned by E. H. Flynn, on Mt. Ætna, 300 feet from the Holy Terror mine.

The National smelter, at Rapid, has one matte furnace in commission, and will increase its production by the blowing in of a lead furnace as soon as sufficient suitable ore is received.

UTAH.

BEAVER COUNTY.

Covert, Buchanan and Ryan have sold the Klondike mine to the Ben Harrison M. Co. for $20,000—$2500 down, $3000 per month until paid in full.

The Black Rock Copper M. & M. Co. will put in a hoist on its property in the Beaver Lake district.

JUAB COUNTY.

J. M. Ferguson, manager Miners' Supply Co., Robinson, will rebuild the plant recently destroyed by fire.

Sandstone carrying $10.50 in gold is reported in the Orient, in West Tintic. T. R. Powers is president of the company.

P. J. Daley, operating the Beatrice, near Silver City, has ore which assays 121.2 ounces silver, $2 gold, 12% lead.

At Silver City the crushers at the Tesora mill are running on ores from the Alaska M. Co, between which and the plant everything is moved by gravity. The ore consists of a sulphide of iron carrying copper and gold, with a light percentage of lead.

SALT LAKE COUNTY.

Bingham mine managers think they should have a reduction in the tariff to the valley smelters. At present the tariff on ores where a fixed tonnage is proscribed is 50 cents per ton. The shippers want a 35-cent tariff. On coke they want the $8.50 reduced to $7 per ton, and the tariff on lime rock reduced from 40 cents to 25 cents per ton.

TOOELE COUNTY.

Leaching of ores has been resumed at the Sacramento Company's mill at Mercur.

The Nebraska group at Stockton has 200 miners on the pay roll.

WASHINGTON.

OKANOGAN COUNTY.

Supt. E. P. Gaillac of the Beaver Lake mines, 7 miles south of Chesaw, has 8 feet of copper-gold ore in a tunnel, 100 feet from the surface. A crosscut drift has started from the tunnel to cut across the ledge at right angles.

WYOMING.

ALBANY COUNTY.

The smelter for the Rambler mine is being unloaded at Laramie.

CARBON COUNTY.

Supt. W. C. Leadbetter of Battle Copper Co. has begun work on the company's copper property at Battle Lake.

Near Grand Encampment 10 miles of the tramway to connect the Rudefeha mine with the smelter have been completed; 6 miles remain. Men are shoveling snow to lay tower foundations. The tramway will be in operation Sept. 15.

FOREIGN.

BRITISH COLUMBIA.

A. I. Goodall, manager Boston & Montreal Co.'s smelting plant at Boundary Falls, expects to blow in a furnace July 1.

Manager Graves of the Granby Co. will have an air compressor in the Granby Co.'s mines in Phœnix, to be run by electricity and to cost $60,000.

The total production of lead in the Dominion for the year ending June 30, 1901, was 50,756,440 pounds. The total value of gold mined during 1901 was $24,462,222. The lead contained in ore exported from Canada during the same time amounted to 65,602,338 pounds, valued at $2,517,084.

The Tacoma Steel Corporation has bought 1760 acres of mineral land on Barkley sound, Vancouver island, for $20,000 cash and $40,000 in capital stock of the company. President Hewitt of the Tacoma company states that the first move in the development of the iron industry will be the erection of a 150-ton daily capacity smelting furnace in Tacoma. The ore, he states, is a magnetite, running from 64% to 70% metallic iron, contains little phosphorus and lime as high as 7%.

At Rossland the Le Roi is shipping ore from the dump at the old workings. It contains 80,000 tons of ore, on which the company expects to realize $1 a ton. Five hundred tons daily will be shipped to the Northport smelter.

MEXICO.

The Mexican government is about to pass a law placing a heavy penalty upon the stealing of ores from the mines by the employes. It is stated by mine owners that some employes cause considerable loss by carrying off rich specimens of ore, which are concealed about their persons.

CHIHUAHUA.

At Panuce de Avino is being changed the mode of treatment. A leaching plant will be erected in place of the plant now on the ground.

The construction of the new sampling works for the Campania Metalurgica de Torreon has begun.

SOUTH AFRICA.

Pretoria reports that a proclamation has been issued substituting a tax of 10% on the net profits of mining operations for the 5% tax that was imposed by the late Volksraad.

YUKON TERRITORY.

The cost to the Government for the maintenance of the land offices on the Yukon was $21,391.76. There was but a single application and a fee of $10. The offices have been abandoned.

Personal.

C. E NASON is Supt. Marble Co., Custer, S. D.

WM. CASTLE is now Supt. Keltz mine, Tuolumne, Cal.

P. M. MCCREE is Supt. Blackbird M. Co., Blackbird, Idaho.

D. C. JACKLING of Canon City, Colo., is in Salt Lake City, Utah.

JNO. R. PARKS is examining the Oro Fino mine, Sumpter, Oregon.

A. S. MCLEOD is now Supt. Cashier mill, near Breckenridge, Colo.

J. GALLAGHER has resigned as Supt. Hazel Dell mine, Tuttletown, Cal.

ARTHUR KEDDIE has been appointed Deputy U. S. Surveyor, Reno, Nev.

D. E. BIGELOW has returned from Cedros Island to San Francisco, Cal.

G. W. KIMBLE of Placerville, Cal., is examining mining property in Idaho.

LIEUT.-GOV. J. H. NEFF has returned from Auburn, Cal., to San Francisco.

GEO. H. ROBINSON, manager Heinze interests in Montana, is visiting Utah.

C. F. CHAPIN of Butte is now manager Montana G. M. Co., Princeton, Mont.

JAS. H. KIRK is Supt. of mines for the Cananea Con. M. Co., Sonora, Mexico.

S. E. BRETHERTON is now metallurgist for the Val Verde, Arizona, Smelting Co.

C. C. NOPPLE is now in charge of the Phœnix mine and mill, Sumpter, Oregon.

S. E. WARE, Supt. Swansea M. Co., Tintic, Utah, has returned from California.

G. S. BINKLEY, manager Esperanza mines, Cedros Island, is in Los Angeles, Cal.

E. H. TEATS has returned from Albina, Dutch Guiana, South America, to Denver, Colo.

F. J. CONROY is now consulting engineer for Belle of Thunder Mountain M. Co., Idaho.

WM. APPLEGATE, president Blaine M. Co, Twin Lakes, Colo., has returned to the East.

PHILIP DEIDISHEIMER of San Francisco is examining Tonopah, Nev., mining property.

THOMAS JONES, formerly Supt. Marion M. Co, Mercur, Utah, has gone to Tonopah, Nev.

R J. ANDERSON, manager Swsepstakes M. Co, Trinity county, Cal., is in San Francisco.

W. STUART SMITH, U. S. N., retired, has returned to San Francisco from Cavite, P. I.

J. L. GOODMAN has been appointed Supt. Hampton Lead Co., operating in Jefferson county, Mo.

GEO. MITCHELL, general manager Greene Con. M. Co., Cananea, Mexico, is in Washington, D. C.

CYRUS O. BAKER JR. of the platinum refining firm of Baker & Co. has gone to Europe for sixty days.

PREST. SCALLON of the Anaconda Copper M. Co. has returned from Bozeman, Montana, to Anaconda.

ARTHUR KENNELLY has been appointed to the chair of Electrical Science in Harvard University.

DUNCAN MCVICHIE, general manager Bingham Con., has returned to Salt Lake City from Denver, Colo.

C. H. MCCORNICK of Salt Lake City, Utah, has gone to Paris to close a Kingman, Ariz., mining deal.

M. W. MATHER, manager Crœsus G. M. Co., Sierra county, Cal., has returned there from San Francisco.

W. G. RICE has resigned as Supt. W. S. Stratton's properties, at Cripple Creek, Colo., and will go to Denver.

J. M. HYDE, field assistant of the State Mining Bureau, is in Kern county, Cal., gathering a mineral exhibit.

WM. SCHOPPE has gone from Salt Lake City, Utah, to the mining office of A. W. McCune, Lima, Peru.

J. F. BURSLEM is general manager Boston & Mexican P. M. Co., Cumaripa, Alamos district, Sonora, Mexico.

T. H. TRACY has gone from El Paso to La Cananea as consulting engineer for the Cananea Consolidated Copper Co.

FORMER MANAGER SHIPMAN of the Independence mine at Cripple Creek is manager Camp Bird, Ouray, Colo.

A. T. CORBUS, secretary and treasurer Alaska-Treadwell G. M. Co., has returned to San Francisco from Ono, Shasta county, Cal.

L. A. SMITH, Victor, Colo., is now manager the Highland Mary mine, near Silverton, Colo., vice Thos. Annear, resigned.

L. L. MITCHELL, manager Standard Bank of South Africa, has been appointed director De Beers Consolidated Mines, South Africa.

J. F. PARKS, Supt. Kennedy mine, has returned to Amador county, Cal., after an extended reconnoissance through Montana and Colorado.

FRED S. JOHNSON has been appointed general manager of the interests of W. S. Stratton throughout the Cripple Creek, Colo., district.

ALEJANDRO LOUBET, general manager Fundicion de Sinaloa of Mazatlan, Mex., has resigned to incorporate a foundry and machine works in Mexico.

CHARLES HURLBURT, manager director Republic M. Co., British Columbia, has gone to the mine, where he will remain, superintending operations.

MANAGER J. E. BAMBERGER of the Daly-West, Utah, may abandon his trip to Europe and return to take part in the closing of the option on the DeLamar, Nev., mines.

C. W. TAYLOR has resigned the superintendency of the Empora M. Co., Magdalena, Mexico, to return to his assay business at Nogales, Arizona. He is succeeded by T. J. Morris.

ROBERT F. CARR, vice-president and manager Dearborn Drug & Chemical Co., Chicago, Ill., has returned to Chicago after a month's visit among the mining districts of the West.

M. C. GLASGOW has returned from Australia, where he went some months ago to look after some mining property for J. A. Butler, who discovered the Tonopah district, Nevada.

CHAS. H. MOYER, Lead City, South Dakota, is elected president Western Federation of Miners; E. Hughes, Butte, Montana, vice-president; W. D. Haywood, Silver City, Idaho, secretary-treasurer.

R. A. TREVARTHEN, late Supt. Portland G. M. Co., Cripple Creek, Colo, is sojourning in California for his health. D. C. Gabrin has been appointed Supt. Portland G. M. Co., to succeed Mr. Trevarthen.

Commercial Paragraphs.

THE Cleveland Pneumatic Tool Co., 74 Frankfort St., Cleveland, O., has appointed the Compressed Air Machinery Co., San Francisco, Cal., to represent it on the Pacific coast.

THE sales of the Overstrom diagonal concentrating tables, manufactured by the American Engineering Works, Chicago, Ill., are reported large. The manufacturers say the table gives satisfaction and is in demand.

THE Raymond Bros. Impact Pulverizer Co. of Chicago, Ill., have a building corner Laflin and Harrison Sts., Chicago, where they will, commencing July 1, manufacture their pulverizers and other machinery. The factory will be fitted with the latest machinery for manufacturing, and will be extensive enough to take care of this firm's large business—mainly the manufacture of pulverizers for mining and other purposes.

Catalogues Received.

The first catalogue of the Standard Diamond Drill Co. is received; 84 pages replete with illustrated description of these mining appliances. The statement is made: "They remove solid cores through rock for prospecting," and the several styles of drills are described in detail. There is also an interesting chapter on diamond drill boring tools. A request to 1644 Monadnock Blk., Chicago, Ill., will bring the handsome booklet.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING JUNE 3, 1902.

701,281.—STARTING MECHANISM—G. M. Brous, Houlton, Or.

701,547.—WELL BORER—J. T. Davis, S. F.

701,555.—FRUIT ELEVATOR—W. M. Ewing, Fresno, Cal.

701,318.—ARTIFICIAL LIMB—I. R. & W. D. Fenner, S. F.

701,710.—FILING SAWS—J. H. L. & G. A. W. Folkers, Oakland, Cal.

701,703.—HOSE COUPLING—C. Frankish, Ontario, Cal.

701,335.—BUNG AND FAUCET—L. H. Handy, S. F.

701,483—FIRE ESCAPE—R. B. Hemming, Oakland, Cal.

701,571.—SHIFTING TOPSAIL—A. Keegan, S. F.

701,589.—CAN HEADING MACHINE—A. W. Livingston, Alameda, Cal.

701,503.—BLOCK SCRAPER—B. I. Plummer, Grants Pass, Or.

701,614.—VEHICLE STORM APRON—W. G. Reese, Oakland, Cal.

701,632.—COFFEE FILTER—A. F. Shriver, Arbuckle, Cal.

701,518.—FEED WATER HEATER—F. W. Shupert, Spokane, Wash.

701,432.—EGG BEATER—E. L. Weed, Baker City, Or.

701,783.—TELEPHONE CALL—Williams, Ingram & Wilson, Walla Walla, Wash.

Latest Market Reports.

SAN FRANCISCO, June 13, 1902.

METALS.

SILVER.—Per oz., Troy: London, 23⅞d (standard ounce, 925 fine); New York, bar silver, 52⅝c, refined (1000 fine); San Francisco, 52⅛c; Mexican dollars, 44½c San Francisco, 42c New York.

COPPER. — New York: Standard, $11.75@12.00; Lake, 1 to 3 casks, $12.25; carload lots, $12.00; Electrolytic, 1 to 3 casks, $12.00; carload lots, $11.75; Casting, 1 to 3 casks, $12.25; carload lots, $11.25. San Francisco: $14.00. Mill copper plates, $17.00; bars, 18@24c. London: £54 7s 6d, spot, per ton.

LEAD.—New York, $4.12½; Salt Lake City, $3.60; St. Louis, $4.00; San Francisco $4.50, carload lots; 4⅛c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; plg, $4.75. London, £11 5s per ton.

SPELTER. — New York, $4.87; St. Louis, $4.50; London, £18 12s 6d per ton; San Francisco, ton lots, 5¼c; 100-lb lots, 5⅜c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN. — New York, plg, $30.50; San Francisco, ton lots, 31½c; 1000 lbs., 31⅝c; 500 lbs., 31⅞c; 200 lbs., 32c; less, 32½c; bar tin, ℔, 37½c.

PLATINUM.—San Francisco, crude, $17.50 ℔ oz.; New York, $19.50 per Troy oz.

QUICKSILVER. — New York, $48 00 large lots; London, £8 15s; San Francisco, local, $46.00 ℔ flask of 76½ lbs.; Denver, $50.50. Export, $43.50.

BABBITT METAL.— San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER. — Half-and-half, 100-lb. lots. 20c; San Francisco, Plumbers', 100-lb. lots, 16½c.

NICKEL.—New York, 50@60c ℔ lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $21.00; gray forge, $20.75; San Francisco, bar, 2.75 ℔ lb.,3c in small quantities.

At New York yesterday the question of pig iron supply for the ensuing year was discussed by the operating chiefs of the various companies that form the United States Steel Corporation. Fully 90% of the pig iron used by the corporation is manufactured at its different plants, the balance coming from furnaces in the Shenango and Mahoning valleys, Pennsylvania. At these places the price is reported to have advanced from $19.75 to $21 per ton, which the corporation regards as excessive. About a month ago the Steel Corporation paid $16.50 a ton for a three months' supply.

STEEL.—Bessemer billets, Pittsburg, $36.00; open hearth billets, $36.50; San Francisco, bar, 7c to 12c per lb.

CEMENT.—Germania, $2.65; K. B. & S., $2.65; Hewmoor, $2.50; Trowell, $2.50 per bbl.

LIME.—Santa Cruz, $1.60; Roche Harbor, $1.60 per bbl.

LUMBER.—(Retail): Pine, ordinary sizes, $18.00@19.50; extra sizes higher; redwood, $19.00@20.00; lath, 4 feet, $3.90 @4.00; pickets, $19.00; shingles, $2.00 for No. 1 and $1.75 for No. 2; shakes, $13.00 for split and $14.00 for sawed; rustic, $25.00 @31.00.

GENERAL SUPPLIES.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.50; Cut, $3.50; 10d to 16d, Wire, $3.55; Cut, $3.55; 8d, Wire, $3.60; Cut, $3.60; 6d and 7d, Wire, $3.70; Cut, $3.70; 4d and 5d, Wire, $3.80; Cut, $3.80; 3d, Wire, $3.95; Cut, $3.95; 2d, Wire, $4.20; Cut, $4.20. Special rates for carload lots.

POWDER.—F. o. b. San Francisco: No 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one toss 15½c. No. 1** 50%, carload lots, 11½c; led, than one ton, 13½c. No. 2, 40%, carloan lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ℔ set; 14 oz., 40s., 9c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $6.50; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $9.56, long ton; Colorado Anthracite, $14.00. Coke, $15 per ton in bulk, $17 in sacks; Sunnyside, $11.75, long ton.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 29@30c ℔ lb.; carloads, 27@28c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c ℔ lb.; soda ash, $1.90 ℔ 100 lbs.; hyposulphite of soda, 2½@3c ℔ lb.; blue vitriol, 5½@6½c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 5c; alum, $1.90@2.00; flour sulphur, French, 2½@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.25 @1.50 ℔ 100 lbs.; sks, $1.05; chloride of lime, spot, $2.50@2.60; nitrate of potash, in bbls. 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 65c; cs, 70c; raw, bbl., 63c; cs, 68c. Kerosene —Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bbls, 19c; wooden bbls., 22½c; cs, 25c; Mineral Sperm, cs, 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 21½c; 86° Gasoline, bulk, 20c; do., cs., 26½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14½c; do., in cs., 21c; Lard Oil, No. 1 bbl., 60c; cs., 65c; Neatsfoot Oil, bbl., 70c; cs., 75c; No. 1 bbl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb, 6¾c; 1 ton and less than 5 tons, per lb, 7c; 500 lbs. and less than 1 ton, per lb, 7¼c; less than 500 lbs., per lb, 7½c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6¾c; do. in kegs, 7¼c.

RED LEAD AND LITHARGE —One ton and over at one purchase, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7¼c; less than 500 lbs., 7½c.

ASSAY LITHARGE.—Per lb, 9c.

BISMUTH.—Subnitrate, per lb., $1.60.

BONE ASH.—3c ℔ lb.

BORAX.—Crystal, 7c: calcined, 20c.

CHROMIUM.—(90% and over) per lb, $1.25.

COPPER.—Carbonate, 20c; Red oxide, ℔ lb., 60c.

MAGNESIUM.—Per lb., $3.00.

MANGANESE.—(90% and over) ℔ lb., $1.25.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—25c. ℔ gramme; 1000 grammes=2¼ lbs.

PHOSPHORUS. — (American) ℔ lb., 80c.

SILVER.—Chloride, ℔ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ℔ lb., $1.00

URANIUM.—Oxide, ℔ lb., $3.50.

ZINC.—Metallic, chemically pure, ℔ lb., 50c.

ZINC.—Dust, ℔ lb., 10c.

ZINC.—Sulphate, ℔ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

WANTED.

Wanted to Bond a Dry Placer Claim, One Rich in Flour Gold.

Must be a dry proposition. Address "Placer Claim," care this office.

WANTED, for a developed mine in California, a competent mining engineer to look after development and exploration. Must be a full graduate of a recognized mining college and have had several years' practical experience in large iron, coal or copper mines, and be fully skilled in the engineering problems pertaining to extraction, haulage, ventilation, etc. Give full particulars of career, experience, age, etc., to "Vulcan," care of this paper.

WANTED.

Consulting Mining Engineer,

familiar with making examinations of mines, prospects and mineral lands. Address stating experience and references. Moderate salary to start, with advancement to competent man. Position permanent if found satisfactory. Address A., care of Mining and Scientific Press.

Quicksilver

BY THE FLASK OR CARLOAD.

WEIGHT AND QUALITY GUARANTEED.

The Eureka Company,

OF SAN FRANCISCO.

320 SANSOME STREET, - SAN FRANCISCO.

Quicksilver

IN LOTS TO SUIT.

Write for Quotations.

REDINGTON & CO., 23-25-27 Second Street, SAN FRANCISCO, CAL.

SITUATIONS WANTED.

A young man with some experience at mines; course in both surveying and assaying, wishes position as assistant at some good mine. Good references. Address S. M. W., 401 Ellis, San Francisco.

PRACTICAL MILLMAN — AMALGAMATOR, Cyanide Man and Assayer, wishes position. School of Mines graduate. Best references. Address R. B., care of Mining and Scientific Press.

WANTED.—Position by experienced Electrician and Engineer. Repairing, armature winding, construction work, air machinery, general mechanics, etc. Familiar with mining and milling machinery. At present chief engineer References. Address "Electrician," care Mining and Scientific Press.

A SOBER AND INDUSTRIOUS MACHINIST and Engineer wishes employment as pumping or hoisting engineer, or anything of the kind Is also a fairly good electrician and a good pipe fitter, and thoroughly understands repairing of machinery of all descriptions. Can give reference as to ability. Address W. M., 43 Sixth Street, San Francisco, Cal.

WANTED.—Position as Assayer and Bookkeeper in a mine; experienced in underground work; good references; present position not desirable. Address Box No. 127, care of this office.

PHYSICIAN AND SURGEON with three years' experience in both emergency and general hospitals, in addition to experience in mines and private practice, wishes position in a mine. Best of references. Address Box 126, care of this office.

CHEMIST AND ASSAYER, WITH TWENTY years' experience in mill and smelter work. Can run sams. Address A. C., care of Mining and Scientific Press

THUNDER MOUNTAIN.—A successful superintendent of over 15 years' experience and acquainted with this district desires to take charge of property there for a good company. Address T. M., care of Mining and Scientific Press.

MINING ENGINEER, practical miner and mill man, assayer, etc., desires position of superintendent or assistant manager of a big property. Eleven years' experience. Best references. Now working in southern California. Address A. M. P., care of Mining and Scientific Press.

WANTED.—SITUATION AFTER MARCH 15, 1902, as Manager or Superintendant of mines. Have had five years' experience in manufacturing and constructing mining machinery and plants. Three years' experience in underground work. Four years' experience as manager and superintendent. Treatment of low grade ores a specialty. Practical in every detail. State location of mine and salary. Best of references. Address X. Y. Z., this office

A technically educated Mining Engineer, at present employed as superintendent of mines for one of the largest corporations in Mexico, desires a change of position to the United States about July 1st. Has had 18 years' successful experience as engineer and superintendent, never having made a failure; 36 years of age; strictly temperate; a skilled designer, geologist and metallurgist, and a practical miner, as well as a hard worker and thorough business man. References of the highest order, including present employers. Address Supt., care this office.

FOR SALE.

FOR SALE.—One-Third Interest in a Good Paying Copper Property.

$20,000 cash payments, balance from mines. Principals only. Address "Copper," this office.

FOR SALE.

Large Deposits of Graphite.

Address F. W. CARTER,

Tenth and Cedar Streets,

SAN DIEGO, CAL.

Gold Mining Properties For Sale.

Two First-Class Placer Mines,

one having 20 years' record as a producer. Both in good working condition. Terms reasonable. Address "Enquirs," care this office.

The Mines Exchange, Ltd.

Mines and prospects in British Columbia, the Western States, and Mexico, for sale.

Free milling gold properties a specialty.

Write us for reports and information.

Bank references given.

Address THE MINES EXCHANGE, LTD., P. O. Box 700, Nelson, B. C.

Branch Office: P. O. Box 594, Salmon City, Idaho.

EXAMINATION OR SUPERVISION of Mines, Smelters and Mills.

Mining Engineer and Metallurgist, of unquestionable reputation and long experience, now permanently residing at Seattle, Wash., will examine or take general supervision of mines, smelters or mills, in Pacific Coast States, British Columbia or Alaska, as consulting engineer, for reliable parties. Is also reliable accountant to examine. Box 813, Seattle.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Sam Abtye, in the Secret Diggings Mine, near Laporte, Plumas County, Cal., to deposit tailings in worked-out pit draining into Clark or Slate Creek, and from P. J. Sheridan and E. N. Ekel, in the Lancha Plana mine, at Lancha Plana, Amador County, Cal., to deposit tailings in worked-out pit draining into Mokelumne River, gives notice that a meeting will be held at Room 96, Flood Building, San Francisco, Cal., on June 16, 1902, at 1:30 P. M.

HENRY CAREY BAIRD & CO.,

INDUSTRIAL PUBLISHERS, BOOKSELLERS & IMPORTERS,

ASSESSMENT NOTICES.

REWARD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Pine Grove, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of May, 1902, an assessment (No. 10) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 56, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of June, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of July, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD JR., Secretary.

Office—Room 56, No. 309 Montgomery street, San Francisco, California

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of June, 1902, an assessment (No. 16) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 708 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of July, 1902, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 18th day of August, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission street, San Francisco, California.

BEST AND BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of May, 1902, an assessment (No. 76) of fifteen (15) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 2nd day of July, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 23d day of July, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

SILVER KING MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Pioneer Mining District, Pinal County, Arizona Territory.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 24) levied on the 17th day of April, 1902, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
J. O'B. Gunn	3679	350	$3 50 00
Michael Levy	7352	100	100 00
Michael Levy	7354	100	100 00
F. Avery, Trustee	7415	100	100 00
New York Issue.			
James Entwistle	1010	100	100 00
James Entwistle	1011	100	100 00
James Entwistle	1012	100	100 00
James Entwistle	1013	100	100 00
James Entwistle	1014	100	100 00
Nathan May	1016	100	100 00
Nathan May	1017	100	100 00

And in accordance with law, and an order from the Board of Directors, made on the 17th day of April, 1902, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, No. 310 Pine street, Room 36, San Francisco, California, on TUESDAY, the 24th day of June, 1902, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. W. PEW, Secretary.

Office—No. 310 Pine street, Room 36, San Francisco, California.

MICHIGAN COLLEGE OF MINES.

An Engineering School with unique location, giving it unusual facilities. Distinctive methods of instruction. Special courses. Field and laboratory courses in regular summer term. For catalogue giving list of graduates and their occupations, address

F. W. McNAIR, Pres't, Houghton, Mich.

Lemhi Mining and Real Estate Exchange,

P. O. Box 165, SALMON CITY, IDAHO.

Thunder Mountain Properties a Specialty.

GOLD, SILVER AND COPPER QUARTZ MINES.

KNOWING how many people read a paper is of more importance to the advertiser than knowing how many people get it.

MINING AND SCIENTIFIC PRESS

Whole No. 2187.—VOLUME LXXXIV. Number 25. SAN FRANCISCO, CAL., SATURDAY, JUNE 21, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

At times of light load portions of the stream shoot out into the river without striking the buckets of the impulse wheels. No attempt is made to "control" the flow of water by the governing apparatus, and sometimes the stream reaches clear across the canyon.

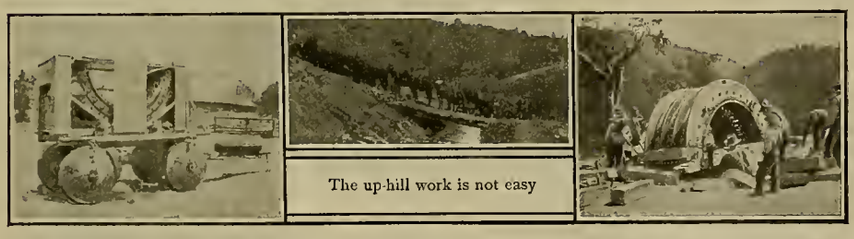
The interior of the Colgate Flume measures 8½ by 6 feet, and the grade is 9 feet to the mile.

This is an illustration of the construction of Lake Frances dam. The dirt, instead of being conveyed in the usual manner, was washed to its destination. A pipe, containing a line of perforations, located on falsework above the site of the dam, was made to receive a mixture of dirt and water and the latter allowed to ooze through the perforations until the filling-in was completed.

Construction Work. The end views are of work on a dam 210 feet high. That in the center illustrates hydraulic excavation for the Electra power house.

Supporting Insulators of the Great Carquinez Span. The Four Anchorages of the Span Cables. One of the Strain Insulators, each Housed Separately.

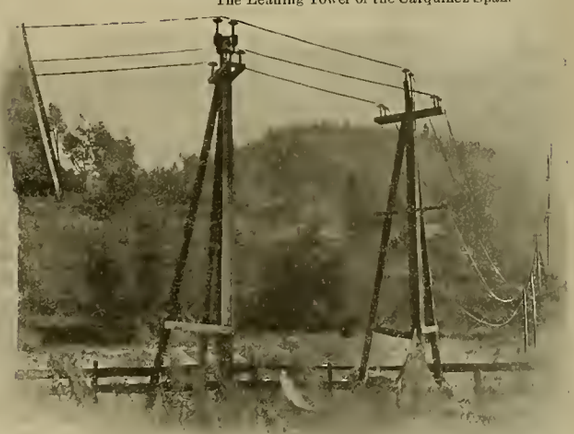
The Leaning Tower of the Carquinez Span.



The up-hill work is not easy

The end pictures represent respectively one of the mountain carts loaded with a section of armature, and the same armature in place to be snubbed down the power-house hill.

High Tension Line Construction. The center picture is of a Standard Company cable stringing cart.



An Angle in One of the High Tension Lines.

Scenes Along the Line of a Great California Electrical Power Company.—(See page 334.)

TABLE OF CONTENTS.

ILLUSTRATIONS.—Scenes Along the Line of a Great California Electrical Power Company, 330. Flume Along Yuba River, Cal. From "Point View," a Panorama of Near y Four Miles in Length Can Be Seen, 334. Making a Cant Hook, 335. Mining and Metallurgical Patents, 338

EDITORIAL.—Litigation in Thunder Mountain, Idaho; Award of the Paris Exposition; Demand for Miners in Alaska; Electric Power Plants on Pacific Coast; A Contribution to Metallurgy; Prevention of Possible Fire Destruction; Smelting Charges; The Usual Number of Mining Schemes; Neglected to Take Advantage of Opportunities; A Department of Mines and Mining for Canada, 331.

MINING SUMMARY.—339-340-341-342.

LATEST MARKET REPORTS.—15.

MISCELLANEOUS.—Concentrates, 332. Costs and Profits in Pyritic Smelting of Low-Grade Copper Ores; Copper Resources of California, 333. Electric Power Plants of the Pacific Coast, 334. Preservation of Wire Ropes; Rough and Ready Cant Hook; Coal Production of Last Year; Acid Plant at Black Warrior, Ariz., 335. Judging From the Surface; A Projected Merger; Casual California Comment, 336. Pacific Coast Electrical Transmission Association; The Foster-Coolidge Automatic Sampling Machine; American Brains and English Bricks; The Altitude of the Colorado River, 337. Mining and Metallurgical Patents, 338. Personal; Commercial Paragraphs; New Patents; Notices of Recent Patents; Recently Declared Mining Dividends; Trade Publications; Books Received, 342.

LITIGATION has begun in Thunder Mountain, Idaho, district, which is the best evidence yet offered of mineral values therein. In any new mining camp, and many an old one, a strike is the immediate signal for a lawsuit, and the more valuable the find the more protracted and expensive the litigation.

FROM the Chicago Exposition of '93 was received by this paper a much appreciated award wherein its merits received due recognition, and now from the Paris Exposition of 1900 comes tardily but none the less appreciated the award of the U. S. Commission based upon the exhibition of this paper there. Both adorn the walls of the San Francisco office and are duly prized.

FROM the north come the usual June statements that "several thousand men are needed in Alaska this season," that "big wages are being paid," and "skilled miners are in great demand." Of course, this is not to be credited by any one looking for work. Miners wanting employment should not believe such stories, which are annually put out by water transportation companies.

REFERRING to the article on electric power plants on the Pacific coast, appearing on pages 334 and 335 of this issue, it is to be stated that an earth dam is now being built by the hydraulic process at Dobbins Creek, Cal., the level of which will be 382 feet above the main flume to the Colgate power house, in connection therewith. It is designed to thus create a reservoir impounding 93,500,000 cubic feet water.

IN this issue appears the fifth and concluding part of the article "Costs and Profits in Pyritic Smelting of Low Grade Copper Ores." It is a contribution to metallurgy that will form the base and groundwork of similar articles the world over for some years. Published in book form as a treatise on that subject, the article as it has appeared during the past five weeks would cost about $6. It is such original matter that gives this paper the prestige it enjoys among mining men everywhere.

THE season of possible fire destruction is at hand and the proverbial ounce of prevention is in order in every mining town. Many mining camps are built in a canyon where the natural suction causes a breeze that makes a big fire of a little one in short order. Carelessness is the cause of most fires and delay in immediate action often entails widespread ruin. It is good economy to have the fire extinguishing appliances in camps, mines and mills in such shape as to admit of immediate and effective use. Many a time in case of fire the first five minutes is worth $25,000 a minute.

Smelting Charges.

A more than usual number of questions concerning smelter charges make timely some general reference to that subject with a few details.

Smelter charges are not designed to be exorbitant or prohibitive. Smelter managers are good business men and understand that they could not long afford to drive away custom. Conversely they figure on a profit; and irrespective of assays other than their own (which are ordinarily rigid and exact), they have certain fixed charges and formulæ for computing them that enter largely into the important question of net returns to the producer. Looking at the matter from an independent standpoint, it may be noted in the case of an ore, for instance, assaying 10% copper, 40 ounces silver, 4 ounces gold per ton, that, though assaying a gross metal value of $50 per ton, it might not net $5 per ton to the producer after all just and necessary charges had been paid.

Leaving out of the question monopoly or combination or the trust feature (which has been fully and freely treated in these columns), there are certain set charges that every smelter makes; and while local conditions govern the question of profit or loss to the producer according to the locality and value of the ore, yet these charges are as much a part of the expense as candles or powder or wages.

In the case of an ore assaying say 22% copper, 1.5 ounce silver and 1 ounce gold to the ton, the smelter would probably pay for the copper, dry assay (equaling wet assay less 1.3 unit), 75% of the value of the copper, current quotations for electrolytic cathodes less 4½ cents per pound; for the silver 90% New York quotations date of assay; for the gold, 95% assay gold value of ore, reckoning gold at $20 per ounce; for any lime in the ore, 5 cents per unit, if 10% or over. The charges for treatment f. o. b. would be $6 per ton, charging for all silica contained at 10 cents per unit.

This, it should be noted, is not designed as specific. It is illustrative and general. With some ores there would be a penalty, on others a premium; this depends largely upon the smelting qualities of the ore and the smelter's immediate requirements in that direction. There are also numerous modifications. It was stated above that 95% of the assay value of the gold in the sample of ore cited would be paid. It is to be noted that this is really a payment of 91.2% of the actual coinage value of the gold. Should the ore run as high as 2 ounces or over, there would be a higher payment by the smelter; where it assayed over 5 ounces to the ton, the smelter might pay 98% on the $20 an ounce valuation, which would be 94.84% of the coinage value of the gold. This would afford a profit margin in 5-ounce ore of $5.35 per ton as compared with a similar profit margin of $3.25 per ton on ore carrying 1.95 ounce per ton.

As to the copper deduction of 4½ cents per pound, that is one way of paying additional percentage. In some smelters there is no such deduction in that way, their practice being to pay for 70% of the copper as determined by wet assay. The 4½ cents charge is really for freight and refining charges incurred by the smelter.

It is to be noted that ordinarily smelting charges are based on neutral ores, where the percentages of silica and iron are nearly equal. Were the charge for a neutral ore $6 per ton, there would be in some cases a reduction of 10 cents for each unit per cent of iron in excess of silica, so that if the ore contained 10% more iron than silica, the charge would be $5 per ton. Where, as in the cases cited above, the charge for silica would be 10 cents per unit, this would greatly increase the smelter costs.

One California correspondent sends smelter assays showing that his ore averages 28% copper, 30 ounces silver and ¾ ounce gold to the ton, but says nothing as to the iron, silica, etc., therein, though, manifestly, it would be fair to assume that in such an ore the silica would be in excess of the iron, thus increasing the smelter charge. He mentions that he has over a 100-mile wagon haul at a cost of $15.50 per ton and a $15.25 railroad rate to the smelter, making a total freight charge of $30.75 per ton. It is manifest that, though the assays show an apparently profitable ore, yet when the freight and smelter charges are paid, in this instance there would be little, if any, left for the miner.

THE activity in mining brings out more than the usual number of mining schemes that have a flavor of misrepresentation. This paper rarely notices those things, as its readers are not of the gold brick buying class. To some of those people any reference in this paper is keenly sought. As one of them wrote to a local confederate: "If we can get the MINING AND SCIENTIFIC PRESS to pitch into us it would be a big ad." Some time ago editorial mention was made of a California mining scheme that was strongly condemned. Immediately those working it up issued a new prospectus with: "See what the MINING AND SCIENTIFIC PRESS says," in big type, preceding a garbled and false statement, purporting to be editorial notice, wherein we were represented as commending what we had condemned. Chicago leads St. Louis now in producing doubtful mining schemes, and even Boston is behind New York City in the misleading statements appearing in the advertising columns of the daily papers and some "mining journals" that ought to know better. One Chicago concern, "The United Investment Co.," 167 Dearborn St., announce that they own the Sun Dance stamp mill and mine, near Prescott, Ariz., and claim to be now producing eighty tons of ore per day. W. H. Hall, the foreman in charge at the mill, says the property is owned by J. H. Wilkerson of Chicago, who has nothing whatever to do with the United Investment Co., and that the mill has not dropped a stamp since February, 1901. The "Union Security Co.," 234 La Salle St., Chicago, issue a "prospectus" of the Feather River Mining Co., Plumas county, Cal., and among the list of officers and directors is "Ell Torrance, commander-in-chief G. A. R., Minneapolis, Minn." Gen. Torrance says that he never was a director, officer or stockholder in that concern, and knows nothing whatever about it. Another "mining company" has large space in New York and Boston dailies, portraying what purports to be a map of the Dewey mine at Thunder Mountain, Idaho, and offering to sell treasury stock therein at 50 cents per share. That stock was long since taken off the market. There is none for sale. Of course, there is no law in those places reached by such advertisements against any one being a fool, though some people seem to abuse their privilege in that regard. Sometimes the federal government tries to protect those who silily seek to thus separate themselves from their money, and occasionally succeeds in securing a conviction, but, ordinarily, the game goes on unchecked. In the haste to take short cuts to wealth and the natural desire to share larger in the general prosperity, many who can poorly afford to lose the money are influenced to invest in "cheap" investment schemes in which the glitter of gold mining success is alluringly used. To warn such people would be a waste of space in such a journal as this.

FROM the northern part of California comes an item of a most suggestive nature. Redding is the natural metropolis of that splendid center of mining industry, but realizing this fact it neglected to take advantage of some of its opportunities till neighboring towns began cutting into its trade. The result is that Redding has waked up and is making superior inducements to create and maintain profitable business relations with outlying camps. The resultant good to the miner is considerable. California's greatest drawback is lack of good roads. Since competition began to get the miner's trade in northern California county boards of supervisors have spent large sums in opening and maintaining roads, subsidized stage lines have been established, and some regular organized effort made to bid in a business way for the miner's trade—a most desirable home market.

CANADIAN MINING JOURNALS announce a department of mines and mining to be created by the Dominion government. This journal has been advocating such department in the United States government since 1865, but Congress is slow to act in anything wherein the miner is concerned. When mining men realize that they have votes to elect or defeat Congressmen they will have a department of mines and mining, and not till then. Whether in Canada or the United States, public opinion must make itself felt on such subjects before there can be satisfactory result.

Concentrates.

THE tin production of Bolivia in 1899 was 5240 tons; in 1900, 6814 tons. The 1901 figures are not available.

THE cars carrying ore from Butte to the Great Falls, Montana, smelters carry an average of 80,000 pounds each.

RUBBING the hard rubber surface with fine emery paper will form a matt surface that will take a pencil mark.

ANY incandescent electric light will burn under water at any depth if the wires and the lamp are protected from getting wet

WOOD COAL or coke is preferable to coal for tool work, as the ordinary coal used has sulphur in it, which is injurious to steel.

TIN SCRAP is treated electrically or chemically for the recovery of the tin. One ton of scraps will yield fifty-five pounds block tin.

AN ALIEN may act as an agent for a citizen in the transfer of a mining claim or other property which he might not be qualified himself to hold.

WITH gas at $1.35 per 1000 cubic feet, the cost per horse power hour of a 4 H. P. gas engine would be $0.04; of a 10 H. P. engine, $0.037; 30 H. P., $0.035.

IN "Concentrates" for May 10, in the formula given for the amount of water discharged per minute from a nozzle, should have read: discharge $= d^2 \times .7854 \times v \times 60$.

ALL real "Babbitt metal" contains copper. To add more put it in the form of filings in the bottom of the crucible, put the Babbitt on top, cover with common soda; melt and stir.

ICE cools twice as readily as water. It forms at 32° F., but once formed is just like any other solid, and can be at a temperature of 40° F. below zero in an atmosphere of that temperature.

A CANDLE POWER is considered to be the light produced by a standard candle, six to the pound, burning 120 grams spermaceti wax per hour, candle 8¾ inches long, 0.85 inch diameter.

IRON is incandescent at 713° F., gold gives out light at 783° F., an electric light carbon at 734° F. Chalk can be made to glow and give out light by an oxyhydrogen jet, as lime does in a calcium light.

THERE are a good many excellent welding compounds for steel welding, but pure pulverized borax is probably as good as any. The main thing in steel welding is to keep the parts clean from dirt.

ANYONE legally locating a mining claim on public land and complying with all legal requirements in connection therewith has just claim on that portion of any dump that may encroach therein, and can enjoin such encroachment if prejudicial to his interests.

THE pressure exerted by a column of water one foot high is 0.434 pound per square inch, at a temperature of 62° F. Of course, this pressure increases directly with the height of the column of water, 10-foot head giving a pressure of 4 34 pounds per square inch, 20-foot 8.68, and so on.

GOOD TOOL STEEL, under a white heat, will fall to pieces; bright red heat will crumble under the hammer; middling heat, or cherry red, may be drawn to a needle point. Nitro muriatic acid (aqua regia) applied to the surface of steel makes a black spot; to iron, the surface remains clean.

THE velocity of steam escaping from a nozzle shaped to give best results depends of course upon the pressure above the atmosphere, as indicated on the steam gauge. At one pound pressure the velocity is 540 feet per second; ten pounds, 1230 feet; fifty pounds, 1740 feet, and at one hundred pounds, 1880 feet.

IN Salvador the mineral deposits include gold, silver, copper, lead and iron ores and coal, and occur chiefly on the slopes of the mountains which traverse Honduras and Nicaragua. The department of Mosazan is the richest. It includes ninety mines, half those in the republic, of which eighty-four produce precious metals.

THE quantity of electric current (amperes) that will fuse copper wire depends upon the area of cross-section, the length of the wire, and the temperature of the location. No. 18 (B. & S.) copper wire 5 inches long will fuse with a current of eighty-four amperes; temperature of location about 70° F. No. 20 wire requires fifty-six amperes.

AIR expands by heat in the ratio of the absolute temperature. The absolute temperature below zero, F., is 460°, to which add the higher temperature and divide by the initial temperature, plus 460°. The absolute temperature of 50° is 510°; and if the air be heated to 200° the absolute temperature will be 660°, and 660 divided by 510 equals 1.294, the new volume.

ACETYLENE GAS is low in heating power, and is not applicable to explosion motors. It has been discovered that by passing the gas through petrol it becomes heavily carbureted. As a heating agent this carbureted gas contains 33% more heat units than the ordinary acetylene gas. It seems probable that this discovery may make possible its practical application to gas motors.

THE most effective antidote for cyanide poisoning is peroxide of hydrogen, taken internally, or better, administered with hypodermic syringe. Such should always be kept in readiness in cyanide mills. This may be advantageously accompanied by pouring cold water on the head and spine and applying mustard plasters on the feet. Keep patient awake. Permanganate of potash is a fair substitute for peroxide of hydrogen.

HOW far a man can see with unaided vision depends upon several conditions—the clearness of vision in the individual, the density of atmosphere, size of object and illumination. Under proper conditions, an object 1 foot above a level stretch can be distinguished 1¼ mile; one 10 feet high, 4¼ miles; 100 feet high, 13 miles; mountains 5000 feet high can be seen 95 to 100 miles. Five miles may be taken as the limit at which a man can be seen by an observer on the same level.

ELECTRO-CHEMICAL reactions depend upon the fact that the salts of metals are dissociated when in solution. When potassium chloride is dissolved in water what actually exists in the water is a succession of free atoms of chlorine and potassium with great electrical charges. Similarly when silver or gold cyanide is dissolved in potassium cyanide solution the atoms are free; the weaker the solution the more perfect such free condition. As soon as the atoms of gold or silver lose their charge of electricity (as they do when an electrical current is passed through), gold with its ordinary properties is at once produced and precipitates itself in the solid form.

UNDOUBTEDLY the Transvaal, S. A., mines will be taxed by the British Government as a necessary contribution to the expense of the war of which they were so largely the occasion. The Transvaal laws imposed a tax on prospectors' or diggers' licenses, varying from 2s. 6d. to £1 per claim per month, and a 5% tax on the net profit of working of mines except on certain forms of mining lease, when 10s. a morgen, or 2½% on the gross production was payable. Machinery paid 1½% on importation, and the mining industry of course contributed indirectly to the revenue under other heads of customs. It is probable that under the new conditions the taxes will not be greatly modified.

WHEN the fire assay of lead is rendered unreliable by the buttons being alloyed with copper, the following method has been successfully adopted: The lead ore or matte is treated with nitric acid and the solution diluted and filtered; precipitation is effected by sulphuric acid, throwing down $PbSO_4$, BaS_4O, $SrSO_4$ and $CaSO_4$. The precipitate is washed down to the point of the filter with water to which a drop or two of sulphuric acid is added, and then dried. The dry precipitate is placed in a small annealing cup of clay and the filter ignited. The ashes are added to the precipitate in the cup. Cyanide of potassium equal to about five times the weight of the precipitate is then added; a larger quantity will do no harm. The whole of the contents of the cup are fused at a gentle heat over a spirit lamp. The lead sulphate in a few minutes is reduced to metallic lead (C. P.), which settles in the bottom of the cup. The cup is allowed to cool, and then, with contents, is placed in a porcelain dish with water. The cyanides readily dissolve, leaving the metallic lead, which is dried and weighed.

BY "absolute zero" is meant the lowest temperature compatible with heat—that point of temperature, in fact, at which a body would be wholly deprived of heat and at which the particles whose motion constitutes heat would be at rest. The temperature is supposed to be about 274° C., or 461° F. The term "heat" is here used in its scientific sense; as the word is ordinarily used its significance depends on the temperature of the human body. Men call "warm" everything with a temperature higher than their own, and "cold" all those objects which have less heat than they. In reality, however, the coldest body known to man is far from being utterly without heat. Ice, for example, has heat, only in a degree so much below man's temperature that one can scarcely imagine it to be anything but "cold," a term which actually implies a comparatively low degree of heat. Accordingly, the zero of thermometers is only a conventional point marking a certain degree of heat. There seems to be a point, however, where heat ceases absolutely, and this point is known in chemistry as "absolute zero."

THERE never was a time when the hydraulic mines of California could not be legally worked. The California Supreme Court has held in express terms that "the business of hydraulic mining is not, in itself, unlawful or necessarily injurious to others." It is only when the business is so conducted as to cause injury to public or private rights that the law interposes objection. Even the Sawyer decision in the North Bloomfield case recognized this principle, and the injunction issued in that case was left subject to modification or dissolution, according as facilities were provided for restraining the debris resulting from the mining operations of the defendant. The same court afterward approved the works constructed by the North Bloomfield Co., and permitted it to resume its mining operations by the hydraulic process. This occurred prior to the passage of the Caminetti act. There were many small mines in the higher altitudes, where the mining seasons are short, and where the debris was easily and successfully impounded, that were lawfully operated without molestation from any source. The great bulk of the hydraulic mines, however, came under the bans of the Anti-Debris Association, which secured the issuance of many injunctions by the courts at Marysville and Sacramento. These injunctions were not issued on the ground that the business of hydraulic mining was unlawful or criminal in its character, but on the sole ground that the particular mines enjoined were being so operated as to cause material injury to other interests. The Caminetti act, however, provides for criminal proceedings in addition to the civil remedies already allowed by law, and this feature of that act caused the owners of the small mines above referred to to shut their mines down until they could bring themselves within the provisions of the Caminetti act, which most of them did. There was an attempt made in the Legislature of 1887 to invest hydraulic mining with a criminal character, but the attempt failed and was not renewed prior to the passage of the Caminetti act.

FOR several years between 1865 and 1876 one could exchange a $20 gold piece at a broker's for $20 50, and sometimes for $21, or even more in silver half dollars or quarters, because silver change was more abundant than gold coin. If one wished to buy $20 gold pieces from a broker, he was charged something more. This was when greenbacks were below par and when banks kept their accounts in three columns—one each for gold, silver and currency. At one time, if one person had a check on a bank for $100 in gold, if he was willing to take silver for it, he could get $110 in halves or quarters. The Mexican dollar was in great demand then for shipment to China, and was worth over a dollar. The trade dollar was coined to take its place, but although it contained more silver, it was not a legal tender and would never pass for as much as the Mexican dollar. Now the Mexican dollar, containing more silver than the American silver dollar, is worth in this country 45 cents. There was also a time in 1879, after specie payment was resumed and greenbacks were worth their face, that silver was so scarce or so much needed for change that it commanded a premium of 1% to 2% in some coast cities. "Concentrates" has paid 25 cents for change for a $20 gold piece; that is, received back $19.75 in silver.

IN general, ore deposits represent a process of concentration of mineral matter either by chemical or physical means—that is, they are unusual localizations of certain minerals which are often found disseminated in smaller quantities in many common rocks, and they differ from the same minerals situated in other conditions only in their degree of concentration. There is a superficial alteration of nearly all ore deposits. The typical unaltered condition of gold in nature is in association with iron pyrites in quartz, and the effect of surface oxidation on such a deposit is first to convert the iron pyrites into hydrated oxidized iron minerals, which permeate the quartz, turning it into a rusty brown mass. The next stage is the gradual leaching out of the iron minerals by the action of surface waters, while the gold which was originally in the iron pyrites mostly remains, though it may have been partially dissolved in one or more several ways. Sometimes gold occurs in the form of telluride instead of iron sulphite, and in such cases superficial oxidation causes the tellurium to be oxidized and the gold to be set free from its combined state. When such deposits as those described are eroded the particles of gold separate from the quartz and are concentrated in the streams as placer gold.

SHOT FIRING by electricity has been employed with success for many years, and is now general. Electricity is employed to generate sufficient heat within the charge to start combustion, taking the place of the squib and safety fuse. Two kinds of electric fuses are employed, known as high and low tension, though this is hardly a proper scientific distinction. In the so-called high tension fuse the heat is furnished in the form of a spark, which passes between the ends of two copper wires, embedded in a detonating mixture. In the low tension form the heat is generated in a small loop of platinum, also embedded in a detonating mixture. The current for the high tension fuse is generated by a small magneto-electric machine, which is carried by hand into the mine, and connected to the wires leading from the fuses, at any convenient point, at a safe distance from the shots that are being fired. The current for the low tension fuses may be generated by means of a magneto machine similar to that used for high tension fuses, but having its coils wound for a lower pressure and a larger current, or by means of a small battery of dry cells carried in a box that can be carried in the hand or slung over the shoulder. They may also be fired from a stationary battery or large cells, placed in any convenient position, so that leads can be taken from it to any position at which it is required to fire shots. With the great improvement that has taken place in the manufacture of dry cells during recent years, the portable battery is becoming more generally used. While the high tension fuse requires a comparatively high pressure to fire, it only requires a very small current; while, on the other hand, the low tension fuses require only a very low pressure, but a comparatively high current strength. Neither the pressure of the high tension fuse, nor the current of the low tension fuse run into anything more than trifling figures, but they are "high" in each case for portable apparatus. High tension fuses have been generally used till recently; low tension fuses are now taking their share of the work, principally since the improvement of the dry cell. In the early high tension fuses there was considerable difficulty experienced owing to the uncertainty of the pressure at which the fuse would fire. This appears to be due to there being at that time no means of accurately measuring the distance between the ends of the copper wires, and of making them all to one standard gauge. The distance is a small one necessarily, and special tools were required to ensure accurate setting. The difficulties have been overcome, as so many other difficulties have been overcome, by improved methods of and greater care in measurement.

Costs and Profits in Pyritic Smelting of Low-Grade Copper Ores.

NUMBER VII—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by F. H. PRENTISS, E. M.

Diagram No. 14 is designed to show the fuel and flux value of the iron and sulphur that are carried into the matte, these values being based on coke at $15 per ton and limestone at $2.50 per ton as heretofore. A 25% matte, for example, from a 6% copper ore (marked X) would carry a value amounting to $1.29 per ton of ore, being equivalent to 25.6 tons of limestone and 4.33 tons of coke per 100 tons of ore. A 50% matte from the same ore (marked y) would carry a flux and fuel value of only 39 cents. With coke and limestone at prices given the difference between making a 25% and a 50% matte amounts to ¾ of a cent per pound of copper, no matter what percentage the ore contains, and similarly for other variations in the matte. The difference in cost for freight and treatment is obviously an item of still greater importance. Although $15 per ton for coke is a fairly high price, there are many localities remote from railway service and coke fields where the cost is much higher. At $45 per ton, for example, the same diagram gives results as follows: Point X shows 4.33 tons of coke, which at $30 extra cost adds $1.30 per ton, making a total of $2.59 for a 25% matte. Point y shows 1.50 tons, which at $30 additional adds $0.45, making $0.84 per ton, or a difference of $1.75 per ton of ore instead of $0.75, as due to increased cost of coke.

It will frequently he found easy to utilize the diagrams heretofore given in a similar manner for any differences in the cost of coke or limestone—or for the direct smelting of a siliceous ore the curves a b and c d of diagram No. 9 and the line c i of diagram No. 5 can he reconstructed to suit local costs and conditions, while the line a e, altered to suit conditions of cost, etc., may he applied to concentrating effects.

While the heating value of one pound of carhon if hurned to CO_2 is definitely fixed at 14,500 B. t. u., the heating value of one pound of FeS_2 due to the reactions through which it passes in the furnace is not so readily determined. In the first place it requires some expenditure of heat to drive off the volatile atom of sulphur, hut as this takes place in the upper part of the furnace we may disregard this expenditure just as we do any henefit from the volatile atom as fuel. The burning of the remaining sulphur to SO_2 produces 1010 B. t. u. per pound of FeS_2. The hurning of the iron to FeO yields 1134 B. t. u. per pound of FeS_2, a total of 2144. From this sum must be suhtracted the heat ahsorbed by the dissociation of the FeS, which amounts to 340 B. t. u. per pound of FeS_2, and finally there must he added the heat due to the formation of $FeOSiO_2$, which will vary with the composition of the slag.

Nor is this all, since still another addition must he made which is usually lost sight of. The ahove heat determinations are based upon the conditions that the elements involved, as, for example, sulphur and oxygen shall have an initial temperature of 62° Fahr. Now the coke and the iron sulphide are gradually heated as they descend in the smelting furnace hy the escaping gases until a temperature is reached where oxidation begins. Let us suppose them to he heated an average of 1200°. One pound of FeS_2 would have yielded .75 pound FeS, and allowing the specific heat as .22, the amount contained hy the FeS would be 200 B. t. u., thus adding 10% to the calculated heat value. Allowing the coke to carry 90% carbon and to have a specific heat of .42, the gain would he 500 B. t. u., which, however, would only he an addition of 3 8% owing to the greater heat developed per pound of coke than per pound of FeS. A pound of coke having 90% carbon which is burned completely to CO_2 yields 13,000 B. t. u. One-sixth of this amount would be 2167 B. t. u., which fairly represents the heat value of one pound of FeS_2. With poorer coke or with coke imperfectly consumed the ratio might become one-fifth, hut prohahly not greater, since to utilize the Fe and S the atmosphere of the furnace must be oxidizing, which would prevent the formation of much carbonic oxide.

It is furthermore true that the oxygen necessary to hurn the iron and sulphur (only half the latter, as the volatile atom does not count) of one pound of iron pyrites (FeS_2) is exactly one-sixth of that required to completely burn one pound of coke carrying 90% carbon. Six tons of iron pyrites, therefore, may he taken as equivalent to a ton of coke of fair quality hoth as to heat produced and air required.

Suppose that we desire to smelt 100 tons of ore of type C, using the concentrates of 200 tons of type G ore as a partial flux and using a hlast heated 500° Fahr. above the temperature of the atmosphere, and making a slag having 40% silica.

Diagram 10 (point X) shows that 250 tons of type G must be concentrated to flux 100 tons of type C, and hence there will remain twenty tons of type C ore requiring limestone.

Diagram 6 gives for type C ore and a 40% SiO_2 slag 60% of limestone, and hence the remaining twenty tons of ore require 12% of limestone.

Diagram 3 shows for type C, with a 40% slag and hot blast, that there will be needed ten and one-half tons of coke, while diagram 2 shows for similar conditions under cold blast a requirement of nineteen and one-half tons, thus making for a blast of 500° F. a coke requirement of fifteen tons.

Column No. 22 shows one-fifth of type G ore to he availahle as concentrates for replacing coke and flux. We shall have, therefore, forty tons of FeS_2, which would (at a little better than one-sixth) replace seven tons of coke, thus cutting our coke down to eight tons. The actual weight of concentrates will include

Cents per lb. of Copper in matte of the Fe and S in the matte
Diagram 14.
Value per ton of ore and per lb. of matte of the Fe and S going into mattes of several percentages of Cu from ores of various grades. Also tons of Limestone per 100 tons of ore to replace the Fe carried into the mattes. Also tons of coke per 100 tons of ore to replace the S carried into the mattes.
MINING AND SCIENTIFIC PRESS
Tons of limestone 44.0 38.6 34.0 29.6 24.8 19.6 14.0 8.8 3.2 0
Tons of coke 8.7 7.8 6.9 6.0 5.1 4.2 3.4 2.65 1.85 1.1 0

the copper, iron and sulphur that go into the matte—twelve tons—and also five tons of lime as a hinder, and some slimes, say three tons, making in all sixty tons.

Diagram No. 4 shows for hot hlast 6800 cuhic feet of air are required per minute, and 10,500 cubic feet for cold hlast; hence for a temperature of 500° F. there will be required 8650 cuhic feet.

One hundred tons of type C ore carries 40% of FeS_2, or allowing 4% to go to the matte there remains 36% to be utilized as fuel and flux. The ore carries 42% SiO_2, and hence (for 40% slag) there will he made 105 tons of slag plus 8 tons from slimes and hinder lime, making 113 tons, and for resmelting foul slag and flue dust say total 125 tons. Quantities per minute are as follows:

Pounds of air	665
Pounds of coke	10
Pounds of charge	255
Pounds of FeS_2 (available as fuel)	105
Pounds of slag	175
Pounds of matte	25
Pounds of limestone	17

Allowing 2000 B. t. u. per pound of FeS_2 and 12,500 B. t. u. per pound of coke we find heat developed per minute to be:

By FeS_2	210,000 B. t. u.
By coke	125,000 "
By hot blast	78,800 "
Total	413,800 "
Allowing 1000 B. t. u. for sensible and latent heat of slag per pound we find the heat carried away per minute by the slag to be	175,000 B. t. u.
And similarly the matte	25,000 "
Escaping gases (600° F. above atmosphere), consisting of the blast with its added burden of sulphur and carbon	105,000 "
Allowing an average of 5% moisture for the entire charge	17,000 "
Allowing sixty gallons of jacket water per minute heated 120° Fahr.	57,600 "
Heat absorbed by dissociation of $CaCO_3$	11,220 "
	390,820 "

Agreeing substantially with the figures for heat generated as given above.

The percentage distribution of heat would he as follows:

Slag	44.90%
Matte	6.30%
Waste gases	26.90%
Moisture	4.50%
Jacket water	14.70%
Dissociation of $CaCO_3$	2.70%
	100.00%

These figures, though hased upon uncertain data and inexact constants, are sufficiently proximate to show in a general way the distribution of heat in the hypothetical case taken. A ton of coke per day yields 17,360 B. t. u. per minute. If the temperature of the waste gases had been assumed at 400° ahove that of the atmosphere, instead of 600°, the coke saving would have heen two tons daily, a reduction from 4% of coke to 3%. Had the twelve tons of limestone heen replaced by FeS_2 the heat value of the latter, together with the coke equivalent to the heat ahsorhed hy dissociation of the $CaCO_3$, would have saved 2.5 tons of coke, reducing the amount to 3.5 tons, or to less than 2%. On the other hand, a cold blast would have increased coke consumption 4.5 tons.

The amount of surplus air has much to do with coke economy. In hurning coal under a boiler the surplus air (that is the amount over and above the chemical requisite) varies under different conditions from 50% to 200%. In these calculations I have allowed 133%. The effect of the temperature and surplus air upon the amount of heat carried off hy the waste gases is easily seen.

In the present hypothetical case the heat of the slag is two and a quarter times greater than that required to heat the hlast, the heat of the waste gases one and a third times as much, and the jacket loss ahout 70% of the amount. Practical difficulties stand in the way of realizing a high temperature of hlast from these sources of heat, although some value is returnahle and a numher of devices are in use.

It may be roughly stated that for every hundred degrees increase in temperature of the hlast a saving of half a ton of coke per 100 tons of charge is effected and nearly 5% added to the smelting capacity of the furnace over that of cold hlast. In case, for instance, the blast should he heated 400° hy means of the slag or the waste gases, the increase in smelting capacity would he 20% and the saving in coke would be two tons for every 100 tons of charge.

It becomes a comparatively easy matter, therefore, to determine the value of a hot hlast appliance, whether the source of heat should he cheap fuel or waste heat from the furnace.

Copper Resources of California.

The most important and valuahle puhlication issued hy the California State Mining Bureau since its oil hulletin is Bulletin No. 23, devoted to the present state of the art regarding the copper resources of California, just issued hy Lewis E. Auhury, State Mineralogist. It is from the office of the California State Printer and is in every way a creditable production, worthy of the Mining Bureau, and up to the standard of its former puhlications, which is saying a good deal.

The volume contains 282 octavo pages and is superhly produced. The illustrations, sixty-nine in numher, are fine engravings from recent photos, the eight maps give clear idea of the subject, and the work is finely printed on heavy plated paper.

Credit is due State Mineralogist Aubury for the arrangement and treatment of the suhject. The condition of the industry and general copper statistics of the State precede some historic notes, followed by detailed description of the principal copper producing properties in the various counties. Shasta county is given sixty-six pages of geologic description, details of the several ores, the manner of mining and metallurgical treatment, and present condition and working of each copper mine and prospect in the county. Similar proportional notice is given the forty-three of the fifty-seven counties in California wherein copper is mined. There are also several fine views of some of the copper smelting works of the State, with a description of how they are operated.

The hulletin throughout evinces care in its preparation. It is not a mere compilation of old material, but shows intelligent and successful effort to have the information up-to-date. Only those who have tried this kind of work can fully appreciate the labor involved in such work.

A limited edition of this book is printed. It will he sent to any address upon receipt of 62 cents.

Electric Power Plants of the Pacific Coast.*

For the past twenty years in the history of electrical engineering there has not been a time during which remarkable work on the Pacific coast has not attracted attention. In San Francisco was one of the first lighting companies, and one of the very first attempts by a public lighting company to light a large city on a comprehensive plan. Power transmission at constant current was first used on the coast, where not only a 10,000-volt motor circuit was installed in San Francisco, but long-distance transmission was also actually performed in the mines with as much success as attended electrical machinery anywhere at the time, and the failure—as far as it was a failure—was due to the faults of design and manufacture of that day, while attempting problems which admitted no failure in their solution. Men's lives, as well as the financial success of such undertakings, depend on absolute continuity in mining operations. Later on long-distance single-phase alternating lighting was installed at Pomona, in southern California, and single-phase power transmission at Bodie.

Walla Walla, Wash., saw one of the first single-phase power transmission plants, and the plant at Redlands proved first the success of multiphase working. Nevada City first proved the commercial success of transmission to the mines and mine working.

The installation of the Folsom and Portland plants is not yet forgotten, and finally we have the remarkable installations at Snoqualmie Falls, Wash., the southern California 33,000-volt, 83-mile transmission, the Bay Counties, with 144-mile transmission, and the Standard Electric Co., part of whose 154 miles of transmission, being used in connection with the Bay Counties plant, enables that company to hold the magnificent record of an actual every day transmission of over 220 miles.

We then see that the notable work on the Pacific coast is not confined to the last few years or to any particular locality. From the north to the south plants are scattered which merit attention and study, particularly to many of us who are not familiar with any work at all similar.

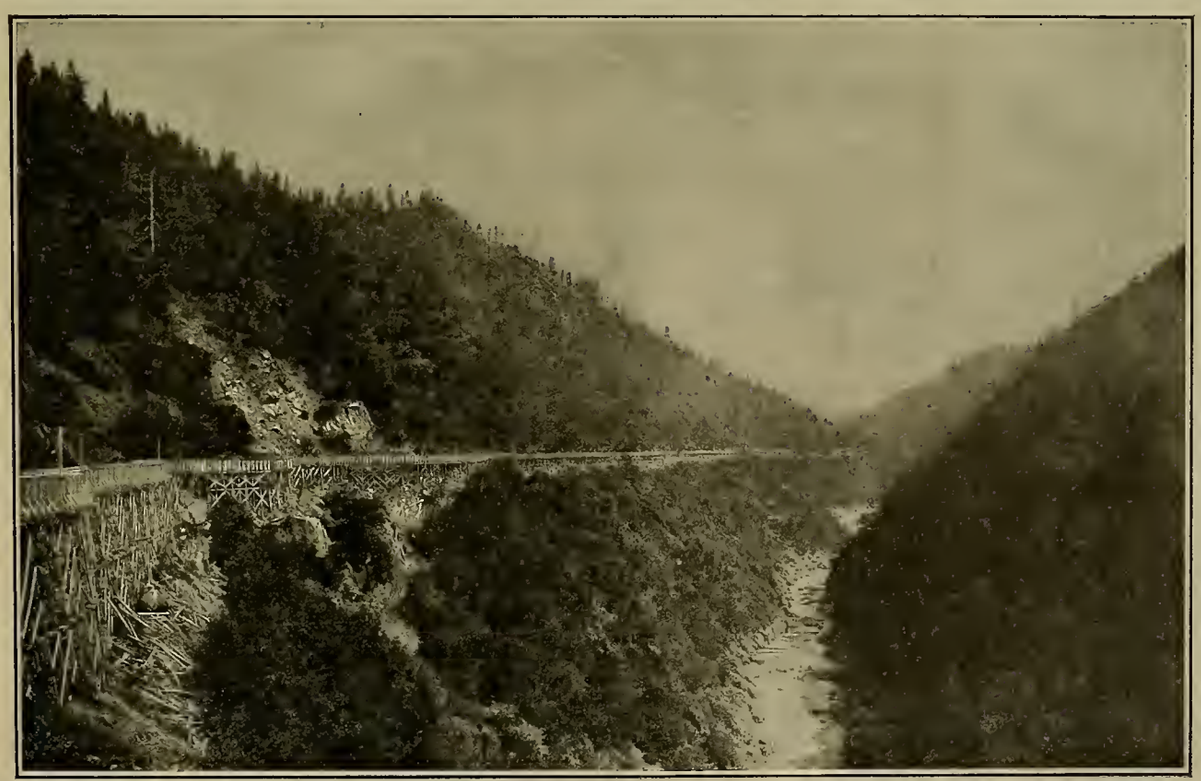
Among the plants themselves perhaps no one has attracted more attention or excited more discussion than the remarkable one at Snoqualmie Falls. Certainly no plant has a more remarkable or beautiful situation.

The lights of the town and wires of the lines are evident, but no power house, for here they have adopted the startling plan of excavating a cavern for the power house within the very rock over which the falls plunge. To reach it you enter a little cabin near the forebay and are lowered by an elevator down the shaft, which also accommodates the penstock, and 250 feet below the surface reach the machine room, where are located six 1500-kilowatt generators in a large whitewashed cavern cut out of the solid granite. The plant is located as it is for the reason that the spray from the falls would have made impracticable any power house at their foot, and to have gone farther down the river would have necessitated a location around a bend, to which a channel must have been cut at an expense probably greater than that for the present work. This plant disputes with the Standard Electric Co. of California the honor of being first to use aluminum for transmission lines. The lines were erected at about the same time, but those of the Standard Co. were the first to be put into service, and, being more carefully strung, were the more successful from the start.

Power is transmitted at 60 cycles to the cities of Seattle and Tacoma, where lights and railways are operated. In Seattle rotary transformers are used for the conversion, but in Tacoma motor-generator sets are employed and regulation obtained by a combination of synchronous and induction motors. Much of the complaint and criticism of this plant seem to have been due to the apparent fact that there is little harmony between the seller and the largest users of power, and both the large companies at Seattle and Tacoma are at present installing some steam in spite of the fact that at no other point on the coast is power sold at a lower rate, and that the difficulties with regulation and general service from the plant are largely chargeable to the atti-

*Condensed from a paper read by F. A. C. PERRINE before the New York Electrical Society.

From Colgate, Cal., to Oakland, where the Bay Counties line ends, is 152 miles. From Oakland to San Francisco by way of the Standard Co.'s line is 70 miles. The tying-in at Oakland gives, therefore, a transmission of 222 miles from Colgate to San Francisco. Power is taken backward, so to speak, from Mission San Jose over the Electra line as far as Stockton. Here energy aggregating several thousand horse power is distributed in every day, hard commercial service at a distance of 218 miles from its point of generation. "S. K. C." are the initials of the inventors of this type of electrical apparatus—W. Stanley, J. F. Kelly, C. C. Chesney.



Flume Along Yuba River, Cal. From "Point View" a Panorama of Nearly Four Miles in Length can be Seen.

tude of the users of the power themselves.

As we move southward into California the power plants begin to multiply, and connected with every one generally is something much of interest. Many have historical importance, though most have long ceased to attract particular attention. The traveler in the mountains finds, far away from any appearance of civilization, a well-kept canal, or ditch, as these pioneer engineers would call it, and following it for a few miles a low, constant, not unmusical note reaches his ear, and he knows that beneath his feet along the river banks lies one of those power plants, ceaselessly generating current to be used in the neighboring mines or the distant cities. Throughout the center of the State a constant type of plant prevails, and it will be of more interest to confine our attention to two most remarkable recent plants than to attempt to mention the many. The type of plant to which we refer is that of one supplied with water in a ditch varying from 5 to 50 miles in length, producing, by its combination of the rapids along the river, a head of from 300 to 1500 feet, which is utilized with impulse wheels running at a high speed and direct connected to generators. These feed step-up transformers and the high-voltage current are transmitted for use over distances of from 5 to 200 miles and more.

The two central California plants to which I wish particularly to direct attention at present are the plants of the Standard Electric Co. and the Bay Counties Power Co. Both of these plants are great and long-distance extensions of small undertakings, though the growth of the Standard Co.'s plant is the more notable and worthy of the greatest attention for the reason that this plant was more original in its conception and the more remarkable in the manner in which that conception has been carried out.

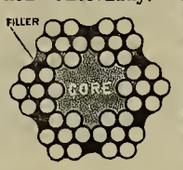
The Bay Counties Power Co. is a growth from two small plants within 30 miles of each other, situated in the Sierra Nevada mountains, the original of the two being the plant of the Nevada County Power Co., supplying Nevada City and its neighboring towns, which is really remarkable on account of the fact that it was one of the first—if not the very first—plants in California entirely successful as a financial undertaking, and one which from its original period of operation successfully carried out the difficult undertaking of supplying mines with power. The other part of the Bay Counties Power Co. was originally more moderate as an undertaking, but has grown to be the more important side of the business. This company was the Yuba Power Co., using a fall in one of the irrigating ditches and returning its tail water to the ditch for further distribution in irrigation. From these beginnings the Bay Counties Power Co. has grown by reaching out after business wherever it was offered and developing water powers wherever they were reasonably available for such purposes, and the success which attended the original elements of this company has been continued during its entire growth.

The Standard Electric Co. is not so much a growth as an achievement. Thirty years ago the Blue Lakes Water Co. was incorporated for the purpose of furnishing water to the mines in Amador county, and a ditch system considerably in excess of 80 miles in length was constructed. For many years the company was very prosperous, but with the change in mining through that section of the mother lode, and the partial suppression of hydraulic mining, the property became only reasonably profitable. While the company was in this condition Prince Andre Poniatowski came to California with the plan of taking up mining properties that had proven to be only partially successful, developing them, and so forming from many small and unprofitable mining concerns one large and prosperous. Incidental to this plan he joined the Blue Lakes Water Co. in building an electric plant on the Mokelumne river, where a head of 1000 feet was available, and distributing power to his mines with the idea of cheapening their cost of operation. A plant was installed and successfully operated, but as Prince Poniatowski became more familiar with power operations in California and the condition of mining on the mother lode he came to the conclusion that a great power plant could be formed, with the Blue Lakes Co. as a nucleus. Accordingly he purchased the Blue Lakes Co. and formed the Standard Electric Co. of California, which company announced its intention of transmitting power to the city of San Francisco, a distance then estimated at 110 miles. The plan was a bold one and has been boldly carried out, without at any time during the development of the scheme ideas less than practical being allowed to prevail in the councils of the company. Previous to the issuance of the specifications for the machinery the best engineers of the country were consulted in regard to the manner in which the work was to be done, and nothing incorporated in these specifications not then considered feasible by a number of the best engineers. Indeed, the boldest thing about this problem, namely, the operation at about 50,000 volts, was proposed by the Stanley Electric Manufacturing Co. of Pittsfield, Mass., as manufacturers, and the contract let to them on account of the saving they were willing to guarantee above the Standard Co.'s engineers' estimates, made possible by the increased voltages they would undertake to operate. This company has now been building its plant for about four years, and will continue to build without supplying power until it is satisfied that the work is done, and so thoroughly done that there can be no question as to the continuity of the service. In the first place, storage reservoirs in the high Sierras have been provided for an estimated storage of water amounting to 150 days—equal to the maximum dry period the records of the State can show are to be anticipated. These reservoirs, situated at elevations varying from 6000 to 8000 feet above sea level, in Alpine county, where there are only eighty inhabitants, exclusive of Indians, are provided with dams built in a most thorough manner and cared for most regularly. From these reservoirs the water is allowed to flow down 50 miles of the channel of the river to the diverting dam near West Point bridge, where it is taken out of the river and carried along in a ditch about 25 feet wide and 5 feet deep to the crest of a hill above the power plant, from which a wood stave pipe line 3000 feet long leads to where a sheer descent can be made to the power plant itself, which is supplied by a head of 1450 feet with a length of pipe of only about 3600 feet. It can readily be seen that the flow of water in 20 miles of ditch cannot be regulated to suit the variation in load likely to be experienced by the plant, and in order that the ditch may be used with a constant flow a reservoir is provided, into which any surplus of water that may be flowing above that demanded by the load can be retained until a peak load period is reached, when the surplus above the ditch capacity is supplied from the reservoir. With a hill so steep down which the pipe line is laid, it can be readily seen that no reservoir site is available between the plant and the ditch. Accordingly a bold plan is adopted of storing water in a valley across the mountain from the power house and leading the water back to the power house side of the mountain through a tunnel about 3000 feet in length.

(TO BE CONTINUED.)

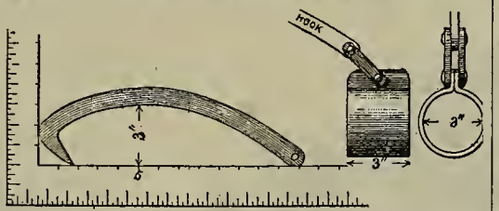
Preservation of Wire Ropes.

There are numerous places where wire ropes are liable to become water soaked where not specially prepared to resist moisture, such as cable railway service, wet mines, dredging machinery, power transmission, and in many other places of exposure. The wire ropes of elevators in offices, stores, warehouses and general buildings sometimes show an outside corrosive effect. Sometimes the interior of wire ropes reveals disintegrated cores and corroded wires, even where there may be little evidence of deterioration externally. The illustration herewith presented shows application of a special material known as "wire rope filler," by which the core is lubricated, and a flexible cushion interposed between it and the strands. The filler exuding between wires is said by the manufacturers to prevent abrasive wear, to seal against acid, gaseous, sulphurous or water attacks, and to form a foundation on which an outside coating should build. The manufacturers of this filler also make an outside coating termed "wire rope shield," for external protection against abrasive wear, designed to completely seal against exterior attacks, and a substantial increase of life is evident from the internal treatment and furthered by the external protection. The Ironsides Co. of Columbus, Ohio, manufactures these materials.



Rough and Ready Cant Hook.

To make a cant hook for rough use the accompanying sketch and description will enable one to be furnished of home manufacture: The hook is made of steel ⅜x1 inch, 15 inches long. A hole is punched in one end and a marl point is made on the other and bent to the inside of a square so that at 5 inches it is 3 inches from the square, and the marl point turns in 1¾ inches, as shown in the accompanying sketch. In the sketch is also shown the band, which is made 3 inches wide and as large as is wanted for the lever. A hole is punched in each end and the ends are brought together and riveted inside two straps, which are ⅜x⅝-inch iron. They are then heated and worked until they are loose so as to make a double hinge. This cant hook will do good work on any size log or square lumber.



Making a Cant Hook.

THE Geological Survey reports a coal production last year of 292,240,758 tons, value $348,813,831; in 1900 the output was 269,881,827 tons, worth $306,-891,364, an increase of 22,358,931 tons, or 8% in quantity and 13.6% in value.

Acid Plant at Black Warrior, Ariz.

Written for the MINING AND SCIENTIFIC PRESS by E. H. BENSON.

Much interest in the manufacture of sulphuric acid has been awakened among mining men from the fact that the process of leaching ores by sulphuric acid has recently acquired new prominence and interest. The process of extracting copper from its ores by leaching with acid, while not new, has acquired interest, owing to the practical manner in which the Black Warrior Copper Co., Amalgamated, of Arizona have taken up the process.

The manufacture of sulphuric acid from sulphide ores is not a difficult or complicated process, though the attention of a careful and experienced man is desirable in this as in other technical industries.

Briefly described, the process is as follows: Ore sufficiently rich in sulphur to support combustion, in roasting, takes up oxygen and liberates sulphur, which is converted into an oxide, SO_2. These fumes of sulphur dioxide are conducted through flues and niter oven to the Glover tower, through which they pass to the condensing chambers.

The sulphur dioxide requires further oxidation to SO_3. When this is accomplished, in the presence of moisture, H_2SO_4 (sulphuric acid) is formed, which liquid settles to the pan of the chamber and is drawn for use or run to platinum stills and distilled to oil vitriol, 66 Baume, specific gravity 1 835. The SO_2 is oxidized by action of nitrous gas obtained by boiling nitrate of soda with sulphuric acid in iron pots heated by the furnace gases. Nitrate of soda is converted into sulphate of soda and the nitrous fumes mingle with the sulphur fumes, oxidizing them to SO_3. The oxidized nitrous fumes take on oxygen from the excess of air drawn through the furnace and repeat the process until the chemical action is complete. The sulphur fumes being converted into H_2SO_4 in their passage from furnace to exit of chambers, the nitrous gas is drawn by the outlet draught through the Gay Lussac tower, which is packed with coke or other acid resisting material, over which cold acid of 1.700 specific gravity or higher is kept trickling, which acid has the property of absorbing the nitrous fumes. This acid is caught as it comes from the bottom of the tower, pumped to the top of Glover tower and run through the same over quartz packing, which is heated by the gases from the furnace, when it is denitrated by the action of sulphurous acid and heat. The nitrous gas passes again into the chambers to repeat its oxidizing action, and this process is repeated indefinitely. A small amount of nitrate of soda is used continuously to make good the losses of nitrous gas, some of which is absorbed by chamber acid and some of which escapes through the exit pipe. The hot, strong acid running from Glover tower is cooled and used for the Gay Lussac tower.

The lead chambers are supported on a special framework in the chamber building, lead of six or seven pounds weight per superficial foot being used. All joints and seams are burned together by the hydrogen blow pipe, making a solid lead joint. Towers are built after the same plan, heavy lead being used. The pan of Glover tower should not be less than forty pounds per square foot to resist the action of hot acid.

It is found in practice that the cubical contents of the chambers determine the amount of acid which is produced by the plant. Eighteen or twenty cubic feet of space for each pound of sulphur burned in twenty-four hours is considered good practice, though smaller space is used in some cases where chambers are supplemented by a condensing tower and a fan system. Steam enters the chambers through pipes placed at suitable intervals, which furnishes the H_2O and determines the strength of the acid produced.

For various reasons the acid produced in the chambers should be from 50° to 55° Baume hydrometer. Chambers are fitted with drips for catching a sample of the acid as it makes and runs through cups containing a hydrometer, which shows at a glance the strength of the acid being produced.

Thermometers give indications of the chemical action, and frequent determinations of the exit gas shows whether the proper amount of oxygen is supplied.

Every pound of sulphur burned should produce 4.75 pounds of acid of 50 Baume strength. This amount varies somewhat according to management of process and proper construction of plant.

Various styles of furnaces are in use, such furnace being determined by the character of ore used. For sulphide ore, concentrates or fines some of the automatic furnaces are desirable. The Black Warrior plant consists of four Herreshoff patent furnaces, each furnace having a capacity of 3000 pounds of sulphur burned per twenty-four hours. These furnaces are driven by a small engine, and requires little attention.

The ore is elevated by a belt elevator to the central hopper and distributed to furnace hoppers, where a small amount is fed to furnaces automatically at each revolution of shaft. Each furnace has five shelves over which the ore passes before reaching the discharge damper.

In practice the furnace is brought to a red heat

witb wood or otber fuel, and the sulpbide ores, which should contain at least 35% sulpbur, are tben cbarged into tbe furnace, no more fuel being used.

The cinder discharged from furnace is iron oxide carrying such values as were contained in the ore. Tbe values may be recovered by smelting in furnace or by leaching.

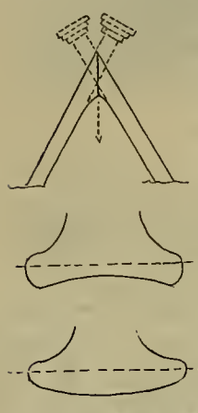
At Black Warrior the buildings are of tbe following dimensions: Cbamber building, 210x65 feet; posts, 35 feet; floor joist, 3x12 incbes, placed 18 inches to centers, resting on 10x12-inch timbers, with supporting posts 8 feet 4 inches to center; trusses, 14 feet 6 incbes to centers. Tbe building is built of best Oregon pine. Towers are built of 10x10-inch timbers surmounted by tank house. Lead chambers are tbree in number, of the following dimensions: No. 1, 200x25x20 feet; No. 2, 160x25x20 feet; No. 3, 35x25x20 feet; lead work of Glover tower, 10x10x24 feet; lead work of Gay Lussac tower, 9x7x40 feet. About 160 tons of lead were used in the construction of the plant, which is thoroughly up to date in all details.

Judging From the Surface.

Written for the MINING AND SCIENTIFIC PRESS by C. H. FITCH.

Continuing the subject of foundations, the point I make is that tbe plane of surface is the proper plane of jointure for the consideration of stresses, and that tbere is no logical nor good engineering reason for going an indeterminate deptb below the surface, making a stub end of heavy and expensive masonry tbere and building up from it.

Tbe point taken may be made more clear by a few sketcbes, which, though freely and rougbly drawn, will convey tbeir ideas as fully as tbough elaborate.



In tbe first figure I show an A frame subject to a load indicated by arrow head. Tbe sides of tbis frame abut against each other, and if they were of material liable to be crushed they might justifiably be widened at the point or place of junction, spreading the stress over more surface. But it would not be warrantable to extend these side frames and put "foundations" on them, as shown in broken lines, without any reference to load or plane of stress.

It may be argued that tbe common foundation is not so bad as this because it does spread slightly and give a larger bearing, and take a load. But it is not designed in reason to effect a clear purpose. It puts increased load on the eartb at a place where it is not as well drained nor as able to resist pressure as at the surface. It is a footing and in a clumsy way serves tbe purpose of a foot, but it is a submerged foot, where there is no more scientific need of it tban there is of a submerged tenth in sociology, and it is a needlessly heavy foot just as there is needlessly heavy weight in human government. Wben we lay out a walk we do not fill it with holes to put our feet in; but when we legislate for the moral walk we do, and wben we set a building on the ground, we make a hole for it. It is the cave and crypt habit.

A flat or blanket form is that of the surface, and it only requires to be given a thickness sufficient to distribute the pressure. Tbis tbickening may be given a convex or concave parachute form, as indicated by the sketches. Tbe surface is still the plane of stress. Tbe footing is a hardening of tbe ground to enable it to distribute and bear its load. I base judgment on the surface. I judge a man by bis face, and a lode by its outcrop. I do not place my hopes in depth and darkness. Tbere is much more to be said on this subject.

I have seen recently the plans proposed by a French architect for a monument to Progressive America, which it is designed to erect at Jackson Park, on tbe site of tbe Columbian Exposition. It is to be several times as higb as the Eiffel Tower, and to make all of earth's tall structures look lowly, and there is not an idea about it except mere bigness. This lack of idea reminds me of the difficulty Randolph Rogers had in making a "genius" for Connecticut. He wrote tbat be had read all the histories of Connecticut sent him, looking for his ideas, and could not find any in particular, so he made an angel with two wreaths and advised its adoption as the Genius of Connecticut. Tbe official commissioners had no ideas to the contrary. Wbat commissioner is ever surprised with an idea? Tbis 17-foot genius has a cousinly likeness to a genius on a fountain at Berlin, and migbt be appropriately styled our cousin German. At a distance it looks like a wild goose in flight. It was imported from Munich at a cost of $17,000 and crowns the lanthorne of a dome supported on granite columns, which broke badly under tbe weigbt which they had to bear, because the stones were not surfaced so as to have a proper bearing. Fifteen tons of type metal were run into tbe joints of these stones, to expand on cooling and bring tbe surfaces to bear.

It was a question of surface. The granite was amply strong. "To question its sufficiency," said General Franklin, "would be to cast doubt on all engineering calculations, and on all bigh structures. Tbe weakness was in tbe surfacing. From tbe crowning figure of tbis tower an adopted genius, if we follow the stresses down tbrough tbe crippled piers to the base, we find tbe structure excessively heavy, witb adopted ideas at every point. Below the surface we find a massive granite substructure—what I call the plug of a building—and under tbat the ground. Is not tbis going to large expense to be needlessly bard on the ground? If the ground bas got to stand it, why not put the substructure above ground, where sometbing can be seen for tbe money? This building is 250 feet high. Proceeding to greater beigbts—even to the gigantic monument proposed for Jackson Park—all are designed with the plug foundation.

I have often seen the foundations of Cbicago "sky-scrapers" going in, wooden piles supporting stones and grillages of iron beams. I have seen calculations of tbe stresses in such beams based on certain assumptions which were hardly demonstrable. But the stresses under the piles or in the ground between tbem I have never seen figured, even bypothetically.

If tbe ground be tender, if it bas not great bearing power, why do we put upon it sucb a prodigal weight of stone and beams? Wby do we not use tbe lightest and strongest steel, protected against corrosion and so disposed as to spread the load of heavy piers over a large area in the most complete, uniform and effective way? For a single pier this form would not be that of a bridge truss nor of a gridiron. We would not think it prudent to take to the air from a balloon depending upon a paracbute in any of these forms. It would be even for the highest and heaviest structures a balanced surface plate of requisite stiffness to distribute the load.

In a stamp mill foundation, or one under a steam hammer, we have to absorb the inertia of a live force and mass is required; but even then tbe plug form largest at depth and built up from depth like a pier on the surface has no special propriety. Better have the area and weight near the surface, wbere it will take up the inertia more quickly and effectively.

In short, foundations should be inverted—tbat is, planned from the surface, instead of from an indefinite point below the surface. The absence of rational grounds for the starting point of the present style of foundation is shown by tbe fact that there is no theory on the subject. In a few inches we pass abruptly from granite, with a crushing resistance of 8000 pounds per square inch, or iron, with a crushing resistance of 80,000 pounds per square inch, to eartb, witb a crushing resistance vastly less, perhaps 500 pounds per square inch, and behaving more like a fluid.

I started this consideration of foundations with roads. I concluded that the Telford idea was wrong. It appeared to be adopted from the building foundation idea. Tbis I conclude to be wrong also.

We build wrong and fancy we must be crushed under the inevitable. I have a friend—a humanitarian minister—given to visiting Count Tolstoi, who on one of these trips made note of that palace of St. Petersburg, said to be sinking in tbe morass, and quoted Kingsley's lines:

> So fleet the works of men,
> Back to the earth again
> Ancient and mighty things
> Pass like a dream.

No doubt this sinking palace is founded on plugs without proper distribution of its loads. If we use the earth reasonably, it will not be in so much of a burry to swallow us up.

Tbe moral aspect of these questions always asks a hearing. We are building a bigh and heavy structure of civilization. We can build it yet much higher, higher than the monument to Progressive America proposed by the French architect, but not if we depend upon foundations of a few heavy monopolistic plugs. If it is founded so tbat its benefits and responsibilities together rest broadly upon all the people, it will be well and permanently sustained by distribution among human elements of no extraordinary strength.

A Projected Merger.

A conference was held at Milwaukee, Wis., June 8th by officials of the United States Steel Corporation and representatives of tbe Allis-Chalmers Co. and the Wisconsin Bridge & Iron Co. Mr. Scbwab's private secretary and the chief consulting engineer were present.

Tbe session was held to devise plans for the amalgamation of tbe bridge and iron and Allis-Cbalmers plants in Milwaukee in a second billion-dollar consolidation.

Edwin Reynolds, chief engineer of the Allis-Cbalmers Co., said: "Wbile I have no hesitancy in saying tbat there is a good field for a billion-dollar trust, I am ignorant of any conference held here between the Scbwab and Allis-Cbalmers people. I understand Eastern men were in tbe city, but I cannot say as to the purpose of their visit."—American Manufacturer.

Casual California Comment.

"Funny," said tbe Tuolumne Co., Cal., man. "If that $12,000 pocket found last week near Stent bad been found in Siberia or Peru or Manitoba wbat a rush and scramble there would be to get there! But it's just California, where the sun and fruit and air are inviting enougb witbout tbe gold, and where you can ride on a broad gauge train almost anywbere."

"You California people don't know bow convenient you are fixed," said the man from Moose Creek, Idaho. "Wby, I was up in Nevada Co. some time ago, and tbe mine boss wanted to bave a new ore house painted. Now with us that would mean three weeks correspondence and tbree more freigbting. But tbis Grass Valley man telepboned to San Francisco and two days after I saw men slapping on tbe paint."

"Talking of telephones," said an attacbe of the Mining Bureau, "I think I made good use of one tbe other day. I went in to a man's place of business. I only wanted a minute's talk with him, and I knew be wanted to see me as badly as I wanted to see him, but tbe little tip-up of a clerk told me I must wait my turn. Tbere were four or five ahead of me, and I could see my man away at tbe other end through the open door of his office, and there was one of tbese desk telephones in front of him. It was tben 2 o'clock, and I saw I couldn't get to bim at the rate he was listening till 5. You know no matter bow important tbe talk going on, a telephone call is always quickly answered. Well, I went across tbe street, called my man up on tbe telephone, got him for an appointment at 2:15, and wben I soon appeared was able to tell tbe outer guard that I had an appointment with his boss and was immediately sbown in ahead of the others."

"That is a tremendous lot of metal," said a Treadwell, Alaska, resident sojourning at San Francisco, "that the Douglass Island people will have pounding next month. They will soon start up the 300 mill, which will make tbe wbole 880 stamps of tbe Treadwell group at work; they are 1050-pounders—nearly a million pounds of metal rising and falling in a ponderous dance. The shoes and dies wear out at the rate of about thirty pounds for every 100 tons of ore crushed."

"I heard a funny thing last week," said tbe man who was quietly smoking in the corner. "It relates to building eartb dams. In India engineers build a good many earth dams, and they do very well, when tbe earth is well packed. Tbey pack tbem by having a herd of sheep or goats on one slope of tbe dam while they are filling about 4 inches or so on the otber slope. Tbey put feed boxes on each end of the dam, and wbenever goats see a goat eating anytbing anywhere they think he bas sometbing good and rush for it, so that several hundred goats keep capering back and forth and thus pack the dam in a very cheap and effective way."

A man who hailed from Sierra county, Cal., now spoke up. He said he had a fine property to sell, but wouldn't go into any details till he had crossed the Mississippi.

"You bet I am not going to try and raise money in San Francisco; I am going to Cbicago," be said. "San Francisco may be all right for pretty, but she's no good. Wby, if San Francisco had the push and enterprise and nerve she had twenty-five years ago it would be tbe mining center of tbe world. Tbere is plenty of money here. Tbe banks are full of cash, but tbe owners of it won't play tbe mining game like tbey should.

"I ran across a prospector the other day who bad San Francisco sized up just rigbt. He said a San Francisco man was all right in his line, but mining isn't his line. You can't get a San Francisco man to go into a mining proposition if tbere is any ore in sigbt—he won't start to work on pay ore. Nobody can tell why, but he won't. If you can go to him tbougb and tell him that some poor devil of a prospector has sunk a shaft down to water level on a jumped claim, and bas been forced to quit work because of lack of money to buy a pump, the San Francisco man immediately becomes interested and will listen to the rest of your story, provided you tell bim tbat you can scare the fellow out of his cabin and jump tbe claim.

"But never say there is any pay ore in sight. Tell bim tbat the shaft ougbt to be sunk 20 feet below water level, tben a drift run 200 or 300 feet and a winze sunk at tbe end. Suggest to bim tbat if ore is not found at tbe bottom of the winze it would be a good idea to upraise for air, so tbat tbe drift may be continued a few hundred feet fartber. Estimate tbe cost of work about 100% high and let him beat you down to about the rigbt figure, but never tell bim you bave ore in sight, no matter if tbe wbole vein looks like a jewelry store.

"A San Francisco mining man doesn't want ore; he wants to mine."

"Right there, my friend," said a man from tbe mother lode, "is wbere you are away off. You simply don't know what you are talking about. San Francisco is the best town tbe mining man ever struck. San Francisco men are always putting up. I personally know of over $4,000,000 of San Fran-

cisco money that has gone into Tuolumne county alone in the past five years. And if a man has a fair prospect he can always get good accommodation in San Francisco by making the right kind of a showing. The trouble is San Francisco has long been looked upon as a good thing, and even if San Francisco were ten times as rich as it is, it couldn't buy every prospect, no matter how deserving. There are 17,000 partly developed prospects to-day in California awaiting capital."

"Whenever I hear a man talk like our Sierra county friend," said a dredging man from Butte Co., Cal., I think of the last time I was in New York. I was on Broadway with a native, and our attention was attracted by a sign, 'Trained Fleas Inside.' We've got any God's quantity of fleas in California, but neither I nor the native had ever heard of trained fleas, so we went in. There they were, dressed in clothing, driving coaches, going through marriage ceremonies and doing things that fleas might not he expected to do. They looked like fleas. After watching them for a long time I said, 'They're not fleas.' 'Why not?' asked the showman. 'Because they don't jump,' said I. 'They've heen trained not to jump,' said the showman. 'They used to jump, but they've quit. I'll show you how I train 'em.' He hrought out a glass hox whose top and bottom were very close together. There were several foolish untrained fleas in it. They kept jumping and striking their heads against the top of the case, when they would fall hack. 'There,' said the showman, 'that's the way we train 'em. When a flea has humped his head against the top of the case ahout a hundred times he quits jumping.' That's the way with San Francisco capital. It's head has been humped so often that it has quit jumping."

"Ever since January," said a Placer Co., Cal., mining superintendent who just joined in the symposium, "we have been feeding our friends and every one else oranges. It isn't every boarding house at a mine where all and sundry can have all the oranges they want, and I douht if anywhere else than in California such a thing is at all common. The oranges are fine, luscious ones, raised right in Placer Co., eaten hy Placer Co. miners—a home market—and cost $15 per ton."

"I have been reading," said one who till now had taken no part in the conversation, "of three California miners who had a good thing in the shape of a ledge from which they took free milling gold and had a crushing whenever funds were needed for current living expenses, hut who never took out more than enough for their weekly needs, arguing that if they milled more the bullion might be stolen or spent, and that the gold was safer in their mine than in any hank, and helieved there was something in it, till I heard some time ago of a mine hurglary at Grass Valley. As I heard it, in an upraise from the old workings a ledge was exposed which showed unusually rich ore. The drift showed a seam ahout 7 feet long and 6 inches wide, the value of which was estimated at $10,000. The superintendent left the ore just as he found it, so that the owners of the mine might see it for themselves. Meanwhile the news of the strike leaked out, as such things will. I was invited to accompany the owners, and when we got to the mine all we could see was an occasional piece of rich ore which showed what the ledge must have heen, but the great mass of the ore had heen carried off. The mine had heen closed, and the entrance harricaded, but the burglars broke into the drain tunnel, traveled 2000 feet to the shaft, 1500 feet farther to the drift in which the ore was exposed, and 800 feet to the hreast of the drift. They used the company's tools and powder, put in two holes, and blasted out the treasure, getting away with their plunder without creating alarm. As near as could he estimated they took out ahout 400 pounds of ore worth $20 per pound, four ore sacks heing missing. The burglary was committed while men were working in other parts of the mine, and the pump men heard the shots hut thought they were fired in the regular workings. And now I don't helieve so much in the safety of that kind of hank deposit, and I also know why mine superintendents so constantly try to keep the news of rich strikes from heing too generally noised around."

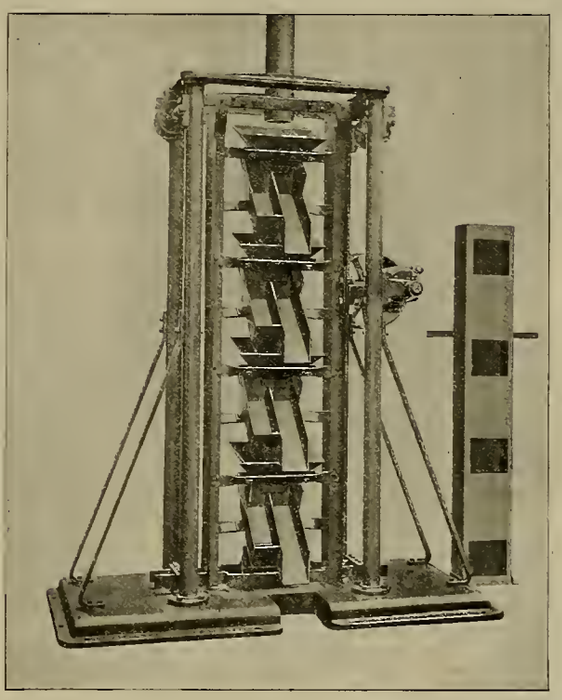
Pacific Coast Electrical Transmission Association.

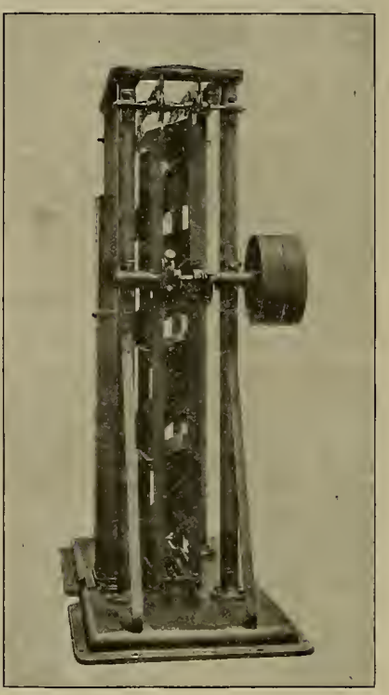
The Pacific Coast Electric Transmission Association held its sixth annual convention in San Francisco this week, heginning on the 17th. Dr. Chas. Van Norden of the Central California Electric Co., president of the Association, delivered the annual address. During the afternoon session the following papers were read: "The Economy of Electric Power in Quartz Mining," hy C. O. Poole; "The Application of Electric Power in the Comstock Lode," by Leon M. Hall, and read by Geo. P. Low; "Electric Pumping From a 1300-Foot Level," hy Donald H. Fry. A. McAdie presented an illustrated paper on "Cloud Versus Coal." A. J. Bowie Jr. read a paper entitled "Wells in Large Ranges," and Jno. S. Eastwood a paper on "The Hydraulic End of Power Transmissions."

E. J. de Sahla Jr. was elected president for the ensuing year, H. H. Nohle vice-president, Wm. Angus of Oakland was re-elected treasurer and Geo. P. Low was re-elected secretary.

The Foster-Coolidge Automatic Sampling Machine.

The machine as illustrated herewith consists of a succession of moving hoppers and dividers, placed alternately one ahove the other. There are four hoppers and four dividers. The hoppers are fastened to the front one of two horizontally moving frames. The dividers are fastened to the rear frame. These frames are suspended on rollers at the top of the machine, the upper crosspiece of each running in grooves in the rollers. These rollers are free to revolve on a fixed axle. Each frame is guided at the hottom hy two pairs of short pipes holted to the hase. The verticals of the frames are of light angle iron, hent at the top and riveted helow to the guiding crosspieces. To the verticals are riveted the cross irons that carry the hoppers and dividers. The hoppers and dividers are single castings of quarter-inch cast iron, holted to the crosspieces. Each divider has a partition in its center separating the discard from the sample channels. The upper end of this partition is cut away to prevent a large piece of ore heing caught hetween it and the hopper above. The lower end of the right hand, or discard channel, is open, and extends into the discard chute in front. The lower end of the left hand, or sample channel, is closed hy a partition. Immediately behind this partition is a square opening in the bottom of the channel. The end partition and sides are extended downward into the hopper helow.





Foster-Coolidge Automatic Sampler.

The two frames carrying the hoppers and dividers are attached hy connecting rods to two eccentrics. These eccentrics are driven by a pulley at the right, and move the frames horizontally and in opposite directions. They are designed to have the delivery openings of each hopper fully over, first, the sample, and then the discard channel at extreme positions. The hoppers are all alike, as are all the dividers. The delivery projection of the last sample channel moves in an inclined sample chute, which extends through the hase.

The discard chute, shown detached and reversed in the first cut and in place in the second, has openings wide enough to receive the discard channels and allow for their motion. The lower three openings are guarded from falling ore hy iron plates holted inside the chute and just ahove the openings. These act as deflectors for the ore.

The base and top are of cast iron and are formed hy 2½-inch pipes. The frame is stiffened by four braces, as shown in the cuts. The machine stands 7 feet 3 inches high and occupies 5 feet 10 inches by 2 feet 9 inches floor space. It is driven hy a 3-inch helt on a 14-inch pulley. The speed is 150 revolutions per minute, which means 150 complete oscillations for each frame.

The ore, not over 1 inch for this size machine, is fed through a 4-inch pipe into the first hopper, as shown in the first cut. There it is mixed hy striking the inclined sides of the moving hopper and delivered first to the sample and then to the discard channels, allowing only the ore that can pass in one-fifth of a second to fall into either channel at one time. The ore is thus halved hy dividing the stream in successive sections of from one-fourth to three pounds and retaining each alternate section to represent the whole.

The ore which enters the discard channel is delivered to the discard chute in front; that which enters the sample channel passes through the opening at its lower end and into the hopper helow, where the process of mixing the ore and its distribution between the channels of the next divider goes on as hefore. The sample is thus reduced from one-half to one-fourth of the whole. This process is repeated twice more, reducing the same to one-sixteenth, which is delivered to the sample chute at the hottom of the last divider.

The ore passing into any of the sample channels is retarded, first, hy striking the hottom; second, hy striking the end partition of the channel; and third, hy its passage down the hopper helow. This process, taken together with the rapid motion of the parts, is designed to thoroughly mix the ore before each reduction.

The machine of the dimensions here given is stated to have a capacity of from twenty-five to thirty tons of ore or matte per hour, or all the material that can he made to pass a 3½-inch square opening.

The following are tests furnished hy the manufacturer, showing results hy this sampler as compared with hand sampling, that is, quartering; 4000 pounds copper matte sampled and resampled:

MACHINE SAMPLES.	Copper. %	HAND SAMPLES.	Copper. %
First run through	34 94	First sampling	35 04
Second run through	35.02	Second sampling	34.99
MACHINE SAMPLES		HAND SAMPLES.	
First run	25.76	First sampling	25 92
		Second sampling	25.69
MACHINE SAMPLES.		HAND SAMPLES.	
4000 lbs. ore	23 13	4000 lbs. ore	23.23
4000 lbs. ore	21.22	4000 lbs. ore	21.16
4000 lbs. ore	23.10	4000 lbs. ore	23.15
Average of 12 lots are:		Average of 12 lots are:	
4000 lbs. each	25.25	4000 lbs. each	25.33

The machine is manufactured hy Winthrop Coolidge, 310 Western Union Building, Chicago, Ill.

American Brains and English Bricks.

J. C. Stewart, the American contractor, whose record bricklaying performance in connection with the erection of the British Westinghouse Electric & Mfg. Co.'s works at Manchester, England, recently caused so much discussion, has been engaged by the Midland Railway Co. to supervise and expedite the work at the mammoth Midland Railway Hotel at Manchester, England. The contract is in the hands of W. Brown & Son of Salford, England, and it is said that they are to receive $100,000 in bonuses if the work is finished within a year, and $10,000 a month for each month shorter than that time. The total price is $5,000,000.

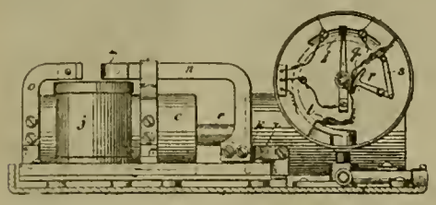
THE altitude of the Colorado river at the Needles, Cal., is 450 feet; at Yuma, Ariz., 107 feet—a fall of 347 feet in 281 miles, or 12.2 feet to the mile. The distance on a straight line from Yuma to the Needles is 147 miles—one-half the distance hy river. The Colorado river drains 225,000 square miles, principally from Colorado, Utah and Wyoming, from the melting snows. It flows about 2,500,000 miner's inches during its annual June rise. At midwinter reaching its lowest stage, the flow is about 200,000 miner's inches.

Mining and Metallurgical Patents.

Patents Issued June 10, 1902.

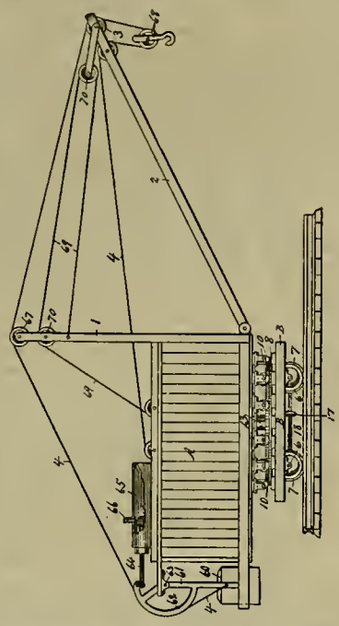
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

AUTOMATIC CONTROLLERS FOR ELECTRIC MOTORS.—No. 701,843; N. A. Christensen, Milwaukee, Wis.



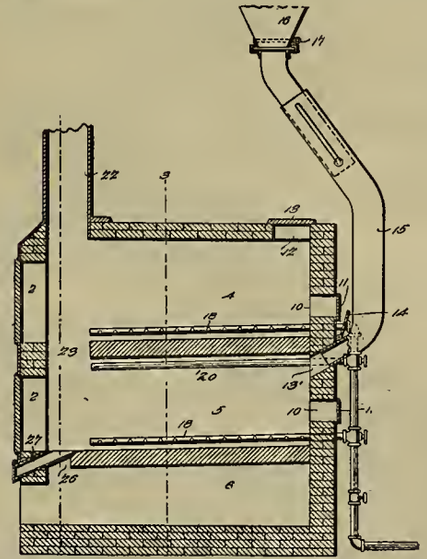
Automatic controller combination, two solenoid magnets arranged in line having common plunger movable axially therein, main switch having contact pieces, one of which is mounted upon plunger, movable therewith into and out of engagement with the other, primary switch having minimum and maximum pressure contact pieces, fluid pressure actuated contact piece for controlling circuits of magnets, normally engaged springs in circuit of switch opening magnet, circuit breaker carried by plunger adapted to separate springs when main switch is opened.

HOISTING AND CONVEYING MACHINE.—No. 701,887; S. Jackson, Fayetteville, N. Y.



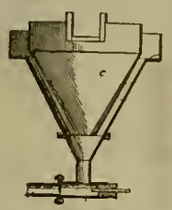
Windlass, suitable train of gears for operating it, main operating shaft 29, friction clutch which operates with last one of train of gears, rod 52, hand lever 53 by which friction clutch is operated, lever 54 secured to rod 52, shaft 55 to which lower end of lever 54 is secured, arm 56 secured to shaft 55, arm 57 pivoted to outer end of arm 56, shoe 58 connected to and operated by arm 57, and wheel 59 mounted upon central shaft 29.

ORE ROASTER.—No. 702,004; J. L. Hopper, Kirksville, Mo.



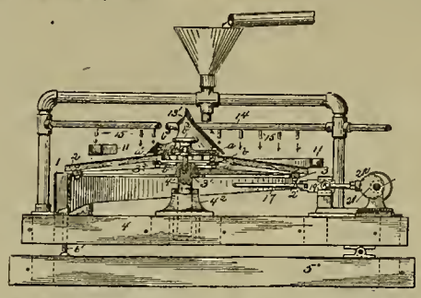
Combination in ore roaster, of lower cooling chamber 6, superposed ovens arranged thereabove having communicating flues or passages, oil supply pipes 18 arranged within each oven at point near floor level, oil supply pipe 20 arranged in lower oven at point near top of same, governing valves on pipes, removable chute 27 arranged at front end of floor of lower oven.

ORE SEPARATOR AND CLASSIFIER.—No. 701,851; C. Culver, Sandon, B. C.



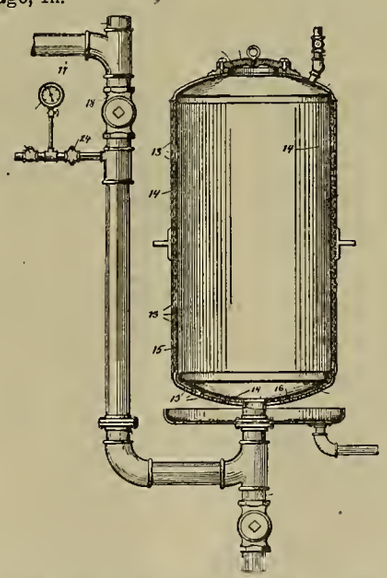
Ore classifier, comprising cone-shaped hopper forming settling chamber, inflow conduit leading into top thereof, secondary cone-shaped hopper forming assorting chamber, having its wide mouth attached to reduced lower end of main hopper, pipe having branch adapted to form means for upward current of water through hoppers, one or more flues leading from upper end of second hopper upwardly, trough surrounding upper end of main hopper into which flues dehouch, baffle plate comprising vertical dam portion extending from side to side of main hopper, across open top thereof, horizontal portion extending toward inflow conduit to check disturbance caused by inflow of water.

ORE CONCENTRATOR.—No. 701,859; W. G. Dodd, San Francisco, Cal.



Ore concentrator, comprising inclined circular table having an unriffled or plain portion adjacent its discharge for the mineral, series of curved collecting riffles arranged on the working face thereof and discharging onto plain or unriffled portion of table, means for imparting an oscillatory motion to table, and valve-controlled return launder or trough attached to and carried by table, launder or trough arranged to receive middlings discharged from table and to return same thereto at its head.

METALLURGICAL FILTER.—No. 702,064; F. H. Long, Chicago, Ill.

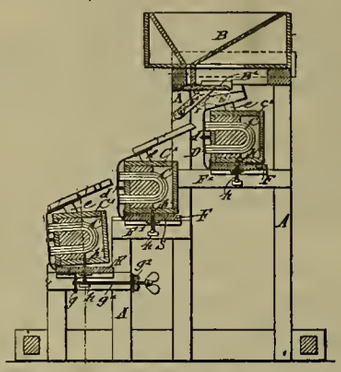


In metallurgic filter, combination with closed, perforated tank having an external drip pan and an internal fabric septum with stretcher frame therefor to rest against tank walls, of feed pipe leading into tank bottom and separate wash water pressure tube united to feed pipe between inlet and outlet valves thereof.

TREATMENT OF ORES AND MATERIALS CONTAINING ANTIMONY.—No. 702,153; J. P. van der Ploeg, The Hague, Netherlands.

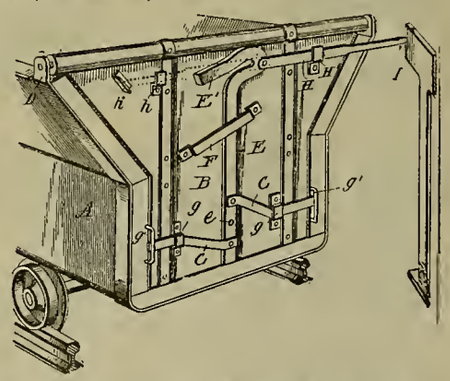
Method of extracting antimony from ores, materials or residues containing it, consisting in finely pulverizing material, mixing it with suitable quantity of powdered quicklime, mixing with it adequate quantity of sulphide of alkali-earth metal and water so as to form solution of lower and most soluble double sulphides as being best electrolytes without use of artificial heat or application of pressure winning antimony from sulphide solution as metal by electrolysis, then using several times solution from which antimony has been separated for treating new quantities of ores or materials containing antimony, or until antimony contents are practically completely extracted from ores or materials containing antimony under treatment, new quantities of quicklime and sulphide of an alkali-earth metal being added according to nature of antimony compound.

MAGNETIC ORE SEPARATOR.—No. 702,184; J. W. Carter, Franklin, N. J.



In magnetic ore separator, combination of gang of magnets inclosed in suitable box having poles of magnets projecting from front of same, vertically disposed septum secured stationary to front of box and over poles of magnets, septum having resilient upper end extending rearwardly in oblique direction, chute connected with and in same plane as upper end of septum supported on box, and means for simultaneously adjusting box and septum in forward tilted position.

MINING CAR DOOR FASTENER.—No. 702,265; J. H. Watt, Barnesville, Ohio.



The combination of mine car, its swinging door, latch lever pivoted thereto, bolts connected to lever, and latch bar connected to the latch lever, adapted to project beyond side of car; with cam plate fixed beside track adapted to engage bar and cause it to move latch lever and release bolts, overbalancing weight on latch lever adapted to move it still farther after bolts are released so as to retract bolts and bar within area or edges of car door so that they will not interfere with free swinging movements of door.

PROCESS OF EXTRACTING PRECIOUS METALS FROM THEIR ORES.—No. 702,305; E. D. Kendall, Brooklyn, N. Y.

Process of treating ores carrying precious metals, consists in treating such ore with lixiviating solution, consisting of cyanide, potassium percarbonate, and water, finally extracting precious metal from such lixivium.

THE velocity of the flow of underground water has been measured by C. S. Slitcher. The measurements were of the underflow in the sand of the Arkansas river. Two set wells were driven and electrically connected. Into the up-stream well was placed an electrolyte or dissolved substance which affects the electric current. The electrolyte entered the underground water at the first well and gradually passed down stream to the second. In the electrical circuit between the two wells the needle of an instrument recorded its approach, and was strongly affected by its final arrival. By watching the increasing deflection of the needle it was possible to trace the movement of the water from the beginning of the experiment and to study the variations of its flow.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

The Alaska-Mexican mine in May treated 21,842 tons of ore and 403 tons of sulphurets; estimated gross yield, $42,037; average, $1.92 per ton; working expenses, $24,706. The Alaska Treadwell mine crushed 83,967 tons ore and treated 1702 tons sulphurets at a cost of $75,949; the ore averaged $1.77 per ton; gross yield for month, $148,949.

The Valdes, Copper River & Yukon Railway Co. has given a contract for building 450 miles of road from Valdes to the Yukon to M. J. Heney, the road to be completed within two years at a cost approximating $15,000,000. Preliminary surveys were made last year under Engineer Gillette, who had leave of absence from his position with the Burlington Railway in Montana. He was chief engineer for Major Abercrombie in building the Government road to Copper river. Gillette sent fifteen surveyors to Valdes this week and will send another party by the next steamer. Rails for the first 70 miles have been bought and one cargo is en route aroud the Horn.

ARIZONA.

COCHISE COUNTY.

The Dragoon Copper M. & S. Co., whose properties, consisting of ten claims, are in the Dragoon mountains, 12 miles east of Tombstone, says it will do development work this season.

According to F. L. Dwight, Supt. Bisbee West Copper Co., there are only three companies in Bisbee, since the Calumet & Hecla and the Copper Queen absorbed other companies. The Copper Queen has 2000 men, and it is stated that inside of a year the Calumet & Hecla will have about 2500. In making its recent purchase of properties the latter company formed other companies inside the parent one; two of these are known as the Calumet-Arizona and the Calumet-Pittsburg.

Supt. Boag says that the reported destruction of the Exposed Reef M. Co.'s holdings was a mistake. The plant was saved by setting back fires.

COCONINO COUNTY.

J. W. Finch, State Mineralogist of Colorado, J. W. Francis and H. Jacoby are examining copper mines on the Navajo reservation.

GILA COUNTY.

The June copper product of the Old Dominion, including matte, is expected to be 900,000 pounds—about the same as the May output. The product of fine copper in May was 875,000 pounds; including matte, the product was 900,000 pounds.

Manager W. Sultan, Copper Hill Con. M. Co. of Globe, says he will erect plant for treating its ores. The company's properties are between the Old Dominion and the Globe Con. properties.

Supt. F. D. Adams of the Bob Tail M. Co. is putting in an additional battery of stamps at the company's gold mine near Ray. He will then buy machinery for the company's copper mine.

MARICOPA COUNTY.

The Pikes Peak gold mine, 8 miles southwest of Castle Creek Hot springs, on the boundary line between Yavapai and Maricopa counties, shows the contact to be schist and porphyry, the vein matter being a lime spar. The lode is about 600 feet wide.

The Electra mine, 10 miles from Wickenburg, has at 120 feet an ore body 2½ feet wide.

A telephone line is finished between Octave and Congress Junction, and twenty-two men are building the line to Wickenburg.

The Montezuma lead and silver mine is sold to the Wickenburg Smelting Co. for $5000 cash. The property lies near Morristown.

MOHAVE COUNTY.

The last payment on the purchase price of the Leland-Mitchell mines has been made. T. Ewing is the owner of the property. For this property J. H. West and S. Bedell received $150,000. T. Ewing is acting as general manager.

Chloride reports that J. W. Haas has sold the Woodchopper Relief mine to Los Angeles men for $15,000.

The Nighthawk M. Co. has sold the property to L. S. Smith and W. W. Phelps of Los Angeles, Cal. July 1st work starts up under the superintendency of A. J. Doran. A road will be built from the Oro Plata mine, Todd Basin, to Layne Springs, and machinery then placed on the mine.

A. I. Richardson, general manager Portales de Oro M. Co., has begun work on the property at Union Pass.

PIMA COUNTY.

The Cuprite mine in the Santa Ritas is bonded to Eastern men.

The Golden Rule C. M. & S. Co. has made a second payment on the Cuprite mine, 7 miles southeast of Vail's station, 20 miles east of Tucson, in the foothills of the Santa Rita range of mountains. The company controls eight claims and has been pushing development work on the properties for a year past. Supt. J. Gutendorf has developed an ore body 15% copper, $20 in gold and $5 in silver. General Manager Lake says the Golden Rule Co. will erect a smelter on the property to treat the ores.

PINAL COUNTY.

Supt. Bagsley of the Jack Rabbit mine, Casa Grande district, is assorting and sacking high-grade shipping ore, leaving the second grade ore on the dumps.

YAVAPAI COUNTY.

Fifteen miles east of Prescott, O. B. Marshall has bonded the Marshall group to Eastern men and will superintend development work thereon.

Supt. S. J. Goldie of the Aztec Copper Co. has sent a carload of mining supplies to the properties of the company for development work.

Supt. Gilmore of the Eureka G. & C. M. Co. will do 500 feet of development work and build necessary roads on the property near Jerome.

Supt. Pickerell has the shaft on the President mine down 500 feet and has started a drift from the 500-foot level.

The Cabinet mine is now known as the King Fortune. It is an extension of the Silver Belt. C. E. M. Beall is Supt.

Development work is being done on the Great Verde mine, midway between Jerome and the Verde river. They have a shaft down 120 feet where water has been struck.

M. R. Kiley, Supt. Oro M. Co., near Prescott, expects to start up the Oro Co.'s new 60-stamp mill July 10. He is working forty men.

CALIFORNIA.

ALPINE COUNTY.

Seventy men are employed at Loope, and as soon as the mill starts the force will be increased.

AMADOR COUNTY.

The Amador G. M. Co. has incorporated in Utah, J. L. Craig, president and treasurer; C. T. Wardlow, secretary. The company will operate the Kruger and Vaughn claims, near Jackson.

The 5 stamp mill recently on the Tripp mine, Plymouth, has been moved to the Hercules mine by the owners, Shields & Noe.

At the Sargent, near Jackson, the machinery from the Peerless is moved to the Sargent ground. Sinking continues.

The sinking at the Argonaut shaft is finished. During the past year in sinking operations nearly $50,000 have been expended.

At the Bunker Hill the Ledger says a portion of the ledge alongside of which they are drifting at the 800 level was blown out in the blasting operations, revealing rich ore. The extent of the ore body is unknown.

In the Keystone mine at Sutter Creek, in crosscutting through the hanging wall greenstone at the 500 level, has been found a new ore body 8 feet thick, 160 feet east from the main fissure.

Rich specimen ore is being taken out at the Bunker Hill mine on the 800-foot level, north drift.

When work on the 2000-foot station and chute at the Lincoln is completed crosscutting to the west will be started.

BUTTE COUNTY.

L. Williams is building a stamp mill at Lumpkin to be run by water power.

The 20-stamp quartz mill at the Miller mine, near Forbestown, is in operation; ten stamps are crushing quartz.

CALAVERAS COUNTY.

At Jackson, a judgment having been obtained in the Superior Court of this county against the Moore mine, with over 200 acres, the property has been sold by J. B. Luddy, as referee, for $70,250, to A. Frankel, who is locally believed to represent Mr. Nevills.

Near Angels the Sultana Co. employs a great many men. It is calculated that more than 1000 miners are working in and about Angels; the proportion of American miners is greater than before.

The Lightner Co.'s new hoist, to lift three-ton cars from a depth of 2500 feet, is under way. A new hoist at the Altaville mine, capable of sinking 1000 feet, is to shortly go in.

The Sierra railroad extension to Angels is progressing slowly owing to the scarcity of men; 120 men employed. The line will be completed next September. Freight is being delivered at Robinson's Ferry and teamed to Angels.

B. Thompson is at Murphys, where he will begin preliminary work on the canal from the middle fork of the Stanislaus.

The owners of the Blue Jay mine, near Glencoe, are about to put up a mill on that property.

The Utica Co. has bonded additional land for mining purposes. At the Utica electric plant at Murphys, work is pushed by Supt. Gurney. The pipe is nearly all laid and the new machinery on the ground.

At the Angels quartz mine work is progressing.

Near Angels, Supt. C. L. Morgan for the Sultana Co. is operating the Bovee and Fritz claims, adjoining the Angels property. The Bovee shaft is now 500 feet.

EL DORADO COUNTY.

Estey & Ball will put in a new engine and pump at their mine at Pi Pi.

A 200-ton plant is in operation at the Vandalia mine, near Shingle This property is owned by J. Rosenfeld's Sons of San Francisco. The mine and plant are under the management of C. E. Seymour and C. F. Staver. The new plant when completed will represent an investment of $100,000.

At the Mount Pleasant mine at Grizzly Flat, 20 miles northeast of Plymouth, are employed thirty-five men; the 10-stamp mill is crushing; sinking the main shaft is being continued.

The Lucero G. M. Co. is shipping concentrates.

All the valuable land for nearly 6 miles on either side of Tonopah has been located.

The Gamecock & Mammoth mine, near Shingle Springs, may be reopened and operated by a German company.

If the Pocahontas mine is reopened the property will be operated through a tunnel from the Union mine, 1 mile in length.

J. F. Bluett is operating the Pyramid mine, near Shingle Springs.

A. F. Levitt projects building a new mill in Dark canyon; the vein averages 40 feet, carrying gold values from $5 to $6.

FRESNO COUNTY.

The Independence Oil Co. has a contract for 6000 barrels a month to the National refinery at 30 cents for ten months.

C. C. Bradley, Supt. Caribou, says that well No. 4 of the California Oil Fields, Limited, is flowing at the rate of thirty-five barrels an hour.

The Pacific refinery, on the Santa Fe west of Bakersfield, when fully equipped will daily consume 900 barrels crude oil, which will make up into about 40% liquid asphaltum.

HUMBOLDT COUNTY.

At the forks of the Salmon Supt. Mills is building a flume to tap the main Nordheimer creek.

The Nordheimer mine has eleven men at work.

INYO COUNTY.

W. C. Pidge, for San Francisco and Eastern men, has bonded two groups of mines near Bishop—the Emily Enot and the Leidy mines; terms, $20,000, final payment in one year.

KERN COUNTY.

During May there were shipped from the Kern River field 3540 cars oil.

In the event of contracts being secured for transportation of 5000 barrels of oil daily for ten years, it is locally stated that the projected McDonald railroad from the Kern river oil field to Port Harford will be finished by Jan. 1, 1904. Contracts are said to have been signed for 3500 barrels already. The road would run via Cuyama valley.

MARIPOSA COUNTY.

Three mines owned by Early & Revel, Sweetwater, have been bonded by J. E. Fowler of San Francisco and T. A. Mitchell of Pacific Grove, Cal.

Seven carloads of lumber have been received by the Mariposa Commercial & M. Co.

MONO COUNTY.

The Crystal Lake M. Co., Lundy, has nearly 1000 tons of concentrates ready for shipment. The property is 12,000 feet above sea level.

NEVADA COUNTY.

The Gold Crown mine, owned by Tilton Bros., near Edwards' crossing, is in good ore.

Nine men are working at the Ironclad mine, near Rough and Ready.

The stamp mill on the Dr. Fouch property, near North San Juan, will be started up.

Suits involving claims aggregating $800,000 have been filed in the Federal courts against the North Star Mines Co. of New Jersey by the owners of the Norwich mine, claiming that the North Star Co. extracted ore therefrom. The defendants assert in their answer that the total value of such ore did not exceed $10,000.

R. I. Thomas has a contract to dredge the Middle Yuba river near French Corral.

PLACER COUNTY.

At Iowa Hill the leasers of the Morning Star have reached gravel by a bedrock tunnel 200 feet left of the main tunnel.

Near Spring Garden the Big Channel Co. has begun the tunnel to tap the gravel. Supt. Nesmith has charge.

G. Knutzen is manager Dardanelles, Bob Lewis and Sacramento gravel mines.

A pack train has left Cisco with supplies for the mines at Meadow Lake. Snow is still 2 feet deep on the road.

The 10-stamp quartz mill at the Central mine, formerly the Dorer, is in operation. F. Develey is Supt.

PLUMAS COUNTY.

C. Adams, Supt. Cataract M. Co., operating on North Fork of Feather river, has twenty men at work on the Giraud claim, and others cleaning out and repairing the Lott ditch.

D. Finlayson Jr. is operating the quartz mill on the Talbot mine, Light's canyon.

Work on the electric transmission system of the Western Power Co. of Los Angeles, involving the diversion and storage of the waters of the north fork of the Feather river, in Big Meadows, has begun at several points. As many men as can be handled to advantage are employed in the preliminary work of opening roads and trails.

SAN BERNARDINO COUNTY.

At Dale, in the O. K. mine, there are 1800 feet of development. The ore averages $18.50 gold per ton. The ledge is in places 100 feet between walls; hanging wall is porphyry, footwall granite.

SAN DIEGO COUNTY.

The thirteenth annual report of the Free Gold M. & M. Co. shows receipts for April $48,069; expenditures, $22,118.69; liabilities, $6500. The cleanup of the cyanide plant showed $11,700. The report was read June 6.

The machinery is arriving at Picacho for a cyanide plant capable of treating 1000 tons of ore daily. The company has fifteen claims at Picacho. The narrow gauge railway from the mine to the mill site, 6 miles, will be finished in September. Ore will be taken from the surface by means of open cuts and hauled directly to the mill for treatment.

SHASTA COUNTY.

Four carloads of lumber are at Redding for the dredger of the Detroit & California M. Co., which proposes to operate on Clear creek near Horsetown.

The Balaklala group of sixty copper claims, Flat Creek district, under bond for $650,000 to Pennsylvanians, may be taken by them. They have already paid $165,000, which may be considered to insure the sale, which will put another smelter in Shasta county. It is a big low-grade proposition. The ore will yield net returns of $3 a ton. C. A. Malm, San Francisco, is president of the present owning company.

The Murray-Conroy-Weil mine, Flat creek, is bonded to the G. W. G. M. Co. for $10,000, for a year. The same company has bought for $250 the Alta mine, sold under execution.

The Mount Shasta Gold Mines Corporation, mainly Chicago men, which owns the Mount Shasta gold mine, have the McClure copper group on Bully hill. The company has bought the townsite of Sallee for a smelter site, and says it will erect a reducing plant.

SIERRA COUNTY.

Development work is being pushed on the King mine, between Marguerite and the Keystone mine.

The H. R. Case Co.'s cyanide plant at the Young America mine is in operation.

The Pilgrim mine at American Hill, owned by the English - American G. M. Co., under the management of T. A. Patterson, Jr., has a body of high-grade ore in No. 4 tunnel. This tunnel is a crosscut for 600 feet. After cutting the vein a drift was run on the ledge 250 feet, at which point the ledge is 5 feet wide and in free gold and galena sulphurets.

The Bellevue tunnel is being run to tap the Thistle Shaft gravel channel below the old works. The tunnel is run 70 feet a week. It is now in 2700 feet. The company employ fifty men. From the mine to La Porte a wagon road, 5 miles in length, has been built.

E. Squier is foreman at the Tabor mine, near Gibsonville. The tunnel to tap the channel is in 3500 feet. They are in soft slate.

A gravel strike is reported from the Steamboat property, near Alleghany, where Jones & Evans are reported to have struck the red channel and taking out rich gravel.

The American quartz property there is also reported to have struck rich ore.

SISKIYOU COUNTY.

Newkirk, Northcutt & Quigley are opening new mining ground on Klamath river, between Honolulu and Walker. With giants and hydraulic elevator they

will sink open cuts to bedrock, expecting to raise pay gravel from 2000 to 2500 yards into sluices at an incline of 45°.

Driving the tunnel at the Cherry Hill mine on Cherry creek progresses. Supt. Baker expects to strike the vein within 100 feet further drilling.

Near Callahans the Sheba mine, Pattison creek, and the Rusby mine, Deadwood creek, are being operated.

The Helene G. M. Co., owners of the McKeen property, is operating its cyanide plant.

Wood & Sheiden of Rainbow, 1 mile south of Sisson, and E. B. Edson have bonded to E. Harrison, for an English company, a group of copper claims for $100,000.

TRINITY COUNTY.

A 5-stamp mill is being erected on the Hershey mine, northern Trinity.

The Fair View M. Co. will operate at Minersville; directors, C. and L. Allenberg, I. J. Weil, C. W. Cross, H. Newburgh.

At Trinity Center Supt. Hoefler has temporarily closed the Headlight mill. A tunnel is in 400 feet, and when the pay shoot is struck the mill will again be started and cyaniding resumed.

The Oriole M. Co., Indian Creek, will put in a mill.

The La Grange mine is in constant operation.

TUOLUMNE COUNTY.

The water and electric plant of the Stanislaus Water & Power Co. will be near the Contention mine, 14 miles from Columbia. One surveying party will survey from the Sand Bar on the main Stanislaus river, where the water will be taken out down the line of the ditch which runs on the south side of the river. Another crew will survey for the power plant, the reservoir and the pipe line leading down from it. Thirty men will be put on clearing brush for the pipe line. The reservoir will be enlarged and cribbing built in several places. Seven thousand inches of water will be used to generate electric power. The remaining 9000 inches will be taken across the Stanislaus into Calaveras county to be used by the mines in the Murphy district. The company will build a sawmill at the head of Knights creek. About 8½ miles of flume will be required.

E. A. Wiltsee has sold to A. H. Ward of Alameda a quarter interest in Two Brothers Consolidated gold quartz mines, near Groveland, and a five-acre mill site, for $3000.

The Roosevelt M. Co., Chinese Camp, has a new quartz mill in operation. C. E. Uren is general manager and superintendent. The mine and mill employ 250 men.

Near Jamestown the Draper M. Co. will add ten stamps to its mill.

Jacksonville reports a strike in the Stanley mine.

At Big Oak Flat A. P. Dron has brought the hoisting plant of the Mississippi to the Nonpariel mine.

At Stent work is resumed at the Jumper and Golden Rule mines. The Jumper mill is in operation.

Ballard & Martin have bonded the Lady Washington mine and started miners at work. They will tunnel 500 feet to strike a vein once encountered in the old workings. If the vein is found, machinery will go in.

YUBA COUNTY.

The United States District Court has confirmed the Eynard condemnation suit and paid to the holder of the property, situated on the Yuba river, the sum of $2000. Work on the river by the Government is now scheduled to begin.

COLORADO.

ARAPAHOE COUNTY.

The Union ore sampling works, owned by the Union Ore Co., at Thirtieth and Wewatta streets, Denver, was destroyed by fire on the 15th. The loss is estimated at $30,000.

BOULDER COUNTY.

W. E. Alexander, manager Copper Ranch Co., Grand Island district, says that in the 180-foot level 30 inches of ore have been opened up which runs $30 per ton.

CHAFFEE COUNTY.

Denver men have bought the Washington and Smuggler mines at Granite. The Washington G. M. Co. has been incorporated under the laws of Wyoming. G. T. Martin is Supt. The mine is in the Mosquito range, 2 miles east of Granite, 18 miles south of Leadville.

CLEAR CREEK COUNTY.

Idaho Springs reports a strike in the Robert Fulton shaft on the properties of the Russell Gulch M. & D. Co. A streak of ore at a depth of 150 feet assays $45 per ton in gold, silver and copper.

Near Empire, in the Gold Bug group, Covode mountain, a vein, continuous from the surface, has been opened at several points, showing a crevice of milling and smelting stuff, averaging $10 for the former and two ounces gold for the latter. The Gold Bug ores, like those of all Covode mountain producers, carry copper in percentage sufficiently high to affect the mill returns. W. P. Clough is general manager.

At Silver Plume the Burleigh tunnel, to connect with the Seven-Thirty shaft, is pushing along. This will open up a big territory in a rich region.

C. Butterfield of Denver has let a contract to drive a drift on the Josephine 400 feet on Kelso mountain, near Brick Pomeroy's A. P. tunnel.

The Double Header group, on McClelland mountain, owned by the Colorado M. & M. Co., will drive the Wheeling tunnel to cut the Double Header lode.

Representatives of the Cherokee-Lanyan Spelter Co. of Springfield, Mo., are looking through the mine for zinc ores.

Near Idaho Springs, General Manager McClelland of the Monarch M., M., P. & T. T. Co. has the McClelland tunnel completed 2100 feet. It is 9 feet wide, 8 feet high, accommodating a double track. It will be pushed to the Freeland mine, 1 mile in from the portal, 200 feet a month, to cut the rich ledge at a depth of 2200 feet.

Idaho Springs reports that in driving the line west of the shaft on the Alpine, between Cascade and Trail Creek districts, 2 feet of solid smelting ore assays $400 a ton in silver. In addition to this streak there is said to be 3 feet of milling ore.

At Dumont Supt. Housing at the Kaverne mine is driving on the vein now in 400 feet from a crosscut tunnel which cut the vein nearly 1000 feet. Twenty men are employed. The company is enlarging its mill.

Supt. David Ellis has resumed work at the Dover mine.

The Old Town property of Kimball & Himrod in Russel gulch is working thirty-seven men besides the leasers.

EL PASO COUNTY.

General Manager H. Fullerton has the Telluride mill, Colorado City, in operation; capacity, 300 tons, not including the roasters, which have a capacity of 150 tons. The company is considering increasing the mill to 500 tons.

FREMONT COUNTY.

At Florence W. D. White has a contract for the removal of 240 tons per day of the tailings from the old cyanide dump at the Metallic mill, by a centrifugal pump, onto the concentrating table of the United States R. & R. Co.

The United Oil Co. has drilled into oil at a depth of 2500 feet in the well that is drilled to sea level near Williamsburg. The United Oil Co. had hoped that it would not find oil until it had reached a depth of 5000 feet, because it was desirous of determining what underlaid the ground at a depth of 4500 feet. The oil may be cased off and the well drilled deeper.

GILPIN COUNTY.

For the first week in June the shipments of ores and tailings from the Black Hawk depot to the Golden and Denver smelters and to the concentrating mills at Idaho Springs were 141 cars—a total of 2820 tons.

The new mill at Chase gulch is operating on ores from the Bonanza property. J. Cundy is in charge.

Before U. S. Commissioner Hinsdale, Denver, H. P. Lowe and T. S. Dines have sued A. J. and E. J. Richardson to recover $187,500, the balance due on the purchase price of the Topeka mine, near Central City. Three years ago Lowe sold the Topeka to the Richardsons for $300,000. The mine was supposed to contain a body of high-grade ore. The defendants allege that they were the victims of extensive "salting," and that the property was practically valueless. They forfeited their first payment, and Lowe and Dines are suing to recover the balance due.

Nebraska men, who have bought the Bant property east of Black Hawk, will put in a plant of machinery and a new shaft building 28x50 feet. G. D. Johnstone of Black Hawk is their representative.

J. F. Scheuer of Milwaukee has a bond and lease on the Cœur d'Alene property, near Central City. J. Mackey is in charge of the work and will put in new machinery.

Near Central City, a half interest in the Old Town mine, Russell district, is sold to L. R. Himrod of New York for $50,000 cash. The Old Town produces fifty tons per day, equal portions being handled by wagon and by tramway to Idaho Springs.

At Central City Supt. W. R. Benzie of the Ingalls G. M. Co. is shipping, with most encouraging results, ore to the Golden smelter and mill dust to the mill at Black Hawk.

HINSDALE COUNTY.

Cummings and Kennedy of Florence have claims near Lake City, between the Golden Fleece and the Inez mines, which they will work.

In the Keystone shaft, Silver Cliff district, the ore is carrying increased values in lead and copper. Water is being pumped from the Hard Times; three shifts of men are sinking the Reveille.

LAKE COUNTY.

The Yak M., M. & T. Co., Leadville, has ordered a new compressor for their tunnel.

Cleaning and timbering the Yak tunnel, preparatory to starting to drive the bore to the Ibex ground, is completed, and driving begins July 6. The distance to be driven is 1450 feet. During May the Yak people shipped 5000 tons—the heaviest tonnage in its history.

At Leadville the A. M. W., Minnie and Mahala have been combined and sold to New York men. S. D. Nicholson is to be general manager of the new company. J. F. Rodman resigns his position as manager of the Arkansas Valley smelter to be financial agent of the new concern.

Manager T. S. Schlessinger of the Morocco M. Co. and the Welcome property, is operating the Last Chance mine for the Cerussite M. Co. The ore is a lead-iron sulphide, carrying gold and silver.

MESA COUNTY.

Grand Junction reports a pyritic smelter to be built there on a site donated near the sugar factory.

MINERAL COUNTY.

A fire on the 18th inst. at Creede destroyed $200,000 worth of property; two lives are believed to have been lost.

At Creede a new 300-ton mill is in operation and treating free milling ore at a profit.

OURAY COUNTY.

In Ouray the Revenue Co. is credited with projecting a tunnel through the length of the mountain from a point near the Batchelor switch to their shaft in the Sneffels district, to cut the Revenue veins at a greater depth and drain the mine of water. The main shaft on the Revenue is down 1000 feet below the level of the present tunnel.

The Revenue Co. is arranging to handle its ores on the Telluride side, presumably through the Ophir tunnel and the mill at the Cimarron.

Near Ouray the Portland reports a good strike. D. Wood is manager, A. Gould foreman. The crosscut tunnel is in 845 feet and intersects a vein 6000 feet in length. The vein in this tunnel was cut at a distance of 520 feet. About 300 feet of stoping has been done. The ores in the stopes consist of grey copper, lead, brittle silver, yellow copper, zinc, gold and chloride.

PITKIN COUNTY.

(Special Correspondence). — The Argentum Juniata mine has closed down indefinitely.

The Mollie Gibson mine is running full handed. It is reported they have made a large strike, but same is not yet confirmed by the management.

The Hunter Creek mill is handling ninety tons of ore daily from the Della S. mine, concentrating about eight tons into one; runs 6½ ounces silver, 4½% lead. The Smuggler zinc mill is handling 150 tons every twenty-four hours and the Smuggler lead mill 160 tons in about eleven hours. D. Cole is Supt. of the mills.

Aspen, June 14.

SAGAUCHE COUNTY.

The new mill at Crestone is working regularly.

SAN JUAN COUNTY.

The Tahasco M. Co., on the San Juan-Hinsdale line, will erect an up-to-date concentrator at the mine. This property is 12,000 feet above sea level.

Grading goes on for the new 200-ton Silver Ledge mill to be erected near Chattanooga.

The Yukon tunnel is now 1120 feet in Boulder mountain. Work is also in progress at the upper Lamont tunnel.

SAN MIGUEL COUNTY.

Manager J. Barnes of the Telluride Coal M. Co. has a tunnel 200 feet north of San Miguel in which the body of coal has increased in size. It was less than 1 foot on the surface, but now there are 2 feet of clean coal of a semi-anthracite character.

Manager C. Anderson of the Nellie has men doing development work.

T.-Elliott, Supt. Smuggler-Union's old mill at Pandora, and W. Morrison project a mill to treat ores from the Sheridan and other dumps of the Smuggler-Union Co. in Marshall basin. Work was started last week; it is expected to have the plant in operation by Aug 1. They have a lease on the Smuggler-Union dumps.

The Ella G. M. Co. at Telluride, just incorporated, capital $20,000, will begin work on the Nellie and Ella group.

SUMMIT COUNTY.

At Kokomo the Michigan mine, Sheep mountain, is shipping ninety tons of ore daily.

Near Breckenridge, Supt. J. F. Hight of the Wellington M. & M. Co. is running a 700-foot tunnel on the Wellington, to strike the main vein.

At Swandyke A. J. Vanco is operating the Three Kings mine.

Manager E. A. Finding of the Breckenridge Deep M. Co. has good ore in the 310-foot drift.

TELLER COUNTY.

(Special Correspondence). — The Independence shaft on Hull City Placer, Cripple Creek district, collapsed this week. All the machinery and gallows-frame may have to be removed from the shaft. W. P. Dunham is manager.

Cripple Creek, June 11.

At Cripple Creek, of the thirty-eight sets of lessees developing the Anaconda estate, fourteen are in ore. The whole property is now under lease. The 1000-foot level has penetrated the Vindicator-Lillie vein about 1000 feet from the shaft. The vein is rich. The screenings yield $100 a ton.

The Mountain Boy G. M. Co. has raised enough money to develop their property on Raven hill, first sinking the shaft, now down 150 feet, to 650 feet.

The Metallic tunnel people, on Copper mountain, think that the present ore showing justifies the project of a $60,000 concentrating mill.

The Independence Con. G. M. Co. expects to pay its $40,000 indebtedness by July 1. The mine, the Hull City Placer, has produced $1,000,000, but lost its rich ore shoot between 700 and 800 feet. Search was made for it and the debt of the company incurred.

Crosscutting on the Ben Hur claim, on Gold hill, at a depth of 600 feet shows the vein. Some ore is being saved. The shaft will be sunk 200 feet deeper.

The Last Dollar has made a six-car shipment—two of high-milling ore and four of smelting ore.

Cripple Creek's proposed deep drainage tunnel would run in from the southwest, under Grouse mountain, starting 3 miles southwest of the Elkton property, near the junction of Cripple and Four-Mile creeks. The cost is estimated at $300,000 and it would take fifty months to complete the undertaking. This involves a monthly tax of $6000 upon the properties to be benefited.

June 10th was pay day in Cripple Creek. Stratton's Independence pay roll was $47,000, the Elkton Co. $22,000, the Mary McKinney Co. $13,500, the Chicken Hawk (Guyot hill) $2100, the Last Dollar $11,000, the Findley $4474; the Cripple Creek M. Co., the largest leasing company in the district, paid $20,000, the Joe Dandy on Raven hill $2500, the Granite mine on Battle mountain $8000, the Golden Cycle $13,000, the Vindicator $10,000, the El Paso $10,000.

The latest consolidation in Cripple Creek takes the properties of the Avalon G. M. Co., the Chicolo G. M. Co., the Helen B. Gould M. Co., the Hard Carbonate G. M. Co., into an organization controlling 11,173 acres. The new company will be the Chicolo Con. G. M. Co.

At Cripple Creek the last 20-ton shipment from the Rittenhouse will go $300 to the ton.

J. F. Burns, president Portland G. M. Co., says they are shipping usual quantity of ore; the greater portion of the force employed is on dead work. They have at the 1000-foot level an ore shoot proved up for 400 feet that varies in width from 50 to 90 feet. The new reduction plant at Colorado City is treating 200 tons a day. He thinks they will have to double the capacity of the plant. The ore now running through the mill is not being sorted, but will go $30 a ton.

C. F. Scherrer's suit against H. T. Weeks, lessee Thompson mine, belonging to the Elkton Con. Co. at Cripple Creek, in the U. S. Circuit Court, resulted in the jury giving a verdict for the plaintiff for $7250. Counsel for the plaintiff contended that a mine owner must adopt rules and regulations for the operation of his mine. If he fail to do so, he is liable for any injury which may result from lack of performing the duty. This principle has repeatedly been declared in reference to railroad companies, but had never before arisen in Colorado as to the operation of a mine. Defendant Weeks was held liable because he had not made a rule requiring the trapdoor at the surface of the mine to be closed before the shaft bucket was unloaded. The plaintiff, who was a trammer in the Thompson mine, lost his leg by being struck by a jackscrew which was dropped down the shaft by one of the miners.

At Cripple Creek the Blue Bird Co. has resumed sinking and expects to reach a depth of 1400 feet before water interferes again

S. Bell, Supt. Hull City property of the Independence M. Co., says that the company will wait a little before repairing the damage done by the recent sinking. A bulkhead may be placed in the main shaft at the third or fourth level, and the Cripple Creek M. Co., leasing the property,

will work through the Whiting shaft. The shaft is twisted and the machinery out of plumb.

IDAHO.

BANNOCK COUNTY.

The Fort Hall Indian reservation was opened with a rush on the 17th.

Prospectors and mining men held a meeting in Pocatello on the 13th and organized a mining distrlct on the portion of the Fort Hall Indian reservation thrown open on the 17th. The sentiment expressed at the meeting was that any intimidation would deprive those making them from sharing in the distribution of claims.

BLAINE COUNTY.

Manager C. C. Ruthrauff and Supt. Mechling of the Rosetta M. Co., operating on the Big Smoky and South Boise divide, near Soldier, are examining the Rosetta workings.

J. B. Laughlin, one of the owners of the Lucky Boy group, Idaho City, is in San Francisco. He says the Mountain Ram property is bonded and that his property will be worked this season.

IDAHO COUNTY.

(Special Correspondence).—The Great Unknown Placers, under Supt. J. Davis, are in operation.

The Newsome & Leggett Creek Hydraulic Co., with J. Surridge manager and A. D. Howell Supt., are running night and day with 800 inches of water, and have demonstrated that they have an unknown depth of gravel over 100 feet. The injunction obtained against them by parties who jumped their dump has been modified by the court, some of the alleged locations having been thrown out and permission granted to mine at central points, pending a decision on the main issue.

The Moose Creek placers of C. P. Richardson, with A. Bishop Supt., are working night and day, using 600 inches of water. They are now showing 200 feet of gravel and still hunting the bottom and north rim, which, so far, have not been found. The outlook is for a very short water season. Spring was very late opening and the starting of the water was followed by hot days and nights and warm rains, sending the snow off with a rush. The roads are lined with Thunder Mountain pilgrims—horse, foot—and one genius with a wheelbarrow.

Newsome, June 10.

OWYHEE COUNTY.

G. W. Venable has miners doing preliminary work on the Tiptop group, Florida mountain.

SHOSHONE COUNTY.

In the Skookum mine case at Wardner the Empire State-Idaho Co. says it either owes K. Hanley $147,000 or else nothing at all, on account of his eighth interest. Hanley claims that Sweeny & Clark unfairly got a deed from him for a one-eighth interest in the Skookum mine, was subsequently transferred to the Empire State-Idaho M. Co., and he wants an eighth interest in the ore taken from the Skookum by the Empire State-Idaho Co. without his consent. The defendants admit that ore has been taken from underneath the surface of the Skookum, but that it is from a vein having its apex on ground owned by the Empire State-Idaho Co. Hanley figures that the Empire State-Idaho Co. had removed ore aggregating 73,000 tons from the Skookum claim up to Feb. 15th; that the company was not entitled to any credits for the costs of mining the ore; that his one-eighth interest on that basis was $315,000. The Empire State-Idaho Co. allege that if Hanley is entitled to anything it would be only on the net profit of the ore after the costs of mining and of smelting have both been deducted. On that basis he would receive $147,000. They argue that Hanley is not entitled to anything at all, because of the extralateral features in the case.

WASHINGTON COUNTY.

At Landore a 350-foot tunnel contract on the Chieftain is done. General Manager Adams is expected to continue development work.

G. W. Moyer, general manager Thunder Mountain Placer M. Co., the townsite of Thunder Mountain being at the junction of West Fork and Monumental creeks, has an office at Weiser.

MONTANA.

CASCADE COUNTY.

Near Neihart, on the Silver Belt tramway, 318 men are at work. The Ripple mine will also use the tramway. The Silver Belt Co. is completing a 3000-foot trestle, from the ends of which the tram will connect.

FERGUS COUNTY.

W. D. Wrighter of Spokane has bought of A. H. Sellers of Maiden the Surprise group of mines for $30,500, payments to be made within the next fifteen months.

FLATHEAD COUNTY.

The Mollie Gibson Co. has three claims in Snowshoe gulch, 18 miles south of Libby, and says the vein in the property is 5 feet wide and the ore will run $30 per ton in gold, silver and lead. Helena has the office of the corporation.

GALLATIN COUNTY.

At Bozeman work has begun on the new properties of the Anaconda Copper Co. A side track will be laid and a town laid out when Engineer White returns from the Pacific coast.

LEWIS AND CLARKE COUNTY.

The Yellow Jacket group of seven claims, 15 miles southeast of Helena, is bonded by the Rose M. & M. Co. The vein is 35 feet wide. Assays run from $2 to $21.70 in gold per ton. The company proposes to develop it on an extensive scale preparatory to the erection of a stamp mill.

At Marysville the Drumlummon mine, owned by the Montana M. Co., reports the chief earnings are from tailings treated by the cyanide process. Last year 12,000 tons of ore were mined and 64,593 tons of tailings treated; net earnings, $75,457.

MADISON COUNTY.

The Watseka's new pump is being installed and everything ready to tap the vein at a depth of 600 feet.

Supt. McConnell of the Fourth of July group, Pony, thinks from tests that two sets of rolls for dry crushing through a 10-mesh screen, then cyaniding and crushing through a 40-mesh screen with a Griffin mill will be the proper thing for the mine's metal. Thirty men are at work.

Supt. Fuller shipped forty tons of ore from the Fairview mine at Sheridan last week.

Operations have been resumed at the Noble mine.

C. E. Lentz, manager Big Show Co., Sheridan, has bought the Lulu and Lone Star mines there.

A. Nesbitt has a lease and bond on the Bill Fairweather mine at the head of Mill creek.

At Rochester sinking continues on the Elgin mine, under the management of Mr. McClure.

B. T. Hickman is pushing work on the Abbie Alice property and is shipping ore to the Colorado smelter, some of which runs $100 to the ton.

F. R. Merk, owner Broadway mine, Silver Star, is having it unwatered, when work will be resumed.

SILVER BOW COUNTY.

An 800 H. P. electric motor for the Anaconda Co., at the Never Sweat mine, will run the compressor with power from the Canyon Ferry Power Co.'s plant on the Missouri river. The motor is the largest one in the State and was made expressly for use at that mine.

T. W. Fisher is drawing plans for a 40-stamp mill for the Bear Gulch M. Co.

NEVADA.

ELKO COUNTY.

The machinery of the Grand Prize & Union mill in Tuscarora is being demolished and shipped to Sacramento, Cal., as scrap iron.

LYON COUNTY.

R. W. Landrum of the Nevada Chief mine, at Rockland, advises his company at Los Angeles, Cal., to put in a 30-ton mill and cyanide plant. The mine is 28 miles south of Yerington.

NYE COUNTY.

A 500-ton lot of Tonopah ore has reached Salt Lake City, Utah.

Manager Healey of the Salt Lake & Tonopah Co.'s properties, at Tonopah, expects to tap the Fraction vein on its dip at or before the 250-foot level is reached.

The mines controlled by the Nevada Co. at Austin are said to be leased. S. T. Peterson is general manager.

The Tonopah City M. Co., organized under the laws of Arizona, has bought the Luetjens, Little Tono, Flying Dutchman and Big Jim Fraction claims. They will sink a double-compartment shaft and do extensive crosscutting. Officers: T. L. Oddie, president; A. J. Crocker, secretary; J. Salsberry, general manager.

STOREY COUNTY.

At Virginia the main building of the Butters plant will be 360x240 feet—the largest building in the State.

WASHOE COUNTY.

Near Steamboat Springs, Supt. F. A. McGuire of the Galena Hill G. & S. M. Co. has three ledges and is drifting to the main body of ore.

Supt. J. W. Hopkins of the Great Western mine, near Reno, has fifteen miners at work developing the property.

Supt. Crane of the Sparks M. Co. is locally credited with having bought the title of the Desert King M. Co. to the lateral extension of the Wedekind mine ledge for the Sparks Co.

WHITE PINE COUNTY.

Manager McGill of the McKinley Co. of Ely, says he has native copper at a depth of 200 feet.

Work will be started next month by the Chainman Co.

NEW MEXICO.

DONA ANA COUNTY.

The Torpedo mine at Organ has been drowned out. There was a cave-in and work suspended.

GRANT COUNTY.

In the Pinos Altos district W. Brandis has secured a lease on the Golden Giant 10-stamp mill on the Mammoth site.

At Stein's Pass, Supt. Rutherford has the mill of the Wilson M. & M. Co. in successful operation, putting ore through which runs forty-five ounces in silver and one-quarter ounce gold.

OTERO COUNTY.

Work at the large lead mines, near Tularosa, has been suspended. The machinery will be moved to Cook's Peak, Luna county.

SOCORRO COUNTY.

The Graphic smelter, near Kelly, is temporarily shut down.

The Cooney mine, owned by the Silver Bar M. Co., H. C. McCreary manager, is reported sold to W. J. Weatherby, manager Mogollon G. & C. Co.

TAOS COUNTY.

At the Fraser Mountain Copper Co., operating at Twining, Leffel turbines furnish 264 H. P. to drive the machinery for the smelter, mine and light. The tramway from the mines to the smelter has been completed, 1990 feet long. Capacity of smelter 120 tons a day. Three shifts are at work in the mines doing development work and piling up ore. The smelter starts July 1.

OREGON.

BAKER COUNTY.

The Phœnix property was bonded last fall by New York men for $80,000. Sinking at the Don Juan has opened up a ledge. The 10-stamp mill on the property is busy.

The Oregon Placer & Power Co. of Sumpter have men at work on Humpback mountain, Nevada gulch, Poorman gulch and the Sam Carpenter diggings near Greenhorn.

Sumpter reports the Badger concentrating plant, Susanville district, to have rolls with 30-ton capacity, besides the ten stamps. The Badger was recently bought by Bunker Hill & Sullivan interests of the Cœur d'Alene for $500,000.

F. W. Bradley, superintendent Bunker Hill & Sullivan G. M. Co., Cœur d'Alenes, and also the Badger mine, Susanville district, 65 miles from Sumpter, has spent a week at the Badger arranging for beginning work there with the new mill plant, to concentrate 100 tons per day, to be operating July 1.

A. B. Brown, in charge development work on the Snow Creek group, Greenhorn district, is arranging development work. The property was bonded last week to New York men for $60,000. A long crosscut tunnel will strike the lode at the lowest possible depth. At 200 feet the crosscut will reach the vein, when it is the purpose to drift fo- 500 feet.

On the Mayflower property, in the Cracker Creek district, J. B. Fryer is directing development.

Dr. Mueller, acting manager of the Oregon S. & R. Co., says he will build a smelter at Sumpter.

JACKSON COUNTY.

W. King has bought the Taylor Bros. mine on Hungry creek for $5000, and will put on a 5-stamp mill.

The Oregon Yellow Jacket M. & M. Co. is organized under the laws of Arizona to work a gold property 2 miles from Gold Hill, ½ mile from Rogue river.

LANE COUNTY.

Five carloads of steel rails for the railroad between Cottage Grove and Bohemia mines are on the ground.

SOUTH DAKOTA.

CUSTER COUNTY.

W. J. Ratte, Supt. Saginaw M. Co., is doing development work on the Saginaw mine, 11 miles northwest of Custer.

LAWRENCE COUNTY.

The Rossiter cyanide plant in Deadwood shows good results on ore from the Big Bonanza and Buxton claims, near Terry. It is treating fifty tons a day. J. V. N. Dorr is in charge of the mill. It is the oldest cyanide mill in the Black Hills.

At Deadwood a custom cyanide plant, 100 tons daily capacity, is to be erected by Boston men.

Roubaix reports ore on the 500-foot level at the Uncle Sam mine.

The Homestake M. Co. has its new settling plant in operation in Lead. It contains six tanks, 10 feet diameter, 16 feet deep.

The Alder Creek G. M. Co. has a $5200 bar of bullion, the result of the first clean-up at the new cyanide plant on Yellow creek, after a run of fifteen days. Eight hundred and fifty tons of ore were milled.

Supt. M. L. Day will resume work on the Lulu M. Co.'s property.

PENNINGTON COUNTY.

The Eagle Rock M. Co. is organized to work the Wealthy mine, near Keystone. It has a 10-stamp mill and 15,000 tons of ore ready to mill that will average $4 per ton gold.

UTAH.

BEAVER COUNTY.

E. T. Wolverton, manager Cave mine, Bradshaw district, is developing the property. He is shipping iron ore to the Murray smelters for smelting purposes. This carries 70% iron, besides values in gold and silver; smelter agrees to pay all transportation charges, give the mine all the gold and silver values and a certain rate per unit for all of the iron in excess of 50%.

IRON COUNTY.

The management of the Oregon Short Line coming to their relief, the owners of the exhaustless deposits of iron on Iron mountain, Iron county, will be permitted to enter the local market with their ores that will be accepted at the valley smelters and made to serve them as a flux. Owners of iron at Iron Mt. are notified by the American S. & R. Co. that they will take 300 tons daily at $2 50 per ton.

GRAND COUNTY.

The S. L. Tribune reports that returns have been received from the metallurgical firm of George G. Blackwell Sons, Liverpool, England, pronouncing the recent discovery of molybdenite ore in Basin district as genuine, but not of high enough percentage to make the product pay. They advise further development work to ascertain whether it is in streaky veins or a deposit. If of a depository nature it is worthy of expensive investigation.

The following is the substance of their report: "Molybdenum, found as the minerals molybdenite and coalfenite, generally occurs in beds, or is disseminated through crystalline rocks, such as granite, gneiss, syenite and granular limestone. The chief uses of molybdenum until recently have been in determining phosphoric acid by ammonium molybdenate and in preparing 'blue carmine' for coloring porcelain. The ferro-alloy of molybdenum is now used in making a special steel, to which it gives valuable properties. The production of this ore in the United States in 1901 was about fifteen tons, which does not near supply the demand. The ore to be marketable must contain over 45% molybdenum, and be free from copper. The average price of a 50% to 55% ore is probably about $400 per ton. The richest molybdenite ore yet found is that discovered near Leamington, Millard county, Utah, and in the Santa Rita district, Arizona, but in such small quantities as to make it unprofitable. In both instances the ore had a percentage of 45% molybdenum.

Blackwell further says: "The ore very much resembles graphite, or a dark colored lead ore, and never oxidizes. It flakes off like specular iron when cut with a knife and does not leave a glossy stain on the hand." Blackwell's analysis of the ore sent him from Basin gives 32% molybdenum and $3 in gold, the latter values no doubt coming in on the syenite rock contained in the gangue. The principal showing is on the Iowa property on Gold Hill mountain in a blowout, indicating a bed or deposit of the mineral.

JUAB COUNTY.

Ruby copper is reported at a depth of 2100 feet in the Mammoth M. Co.'s property. Gold-bearing ore is opened up 300 feet east on the 1800-foot level and followed down to the 1900 level.

J. R. Creighton, Supt. of the Tesora, has a lease on the Rabbit Foot at Silver City, and is working it. When the property was closed down it had been producing silver-copper ore of a value of $90 per ton, but the pumps were unable to handle the water. It has since found an outlet through a fissure connecting with the Sunbeam.

Eureka's city council wants bids for 4400 feet 2-inch pipe, 10,000 feet 3-inch, 1800 feet 4-inch, 3700 feet 5-inch pipe; and two tanks 16 feet high, 24 feet in diameter.

SALT LAKE COUNTY.

The towers for the United States tramway at Bingham are raised. Forty range from 16 to 80 feet in height, to support a cable spanning 17,000 feet. The work will be completed Sept. 1.

At the Bingham Con. the fourth furnace at the smelter plant is in operation.

SUMMIT COUNTY.

Supt. M. J. Daily will put in a new gallows-frame for the King, Park City.

TOOELE COUNTY.

Plans for an electric plant for the properties of W. A. Clark in Ophir canyon are under consideration.

D. Kelly, superintendent Sunshine mill, has the total earnings for forty days figured at $15,997.88, now on its way to the refinery. The crushers are taking 120 tons of ore daily. Thirty days' net earnings amount to $2000.49.

From Mercur comes a statement that a strike has been made in the properties of the Con. Mercur M. Co. that adds $1,000,000 to the valuation of the company's wealth. The strike is in the main electric tunnel level, disclosing ore that goes $13 in gold.

The Sacramento mill, Mercur, has started.

WASHINGTON.

FERRY COUNTY.

Because of the nearing of the completion of the Great Northern into Republic, preparation is being made to resume work on the Quilp, Black Tail and the Lone Pine - Surprise. Among the mines now being worked at Republic and which will soon start shipping are the California, Gold Ledge, Trade Dollar, Tom Thumb and Ben Hur.

LINCOLN COUNTY.

C. Grutt has upon the Egypt claim, Pitney Butte, 15 miles north of Davenport, a 2-foot vein of steel galena.

OKANOGAN COUNTY.

Supt. Oliver Tufty, Horn Silver Co., near Oroville, reports a strike at the 350-foot station.

SNOHOMISH COUNTY.

L. Bilodeau, Supt. Monte Cristo mill at Monte Cristo, has in the rear of the mill a tank so arranged that the concentrate water passes through a series of compartments with small opening doors to give the flow a slow motion and cause the water to travel in a serpentine course to catch the slimes.

WYOMING.

CARBON COUNTY.

At Grand Encampment, General Manager I. C. Miller expects by Jan. 1, 1903, that the Ferris Haggarty Copper M. Co. will give employment to 300 men. Supt. A. Brile will put in a 500-ton concentrating plant. The company has a contract with the Southern Wyoming Transportation Co. to furnish that company 200 tons of ore daily to the smelter; transportation $2 per ton. An electrical plant for operating the drills, hoists, etc., will be bought as soon as practicable. It is expected that the aerial tramway will be completed on schedule time.

FOREIGN.

BRITISH COLUMBIA.

Ymir reports that at the meeting of the stockholders of the Ymir Gold Mines, a Mr. Popkiss is coming to examine the property, accompanied by E. Hooper, a mining engineer. Increase of capital stock £20,000 was authorized for an electric plant. Supt. Barnhart reports that in twenty-nine days and five hours the mill crushed 6520 tons of ore, yielding $23,850 in amalgamation, and 440 tons of concentrates with a gross value of $12,160, making a total output of $36,010. For the last month only forty stamps have been working. The reason for shutting down the other forty is explained as due to the great quantity of water in the mine. The upper level has been stoped to the surface. As a result a sort of reservoir formed for the melting snow and surface water, and the pumps were unable to contend with the excess of water in the lower levels.

At Rossland the Le Roi pays the Great Northern railroad $80,000 a month, directly and indirectly. The freight rates wipe out the margin of profit upon most of the ore shipped from the mine. The Great Northern has not consented to lower some of its rates to the mine and smelter, but has the concessions under advisement. Meanwhile only the higher grade ore bodies are being stoped at the mine. If the railroad declines to concede, Manager McKenzie may close down the smelter. If the concessions are granted, the force at the Le Roi will be doubled and shipments made to Northport at the rate of 800 tons daily.

A. C. Garde, manager of the Payne mine at Sandon, has a contract with the Trail smelter to ship 500 tons of clean ore and concentrates monthly. The mine has considerable on the dumps, running fifteen ounces in silver to the ton. This will be put through the concentrator and the result be a concentrate going close to 125 ounces of silver and 75% lead. The crew at the mine numbers sixty. Mr. Garde states that the result of tests of electric drills at the Payne mine has been satisfactory. He has no confidence in the report that the American Smelting & Refining Co. will re-enter the British Columbia lead ore market, and believes that some improvement in the London market is the only solution to the Canadian lead miners' troubles.

At Nelson N. F. McNaught wants figures on a tramway for the Kilo group.

Phœnix reports during the last week one furnace at the Granby smelter was closed because of lack of coke. Shipments were as follows: Granby mines 6117 tons, Mother Lode 188, Sunset 120, B. C. mine 840, Jewel 240. The Granby smelter that week treated 8226 tons of ore.

The last spike is driven on the Kootenay & Arrowhead Railroad and trains running from Gerrard to Lardo.

Active operations have resumed at the Rambler-Cariboo mine with 100 men.

MEXICO.

CHIHUAHUA.

The Guaynopa S. & R. Co. owns fifty-four pertenencias in the Guerrero district of Chihuahua and is erecting smelters on the property for their own ores and for custom smelting.

Near Chihuahua H. Allen of the firm of Allen & Snyder has bought the Maid of Erin for $60,000.

SONORA.

The first shipment of copper bullion, the product of the new converters, four cars weighing 320,000 pounds, 98½% fine, was made last week from Cananea. Three converter stands are running.

On the Penasco Quemado a track has been run from the hins at the smelter into the workings. Ore assays 26 ounces silver per ton and some gold. He says "the ore from this mine can be mined and put into the bins at the smelter, cost not to exceed 40 cents per ton."

At La Fortuna, ore samples from the north half of level give from 4% copper and 20 ounces silver to 30% copper and 2400 ounces silver.

Developments on the Mina Grande and Cobre show the ore body to be 200 feet wide.

The U. S. M. & S. Co. is organized to develop the San Jose de Gracia mine (the Ahogada, it is now called) in Sonora. The property is located 45 miles from Hermosillo.

Supt. J. W. Walsh, Sonora M. & M. Co., operating the Penasco Quemado, La Fortuna and Mina Grande, says since last July the amount of work done amounts to 2450 feet, besides 17 miles of wagon road from Tubutama to the Penasco, thence to the Fortuna, Mina Grande and other mines.

SOUTH AMERICA.

The output of gold in British Guiana in 1901 was the smallest recorded for several years, the total production having been 102,182 ounces in 1901, as compared with 116,266 ounces in 1900.

SOUTH AFRICA.

The gold output of the Rand mines for May was 138,602 ounces, an increase of 19,014 over April.

The Rhodesian gold output for 1901 was 180,888 ounces, an increase of 69,385 ounces over the yield for 1900. The output since September, 1898, amounts to 399,441 ounces.

YUKON TERRITORY.

F. C. Wade says there are nearly 7000 miles of creeks unexplored in the Yukon, which, if so, would indicate that the day has not yet come for the suppression of placer mining by hydraulicking.

J. D. Meenach, general manager Reliance M. & T. Co., Dawson, says Klondike mining operations in the district are being carried on on a larger scale and with less expense than ever. There are still some large dumps on Dominion, Hunker and Sulphur creeks to be washed out. His company cleaned up $30,000 from the dumps mined during the winter, and expects to take out $100,000 during the summer. He is putting in centrifugal rock pumps.

The Lippy claim, on El Dorado, from which $1,500,000 in gold has been taken, has been sold to a Cleveland, O, company for $75,000. The spring cleanup on the claim was $130,000.

An order in council has been passed at Vancouver, B. C., amending Section 7 of the regulations governing placer mining in the Yukon, so that persons in the employ of an individual or joint stock company operating mineral claims are no longer required to have free miners' certificates. The words "and every person in his or its employment, except house servants," have been eliminated from the regulation. An order in council has been passed providing that a royalty of 2½% on the value of all gold at $15 per ounce shipped from the Yukon Territory from the 1st of May, 1902, shall be paid to the comptroller instead of the royalty heretofore collected. An order in council authorizing the Minister of the Interior to dispose of any mining claim forfeited under the provision under Section 41 of the regulations governing placer mining in Yukon has been cancelled.

Personal.

H. L. FRANK has returned to Butte, Mont.

W. N. MCGILL is manager Ely M. Co., Ely, Nev.

W. S. KEYES will in future reside in Napa, Cal.

HORACE MILLER is Supt. Hard Cash group, Elko, Colo.

R. M. KEEN is Supt. Old Spanish mines, Richfield, Utah.

CHAS. E. STEVENS is Supt. Stevens Copper Co., Clifton, Ariz.

THOS. NEILSON is in charge of the new smelter at Chloride, Ariz.

N. A. DUNGAN is examining mining property at Hailey, Idaho.

J. A. SNEDAKER has returned from Ely, Nev., to Denver, Colo.

T. L. HENDERSON is elected mining recorder, Searchlight, Nev.

D. H. JACKSON has returned from San Francisco to Tonopah, Nev.

JASPER R. RAND of the Rand Drill Co. of New York is visiting Utah.

JOHN B. HASTINGS is examining properties at Stanley Basin, Idaho.

H. C. BROWNLEE is Supt. St. Louis-Ontario mine, Park City, Utah.

J. W. OPP has charge of the Gold Standard mine, Jacksonville, Or.

H. J. LEWIS is examining the Golden Chariot mine, Rock Creek, Idaho.

C. H. HAMPSON has returned from Deadwood, S. D., to Denver, Colo.

MARK BRADLEY is the new manager Lion M. Co., Yavapai county, Ariz.

J. O. STEWART is Supt Anglo-Saxon mines, Rich Gulch, Calaveras county, Cal.

R. C. CAMPBELL - JOHNSTON is in charge of the Republic mine, Slocan, B. C.

T. REED succeeds J. F. McClelland in the Wyoming School of Mines at Laramie.

FRANK L. SMITH of Denver, Colo., has returned from a business trip to New York.

SAM W. CHEYNEY, Supt. Jamison mine, Plumas county, Cal., is at the works.

C. C. LONGRIDGE is examining newly discovered copper deposits in the south of Spain.

J. K. FLEMING, manager Lappin mine, Deadwood, Trinity county, Cal., has returned there.

C. C. WARD, Seattle, Wash., has been appointed chief engineer Wenatchee Improvement Co.

J. A. FRASER is appointed gold commissioner, Atlin, B. C., vice J. D. Graham, resigned.

THOS. COX, manager Morning mine, Mullan, Idaho, has resigned and will go to Portland, Or.

W. H. THOMAS, consulting engineer B. C. Copper Co., is at Vancouver, B. C., from New York.

E. F. MCCARTHY has been appointed assistant general manager Horseshoe M. Co., Pluma, S. D.

DR. J. B. MCLAUGHLIN has the appointment as physician for the Lightner mine, Angels, Cal.

SUPT. W. H. STORMS of the Baliol mine has returned from San Francisco to Sutter Creek, Cal.

GEO. WILLIAMS of Central City is manager Boulder County mine, Cardinal, Boulder county, Colo.

WILLIS G. MOORE has returned to Denver, Colo., from inspection of Montana mining property.

C. A. LAWSON of the J. Geo. Leyner Drill Co., has returned from Salt Lake, Utah, to Denver, Colo.

J. F. UHLHORN retains the superintendency of the Carson Valley, Nev., Smelting & Refining Co.

CHAS. WEIDER, former Supt. Moose mine, is now in charge of the Independent mine, Crestone, Colo.

A. DOWNE AND J. FOWLE of London are in Jackson, Amador county, Cal., looking at mining properties.

D. A. BUCHANAN, the mill man of the Cornucopia mines, Baker county, Or., is in Thunder Mountain, Idaho.

F. A. WING, U. S. assayer, Seattle, has returned from an inspection of mining property at Republic, Wash.

JOHN HAYS HAMMOND is visiting the Camp Bird mine, Ouray, Colo. He is accompanied by George Crocker.

V. G. HILLS of Cripple Creek, Colo., is examining mining property at Santa Maria del Oro, Durango, Mexico.

C. H. RICE of Ottawa, Ohio, president Yreka M. & M. Co., has returned from a visit to the Ball mine, Rollin, Cal.

J. C. MCCORMACK, former assistant superintendent Vindicator mine, Cripple Creek, Colo., succeeds A. T. Holman, resigned.

A. S. ADDITON is installing cyanide works for the Confidence G. M. & M. Co., Confidence, Tuolumne county, Cal.

D. RYAN has gone to Exland, Mexico, where he will act as general manager of the United States & Mexico M. Co.

OSCAR ROBERTS returns to San Francisco from Thunder Mountain, Idaho, this week, and then goes to Alaska.

PROF. PEELE of the mining department, Columbia University, New York, has returned from Park City, Utah.

J. SHROTE AND A. R. BENZIE of the Benzie Investment Co., Denver, Colo., are examining California mining property.

J. E. RIDGWAY, JR., is assistant manager California King G. M. Co., Picacho, Cal. A. Trumbo is foreman of the mill.

E. C. VOORHIES, president California State Miners' Association, has returned from San Francisco to Sutter Creek, Cal.

F. E. WARE, general manager Mount Shasta Gold Mines Corporation, has returned to Redding, Cal., from San Francisco.

E. E. BURLINGAME has returned to Denver, Colo., from Payette, Idaho, where he had been inspecting mining property.

F. BULKLEY is manager Robinson Con. M. & S. Co., Leadville, Colo. Supt. Doolittle, formerly with the Bimetallic plant, has charge.

DR. L. D. GODSHALL has resigned the superintendency of the Boston-Wyoming Smelter, Power & Light Co., Encampment, Wyo.

JNO. W. BENSON, late manager Camp Bird mine, Ouray, Colo., will have a mining engineering office in Denver, Colo., Jan. 1, 1903.

P. O. WELLS has resigned as Supt. Shannon Copper Co. smelter, Lordsburg, Grant county, N. M., and is succeeded by A. R. Bennie.

W. P. JENNEY, who has been expert-ing the geology of Neal mining district, near Boise City, Idaho, has returned to Salt Lake, Utah.

W. MCC. CAMERON has resigned as Supt. Small Hopes M. Co., Leadville, Colo., and goes to South Africa. A. A. Burnand succeeds him.

G. T. MARTIN will be Supt. Washington G. M. Co., a new organization that has bought the Smuggler and Washington mines, Granite, Chaffee county, Colo.

S. J. HENDY, president of Joshua Hendy Machine Works, leaves San Francisco next week with the Sierra Club for a jaunt through Kings River canyon, Cal.

SUPT. CARRERA has resigned as Supt. Lena M. & C. Co., Lordsburg, Grant Co., N. M. T. Ray has been appointed mine superintendent and E. L. Pennock mill superintendent.

GENERAL MANAGER H. A. SHIPMAN of Stratton's Independence, Ltd., Colorado, is slated for the management of the Camp Bird. R. J. Grant is mentioned to succeed Mr. Shipman.

A. GRAVES, manager Alma Copper M. Co., Carbo, Sonora, Mexico, is in Denver, Colo., making tests of the Alma ores to determine the character of the reduction mill or smelter his company will build at the mines.

FRANK L. SIZER, M. E., of Butte, Mont., has gone to Denver, Colo., on professional business, and from there will probably go to Guadalupe y Calva, Mexico, where he is still conducting operations on the Rosario mine, which is under bond to C. W. Clark.

MISS JOSEPHINE KELLETT, MISS LUCY KEMPER, MISS ISABEL LITTLE AND MISS CLARA CLARK are students in the Montana School of Mines, and say they think they can learn those things just as well as some of the young men at that institution.

C. L. BUCKINGHAM of Denver, Colo., returned there from Twining, N. M., where he had been superintending the erecting of a mill and smelter for the Fraser Mountain Copper Co., and is now in Salmon, Idaho, putting up a stamp mill for the Kittle Burton G. M. Co.

W. A. STEVENS, manager Big Buffalo mine, Buffalo Hump, Idaho, has resigned to take charge of the Cracker Jack. N. McGee, Supt. Big Buffalo, goes with Mr. Stevens as Supt. Cracker Jack. It is locally understood that W. Morrison will succeed Mr. Stevens as manager Big Buffalo.

F. M. SPAULDING, representing the Pacific Coal & Transportation Co., and C. A. Hardy have gone north to examine and report on the company's coal and other properties in Alaska. They go via Skaguay and the Yukon river, meeting the steamer Corwin at St. Michael, thence to Nome.

WM. FITZHUGH of San Francisco, Cal.,

gets $50,000 to inspect some Klondike properties for London men, who are credited with being former associates of Cecil Rhodes and with intention to invest $5,000,000 in Yukon mines.

J. GAYLEY has been elected to the hoard of directors of the United States Steel Corporation. He acted as vice-president since the formation of the company, and has had general charge of all material and transportation of the mines, ore, coal, coke, limestone, railroads, steamships and ore docks.

Trade Publications.

The standard sizes for pamphlets and trade catalogues, recommended hy all the principal engineering societies of the United States, are 3½x6 ins., 6x9 ins., and 9x12 ins.

SMALL POWER MOTORS —The Crocker-Wheeler Co., Ampere, N. J. Paper, 3½x6 ins.; pp., 24; illustrated.

Chiefly noticeahle for its fine illustrations showing size and practical application of various styes of small motors ready for immediate shipment.

HOISTING MACHINERY.—The Webster, Camp & Lane Co., Akron, Ohio. Paper, 6x9 ins.; pp., 90; illustrated.

A series of four, No. 1 describing direct-acting hoisting engines; No. 2, high-grade geared hoisting engines; No. 3, self-contained gearing hoists: No. 4, electrically driven hoists.

WIRE ROPE HAULAGE MACHINERY.—The Wehster, Camp & Lane Co., Akron, Ohio. Paper, 6x9 ins.; pp., 24; illustrated.

ORE CARS AND CAGES.—The Wehster, Camp & Lane Co., Akron, Ohio. Paper, 6x9 ins.; pp., 40; illustrated.

The entire series contains elaborate information on the several topics treated, with sectional profile views, tahles, prices, etc.

THE WILFLEY CONCENTRATORS. — The Mine and Smelter Supply Co., Denver, Salt Lake City, El Paso and New York. Paper, 6x9 ins.; pp., 54; illustrated.

Descriptive of this well-known concentrator, with general discussion of concentrating machinery. The ninety-one parts of the Wilfley tables are specified and separately depicted. The front page has as the motto: "The German idea is to dress ore well; the English to dress ore quickly; the American to do hoth."

MOTOR-DRIVEN AIR COMPRESSORS.—Christensen Engineering Co., Milwaukee, Wis. Paper, 6x9 ins.; pp., 24; illustrated.

Showing sizes and styles of motor-driven air compressors with capacities 7½ to 50 cubic feet free air per minute.

FURNACES, MUFFLES, CRUCIBLES, CHEMICALS, ASSAYERS' SUPPLIES. — The Denver Fire Clay Co., 1742-1746 Champa St, Denver, Colo. Paper, 6½x9 ins.; pp., 290; illustrated.

The eighth edition of an unusually fine trade treatise with nearly 2000 illustrations; condensed description and prices are given of as many articles in daily use by chemists, assayers, metallurgists and miners.

Recently Declared Mining Dividends.

	Payable.
Lightner M. Co., Angels, Cal, 5 cents per share	June 20
United Gold Mines Co., Cripple Creek, Colo., 1 cent per share, $39,947.69	June 12
Homestake M. Co., South Dakota, monthly regular dividend, 25 cents per share, also extra dividend, 25 cents	June 25
Daly-West M. Co., Utah, 40 cents per share, $72,000	June 16
United Gold Mines Co., Colorado, 1 cent per share, $40,000	July 5
Gold Coin M. & L. Co., Colorado, 3 cents per share, $30,000	June 26

Books Received.

"The Gold Mines of the World," is the pretentious title of a 380-page quarto, second edition, finely printed on glossy paper and superbly illustrated. It gives the author's personal impressions of what he saw in a visit to various parts of the globe and contains some interesting discussions of mines and mining methods. There is a sprinkling of facts, some very positive assertions and considerahle energetic criticism. It views things from a foreign standpoint hut with an insular capacity for prejudiced observation. Some of the contents of the hook are humorous, though the author seems to he serious throughout. It is written hy J. H. Curle, published hy Waterlow & Sons, London, and sold hy the Engineering and Mining Journal, New York; price $3.50.

Latest Market Reports.

SAN FRANCISCO, June 20, 1902.

METALS.

SILVER.—Per oz., Troy: London, 24⅜d (standard ounce, 925 fine); New York, bar silver. 52⅞c, refined (1000 fine); San Francisco, 52⅞c; Mexican dollars, 44½c San Francisco, 42½c New York.

COPPER. — New York: Standard, $11.50@11.75; Lake, 1 to 3 casks, $12.00; carload lots, $11.90; Electrolytic, 1 to 3 casks, $12.00; carload lots, $11.75; Casting, 1 to 3 casks, $12.25; carload lots, $11.25. San Francisco: $14.00. Mill copper plates, $17.00; hars, 18@24c. London: £53 5s, spot, per ton.

LEAD.—New York, $4.12½; Salt Lake City, $3.60; St. Louis, $4.00; San Francisco $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, $4.75. London, £11 5s per ton.

SPELTER. — New York, $4.87; St. Louis, $4.50; London, £18 12s 6d per ton; San Francisco, ton lots, 5½c; 100-lh lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lh. lots, 13@15c.

TIN. — New York, pig, $29.00; San Francisco, ton lots, 31½c; 1000 lbs., 31⅝c; 500 lbs., 31¾c; 200 lbs., 32c; less, 32½c; bar tin, ℔ lb, 37½c.

PLATINUM.—San Francisco, crude, $17.50 ℔ oz.; New York, $19.50 per Troy oz

QUICKSILVER. — New York, $48.00 large lots; London, £8 15s; San Francisco, local, $46.00 ℔ flask of 76½ lbs.; Denver, $50.50. Export, $43.50.

BABBITT METAL.— San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER. — Half-and-half, 100-lb. lots. 20c; San Francisco, Plumhers', 100-lb. lots, 16½c.

NICKEL.—New York, 50@60c ℔ lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $21.50; gray forge, $21.00; San Francisco, har, 2.75 ℔ lb .,3c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $36 25; open hearth billets, $36.75; San Francisco, har, 7c to 12c per lb.

CEMENT.—Germania, $2.65; K. B. & S., $2.65; Hewmoor, $2.50; Trowell, $2.50 per bhl.

LIME.—Santa Cruz, $1.60; Roche Harbor, $1.60 per bbl.

LUMBER.—(Retail): Pine, ordinary sizes, $18.00@19.50; extra sizes higher; redwood, $19.00@20.00; lath, 4 feet, $3.90 @4.00; pickets, $19.00; shingles, $2.00 for No. 1 and $1.75 for No. 2; shakes, $13.00 for split and $14.00 for sawed; rustic, $25.00 @31.00.

GENERAL SUPPLIES.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.50; Cut, $3.50; 10d to 16d, Wire, $3.55; Cut, $3.55; 8d, Wire, $3.60; Cut, $3.60; 6d and 7d, Wire, $3.70; Cut, $3.70; 4d and 5d, Wire, $3.80; Cut, $3.80; 3d, Wire, $3.95; Cut, $3.95; 2d, Wire, $4.20; Cut, $4.20. Special rates for carload lots.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; douhle tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ℔ set; 14 oz., 40s., 9c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $6.50; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymho, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $9.56, long ton; Colorado Anthracite, $14.00. Coke, $15 per ton in hulk, $17 in sacks; Sunnyside, $11.75, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 27@28c ℔ lb.; carloads, 25@26c; in 10-lb. tins, 38c; sulphuric acid, in carhoys, 66% B, 2c ℔ lb.; soda ash, $1.90 ℔ 100 lbs.; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5¾@6½c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 5c; alum, $2.00@2.25; flour sulphur, French, 2½@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.25 @1.50 ℔ 100 lbs.; sks, $1.05; chloride of lime, spot, $2.50@2.60; nitrate of potash, in hhls, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c; lots of 5 hbls., 1c less; Lucol oil, boiled, hhl., 65c; cs, 70c; raw, hhl., 63c; cs, 68c. Kerosene —Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bbls., 19c; wooden hbls., 22½c; cs, 25c; Mineral Sperm, cs, 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 21½c; 86° Gasoline, bulk, 20c; do., cs., 26½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14½c; do., in cs., 21c; Lard Oil, No. 1 hhl., 60c; cs., 65c; Neatsfoot Oil, bbl., 70c; cs.. 75c; No. 1 bhl., 52½@55c; cs.. 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6¾c; 1 ton and less than 5 tons, per lb., 7c; 500 lbs. and less than 1 ton, per lb, 7¼c; less than 500 lbs., per lb, 7½c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In hhls., 1 ton and over, 6¾c; do. in kegs, 7¼c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7½c; less than 500 lbs., 7¾c.

ASSAY LITHARGE.—Per lb, 8½c.

BISMUTH.—Subnitrate, per lb., $1.60.

BONE ASH.—4c ℔ lb.

BORAX.—Crystal, 7c: calcined, 25c.

CHROMIUM.—(90% and over) per lb., $1.25.

COPPER.—Carbonate, 20c; Red oxide, ℔ lb., 60c.

MAGNESIUM.—Per lb, $3.00.

MANGANESE.—(90% and over) ℔ lb., $1.25.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—25c. ℔ gramme; 1000 grammes=2¼ lbs.

PHOSPHORUS. — (American) ℔ lb., 80c.

SILVER.—Chloride, ℔ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ℔ lb., $1.00.

URANIUM.—Oxide, ℔ lb., $3 50.

ZINC.—Metallic, chemically pure, ℔ lb., 50c.

ZINC.—Dust, ℔ lb., 10c.

ZINC.—Sulphate, ℔ lb, .04c.

(These prices are wholesale, f. o. h. San Francisco, unless otherwise noted.)

Commercial Paragraphs.

GILBERT WILKES & CO., Coronado building, Denver, Colo., are Colorado representatives Wickes Bros.' steam generators, Underfeed Stoker Co., Bullock Electric Mfg. Co., and Wagner Electric Mfg. Co.

THE Ironsides Co., Columbus, Ohio, advise us that its latest acquired additional specialty, the Ironsides improved patent Tormay mine car-wheel oiler, is heing rapidly adopted by the principal mining plants of the country, and that the general demand has taxed its facilities.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING JUNE 10, 1902.

701,840.—TYPEWRITER—H. B. Cary, Los Angeles, Cal.

702,123.—WELL CASING PERFORATOR—T. E. Clark, Visalia, Cal.

701,859.—CONCENTRATOR—W. E. Dodd, S. F

702,049.—FIRE STARTER—Draper & Lyon, Oakland, Cal.

702,092.—GAS GENERATOR—A. W. Edwards, Sacramento, Cal.

702 197.—TUBE MACHINE—J. J. Garrity, Pinole, Cal

701,871.—SEWING MACHINE—A. Giacomini, S. F.

701,872.—SEWING MACHINE—A. Giacomini, S. F.

702,008.—OIL BURNER—A. Johnson, S. F.

702,009.—MAKING CEMENT—F G. Jordan, Spokane, Wash

702,102.—BEDSTEAD JOINT—J. R. Konetsky, S. F.

702,370 —BED RAIL—E. G. Lundquist, Los Angeles, Cal.

702,022.—DISC PLOW—F. M. Mecum, Chico, Cal.

702,024.—HOOP LUG—R. B. Moore, S. F.

702 071.—HARROWS—N. Paulsen, Jolon, Cal.

702,377.—OIL BURNER—J B. Payne, Hanford, Cal.

702,073.—DENTAL TOOL—E. O. Pieper, San Jose, Cal.

702,079.—PIPE WRENCH—G. H. Swarthout, Placerville, Cal.

702,270.—WEATHER STRIP—B. M. Whiting, Spokane, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

STORM APRON FOR VEHICLES.—No. 701,614 June 3, 1902. W. G Reese, Oakland, Cal. The object of this invention is to provide an apron for the front of vehicles which by its peculiar shape serves to shed rain and snow and prevent its getting into the vehicle or upon the occupants. The apron has a pocket in front which is adapted to fit over the dashboard and it extends down upon each side thereof. The front portion has angular extensions and in connection with these extensions a body portion, the edges being so connected that when the apron is drawn up in front it forms a central ridge or apex so that the water is diverted to flow off on either side and is prevented from settling into pockets of depressions which may be formed in the apron. The shape also enables it to fit closely along the sides to prevent ite heing blown up hy wind.

SAW FILING DEVICE.—No. 701,700. June 3, 1902. J. H. L and G. A. W. Folkers, San Francisco, Cal. This device consists of a frame to be rigidly secured to a support and horizontal guide bar against which the side portion of the saw is to be held, a filing carriage standing over the saw and reciprocal along the guide and having oppositely rotatable filing members adapted to engage the teeth of the saw; a har below the guide and parallel therewith serves as a lateral support for the lower portion of the carriage.

OIL BURNER.—No. 702,008. June 10, 1902. A. Johnson, San Francisco, Cal. In this burner for liquid hydrocarbons there is an oil distributing plate disposed below the discharge end of the feed pipe and having its lower edge turned upward to arreet the flow of oil and form a shallow reservoir. The upper edge of this upturned portion has notches formed in it like teeth with channels leading down the outer front of the upturned portion so that any oil overflowing will be distributed by these channels and fall in a sheet which is caught by the air or other blast and driven forward out of the burner discharge.

HOOP LUG.—No. 702,024 June 10 1902. R. B Moore, San Francisco, Cal. The object of this invention is to provide a means for connecting the ends of hoops or rods which are employed for holding the staves of tanks and conduits together. It consists of a lug having one end adapted to embrace the head end of a hoop bolt, a plurality of bifurcations radially disposed projections on the block and means hy which the opposite end of the bolt is adapted to be engaged and guided and held between the projections so as to adjust the length of the bolt; the hoop being tightened by means of nuts screwed upon its threaded end and abutting against the lugs.

DISK PLOW ATTACHMENT.—No. 702,022. June 10, 1902. F. M. Mecum, Chico, Cal. This invention is applicable to that class of plows in which concavo-convex disks are journaled and revolnble upon a suitable frame and it consists in means for changing the lines of travel of the bearings so that the plows may be held up to their work and to regulate the width of furrows cut by them. A swinging draft pole is also so connected that the wheels may he turned in unison with the movement of the pole, and in connection with this is a means for multiplying the rate of movement of the wheels with relation to that of the pole. Means are also provided for raising and lowering the frame.

PIPE WRENCH.—No. 702,079. June 10, 1902. G. H. Swarthout, Placerville, Cal, one-half assigned to M. L. Smith, of same place. In this invention a flexible gripping member is connected with the end of a rigid lever and adapted to pass around the pipe, and this flexible member which consists of chain links is connected hy slipping one of the links over a pin on the end of a lever so that the movement of the lever will cause the chain to grip upon the pipe and turn it. The construction is such as to prevent the pipe being crushed by the pressure of the links when power is applied.

SITUATIONS WANTED.

Young man with a good knowledge of mining, and ho ding a certificate for aseaying, seeks employment as a chemist and assayer. Satisfied with moderate salary to etart. References furnished. Address J A., care of thia office.

PHYSICIAN AND SURGEON with three years' experience in both emergency and general hospitals, in aodition to experience in mines and private practice, wishes position in a mine. Best of references. Addrees Box 126, care of this office.

A young man with some experience at minee; course in both surveying and assaying, wishes position as assistant at some good mine. Good references. Address S. M. W., 404 Ellis, San Francieco.

PRACTICAL MILLMAN — AMALGAMATOR, Cyanide Man and Assayer, wishee poaition. School of Mines graduate. Beet referencee. Address R. B., care of Mining and Scientific Preaa.

WANTED.—Position hy experienced Electrician and Engineer. Repairing, armature winding, construction work, air machinery, general mechanica, etc. Familiar with mining and milling machinery. At present chief engineer Referencea. Addreae "Electrician," care Mining and Scientific Preas.

WANTED.—Position as Assayer and Bookkeeper in a mine; experienced in underground work; good references; present position not desirable. Address Box No. 127, care of this office.

CHEMIST AND ASSAYER, WITH TWENTY years' experience in mill and smelter work. Can run same. Address A. C., care of Mining and Scientific Press

MINING ENGINEER, practical miner and mill man, aasayer, etc., desires position of superintendent or assistant manager of a big property. Eleven years' experience. Best referenoea. Now working in aouthern California. Address A. M. P., care of Mining and Scientific Presa.

WANTED.—SITUATION AFTER MARCH 15, 1902, as Manager or Superintendent of mine. Have had five years' experience in manufacturing and constructing mining machinery and plants. Three years' experience in underground work. Four years' experience as manager and superintendent. Treatment of low grade ores a specialty. Practical in every detail. State location of mine and salary. Best of references. Address X. Y. Z., this office.

A technically educated Mining Engineer, at present employed as superintendent of mines for one of the largest corporations in Mexico, desires a change of position to the United States about July 1st. Has had 18 years' successful experience as engineer and superintendent, never having made a failure; 36 years of age; strictly temperate; a skilled designer, geologist and metallurgist, and a practical miner, as well as a hard worker and thorough business man. References of the highest order, including present employers. Address Supt., care this office.

EXAMINATION OR SUPERVISION of Mines, Smelters and Mills.

Mining Engineer and Metallurgist, of unquestionahle reputation and long experience, now permanently residing at Seattle, Wash., will examine or take general supervision of mines, smelters or mills, in Pacific Coast States, British Columbia or Alaska, as consulting engineer, for reliable parties. Is also reliable accountant to examine. Box 813, Seattle.

MINING AND SCIENTIFIC PRESS.

Whole No. 2188.—VOLUME LXXXIV. Number 26. SAN FRANCISCO, CAL., SATURDAY, JUNE 28, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

In San Francisco, Denver, Butte and other Western mining centers one daily sees some poor fellow, maimed or blind, begging on the streets, with a little card stating that he lost his limbs or his eyesight in a mine accident. The sight brings up the thought that such loss must be paid for somehow, in that case it being paid for by the charitable public. If the breadwinner of the family be killed or disabled, and there be no compensation from the employer, the support of the family falls on the public. In any case the regular law that runs through life makes it mandatory that somewhere, somehow there shall be compensation for all loss. This is a law that cannot be evaded or overruled, unlike laws of man in such cases. The thought brings up the question of compensation for injuries to working miners—how far the employer is responsible for such injuries. It is a problem that cannot always be correctly solved by judge or jury. Meanwhile the misery depicted on the faces of these unfortunates in city streets speaks for the greatest measure of safety to miners in a tone more eloquent than living voice can utter.

Steel and concrete are universally employed in foundations for all important structures. In the construction of the Owing's building, the Monadnock and other buildings in Chicago it was probably used for the first time, and since about 1885 or 1886 its use has been growing rapidly. It is one of the most durable forms of foundation constructions known, possessing as it does the qualities of fire resistance, economy and strength. The coefficients of expansion of steel and concrete are practically the same. As steel is a better conductor of heat, it is protected (in foundations) from heat by being imbedded in concrete, which is comparatively but slightly affected by heat. The steel is also protected from effects of the atmosphere by the surrounding concrete. This combination has many uses, being employed in the construction of foundations, walls, floors, roofs, interior and exterior coverings (such as decks) of steel ships, and there have been small boats built of cement (with sand) on wire netting. All cement mixtures with sand should be used as soon as mixed to obtain the best results. The proportion of sand, broken stone and cement should be such that the sand shall fill the voids in the broken stone, and the cement shall more than fill the voids in the sand by say 10%. Practically, the voids are equal to one-half the solid mass. Each layer of concrete should be deposited about 10 inches deep, and allowed to set over night before the next layer is put in place; the surface of the concrete should be cleaned and thoroughly wet before the next layer is deposited. Concrete kept wet for two or three weeks will give best results.

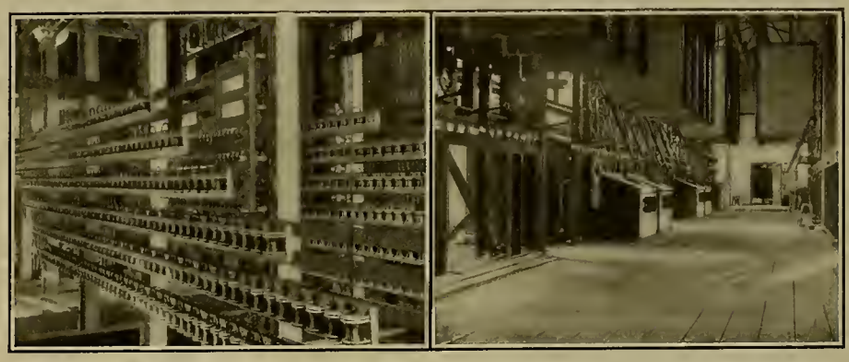
Everywhere on the Pacific coast that coal was formerly used for steam making, oil is winning its way, and the idle fleet of colliers in San Francisco bay and northern ports bear witness to the sudden and probably permanent cessation of such supply. Oil is cheaper, cleaner, more compact, and tends to solve the problem of cheaper manufactures on this coast, removing the onerous handicap of costly fuel and making possible many forms of competitive manufacture. With its great ally—electrical power—and a climate that makes every day in the year an out-door working day, there should be a great advance in Pacific coast manufactures and general industries. The $10,000,000 annual coal bill of California was cut last year to $5,000,000, indicating possibilities of economy and profit.

There is no standard for screens, though there manifestly should be. A 30-mesh screen means thirty wires to each lineal inch and twenty-nine holes. In wet concentration much coarser screens are used than for dry crushing.

Flume Tender's Cabin on the Colgate Flume

Spillway or Overflow Drain from the Colgate Flume

The center picture is a point on the Colgate flume known as Cape Horn, and illustrates some of the difficulties encountered and successfully engineered.



Part of the lightning arrester equipment at Electra.

The switch room at Electra; the 60,000-volt switches may be observed on both sides of the room.

One of the Lakes in Alpine County Constituting Part of the Standard Company's Reservoir

The Hotel Standard at Electra for the Engineers and Attendants of the Power house

The Standard Company's high-pressure pipe line.

The Electra power house is on the bank of the Mokelumne.

Another view of the Electra power house with the Hotel Standard in the distance. The 1500-foot drop in the pipe line can also be observed in the distance.

Smelter Charges and Mine Profits.

The assay value of an ore is only one of the many items that enter into the final determination of the value of a mine. Even granted that the ore assayed is a true average sample (which often it is not) and that the quantities in sight have been fairly estimated by recognized mining methods, the jump from the assay value of ore in the ground to its final cash value in the bank is a long one. A short answer to some correspondence on this subject was essayed last week, but a more extended discussion of the subject is requested.

To make the matter more direct is given below a portion of a letter received:

———, June 1, 1902.

* * * * I have excellent shipping ore on the claims here, but do not like the idea of receiving 4½ cents less than market price (as per attached letter), especially as I prepay all freight charges, and also pay smelter charges.

I have smelter assays as follows:

No. 1..	Copper,	48 69%	Silver, 102.50 oz.	Gold,	1.30 oz.
No. 2..	"	30.74%	" 15.35 oz.	"	1.15 oz.
No. 3..	"	22.00%	" 3.20 oz.	"	.08 oz.
No. 4..	"	12.00%	" 2.40 oz.	"	.06 oz.

The quotations in enclosed letter are on Nos. 3 and 4.

Can you give me consistent explanation of why such a reduction is made (4½ cents) * * * * * *?

I have a 105-mile wagon haul to R. R., $15.00 per ton, and $15 40 R. R. rate to smelter, total $30.40 for freight, prepayment being required.

Following is a portion of the letter which our correspondent encloses received in answer to his inquiries from a Rocky mountain smelter:

* * * * Have your letter asking for quotations for ore represented by your samples recently sent us. In reply, will say we would be willing to receive this ore upon the following rates:

Pay for silver, 90% of N. Y. quotations date of assay.

Pay for copper, dry assay (equals wet assay, less 1.3 unit), at quotations for electrolytic cathodes, week previous to that in which assay is made, less 4½c lb.

Pay for all lime contained in the ore, if 10% or more, at 5c per unit.

Charge for treatment, f. o. h. our works, $6.00 per ton.

Charge for all silica contained at 10c unit.

Upon the above quotations, we would pay you for 75% of the value of the copper, making final settlement upon the quotation for copper ruling 120 days hence.

* * * * * * * * * *

Smelting companies are in business for profit quite as much as is the mine owner. While far from apologizing for apparent high charges by smelting companies and railroad companies, it is but fair to both the latter to remember that they also are pioneers in the development of mining regions, and have in many instances made it possible to work the mines at all. From crude ore at the mine to merchantable copper in New York is a long distance, in more senses than one, and for each step of the way a charge (including a profit) is exacted. The obvious remedy is to reduce the ore to matte as near the mine as possible. A sufficient number of developed mines would encourage the erection of a local smelter—even though the mine in question should not warrant it.

After paying all of the charges enumerated, a deduction of 4½ cents per pound from a 12-cent market price of copper does look aggravating and unwarranted at first sight, but a few figures will show that this particular charge will have to be met even with a matteing furnace at the mine and under the same ownership, since only the largest properties can stand converting works, and even then the copper must be shipped to the Atlantic seaboard to be refined and to seek a market. A 50% matte would make the cost for freight alone at $20 per ton amount to 2 cents per pound of copper, while charges for converting, refining and sales commission would make up the balance of the 4½ cents. In the present case the freight cost would even be greater. Dividing this greater cost, however, so as to make an all round comparison between a matteing furnace at the mine and a custom smelter several hundred miles distant, the probable saving for each item is indicated in the table below so far as can be done from incomplete data. The deduction of 1.30% copper as the difference between dry and wet assay is merely a very indirect way of deducting a loss of copper that goes into the slag—since the wet assay is the only one in practical use—while, as a matter of fact, the real loss in the slag is nearly always under 5%, and sometimes does not exceed .3 of 1%.

Various expenses reduced to cost per pound of copper in the ore.

Referring to sample No. 4 in our correspondent's letter, assaying 12% copper:

	Custom Smelter Ore.	Smelter at mine. Matte.	Difference.
Wagon freight	.0625	.0150	.0475
Railroad freight	.0642	.0154	.0488
Smelting cost	.0250	.0125	.0125
Smelting loss	.0130	.0040	.0090
Through freight (in addition to above), converting and refining charges, sales, commissions, etc.	.0450	.0350	.0100
Totals	$.2097	$ 0819	$.1278
Profit per pound			$ .0381
Profit per ton			9.14
Loss per pound	0.0897		
Loss per ton	21.37		

Similarly for the 22% ore we have:

	Ore.	Matte.	Difference.
Wagon freight	.0341	.0150	.0191
Railroad freight	.0350	.0154	.0196
Smelting loss	.0071	.0022	.0049
Smelting cost	.0136	.0068	.0068
Added through freight, converting and refining charges, sales, commission, etc.	.0450	.0350	.0100
Totals	$.1348	$.0744	$.0604
Profit per pound			$0.0456
Profit per ton			20.06
Loss per pound	0.0148		
Loss per ton	6.52		

Adding together the cost per pound of copper of wagon haul (.0150), local railroad haul (.0154), through freight and treatment charges (.0350), we have altogether $.0654 as the charge against the copper in the matte at the mine, and deducting this from market price, 12 cents, there remains 5.46 cents per pound. This is the matteing value of the copper. Gold that is carried in the matte is paid for at about $19.50 per ounce and silver at 95% of New York quotations. Now, if we deduct four-tenths of 1% from the copper for slag loss and 5% for silver oss we shall arrive at the true value of the ore when converted into a 50% matte. There is no deduction to be made for gold, as the recovery is generally better than the assay.

Taking assay of sample No. 4 we get value as follows:

	Per ton. (2000 lbs)
Copper at 12%, less 4%, at 5.46 cents per pound	$12.77
Silver, 2.40 ounces at 52 cents, less 10%	1.12
Gold, .06 ounce at $19.50	1.17
Value of one ton of ore reduced to 50% copper matte	$15.06

(N. B.—The assay value of the ore is $31.29.)

Deducting from the matteing value ($15.06) the cost of mining, smelting and general expenses, the remainder is the net profit per ton of ore. The matte can then be shipped to the nearest custom smelter with bessemerizing plant and by them converted into copper and shipped East to be refined.

The charge at the smelting works of 10 cents per unit for all silica in the ore is equivalent to an extra of $10 per ton of quartz, which added to the regular charge of $6 makes $16, and is based upon the extra expense over and above that of smelting a neutral ore. Assuming the cost of coke at the smelting works to be $6 per ton, the cost of limestone $1.50 per ton and that the slag carries 35% silica, the charge is a reasonable one. To smelt one ton of silica requires 65 ÷ 35 = 1.85 ton of lime (CaO) or approximately 3 7 tons of limestone ($CaCo_3$), and about three-quarters of a ton of coke. By reference to diagram No. 9, page 308 of the MINING AND SCIENTIFIC PRESS of June 7, 1902, the cost of smelting a ton of quartz with coke at $15 per ton and limestone at $2.50 per ton, making a 35% SiO_2 slag, is shown to be $27. The saving on three-quarters of a ton of coke at the difference in price is ($15 — 6) × .75 = $6.75, and in like manner on 3 7 tons of limestone the saving is $3.70—a total of $10.45, which deducted from $27 leaves the cost at $16.55. Since it requires about two units of lime (CaO) to flux one unit of silica, the lime credit is worth but 5 cents per unit as against 10 cents debit for silica.

It is to be noted in connection with this subject that custom gives way to local requirements and that nearly every locality now becomes a law unto itself. In the letter written by the smelter manager to our correspondent it will be noted that he stipulates: "Charge for all silica contained at 10 cents per unit." That applies in that particular case, and bears hard enough on the output, while in some localities such a charge would be prohibitive. In Colorado the regular smelter schedule calls for 10 cents per unit for all over 40%. Manager Carpenter of the Golden, Colo., smelter has not been charging any penalty for siliceous ores (purely because of local conditions referred to), but states that after the 15th inst. on low grade ores his charge will be "$5.50 per ton, f. o. b, Black Hawk or Idaho Springs, Colo., with penalty of 5 cents per unit for silica over 50%." Now, while this appears much better than the regular Colorado smelter schedule of 10 cents per unit for all silica over 40% (and infinitely more favorable than the charge in the smelter superintendent's letter published above), yet in the cost of the Golden, Colo., smelter there will result dissatisfaction among local ore producers, because most of the milling ores of Gilpin county carry at least 50% silica (some as high as 75%), and the silica charge noted, though by comparison appearing extremely favorable, may run the smelter charges there up to $7.50 per ton, with the probable result of sending all that class of ore to the stamp mills, instead of to the smelter.

GOVERNMENTAL mining statistics at times run into a variety of things, an unusual form being manifested in an elaborate report received from the Queensland, Australia, Mining Inspector, wherein he shows that in that region during the past year "50,000 oz. of gold have been obtained per life lost." During twenty years there "the general result has been the loss of a life for 41,280 oz. gold obtained."

INERTIA is not a force. It is merely a term expressing the inability of matter of itself to stop or start. A body at rest will remain at rest, because of inertia, unless started by some force. A body in motion will remain in motion because of inertia, unless stopped by some force. A body once started in motion will continue in motion forever, unless there is some cause of loss of the original energy.

IN noticing the 42nd anniversary of this paper's existence, the editor of the Bingham, Utah, Bulletin says he "set type in 1860 on the MINING AND SCIENTIFIC PRESS—the first year of its existence." And yet they say printers and newspaper men are not long-lived! Here is a man who set type on this paper in 1860, and is in 1902 weekly publishing a fine paper!

ALL subscribers are urged to bind in the five-page index in this issue with the twenty-six numbers of the volume that ends to-day. The index is a great time-saver in finding an article or item when wanted.

Concentrates.

A DRUM of liquid chlorine should treat about fifty tons concentrates.

A 3-INCH Manilla rope, 500 feet long, will weigh 1485 pounds. One wire rope will outlast 3 hemp ones.

THE temperature of a strong coal fire is from 2000° to 2500° F.; the temperature of a kerosene lamp from 1600° to 1800° F.

COLORADO law provides that wages or income to the amount of $60 per month are absolutely exempt from attachment for debt.

WITH the piston speed 100 feet per minute, and the plunger 4 inches diameter, a double-acting pump would discharge 7¾ gallons per minute.

THE general rule in electrical engineering may be summed up: "Alternating current for transmission; direct current for local distribution."

COKE for the Le Roi, B. C., smelter costs $6 per ton, delivered. One-fourth of a ton of coke is required in the smelting of one ton of Le Roi ore.

KLONDYKE gold is usually about 800 fine, the remainder being silver, with an occasional trace of baser metal. The purest gold on the coast has been found in Tuolumne Co., Cal.—978 fine.

A DITCH 30 inches wide at surface, 30 at the bottom, gives average width 33 inches; average depth, 10 inches, area of a cross-section is 330 square inches; 2.29 square feet; surface velocity per second, 1.25 feet; theoretical discharge would be 2.86 cubic feet; deducting 20%, leaves 2.29 cubic feet per second.

THIRTY THREE and one-third inches, or 2.78 feet,=1 vara; 5000 vara square, or 4425 acres,=1 league; 1000 vara square, or 177 acres,=1 labor; 5645.37 square varas, or 43,560 square feet,=1 acre; 208.71 feet, or 75.13 vara square,=1 acre. To reduce varas to feet divide by 0.36. To reduce square varas to acres, multiply by 0.000177.

WHEN sharpening and tempering drills leave the sets on the forge until all are finished, then heat the bits cherry red, but not the body of the steel; dip in clean water, moving slowly down, then out, leaving heat enough in the body of the drills to toughen the bits by starting temper to show color. Check color by cooling in slack tub.

AT sea level 1000 cubic feet of air compressed to 80 pounds in two stages develops 1000x.137=137 H. P. at an altitude of 10,000 feet above sea level, the volume to be equivalent at this pressure must be 39% greater, or 1390 cubic feet. At that altitude the H. P. factor for compression to 80 pounds is .113 per cubic foot; so 1390x .113=157 H. P. Hence 20 H. P. more than at sea level is reuired for the same effect.

IT doesn't add anything to the desirahllity of a mining stock to make it non-assessable. That non-assessable provision is usually paid for at a high rate hy the owner. Should the mine prove valuable the vendors who insure the non-assessable feature get the higgest part of the profit. If the property prove profitless what good is the non-assessahle feature? If (as is generally the case) more money is needed, how can stockholders he compelled to contrihute or quit if the stock he non-assessable? The argument lies in favor of assessahle mining stock, every time.

ONE mile street railway track would take 157½ tons of 100-pound rail, that is 9-inch girder rails, 60 feet long, weighing 100 pounds per yard; 176 joints, with holts and nuts; 2112 ties, spaced 2½ feet on centers, or 24 to a 60-foot rail; 4224 tie plates; 8448 spikes, 4 to a tie, or 12,627 spikes, 6 to a tie; 1056 tie rods, spaced 5 feet apart, double nuts each end; 176 single-rail bonds, or 352 double-rail bonds. The rails would cost $4714, the joints and holts $1056; the ties, $1056; the tie plates, $844.80; spikes, $160; tie rods, $528; rail bonds, $176; freight not counted.

THE description of a mining claim in a notice of location hy metes and bounds, with reference to stone monument erected at the four corners and at the center of the east and west lines of the claim, is sufficient, under statute 1897, requiring a description which defines the exterior boundaries as they are marked upon the ground, and such additional description reference to some natural object or permanent monument as will identify the claim, especially as against a subsequent locator who finds the bedding and tools of the previous locator upon the claim, and an employee holding possession for them.

FROM consumption tests the Santa Fe Railroad Co. figures comparative costs of coal and oil for fuel: 25 passenger and freight engines on a 30-day run used 2077 tons of oil and traveled 87,063 miles, or 41.9 miles per ton, or 3500 miles per month per engine. Oil at $1.33 per harrel would at this figure cost 14.4 cents per mile. Twenty-five passenger and freight engines (same days, same track and same condition), hurning coal, cost 23.2 cents per mile. The oil was 15° Baume. This showed a saving for oil of 38%. The experiment was tried with coal at $6.65 per ton. By further experiments the Santa Fe figured that oil at $2 a harrel is equivalent to coal at $6.60 per ton.

IF the steel is too mild for tool steel it can be improved for such purpose hy heating to a red heat, and coating it with pulverized ferro-cyanide of potassium, same as applying horax as a flux. Reheat to a red heat and sprinkle powder of same material over the same, and then plunge in cold water to harden. Draw temper to suit. If this does not produce the desired degree of hardness, add to 10 gallons of water ½ pound ferro-cyanide of potassium and 10 pounds of chloride of common salt. When entirely dissolved the bath is ready to use. To drill chilled castings make the drill as hard as it will stand, and then use muriatic acid on the drill. Keep the drill sharp all the time.

IN running levels for a ditch line, allowance should be made for the curvature of the earth. The line of the axis of the level telescope is not a level line, it is not parallel to the surface of the earth, but is tangential to it. If such a line be continued a distance of 6 miles, it would he 20 feet 6 inches too high at the end, and a ditch run by it would have a down grade towards the point where telescope is. The line would be horizontal, but not a sea level, i. e., parallel to the sea surface. For 1 mile this difference, due to curvature (and refraction), is 0.572 feet; 5 miles, 14.3 feet; 10 miles, 57.2 feet; 50 miles, 1429 feet, and for 100 miles, 5717 feet. This difference increases as the square of the distance; the refraction, which causes the object to seem higher than it is, is about one-seventh the curvature and should be deducted from the same.

FOR purity of water the following tests may be employed: Organic impurities may be detected by dissolving a lump of loaf sugar in the water. Let it stand in a bottle tightly corked (better glass-stoppered) two or three days in the sun. If it becomes turbid it has organic impurities; if it remains clear it is safe to drink. If the water contains iron, boiling it with a little nutgall will show the presence of iron if water turns black or quite dark. By adding lime water, free carbonic acid is shown to be present by the formation of a precipitate, further proof of which is obtained by adding hydrochloric acid, which should show evolution of gas. The presence of lime is told hy adding two or three drops of a solution of oxalic acid, then blow through the water (using a glass or other tube), if present, the water will turn milky. To test for hardness of water, dissolve soap (castile preferahly), in alcohol; add a few drops of this to the water, if hard it will turn milky, if soft it will remain clear.

IT is not correct to assume that when a chain gears into a toothed wheel all the teeth entering the chain are simultaneously in action. No matter how accurately a chain and wheel may fit when new, the moment a strain is brought to bear on the chain, and the wheel begins to turn, the pins hegin to bed themselves into their hearings, producing at once a lengthening of the pitch. The amount of this bedding or seating may he infinitesmal in each joint, hut it is sufficient to destroy the simultaneous bearing on all teeth. The action between chain and wheel tends to wear the chain long and the wheel small, and results in one tooth doing all the work at one time. Unless the wheel face is kept well luhricated more perfect action is secured hy the type known as the roller chain than hy the ordinary solid joint chains, because the release of the outgoing link and the slipping hack of the remaining links is accomplished with less jar and with less wear on the external part of the chain joint hy rolling than hy sliding.

IT is customary to measure all foundation and dimension stone hy the cubic foot, and no wall less than 18 inches. In stone work, corners of huildings are measured twice, and arches are counted solid from their spring. One cord of rough stone, 3 hushels of lime and 1 cubic yard of sand will lay 100 cubic feet of wall. When suitable stone cannot be obtained for engine foundations, concrete composed of 1 part No. 1 Portland cement, 2 parts coarse sand and 5 parts stone broken to size of egg coal, or coarse gravel may he substituted for stone. Turn and mix while dry, twice. Turn and mix with water, twice, and place. If the concrete is to be richer, use more cement. Brickwork is generally measured by the 1000 brick laid in the wall. In consequence of the variations in size of common brick, no rule for volume of laid brick can be exact. The following scale is, however, a fair average: Seven common bricks to a superficial foot for a 4-inch wall; fourteen common bricks to a superficial foot for a 9-inch wall; twenty-one common bricks to a superficial foot for a 13-inch wall; twenty-eight common hricks to a superficial foot for an 18-inch wall; thirty-five common hricks to a superficial foot for a 22-inch wall.

CALCULATE that boilers operated at 5000 feet above sea level require 16% more air (or draft) than when used at sea level, and ahout 35% more at 10,000 feet elevation. The capacity of a flue or smokestack is determined by its height as well as hy its diameter. In return-flue hoilers the longer the flues, the larger would be their diameter. When selecting return tubular boilers, where cordwood is to be used, let the diameter be small in proportion to length, but when coal is to be fired the diameter should he large in proportion to length of shell, as the flame is so much shorter with coal than with wood. See that the flues do not come nearer than one-fourth of the shell diameter from the top of boiler, and that all flues are not less than 1 inch apart. Also require a man-hole below the flues and a man-hole above the flues. Have a regular time for cleaning the soot from flues of hoilers, and sediment and scale from the inside of hoiler; neglect of such cleanings means waste of fuel and decay of hoiler. An exhaust heater heats the water fed to the hoiler hy means of exhaust steam from the engines; in addition to saving from 5% to 15% fuel it avoids the damage otherwise done to the boilers feeding cold or only warm water to them. Records for highest fuel economy in boilers have been often made by lnternally fired hoilers. A water-jacketed fire-hox is more conducive to economy than setting in brickwork. Radiation or waste of heat from a hoiler can be prevented by coating with non-conducting material rather than by brick setting, besides incurring less cost and occupying less space.

ATTEMPT to state whether the copper ore described is or is not susceptible of satisfactory leaching, would manifestly be inaccurate. J. W. Neill of Salt Lake City, Utah, patentee of a process for leaching copper ores, uses as a solvent sulphuric acid gas, which has been tested on a working scale of two ton charges on ores from Butte, Mont., and from these got a result of 96% saving of the copper. The ore described might be leachable by that method; that could be determined by suitable tests. Copper present in the ore as metallic copper might not he soluble (commercially) in any of the solvents in use; so that if there were a large percentage of the copper present in the ore in the form of metallics it would have to be saved in some ether way, possibly by concentration of the tailings after leaching. Oxides, carbonates, silicates (and this also includes roasted ores), readily dissolve in sulphurous acid, and from the solution obtained copper may be precipitated by boiling the filtered solutions. Lime, magnesia, and to a less extent alumnia and iron (in the order named), are objectionable, as they consume sulphur, and in part also adulterate the copper precipitate. The question of the amounts of these materials which can he commercially suffered in a leaching ore is one of considerable latitude, based on the contents of the ore in copper and the costs of sulphur. If the copper ore deposit were near a deposit of pyrites, which would supply the necessary sulphur at a reasonable cost, the presence of the lime need not he a barrier to the successful leaching of the ore. If the ore is located far from sulphide ores, and the sulphur has to be taken to the locality in the shape of brimstone, the question becomes more complicated.

IN Guerrero, Mexico, free milling gold ore is treated by the old Spanish method in arrastras and the tailings for treatment by modern machinery later on. The total cost of a 10-foot arrastre does not exceed $35. Their construction is simple. Near a stream of water a circular hole, about 3 feet deep and 12 feet in diameter, is dug. A layer of clay is placed on the bottom, in which is evenly imbedded flat stones—interstices being carefully filled up with clay. Around this hole timber, or, more preferably, stone is built, clay being filled into the cracks. Four wood posts are sunk into the ground 16 feet apart, on which cross pieces rest. In the middle an upright wooden shaft is placed with two iron pins in center, top and bottom. A cross piece passes through the shaft 3 feet from the floor on which are hung two or more stones as flat on the hottom as possible, weighing ahout 600 to 800 pounds each. These are the metlapiles or grinders. Another cross piece passes through the shaft a few feet higher, on which the animals—horses and mules—are hitched. The ore is crushed about the size of a bean and placed in the arrastra—100 pounds at a time, 100 to 1000 pounds heing sufficient for a 10-foot arrastra. When it has been ground almost to a pulp, quicksilver is added in quantity according to the richness of the ore. One-ounce gold to the ton will require half a pound—the clean-up enabling the operator to judge how much is necessary—the quicksilver showing whether it is sufficiently charged or not. When the ore is ground fine enough to pulp, the water is turned on and mixed for an hour, when it is turned off and gradually emptied, running through a 10 to 12-foot sluice box, into a 3-foot square box. The lama or pulp is then placed in a rocker, and the quicksilver is squeezed through a buckskin, and what remains is afterwards retorted and smelted into bars. If the ore is free, 60% of the gold will be saved.

STATES and Territories having laws requiring discovery shafts 10 feet deep, or deeper, if necessary to reveal a well-defined vein or lode, are Arizona, Colorado, California, Montana and New Mexico. States in which a shaft must he sunk only deep enough to reveal a vein or lode are Idaho, Nevada, Oregon, Utah, Washington, North Dakota, South Dakota and Wyoming. In every State the locator must define his claim boundaries hy stakes, which may be either wood or stone, and state in the location certificate and notice the name of the locators, a description of the property and date of location. Courts hold locators to the strict letter of the statute, and a failure to comply with each and all of them, in case of adverse suits, is almost always fatal. Especially should the stakes marking the boundaries be always set, and witnesses should be obtainable to prove, in case of necessity, that they were set. A failure to mark boundaries is universally held to invalidate a location. The width of claims allowed by law in different States is as follows: 600 feet in Arizona, California, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington and Wyoming. North Dakota and South Dakota allow 300 feet as the width of claims. Colorado allows 300 feet in part of the counties and only 150 feet in others. In each State miners are allowed in each properly organized district to make any regulations regarding claims not in conflict with State or United States laws. In Wyoming, Nevada and California district organizations and regulations are common. In most other States and the Territories they have gone out of business, relying upon the State and United States laws. In Colorado there are no district laws and regulations in use. As a rule they are not desirahle, though where there were districts far removed from the centers of population, and the State laws favor district organizations, they may be desirable or necessary.

Electric Power Plants of the Pacific Coast.*

NUMBER II.—CONCLUDED.

For the best efficiency the wheels must run at half the spouting velocity of the water, which in this case is as high as 18,000 feet per minute. In other words, the peripheral speed of these water wheels amounts to 9000 feet per minute. They are 11 feet in diameter and run at 240 turns. Two wheels each of 1000 kilowatts capacity are attached to each generator and five sets of wheels and generators are installed. From the power house the lines lead through hill and dale, through the city of Stockton on to the little town of Mission San Jose, along the shores of San Francisco bay, a distance of 100 miles from the power plant. At this point the lines diverge north and south and are here controlled as a center of distribution for the system. Thence they run north about 28 miles to Oakland and south to San Jose, around the bay and up north to San Francisco, making a total transmission distance of 154 miles—34 miles farther than was originally contemplated, for the reason that originally it was intended to cross the hills direct to Oakland and cross the bay direct to San Francisco, but permission could not be obtained from the Government to erect poles and cross the 10-mile stretch of navigable water between Oakland and San Francisco, whereas the expense of submarine cables would have amounted to as much as the remaining expense of the entire line—the change in the distance and the lengthening of the line being made further justifiable by the fact that all around the bay are towns, large and small, which form satisfactory customers for the power. The plant is now nearing completion, but, as I have already said, these men who have invested in the Standard Electric Co. have faith enough in the engineering that they are doing to be so sure of success that they are unwilling to experiment with their customers, and only enter upon their period of regular operation after they have satisfied themselves with their plans and their construction work. In Oakland, San Jose and San Francisco they have added, as an additional safeguard against interruption of service, storage battery plants, and have installed for charging these motor-generator sets capable of being used in such a manner that, should accident occur along the line, both the alternating current and direct current service can be maintained by means of the batteries. This company is entitled to much of the credit for the exceedingly long-distance transmissions on the Pacific coast, and while it may be unfortunate for their immediate glory that other plants are in operation before theirs is ready, their customers in later years will have reason to thank them for the care with which they have taken every step. Since their plans were laid out and the work begun, the Bay Counties Co. found that they could make a contract with the Folsom Co., who supply Sacramento, and whose plant was deficient in capacity. Accordingly they built to that city a line 60 miles in length, which they operate at 40,000 volts, supplying current in conjunction with the 10,000-volt plant 20 miles away at Folsom, the two plants, one at Colgate, 60 miles from Sacramento, operating in parallel with the Folsom plant, 20 miles from Sacramento. Later on the Bay Counties Co. built, and is now operating, a line 152 miles in length from their plant to the city of Oakland. To reach this city they had to cross the navigable straits of Carquinez, through which the deep-water grain ships go from San Francisco bay to the principal coast grain shipping port of Port Costa. Fortunately these straits are bordered with high hills. At these hills they erected towers and stretched their cables with a span exceeding 4000 feet, effecting one of the most remarkable feats that has ever been attempted in long-distance power transmission. As the sub-stations and lines to this point belonging to the Standard Electric Co. were ready for operation, this company has bought a large amount of power from the Bay Counties Power Co., which they transmit south to Mission San Jose and thence to Stockton, San Jose and up around the bay as far as Redwood City, effecting a total transmission for the Bay Counties Co. of 198 miles to San Jose, 200 miles to Redwood City, and 218 miles to Stockton. These distances are met successfully in every day working, and the interruptions in supply have at no time been serious, nor has there at any time been any reason to feel that the work is at all of an experimental character. Up at Colgate their generators run day and night, supplying power to these distant points, with the result that the company is successful, not only from an engineering point of view, but financially successful, with the success that has given confidence and strength to all electrical transmission securities along the Pacific coast. These plants operate lights, mines, railroads, flour mills, and in every operation have given such service to their customers that, in spite of the fact of recent discoveries of large quantities of fuel oil, their only difficulty is to find enough power to supply the demand made upon them.

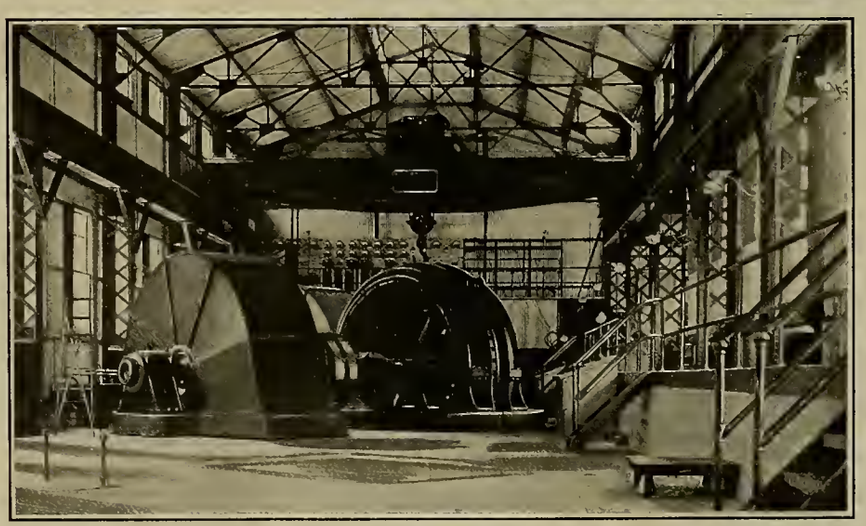
I might go further and describe the power plant of the Big Creek Co., whose lines run along the seashore and operate almost continually in a sea of fog, or that of the Fresno Co., which was the first, with the exception of that at the Chollar mine at Virginia City, Nev., to operate at a head exceeding 1000 feet, or give a description of the plant at Bakersfield, where electric power is preferred to a ditch system for irrigation; but in describing these plants I would only be repeating what has been said concerning them, or repeat descriptions which, on a larger scale, would apply to the two plants that have just been mentioned. Instead of going over these in detail, I prefer finally to call your attention to the collection of plants feeding into the city of Los Angeles. In this region was the first really long-distance transmission plant, that at Pomona, a single-phase lighting plant, where the power for lighting was transmitted a distance of 28 miles at 10,000 volts. From this beginning one plant after another has been installed, until finally the plant of the Southern California Electric Co. was built, with a transmission of 80 miles at 33,000 volts.

*Condensed from a paper read by F. A. C. PERRINE before the New York Electrical Society.

engineer. No rule of thumb principles is applicable. The men encountering these problems must be and have been men with independent minds—men capable of realizing the difficulties and not frightened by them. They are frontiersmen—undaunted, unafraid and resourceful.

In addition to Prof. Perrine's remarks it may be said that the Colgate development has been most notable on account of the difficulties in its construction and the long range of its current-supplying network of transmission lines. The Colgate installation is on the north bank of the North Yuba river, where the old Missouri trail crosses it. Seven miles up stream the water is impounded and let from dam to power house in a wooden flume which consumed 8,000,000 feet of spruce, pine and cedar. The flume has the delivering capacity of 23,000 cubic feet per minute, pouring the water into the reservoir on top of the hill, at the foot of which the power house is located, 700 feet below. The water has considerable head on when it finally flows into the turbines, nearly four times as far below the water level as the Niagara turbines. The success of this and of similar plants like the San Joaquin one (which has a 1400-foot head), lies largely in the Californian practice of using a comparatively small stream of water with great head, getting as much power out as from a larger stream with a small head.

An interior view of Colgate, showing the electric generators and turbine casings on the right and the transformers on the left.



The Interior of Electra. The machines are placed diagonally in order to minimize the angle in the pipes bringing the water under 1500 feet head.

Shortly after this plant was constructed a consolidation of interests centering in Los Angeles was made, and now there is there daily effected parallel running to a most remarkable extent. Alternators of both revolving field and revolving armature types and of different makes are running in parallel and supplying together power for railroads and lights in conjunction with steam-driven plants, without a thought of such troubles as are supposed to come from the coupling in parallel of steam engines or of engines with water wheels, and yet there is nothing that has been done to effect this successful operation which can be considered remarkable for ingenuity—simply the plants have been well engineered, well installed, and are well operated. After all, this sums up everything that has at all attracted your attention in connection with work I have been describing. The problems of the Pacific coast are problems for the trained

The power house, built to permit of enlargements as required, contains seven units in all, aggregating 15,000 H. P. in 3000 H. P. generators and four of 1500 H. P. each. After leaving the generators in the Colgate power house at 2400 volts the current goes through the step-up transformers and comes out with a 2% loss at a potential of from 40,000 to 60,000 volts, and occasionally, during bad weather, at 80,000. It is stepped down again, on reaching its

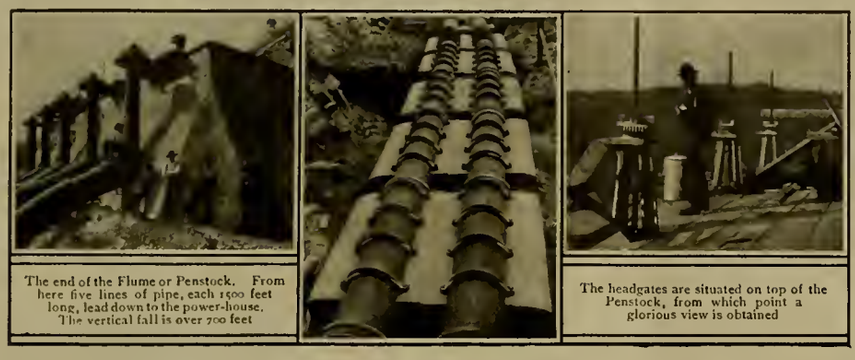
destination, to the potential required for the local service, which varies from 110 to 5 volts.

Losses are an important feature of any transmission system, and one on which the efficiency of the line largely depends. Working a line with such pressures as are here employed the losses are comparatively insignificant; 1000 actual H. P. sent from the power house at Colgate, 220 miles, to San Francisco, should lose only about 250 H. P. in transmission, netting 750 H. P. at the receiving station. T. Commerford Martin estimates the losses in current as follows: In the generators, 6%; step-up transformers, 2%; regulation and line losses, 15%; and 2% again in the step-down transformers, thus making a total of about 25%. In the report of the company is shown the following financial table:

1901—	Gross Receipts.	Expenses.	Net Profits.
April	$13,913 21	$4,466 35	$ 9,446 00
May	16,195 76	4,590 86	11,604 90
June	18,219 78	4,217 11	14,002 67
July	20,903 46	6,674 15	14,229 31
August	24,185 70	6,033 51	18,152 19
September	25,463 52	6,864 59	18,598 93

In a development of this character it is impossible to get at exactly the cost per horse power of plant installed, and it may be said that so far as the hydraulic and electric installation is concerned, no accurate estimate of the cost can be given for the total horse power, including land, water rights, buildings, machines and accessories complete for operation. The pole lines, because of some of the expensive engineering features connected therewith, can be roughly estimated at approximately $20,000 per mile. Such data as can be given regarding the Colgate line shows that the wire used varies from ¾-inch diameter down to No. 1 B. & S. The line loss between extreme points of production averages about 12%, i. e., C^2R loss.

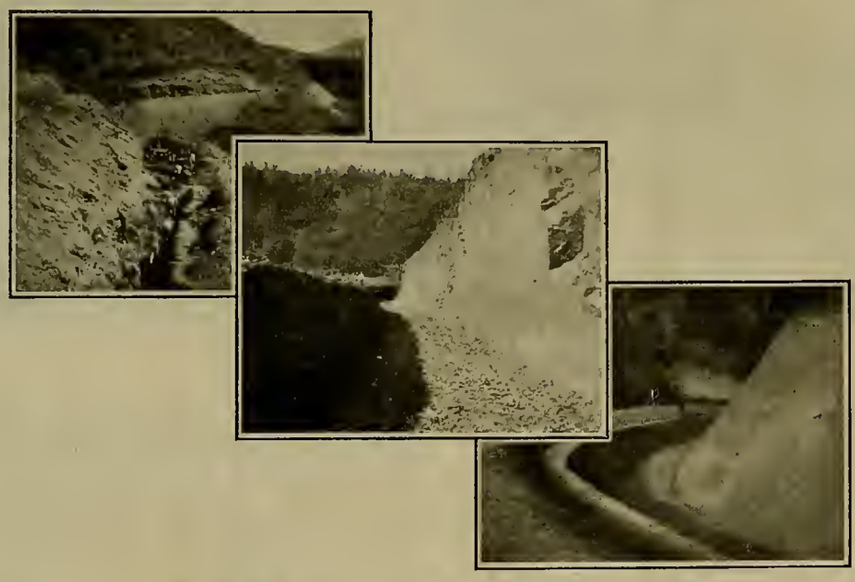
The flume which conveys the water to the power house has a watershed 532 miles in area to draw from, and is 7 feet wide and 6 feet deep for a large part of its length. From the flume itself the water drops from the power house through five separate steel and iron pipes 30 inches in diameter, and after passing through the gate valves impinges upon the turbine wheels, which are driven at high speed and direct connected to the generators. The Carquinez span, where the cables cross the Carquinez strait 200 feet above the water, is 4480 feet in length—three times the length of the Brooklyn bridge. The steel towers which carry the shore ends of the cable are noticeable viewed from the engineering standpoint and are also beautiful pieces of lattice work. The cables are four in number, made of stranded plow steel. Insulators of the Locke type are used on the poles. The company experimented for some time to try what effect rain would have upon them. The result of the experiments was that the insulators permitted the water to run off the top in a steady stream at no voltage, while at a pressure of 40,000 volts the water was so electrified as to be sprayed off at an angle of about 10°. One of the transmission lines is built of aluminum and measures a scant ¼-inch diameter, having a total length of 61 miles, running from the power house at 40,000 volts; another line similar to it goes in a northwesterly direction 30 miles to Oroville, where power is delivered to two sub-stations, which in turn supply energy for the gold dredgers of the Feather river.



The end of the Flume or Penstock. From here five lines of pipe, each 1500 feet long, lead down to the power-house. The vertical fall is over 700 feet

The headgates are situated on top of the Penstock, from which point a glorious view is obtained

The center picture illustrates the method of anchoring the pipes in massive concrete piers.



The upper left-hand picture is of the ditch under construction. The lower right-hand picture is of one completed. The center view is of a point where cutting through solid rock was necessary.

A 120,000-volt arc between the needle points of a spark in the testing room at Electra.

THE experiments of the Santa Fe Railroad Co. with oil on its road beds have been successful. The 1200 miles between Point Richmond, Cal., and Albuquerque, N. M., are well oiled. The longer the oil is used the less the amount which is necessary. When a portion of the track has been well oiled it is found that the surface maintains its hardness for several months and that the next time it only requires about half as much.

Saving Gold From Black Sand.

Written for the MINING AND SCIENTIFIC PRESS.

There have been many attempts made to recover the gold from the black sand found on the beaches along the Pacific coast, but few have been able to save much of the gold and none have been able to save all of it. Most of the attempts have been failures and none have paid more than ordinary wages at the best for any length of time.

Men have thought the problem over and over, for the man who at last solves the riddle will have an almost unlimited amount of material awaiting him. There have been all sorts of sluice boxes, rockers and long toms tried, various shapes and arrangements of riffles and burlap, carpet and plates, but none have been successful enough to pay more than ordinary wages when rich sand was worked, and none have been able to handle the sand on the large scale necessary to make big money out of it.

Machines having magnets to separate the iron or magnetic portion of the sand from the rest have been made, but they have found that only about 10% of the black sand is magnetic. While running the sand through these machines some of the flakes of gold and the particles of gray sand that happen to get caught between the grains of magnetic sand and the magnets are taken out with the magnetic sand, making the separation unsatisfactory.

The sand has to be screened first to get all the gravel and pieces of wood out of it. If the sand only averages $1.50 per ton, with this slow method of handling, it would cost more than the value of the gold in it, even if it were possible to get the gold afterward by sluicing.

The black sand found in the bottom of the sluice boxes in hydraulic mines is almost all strongly magnetic, but the black sand found on the beaches along the coast does not resemble this sand much. The magnetic portion of the beach sand is only about 10% of the whole amount of the black part of the sand, so eliminating the magnetic part of the sand does not reduce the specific gravity of the whole much, and does not make any appreciable difference in sluicing afterward.

The great obstacle that cannot be overcome in working the sand by sluicing is that the gold is so thin and light that it is carried more easily by the water than are the grains of sand, which have so much more body to them, and the sand instead of the gold settles between the riffles and packs hard. If the head of water is increased, or more slant given to the sluice box to keep the sand from packing, the gold goes through all the more readily.

If amalgamated plates are used to catch the gold the mercury and what little gold caught is scoured off the plates by the sand. If only $1 in gold is caught by the plates, while 2000 pounds of heavy sharp sand is washed over them (specific gravity about 4.54), the effect can be easily judged without a trial.

If Brussels carpet or burlap is laid on the bottom of the box to catch the gold the carpet or burlap soon gets a coating of sand so solid and smooth that the rest of the sand runs along the top without disturbing the sand beneath which is so firmly held by the threads of the material. The gold is so light that if it is not thoroughly wetted before it goes into the sluice box the chances are that it will have a small air bubble attached to its side and rise to the top of the water and float off without sinking at all. With such light gold as that there is little chance of saving it.

There is one way to save the gold and that is by the cyanide process. The gold, being so light and thin, is in the best possible form for cyaniding. The cyanide process is capable of handling a large amount very cheaply and without a large outlay of money for a plant. The thinness of the gold makes a weak cyanide solution very effective, and a weak solution must be used to keep the iron of the sand as much as possible from being dissolved.

Where the cyanide process has been tried on black sand and has not been a success, the reason is that zinc shavings were depended upon as the precipitant and they failed because the small amount of gold in the sand and the large amount of iron dissolved by the solution prevented the proper chemical action of the zinc shavings upon the cyanide solution, the iron which is dissolved in such a great amount in the solution accumulating to such an extent after the first leaching that it prevents the precipitation of the gold.

Iron will precipitate zinc from an acid solution, and although it will not precipitate it from a cyanide solution it has the property, if there is much iron in the solution, of keeping the zinc from going into the solution to replace the gold. And it is this reason that has prevented the successful working of black sand. The writer is personally acquainted with some gentlemen who spent over a year experimenting with a black sand mine in Oregon. The sand averaged a little over $2 per ton and they had a back beach covering ten acres and nearly as much more near by.

They used zinc shavings in every experiment, and say that if the sand was cyanided in the laboratory in large glass jars the gold dissolved easily and they were able to precipitate it afterward with zinc shav-

ings and recover the gold. But when they put up a cyanide plant and tried it on a large scale they could get but part of the gold the first time the solution was used, and the second and third times they used the solution they could get no precipitate on the shavings, the solution even seeming to dissolve the first precipitate, leaving the shavings bright and clean again.

The difficulty of precipitating the gold is solved by the use of a current of electricity. The electric current will precipitate gold from the solution with ease and also throw the iron out of the solution in the form of a gray powder, which can be strained out of the solution, and thereby at the same time save the gold and eliminate the chief cause of the trouble. By keeping the amount of solution as small as possible black sand can be worked in this manner cheaply.

A leaching vat holding fifty tons of sand could be worked with but ten tons of solution if the solution was allowed to percolate upward slowly through the sand and then pumped to a small tank a little above the vat as it accumulated above the sand, and then run through a pipe to the bottom of the vat, where it would again percolate through the sand, making a continuous flow until the gold was all dissolved. The solution being weak would necessitate but a small amount of wash water to displace it effectively.

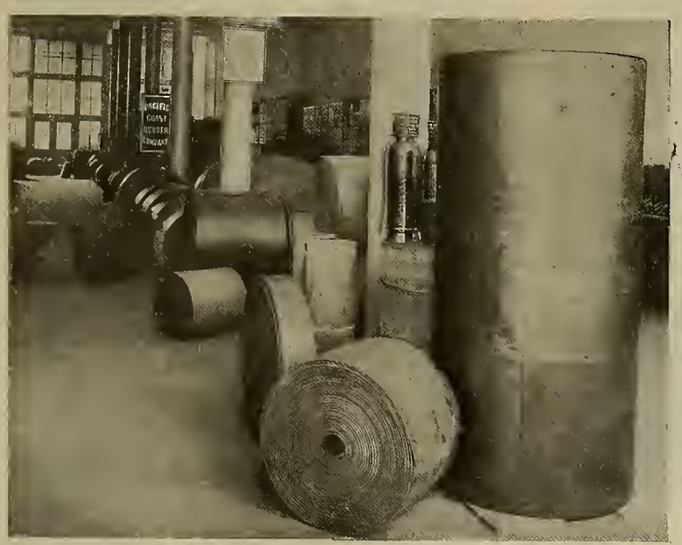
Nearly all the beach sand carries platinum and iridium in the form of grains like the rest of the sand, and they can be saved by a concentrator, making an additional profit for the plant.

Electrolytic Lead and Oxides.

At the recent meeting in Philadelphia of the recently organized American Electrochemical Society, P. G. Salom read a paper describing a process of his invention for electrolytic lead reduction which is in operation at Niagara Falls. The principle lies in the use of lead sulphide as cathode in an acid solution, the hydrogen cation forming with the sulphur gaseous hydrogen sulphide, and thus reducing the lead sulphide to lead in spongy form. The form and construction of the cells used were described and the difficulties discussed which had been encountered. The principal difficulty was that the reduction was not complete, and the degree to which the ores are reduced varies without apparent reasons. It was stated that at present 92% to 95% of the sulphide is reduced. Another difficulty is that the workmen's eyes are affected in the operation of the process. Two pounds of lead are produced per horse-power hour, forty-eight cells in series being electrolyzed at 130 volts. Specimens were shown of spongy lead, compressed sponge, litharge and other materials made by Mr. Salom's company. Owing to the spongy form, the material is very readily transformed into litharge. The company intends to take up later the manufacture of storage battery plates. — Journal Franklin Institute.

A Huge Leather Belt.

The accompanying illustration shows the interior of the warerooms of the Pacific Coast Rubber Co., at 453 455 Mission street, San Francisco. This company has just filled an order from the Vance Redwood Lumber Co. of Eureka, Cal., for what is believed to be the largest leather belt sold in California. The engraving shows the great roll on the right. It is a 3-ply belt, width 72 inches, length 117 feet, weight 2700 pounds. It is a Hoyt Short Lap leather belt, there being no sectional pieces over 4½ feet long. It is made from pure oak-tanned butts. The leather was cut from the heart or solid part only; no part of the shoulder was used.



A Large Leather Belt.

Concentrative Experiments on Antimonial Silver Ores.

Written for the MINING AND SCIENTIFIC PRESS by CHAS. M. FASSETT, M. E.

No one who has not made concentration experiments on antimonial silver ores can appreciate the disappointment they usually cause both to the miner and metallurgist. A highly siliceous ore carrying 15 to 20 ounces of silver, a trace of gold and very small quantities of antimony, copper and lead and 8% to 10% of iron pyrites, located 100 miles from a railroad, is a pretty hard proposition to figure a profit out of, even if developed in considerable quantity. The chief hope is in concentration, and if repeated experiments along the usual lines yield a saving of only 20% to 25% of the values, one is likely to give up in disgust. In order to get the hard, siliceous gangue through a thirty-mesh screen it is impossible to avoid grinding the more friable mineral contents to an impalpable powder, which cheerfully floats off on the top of the water towards the tailings pile.

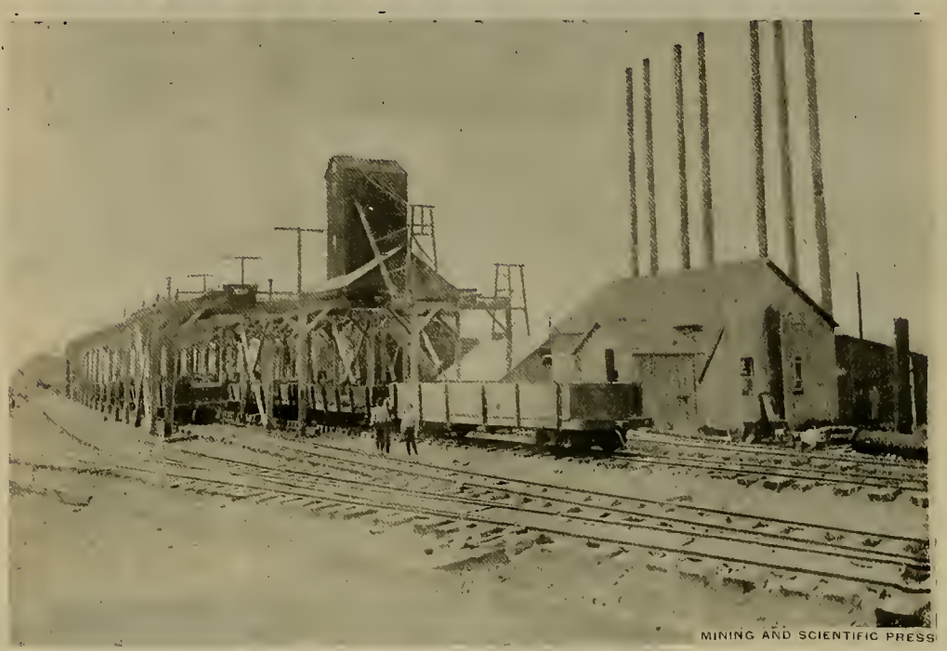
I have been struggling with just such a problem, and after frequent and futile attempts with a modern humping table I have found the solution of the matter in the use of the oil process. I give the details in the hope that some struggling brother may be helped. My ore was the one described above, assaying 18.8 ounces silver and a trace of gold. This, by the oil process, yielded 8.9% of concentrates, assaying 169 ounces silver and 0.10 ounce gold. The cost of crushing and concentration should not exceed $1.00 per ton in a plant of fair size, and with these results a nice profit can be figured out.

The laboratory test is made as follows: Put fifty grams of ore (thirty or forty mesh) into a half litre beaker and pour on about 300 c. c. of water. The beakers to be used should be thoroughly cleaned and, just before using, rinsed with a little strong sulphuric acid, which prevents the oil from unduly sticking to their sides and bottoms. Stir the ore in the water a few minutes to rid it of adhering air bubbles and add 15 to 20 c. c. oil. Now take a beaker in each hand and pour the contents from one to the other, keeping the mixture as well agitated as possible so that the pulp will all flow out at each pour, repeating fifteen or twenty times. If the concentrates are heavy, globules of the loaded oil will begin to sink to the bottom of the beaker. The oil holding the concentrates should now be poured off into a clean beaker, more oil added to the ore mixture and the pouring repeated as before. This mixing and pouring off the oil, with the addition of fresh oil to the ore, should be repeated five or six times, until the oil ceases to take up concentrates from the ore.

If the oil containing the concentrates has been poured off carefully and is comparatively free from water the oil can be removed by heating the beaker until the oil foams, and filling up the beaker with gasoline at once while the oil is hot. This must be done away from fire or light on account of the extreme inflammability of the gasoline. The concentrates will settle out at once, the dissolved oil is decanted off and the residue washed once or twice with gasoline by decantation, the concentrates dried, weighed and assayed. The tailings are allowed to settle, the water decanted off, dried, and if at all oily, washed once with gasoline and again dried, when they are ready for assay. The oil used is a heavy petroleum residue. If this cannot be obtained a mineral lubricating oil of good body can be used for laboratory work.

Improvement In Handling Ore.

In the issue of May 24th the headgear on the Wolftone shaft, Leadville, Colo., was illustrated and described. The Wolftone shaft is operated by the A. M. W. Combination, Leadville, Colo. This single shaft does the work of several shafts—the Mab, Maid, etc. The accompanying illustration shows the improvements made therein in handling ore. The trestle work will allow four strings of cars to stand ready for loading; each string is made up of six cars, so that 400-500 tons of ore can be loaded direct from mine cars into railroad cars. The advantage over bins are: 1. Bins only allow two cars to be loaded at one time without moving. 2. Cost is trifling; this structure costing about $500 a bin to hold the same costs $4000 to $5000.



Handling Ore at the Wolftone Shaft, Leadville, Colo.

The trestle is lighted by electric light. The engraving shows the design of the shafthouse and arrangements for preventing sag and side sway of hoisting rope between sheave and hoist.

Miners' Wages in Mexico.

Why Mexican miners at Cananea, Mexico, are paid $2.75 per day in Mexican silver, while American miners receive from $3.50 to $4.00 in gold in the same camp, is being discussed in Arizona. J. C. Goodwin, from Cananea, tells the Arizona Republican that he asked a Mexican miner why he was getting less than half as much as an American. He thought he knew. He said that in case a native of Mexico was killed while at work about the mine, the company would have to pay for him. If an American or one not a native of the country were killed, he would be already paid for. In the opinion of the Mexican the difference between what the Mexicans receive and what is paid to the Americans is turned by the company into a sort of life insurance fund.

"It is a fact that companies must pay for Mexicans who are killed in their employ, but that is not the reason that American miners are paid twice as much. The Mexican Government will not let the Greene Company pay more and the company cannot get Americans for any less than they pay them. This is the Mexican Government's way of solving industrial problems, or rather its way of preventing them from arising. It is the Government's theory that if the Greene people paid the native miners fancy wages miners would flock there from all parts of the Republic and there would be an industrial plethora there, while mines elsewhere would be deserted. Then there would be strikes, and in Mexico it is not far from a strike to a revolution. Accordingly the Government has fixed a scale of wages for its own subjects, and requires the company to employ 65% of its force in the Republic. The company finds it no hardship to be interfered with and restrained from

paying 65% of its employes more than half as much as it has to pay the other 35%."

[But, after all, the reason that American miners are paid more is because they are worth more. At double local wages they are still cheaper. Cheapness is not regulated by what you pay, but by what you get for what you pay. A man may be cheap at $5 per day, or dear at 25 cents per day. Cheap labor is really the dearest kind of labor where skill is required.—ED.]

Hoisting Works for Deep Mines.

In 1897 this journal began the discussion of Rand requirements in hoisting facilities, it being manifest that the Johannesburg, South Africa, mines would ultimately entail the sinking of shafts 10,000 feet deep, the suggestion being made that the relay system would probably present sufficient practical value to merit consideration.

Considerable has been editorially said herein on that subject, the latest being in the issue of the 31st ult.

The matter is one of economic importance. Hans C. Behr, of California, now in charge of one department of the Consolidated Gold Fields of South Africa, has written a paper entitled, "Winding Plants for Great Depths," which was the subject of discussion at the last meeting of the London Institute of Mining and Metallurgy.

In opening the discussion the president, A. G. Charleton, in the course of his remarks, said: "As time goes on this problem of deep sinking is one which will force itself more and more on the attention of mining engineers, and I think, therefore, that this paper is presented to us at a most opportune moment. The importance of the subject, as far as concerns the Witwatersrand, is evident if you consider for a moment the following facts, to which I would like to draw your attention before you proceed to discuss the paper itself. The average tonnage crushed per month on the whole Witwatersrand for the first eight months of 1899 preceding the war is put, I believe, at 758,514 tons, with a total average number of 5672 stamps, of which number, I understand, 1370 were operated by the first row of deep level companies. Assuming that all the first and second rows of deep levels that started active operations before the war will have reached the producing stage by 1906, that in the meantime some of the first row of mines will have increased their plant; that at the end of the period named some eighteen or twenty new deep level companies will be crushing on an average with 100 stamps, and that outlying areas like Krugersdorp, Bokshurg and Modderfontein will be adding their quota to the quantity of stone raised and crushed, it has been estimated, I am informed, that at the end of 1906 there are likely to be some 10,000 stamps in operation on the Rand. Now, it is obvious that where you are dealing with quantities such as crushing on anything like this basis will entail, a fractional saving per ton must largely affect the gross profits, and so far as concerns the deep level companies nothing will influence the commercial aspect of the company more than economy in winding, since the proportion which hoisting charges will bear to the total cost must obviously increase with greater depth and load. Taking the underground force required to run 200 stamps at approximately 2500 natives and 200 white men, the mere expense of lowering and raising this force daily must amount to a considerable item, without taking into account the much more serious expense of raising the ore. These costs are, however, liable to be considerably modified by the system of haulage adopted and by the design and management of the machinery employed for the purpose, a discussion of which is, therefore, obviously a subject of the greatest importance to mining engineers. Public confidence in deep level mining upon the Rand has, it may be added, been established by the results obtained from the first and second row of deep levels, and attention is now being directed towards deep level areas of 4000 to 6000 feet, in the confident expectation of achieving similar results, as I may remind you that the Turf Club bore has proved the existence of auriferous banket at a depth of 4800 feet. As T. H. Leggett has remarked: 'Although progress in the direction of deep mining upon the Rand has been startingly rapid, it is still the logical result of underground development, of the yield of gold, and the profits obtained from deep level mines now in the producing stage.' It appears from a table compiled by Mr. Leggett that in the Rand district there are 20 shafts that will average 400 to 1000 feet in ultimate depth; 22 that will average 1000 to 1500 feet; 13 that will average 1500 to 2000 feet; 10 that will average 2000 to 2500 feet; 7 that will average 2,500 to 3000 feet; 1 that will average 3000 to 3500 feet; 2 that will average 4000 to 4500 feet; 3 that will average 4500 to 5000 feet; 3 for which no estimate depth is given; making a total of 81 shafts." Grouped in rows, they may be subdivided as follows:

	Average distance from outcrop Feet.	Average ultimate depth. Feet.	No. of shafts.
First row of deep level properties, including Simmer and Jack outcrop	1730	1189	45
Second row of deep level properties	4162	2611	21
Third row of deep level properties	8113	4500	3
Omitted from lack of data	....	....	3
Total			81

E. P. Rathbone thought that the works would interfere with a good system of ventilation. With all those turns from the bottom of the shaft and having to take all those corners it would increase the friction, especially when they were dealing with dynamite and powder smoke, and blasting operations were going on when the first sinking of the shafts took place, and then, where time was of such importance, to get the working places clear of smoke. It also seemed to him that there were so many turns of the rope being taken round with sheaves of a small diameter that the rope would have a much shorter life than with a single sheaf in a straight shaft, as the shaft would be bound round at such a narrow angle; this would also very much increase the danger of accidents due to the breaking of the rope. Another objection to the two-stage system was that the hoisting of men from the two stages would take up far more time than if directly hoisted from the bottom of the shaft. The first cost of sinking such two-stage shafts would also be considerably greater than in a straight shaft. These seemed to him to be some of the objections which mining engineers might make.

F. Irvine said it seemed to him that the proposition discussed in Mr. Behr's paper was limited by two problems. The first, the tensile strength of the rope, and the second, the size and the weight of the drums which it was possible to construct and operate with economy. The propositions before them were (1) of winding in one stage from the ultimate depth of the shaft; (2) of winding in two stages. It would seem improbable that winding from the deepest shafts could be done in one stage effectively, especially when inclines had to be operated from the vertical, and that, therefore, two or more stages of winding had to be fallen back upon. He was speaking, of course, of those very deep shafts which would be the exception to the rule rather than the average of deep mines, the ultimate bottom of which might probably be reached in one stage of winding. It seemed possible also that tapered ropes of the highest grade tensile strength could be manufactured to reach the greatest possible vertical depths unless in the exceptional cases to which he had already referred. It would, therefore, appear that the best practice would be to put down a winder on the surface to work down to the most suitable practical depth and at that point to put down another winder driven by transmitted power from the surface to haul the rock up to the foot of the shaft or stage in which the surface winder operated. That would enable a surface winder to always run balanced, and it would make it a much more economical engine in the consumption of power, and it would enable the drum to be built, if cylindrical, in one piece, that was to say instead of having two drums one drum would be quite sufficient, because the rope would be wound on one-half and unwound from the other. This would, therefore, meet some of the objections of the undue size of the drums which other methods entailed. It was obvious also that in the case of those very deep shafts where a taper rope could not command the bottom of the vertical that this method of winding in two stages could also be applied. Under those circumstances, with the possibility of winding in two stages where necessary, the problem of reaching the bottom of the deepest shafts as far as the rope was concerned might be dismissed as satisfied. With regard to the winders themselves the various systems proposed in this paper has been evolved for different objects. Some winders had been built with cylindrical and some with conical drums. The conical drum seemed to him to have been devised to equalize as much as possible the load on the engine. The Koepe and Whiting systems had been devised in order to get the drums down to as small as possible dimensions, and to therefore save momentum or flywheel action in the machine, and first cost.

The methods proposed for two-stage winding from the surface seemed to him to provide only for a saving of drum size, because although the ropes hung from the surface right down to the bottom of the shaft, they were not all wound upon the drum during the operation of the engine, and, therefore, they might conclude that the only saving to be effected by such two-stage winding with two engines was that the drums of the two engines at the surface were kept small, and there would be no power saved over that used in the small engine, because the loads to be lifted would be the same, both with regard to the weight of the skip load and the weight of rope in each hoisting operation. These remarks applied to the tandem system also, in which the ropes were attached to the bottom of the cages of the first hoist. Neither of those systems, to his mind, seemed to do anything more than make a reduction in the size of drum on the surface because of their not having to wind the whole of the rope used in lifting the ore upon the one pair of drums. Therefore he could not see that this two-stage method of winding would be more economical than the single system, as they would only save the large drums of the single winder, whereas they would entail two sets of drums and extra rope in the one case and some kind of auxiliary winder in the other. If two stages had to be contemplated in a winding proposition of this kind he thought it would be better to put down a winder on the surface running balanced with a constant lift, and with practically constant loads from a given fixed point, and to put at that point an auxiliary winder operated by transmitted power to work the rest of the mine. The conical drum, as compared to the cylindrical drums, was costly and large in size, and although Mr. Behr said that a tapered rope would affect a reduction in their size he could not see that was so, because the taper rope was largest where it was wound first upon the drum. That when the load was at the bottom of the shaft the rope was paid right out, and its largest diameter was on the smallest portion of the drum, and as the diameter of the rope determined the minimum diameter of the drum the diameter of the taper rope at its largest would determine the minimum diameter of the conical drum; and, therefore, the whole of the remainder of the conical drum must be larger in diameter than the size so determined.

Thus the smallest diameter of a conical drum would be of equal size to the diameter of a cylindrical drum to wind on the same rope, and, therefore, the conical drum would be very much more expensive, heavier and bigger in diameter, and require a larger engine to drive it than an engine with a cylindrical drum. This drum has been designed to obviate to a large extent the varying loads upon the engine, to equalize them and to create a greater efficiency and a greater economy. That purpose, perhaps, could be obtained if an engine could be designed to take a large overload at starting without any risk or trouble and to run efficiently down to a small percentage of its full load. That could not be done with a steam engine. A steam engine which was designed to be economical at one point could take an overload, but it could not take a very large overload without becoming too large, and, therefore, inefficient. On the other hand, it could not take a light load without becoming very inefficient. The only motive power which he could think of which would attain these results and thus increase the economy of the operation was an electric motor. It could not only take 50% overload in starting, but could now also be built to run at 20% full load without the efficiency falling off more than 7% to 10%. That was done every day in electric traction, and, to his mind, the problems in electric winding were very much the same. They wanted to start with an overload on the machine, to accelerate quickly, to obtain great efficiency down to the lowest point of load, and to stop equally quickly and without having too much momentum on the machine. Mr. Behr said that the objections to operating underground hoists by transmitted power from the surface were the great first cost of the installation and the additional attendance that was required to operate them. That might be the case if they considered that, in order to operate one electric hoist underground, it would be necessary to install an electric power station on the surface. But as this paper referred very largely to problems which were before the mining engineers of the Rand, he might state that most of the mines there already had their power installations. The electric light was the first reason for their installation. Then power was required to work pumps, cyanide works, workshops and all kinds of machinery distributed about the mine, and it was soon found out that electricity was the best means of transmitting the power, and at the present time all the large mines on the Rand have got their own power stations installed in their engine room. A large mine operated two or three shafts, a large surface plant and other machinery underground, such as pumps, which are nearly all being driven now by electricity, and even small electric winders in winzes and stopes, and so on; these would require a very large power station, and the call for current upon such a station by even a large underground winder would not be such as to make the fluctuations detrimental to the general use of the power. He therefore thought the objection to the installation of this power station would, in the case of the Rand anyway, not be so great as Mr. Behr seemed to think and that, therefore, winding in two stages there with a good surface winder installed on the surface to wind to a fixed point and an underground hoist to do the best of the work, was probably the best solution that could be got.

(TO BE CONTINUED.)

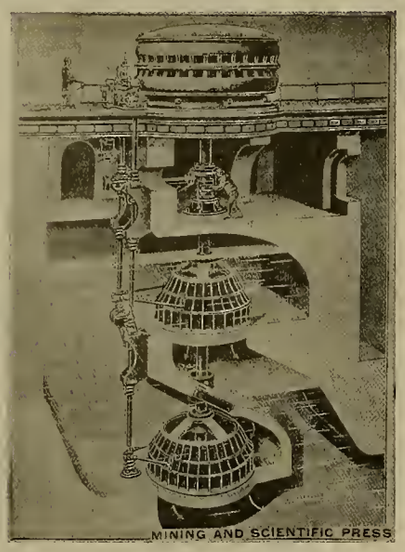
A Two-Story Turbine Plant.

When the city of Geneva established its electrical generating plant at Chevres-on-the-Rhone its engineers had a new and difficult problem, because of the great difference in height of water at various seasons. The head of water at Chevres varies from 8.50 meters at high water to 4.30 meters at low water. It was necessary to provide some arrangement which would give constant speed and power for the driving of the generators.

This problem was solved by building a two-story water station and placing two turbines, one above the other, on each dynamo shaft, as shown in the accompanying engraving. The plant has eighteen sets of turbines. Three of these are used for the exiters. These give but 150 H. P. each. The others which

operate the generators give a mean output of about 1000 H. P. each.

Of the output of the plant about 5000 H. P. is used



Sectional View of Chevres Turbines in Position.

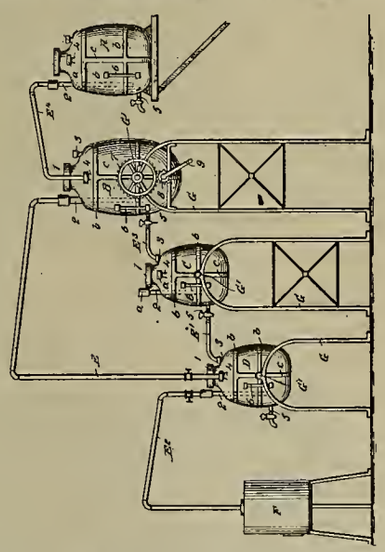
by electro-chemical factories, 4500 H. P. for large motors and for the maintaining of about 55,000 electric lamps, and about 1850 H. P. for the running of small motors.

Mining and Metallurgical Patents.

Patents Issued June 17, 1902.

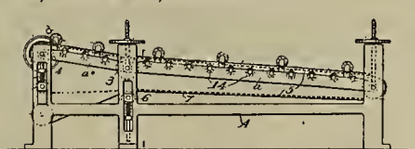
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR TREATING COPPER ORES.—No. 702,490; R. Seeman, Ealing, London, England.



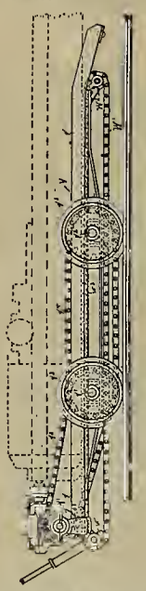
Plant for treatment of ores, comprising safety vessel, mixer revolubly mounted, pipe leading from top of mixer down into safety vessel, settler revolubly mounted at lower level than mixer, pipe leading from top of settler to lower portion of mixer, still revolubly mounted at lower level than settler, pipe leading from top of still to lower portion of settler, pipe leading from top of still down into mixer, several vessels and pipes being of acid resisting material.

ORE CONCENTRATOR.—No. 702,541; L. Cohen and J. Gross, Sombrerete, Mexico.



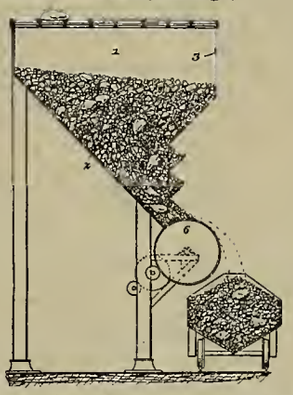
A concentrator consisting in combination of two horizontally disposed bed sections having ends pivotally supported, means by which sections may be moved so as to change relative angles of inclination, rollers upon sections, endless belt supported upon rollers having upper surface conforming to inclination of sections, a second belt supported upon and inclosing first named belt, means by which belts are driven in unison, lateral guides upon outer belt and sheaves having grooves in which guides are adapted to traevl.

MINING MACHINE TRUCK.—No. 702,817; A. Palmros, Columbus, Ohio, assignor to Jeffrey Manufacturing Co., Columbus, Ohio.



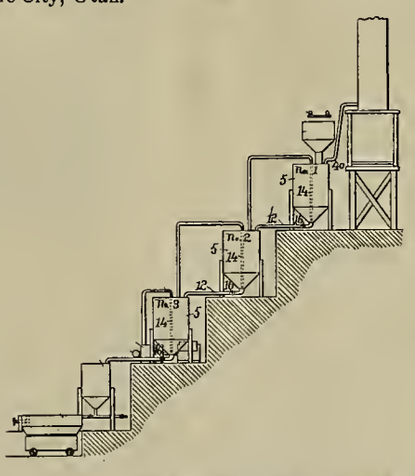
Apparatus comprising wheeled truck and separable mechanism adapted to be transported by truck provided with motor, and rotary power transmitting element actuated by motor and otherwise having fixed position, combination of truck frame, wheels thereon, power transmitting devices connected with wheels, initial power receiving element actuating power transmitting devices having fixed position adapted to mesh or be engaged with power transmitting element on separable mechanism when latter is moved bodily onto truck.

ORE POCKET.—No. 702,731; F. K. Hoover, Kansas City, Mo., and A. J. Mason, Chicago, Ill.



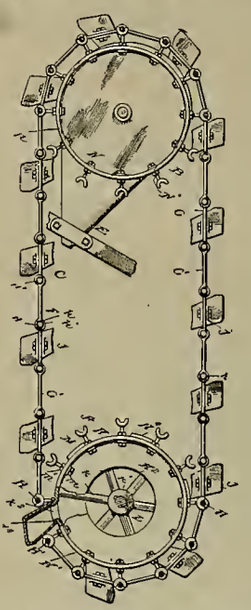
Ore pocket or hopper having converging front and rear walls, in combination with roller journaled below, forming movable bottom wall for discharge outlet, rear wall of hopper extending substantially into contact with periphery of roller, front wall terminating above roller below line marking natural angle of repose of material operated upon and at distance from nearest point of periphery of roller, which is substantially equal to distance between such lower termination of front wall and nearest point on opposite rear wall.

PROCESS OF RECOVERING METALS FROM ORES.—No. 702,582; J. W. Neill and J. H. Burfeind, Salt Lake City, Utah.



Forcing sulphurious acid gas through charge of pulp to agitate same mechanically and to assist in leaching action, then filtering pulp to obtain metal-bearing solution, precipitating metal from such solution thereby releasing gas and returning sulphurous acid gas released by precipitating process for use in agitating and dissolving metals from fresh charges of ore. The improvement consists in agitating the charge of pulp containing ore by gas from roasting furnaces charged with material suitable for producing sulphurous acid gas, separating resultant solution, precipitating metal from solution, employing sulphurous acid gas released by precipitating process to enrich gas derived from furnace and used in leaching charge of ore.

ORE ELEVATOR.—No. 702,892; H. A. Vezin, Denver, Colo., assignor to J. A. Jeffrey, Columbus, Ohio.



Combination with loading drum, having vertically arranged conical parts and filling tubes between conical parts, two series of independently adjustable forked sprockets rigidly connected to filling drum to form substantially two sprocket wheels, sprockets of one series being radially adjustable independently of sprockets of other series, series of buckets adapted to register with filling tubes and chain carrying buckets formed of alternating inner links with bars, G, G, and outer links with bars, G′, G′, pintles, H, H′, hinging the alternating links together, spacing devices between inner bars, G, G, and thimbles, I′ I′, on pintles outside of outer bars adapted to engage with forks in adjacent sprockets.

Bids Wanted on Work.

OFFICERS:
DR. C. R RAY, Pres.
O. C. CRAWFORD, Sec.

OFFICE OF
GOLD HILL QUARTZ MINING COMPANY,
GOLD HILL, OR., JUNE 24, 1902.

MINING AND SCIENTIFIC PRESS,
San Francisco,

GENTLEMEN:

We contemplate the installation soon of a 200 H. P. electric plant power to be furnished by ditch, to operate our mines. We would prefer to contract the ditch and dam, together with the electrical plant, with one firm.

If you can refer us to several reliable contractors for this character of work you will greatly oblige.

Respectfully,
C. R. RAY, Pres.

SEVERAL METALLURGISTS have experimented on the extraction of the copper oxy-chloride ores of Chile by means of sulphuric acid. The average copper contents was 6.2%, and the ore contained 0.873% of chlorine. The gangue is siliceous, however, and contained 3.25% of oxide of iron, which, however, is harder than the copper mineral, so that after crushing it is found that the copper concentrates in the flues. These assay from 10% to 13.5% copper. On treating this material with frequent agitation the whole of the copper was found dissolved in 40 minutes. With the harder and coarser portions of the ore it was also found that all copper practically dissolved, but two or three days time was necessary to complete the treatment. All of the oxide of iron present was found to dissolve and to increase in the solution as the time of contact was prolonged, and also if the strength of the acid was increased beyond 5%. The process, however, was found too expensive for the district in which it was proposed to use it, as the expenses of recrystallizing sulphate of copper several times would be very high.

Mining Summary.

Specially compiled and roported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

The Treadwell Co. daily consumes 140 tons of coal. It comes from Vancouver. A duty of 70 cents a ton is paid at Douglas island.

There is some mining boing done on the Nome beach and miners are rocking out from $8 to $10 a day. There aro good reports from Candlo, Council and other regions. Ophir creek, which is in Council district, is reported rich. The Wild Goose M. Co. owns the claims from 15 to 29 above, and from them may take out this season $1,000,000. Good reports also come from the Kougarok, but Gold Run seems to be not panning out. Nome miners gencrally regard it as a poor showing.

There is a placer stampede from Valdes to the Chittyna. Almost every ablebodiod man in Valdes is off for the diggings.

ARIZONA.

COCHISE COUNTY.

There will be a drilling contest at Bisbee, July 4, 1902, conditions and prizes as follows: Double hand contest, first prize, $800; double hand contest, second prize, $300; single hand contest, first prize, $250; single hand contest, second prize, $100; entrance fee, double hand contest, $25 per hammer; entrance fee, single hand contest, $15 per hammer. Regulation rules will govern contests. Hammers: Eight and four pounds respectlvely. Steel: Seven-eighths. Time: Fifteen minutes.

Near Bisbeo W. Goodrich will develop the Golden Era group of mines. The Brice Glass Co. of Pittsburg is interestsd in the Golden Era M. Co.

At Tombstone the Ground Hog will resume. H. T. Fisher, Supt., says he has made arrangements for new machinery on this property.

At the site of the Douglas reduction works the first building of the smelter plant to be erected will be the machine shop, of brick and structural steel, 216x 79.4 feet, he divided into two parts, one for repairing locomotives. There are now on the ground 14 carloads of machinery.

GILA COUNTY.

W. Sultan, of the Copper Hill Con. M. Co. of Globe, will erect a plant for treating its ores. The properties are between the Old Dominion and the Globe Con. properties. There is a large amount of ore ready for the new plant.

The new leaching plant of the Black Warrior Co. will be closed down and enlarged to three times its present capacity.

The Troy and Manhattan copper companies at Troy are to be consolidated. C. H. Cutting will continue in charge.

W. J Larsen, Supt. Buckeye M. Co., Dos Cabezos mountains, 8 miles southwest of Bowie, has forty men developing mine and building a 50-ton concentrator.

MARICOPA COUNTY.

In tunnel No. 2 of the Catalina Copper M. Co., 275 feet below the surface, the main drift has been extended along the vein 300 feet in ore; average width, 6 feet; ore's average assay, 6% copper. Surveys are ready for the line of the Phœnix & Eastern railroad, Phœnix to Benson. The road, when constructed, will run near the Catalina property.

MOJAVE COUNTY.

The Gold Road Co. is dismantling the mill at Albemarle, N. M., and will move it to the Gold Road mines. A larger hoisting plant is to he put in to carry the shaft to a depth of 1000 feet. The recent sale of a one-third interest in the mine by Posey-McCornick syndicate to French-Swiss people for $50,000 was to carry on exploration. The new company has the Ben Harrison group of mines and placed E. Hilty, one of the former owners, in charge. A gasolene hoist will be placed on that property.

The Supt. of the Ben Harrison group, Kingman, says the shaft on the Bryan claim has ore that affords a $60 average.

PIMA COUNTY.

The Golden Rose M. Co., operating west side Patagonia mountains, near Tucson, has a ledge 75 feet in width, and is rich in native silver.

At the Banner, 30 miles southwest of Tucson, twenty-five men are working. The company is daily treating twenty-five tons of ore, concentrating it.

The Sierritas M. & M. Co. has been organized to develop property in the Sierritas and to erect a smelter. The Banner mines are being exploited. There are many prospectors in the Sierritas at the present time. Development work is being pushed at the Loma Verde mine in the Rincons for the smelter which the board of directors propose to erect. Mining in the Catalinas is at a standstill. If the Phœnix & Eastern Railroad is built work will be resumed at Camp Condon, Copper Hill and the Catalina camp.

W. W. Robinson, representing San Francisco men, who propose to erect a cnstoms smelter in Tucson, has forwarded all the data he has collected and all of the contracts for ore that ho has made, to his clients in San Francisco, that they may examine them and determine whether it would be advisable to erect such a smelter.

PINAL COUNTY.

The Newbury mines, 18 miles east of Florenco, have resumod.

YAVAPAI COUNTY.

E. A. Franke is operating the Theisig group of gold claims, Lower Turkey creek. He expects to have a steam stamp mill in operation on the property by Sept. 1.

The Model G. M. Co. has ore that goes $50 per ton. The main shaft is down 350 feet. The oompany will erect a stamp mill. J. McGinn, assistant manager, has resigned and gone to Prescott.

The 10-stamp mill on the Victor mining property, Lynx creek district, is running. Twenty-five men are working and are down 200 feet.

The grade of the Crowned King branch railroad is 24 miles out from Mayer; 16 miles have been contracted for. Water is running through the 9-mile pipe line from Johnson's Springs to Mayer. It will also supply the Treadwell smelter. J. Mayer has men developing the Cypress mine, on Bigbug, and has a 3-foot ledge of gold and copper ore. The Poland tunnel is now in 920 feet from the Bigbug side of the divide.

Grading from Congress Junction on the Colorado river extension of the Prescott, Phœnix & Santa Fe Railroad is in progress; the road will connect with the Santa Fe near Franconia. Surveyors are at work on the line along the Santa Maria and Bill Williams fork. The road will open a rich mineral section.

Work is discontinued on the Iron King mine, 3 miles from Jerome. Mr. Giroux, Supt. of the United Verde mine, and one of the owners in the Iron King, visited the camp, and after looking over the property ordered the mine to be closed and all the men discharged.

YUMA COUNTY.

The U. S. Geological Survey reports fluorspar in abundance in the vicinity of Dorne. It is used in the manufacture of opalescent glass, but its greatest use is as flux for iron; it is worth about $5 per ton.

At the Monarch G. & C. Co., near Jerome, the 500-foot double-compartment shaft is now down 90 feet. In places the ore body is 3 feet wide. The steam hoist is in operation.

CALIFORNIA.

AMADOR COUNTY.

A 10-stamp mill is to go in on the Defender mine.

Supt. Fisher of the Edinburgh mine, near Wieland, is running a tunnel on the vein, which is about 8 feet wide. Rock from the hanging wall shows free gold.

A new mill for the Kennedy goes in between the east shaft and the old works—twenty stamps at first, capacity increased to sixty later on. A new hoist will he built over the east shaft capahle of extending the works to a depth of 5000 feet.

The Mahoney, at Sutter Creek, is closed down.

The Imperial quartz mine, south side of Sutter Creek, nearly opposite the Baliol mine, has resumed work; a 10-stamp mill is being hauled from Ione.

Supt. J. Ross, Jr., of the Wildman-Mahoney mine at Sutter Creek, is sinking the Wildman shaft below the 1400-foot level and drifting on the 1225-foot level of the Mahoney shaft. Twenty stamps are dropping in the mill.

At the Fremont Con. mine, near Drytown, Supt. Purrington has the Gover shaft unwatered and retimbered 1500 feet. He will have the compressors in operation August 15th. At the Fremont shaft a new gallows frame will be erected this summer and a new engine capable of hoisting a three-ton skip 2500 feet put in. Grading for an 80-stamp mill is begun.

The new shaft at the Sargent mine, Middle Bar, is being timbered with 14x14 inch sawed lumber.

BUTTE COUNTY.

The capital stock of the Boston & Oroville gold dredging proposition may be listed in Boston. R. D. Evans of the U. S. M. Co. is interested in the company.

CALAVERAS COUNTY.

Near Angels B. W. Thayer has a working interest on the Jolly Tar and Davis quartz mines, near Altaville, for $10,000, and in the Ætna, Hecla and Vesuvius quartz mines for $60,000. C. W. Higgins has a bond on the Washington and Last Chance mines for $4000.

Near Jenny Lind the Slate Creek mine is being worked on dividend paying ore. The Big Six claim, McAffee & Williams, near Bear creek, shows a 3-foot vein that goes $16 in gold and $100 in silver to the ton. The Golden Eagle mine is under bond to San Francisco men.

J. V. Coleman recently bought the property opposite the Angels mine of T. G. Peachy for $25,000.

The San Domingo Water Co. has started work on their water and power plant.

The Parnell mine is being worked; new machinery will be put in.

The surveyors for the water company at Murphys will begin work on the canal to run from the middle fork of the Tuolumne to Dogtown, by way of Murphys.

At Mokelumne Hill the shaft at the Giuffra mine is now 100 feet and the first level will tap the ledge. The mill will be in operation as the first level progresses.

DEL NORTE COUNTY.

W. Burgemaster has bought the Yates' black sand mine at Crescent City. Water will be secured from the ocean from power furnished by a gasoline engine.

EL DORADO COUNTY.

The Placerville Republican says the Mount Pleasant mine is employing thirty-five men and the 10-stamp mill crushing good ore. Sinking the main shaft continues.

It is reported in Placerville the Pocahontas mine, near El Dorado, will be bought by San Francisco men.

At the Cambrian mine, near Lotus, a tunnel is being driven to drain the mine and strike the ledge at a depth.

KERN COUNTY.

The American Golden Eagle M. Co., Hellman, about 40 miles from Bakersfield, says it has work for hard rock miners.

The Stanford M. & R. Co., Randsburg, is daily extracting fifteen tons of ore on the Gold Coin property, and is doing development work on the Stanford.

The Supreme Court of the District of Columbia has denied an application for a writ of mandamus against Secretary of the Interior Hitchcock to compel him to approve selections of mineral oil lands in Kern county under forest reserve scrip. This is another victory for the oil men in the case of the Kern River Oil Co. vs. Clerk, which has been fought through the courts and the Interior Department by scripper lawyers. A victory for the scrippers would mean that millions of dollars worth of California oil lands would be taken from their present mine owners.

LOS ANGELES COUNTY.

The annual meeting of the members of the Southwest Miners' Association will he held on July 8th, at 8 P. M. in the rooms of the association, First and Main streets, Los Angeles.

MARIPOSA COUNTY.

Near Coulterville S. E. Rigg has charge of the McAlpin mine. He intends to start the new shaft at the level of the lowest tunnel, 300 feet below the apex, and sink 500 feet. Then 1000 feet of drifting will be done.

NEVADA COUNTY.

Supt. A. D. Gassaway is driving the tunnel at the Union blue gravel mine near North Bloomfield. The company has completed 4000 feet of tunnel, with about 1015 feet more run it is expected that the gravel channel will be reached, where it was abandoned by the Derbec Co.

At the Niagara mine, on Deer creek, the new shaft is down 65 feet; ledge 6 feet in width has been found.

ORANGE COUNTY.

The mines and mill of the Santa Ana Tin M. Co., Trabuco canyon, are 14 miles from El Toro. The shaft is down 50 feet, with a crosscut of 36 feet, crosscutting a 10-foot vein of gold, silver and copper ore; assay value $18 50 per ton. The shaft will be put down to the 100-foot level. The company has expended $55,000, including machinery.

PLACER COUNTY.

The Washington Quartz M. Co. at Bath has bonded the Dewey & Hancock ledge. Supt. Dudley is extending the Dewey tunnel to the ledge 500 feet lower than the upper tunnel.

J. Nihill, in charge of the development at the May Flower mine, is running three 8-hour shifts.

King & Wolford have a shoot of quartz at their mine in Black Canyon, 4 feet in width; a 5-stamp mill is projected. The Black Canyon quartz mine will build a ditch and flume to bring water from Secret canyon to run the mill. The work of excavation for a 20 stamp mill goes on.

The Herald says mines are looking up on the Forest Hill Divide. There is not an idle man in Forest Hill and Michigan Bluff, and men are wanted at the Jarvis mine.

RIVERSIDE COUNTY.

In the Pinacarte district the Santa Rosa M. & M. Co. will do considerable work this season. It has a 20-stamp mill, hoisting plant, pumps, pipe lines, tanks for oil and water, electric machinery, etc.

SAN DIEGO COUNTY.

The latest phase in the Golden Cross mine litigation is that the late receiver, Trumbo, is to personally assume $10,500 of obligations which the court rules should not be charged to the mine. Merchandise claims aggregating $49,000 are to be paid from the mine company funds or from the future operations of the mine. Other creditors claiming $44,000 are to get $20,000 down and half the net earnings of the mine till the other $24,000 is paid. The mine is turning out $45,000 per month, of which $20,000 is profit. Receiver Pauly continues in charge.

SANTA BARBARA COUNTY.

The Interstate Asphalt Co., at More's Landing, near Goleta, has the contract for paving fifteen streets in Brooklyn, N. Y.

SHASTA COUNTY.

The Bullychoop M. Co., 25 miles west of Redding, is removing the 10-stamp mill to south fork Indian creek, and ten stamps will be added to make the crushing capacity sixty tons daily.

W. A. Hall says he will drive a 1000-foot tunnel through the divide between the Camden toll house and Whiskytown, through which it is intended to bring Brandy creek water to Redding and Keswick.

A. Onn, owner Spread Eagle copper claims at Copley, will build a gravity tramway 4 miles from the railroad to the top of the mountain, where the mine is. The ore, he says, shows 11% copper.

The transmission line from the electric power plant of the Hazel M. Co., Crystal creek, will pass through French Gulch on the way to the Gladstone mine. The line will be about 8 miles in length.

The Gladstone, at French Gulch, has seventy men at work. The 20-stamp mill is in operation. Twelve men are employed in the Milkmaid mine and mill.

T. S. Irvin, at the American mine, has fifteen men at work.

SIERRA COUNTY.

R. Phelan at the Gold Ridge mine has twenty men employed.

At the Independence mine, Wolff creek, an 8-stamp mill is in oporation. Ten men are employed. C. M. Root is Supt. The machinery is run by water power, 250 feet pressure, 50 inches of water.

SISKIYOU COUNTY.

The Mother Lode mining claim, Apple Sauce gulch, Russian creek, Liberty mining district, 5 miles from Sawyer's Bar, is bonded to Baker, Henderson & Graves for $25,000.

The 10-stamp mill at the Dewey mine, Gazelle, is running steadily. Thirty-two men are doing development work.

The Punch Creek quartz mine, Humbug creek, keeps the McCook quartz mill running constantly.

H. Marnet now has a 10-stamp mill at his quartz mine, near Hornbrook, using oil for fuel.

The Punch Creek Q. M. Co. will ship tailings over the new Humhug road to the Yreka railroad depot.

W. Quigley, at his river mine, Klamath river, has 300 feet of wingdam built.

The Cherry Hill M. Co. expects to tap the ledge in the 1500-foot tunnel 800 feet below the surface.

STANISLAUS COUNTY.

J. T. Doolittle and A. Brown find encouraging progress in prospecting with drilling machines the gravel in the bed of the Tuolumne river, near La Grange. The rich gravel will he washed by the dredger method.

TRINITY COUNTY.

There is considerable cessation of work in the Sweepstake gravel mine and some sensational stories are published. The conditions, geological and otherwise, were discussed authoritatively at length in this paper in the issue of June 29, 1901.

The San Francisco Construction Co., which has been doing all the contract work at the mine, is locally credited with intention to build a new pipe line for the corporation, and to employ on the job about 200 men. So says Superintendent McCoy of the Construction Co. at Weaverville. A. E. Buckman of the San Francisco Construction Co. says to the Searchlight: "The expectations of peoplo not familiar with the laborious and gigantic undertaking of mine developing are prone to fly high at the beginning, and if things do not materialize in a hurry they are disappointed. It will take a good year of hard work yet, and probably longer than that, before a proper outlet for the removal of the gravel can he made. I am in receipt of a letter now requesting me to hold myself in readiness to place a larger force than ever on the company's property."

The Bartolett placer mine, near the Sweepstake property, is to he opened by the Sweepstake Co.

The Dorleski's new mill is about to start.

The pnwer plant and drills have resumed operations at the Brown Bear mine. Work is being advanced on the Lappin mine, bonded to Eastern people for $110 000. The triple compartment shaft is being sunk frnm the face of the lower tunnel and has attained 150 feet on the ore body. The Midas mine is producing high-grade ore.

W. R. Beall of Redding and J. S. Childs of San Francisco are at New river, where a rich find was made, 1½ mile from the mouth nf Quimby creek. They have a ledge 8 feet wide, assaying $40 in gold to the ton.

Payne & Story are dredging near Trinity Center.

TUOLUMNE COUNTY.

At the Harvard mill. near Jamestown, sixty stamps are in operation. —— On the 300 level of the Crystalline connection is made between the main shaft and the old workings at the south shaft.——The Rawhide and App chlorination plants are in operatinn, daily output being ten tons sulphurets.——The Republican M. Co. will build a dam across Woods creek.

Near Stent the Dutch M. & M. Co. has an ore shoot 14 feet wide, 75 feet long on the 1200 level.

At Tuttletown the Bell mine is unwatered and development work begun. Rich nre, carrying sulphurets and free gold, is struck on the 300 level.

The case of Emerson et al. vs. The Yosemite G. M. Co. has been decided by Judge Nicol in favor of the plaintiffs. It invnlves the Slapjack mine near Groveland.

Near Big Oak Flat the Longfellow mill is under management of L. D. Roberts. The Cosmopolite and Big Casona mine are in nperation, as is the Mohican mine on the Tunlumne river.

A. B. McCaw has men on the Gold Hunter mine at Tuttletown. W. Forsyth has bonded the Toledo mine and the Big Indian mine, near Tuttletown. Options run for two years, purchase price $25,000, $1000 down.

At Jamestown fire in an abandoned stope below the 400-foot level in the Jumper mine is confined there. The mine was temporarily closed.

YUBA COUNTY.

Work on the restraining dam on the Yuba river, below Smartsville, will begin next mnnth.

The Eagle Canyon G. M. Co. is at work on quartz and river claims south of Dnbbins Ranch.

COLORADO.

BOULDER COUNTY.

At Eldora the $250,000 chlorination plant, completed last year, is in the hands of a receiver, because of the murder of its owner. The Revenge mine, which can produce enough three-ounce ore to run the mill, talks nf a tunnel to enter Bryan mountain at the foot and cut the Revenge at a depth of nearly 1000 feet. The Boulder County mill at Cardinal and the St. Louis mill at Caribou are in operation.

At Cardinal the Boulder County mine has its stamps dropping on nre. The mine has ore enough in sight for two years. The St. Louis, at Caribou, has started up. In the Phœnix district the Champion is producing ore; Eastern men are about to start up the German and Phœnix No. 2, which have bodies of low grade ore, also a sized streak of smelting ore Considerable placer mining is being carried on along Beaver creek, 2 miles south of Nederland.

Boulder reports the Logan mine again showing high-grade ore. In the lower tunnel, 900 feet beneath the surface, ore is being shipped from a 6-inch streak, worth ten ounces gold to the ton.

CLEAR CREEK COUNTY.

Near Idaho Springs a 3-inch seam, carrying values of $35 per ton in silver and lead values, is reported in the property of the Omar G. M. Co.

The Freeland Extension M. & M. Co. of Mitchell, S. D., will operate the Freeland Extension mine at Idahn Springs.

The Golden Lilly 20 stamp mill at Alice is in constant operation.

The Idaho Springs Gazette says the breast of the Miami nr Wilcox tunnel is in 3000 feet. The west drift on the Edgar vein is in 1100 feet.

The Courier says the Empire tunnel is now over 1000 feet in length, and advancing at an average rate nf 5 feet per shift. Fnur lodes have been cut; the breast of the bore is now directly under the Paymaster lnde that is opened in the upper level. The tunnel has a steel ventilating line, 3 inch power line, and nne track laid with 20 pounds of steel rails. When completed this tunnel will penetrate Cnvode mountain 10,000 feet, through the company's territnry the entire distance, and will enter the district at North Empire 750 feet lnwer than any workings there at present.

CHAFFEE COUNTY.

Manager Goodwin of the Ohio & Colorado Smelter at Salida says four of the six furnaces are in position. The plant will be blown in Aug. 15.

EL PASO COUNTY.

The Colorado Springs Mining Exchange will reduce the membership to 100.

FREMONT COUNTY.

The New Jersey Zinc Co., at Canyon City, is using the Wetherell magnetic separation process, and asserts ability to handle with profit a lead-iron-zinc ore carrying 20% zinc. The ore should carry snme lead in order to make up the values. The grade of ore is too low where lead is absent to make a 20% or 25% zinc-iron material pay.

W. S. Stratton is reported negotiating for the purchase of the Metallic mill at Florence. If be fails to make a price he will erect a mill of his own to treat the lower grades of his Cripple Creek properties.

Crystallized lead ore has been found by Florence men near Isle, 4 feet from the surface. The vein is 2 feet wide; parts of it assay 50% lead. The Grant smelter people will buy the two adjoining claims on the same vein.

GILPIN COUNTY.

D. Woods, in the Powers mine, Russell district, has shipped sixteen tons enargite ores to the Argo smelters; the last shipment gave values of $47 per ton.

The British mine in Illinois-Central district is being operated under a lease and bond by the Golden State M. & M. Co. The ores are divided into concentrating and smelting classes, the latter giving average values of between $35 and $45 per ton. The ores show lead and gray copper.

The Chase mine, Russell district, is figuring on unwatering to its total depth, 500 feet, and sinking. Leasers are working in the 300-foot level taking out ore.

The Four-Mile Gulch M. Co., in the Wheeler shaft, Enterprise district, will retimber and sink 275 feet. J. Brohl is in charge.

Milling ores are being shipped from the Galena mine, in Central City district, to the Black Hawk mills.

A new shaft building has been erected over the main shaft of the Horseshoe mine, in Enterprise district, by the N. N. T. M. Co., and a gasoline hnisting plant installed. The shaft, now down 125 feet, will be sunk to a depth of 500 feet to connect with the Wabash tunnel of the group of claims.

Ore shipments from the Black Hawk depot to smelters and other points of treatment for the first half of the month were 241 cars—4820 tons.

Operations are resumed on the Central City mine. The ore carries pyrites of iron, gold and silver values.

GUNNISON COUNTY.

At Crested Butte considerable development work is being done. Machinery will be installed on the Painter Boy. The Washington gulch placer mines have resumed operations after having been idle for nearly twenty years. G. McCay is in charge of the work. A reservoir has been built and 3500 feet of high-line ditch constructed to carry water to the workings. The water has a perpendicular fall of 170 feet, yielding a pressure of nearly 125 pounds to the square inch.

In the Irwin district the Ruby M. Co., operating the Venago and Forest Queen, is working. Supt. J. K. Hallowell states that the price of silver influences the operatinn of these mines.

The International M. Co.'s Ruby King has resumed operations.

Supt. Jno. Lynch of the Grizzly Mountain M. & M. Co., located northwest of Grizzly Peaks, will put in a mill.

Supt. A. W. Hall is working the Hall placer.

The Akron Mining Co., under the direction of Supt. Harper, has been running a tunnel since August, 1901. Over 1800 feet has been made. They are working three shifts every twenty-four hours, seven days every week, and expect to finish the 3000 feet in 1903.

LAKE COUNTY.

Leadville merchants complain that freight rates are cheaper from Chicago to Salt Lake than from Chicago to Leadville.

Work is to be resumed on the Homer placer, west of Leadville, 150 acres, through which it is believed the Leadville basin nre chutes extend.

The News-Dispatch shows that Leadville needs an independent smelter to open a market for the product of the small mines. The large mining companies have made contracts with the smelting trust, and the small operator must either accept the contract at a price that will leave him no profit or abandnn mining altogether until an independent smelter comes in. On the other hand, the independent smelter must look to the small mines for the greater part of its supply. The big mines have made contracts with the smelter trust, and the independent smelter can only expect to receive contracts from the mines that are nnt tied up. If Leadville had two or three independent smelters there might be a new market for 500 or 1000 tnns of ore more than is now being consumed.

At Leadville, in the Fryer hill section, the Fryer Hill Mining Co. is draining the hill preparatory to opening 150 acres of territory. The Colorado & Southern and Rio Grande have grading crews at work on spurs to several of the shafts of the Fryer Hill Mines Co. The Rin Grande will put in a coal switch to the El Pasn and the other line will run spurs to the Tip Top, Jamie Lee and Dunkin.

MINERAL COUNTY.

At Creede the output of ore for the present mnnth to the 14th inst. was 185 cars, carrying 2942 tons. The Humphreys mill has resumed work.

OURAY COUNTY.

The Ouray Herald says: "After making a sale of his Camp Bird mine, Mr. Walsh, cnntrary to the precedent set by most wealthy men, did not fail to remember the men of brawn and brain who made it possible for him to acquire his millions. All of the old employes were handsomely remembered by genernus checks, while his head men received checks ranging in amount from $500 to $5000, according to the time spent in his employ and the service rendered. The checks handed to his faithful Supt., J. W. Benson, A. Richardson and D. R. Reed, of course, ranged in amounts much larger than this, some placing it from $15,000 to $25,000 for the two latter, while the fnrmer, perhaps, did not receive less than $50,000."

SAGUACHE COUNTY.

In Bonanza district new concentrating mills are being built. The smelter being built at Salida is expected to aid in development work. A 100-ton concentrating mill has been completed by Mr. Weens.

The Little Sister G. M. Co., under the management of J. MacMillan, has secured a group nf claims nn Kerber creek, which they propose tn work through a tunnel, and will erect a concentrating plant of their own

SAN MIGUEL COUNTY.

Five miles west nf Telluride, for the first time in sixteen years, bedrock has been found at the Keystone placer.

The entire Gold King mine has been leased aud the mill is crushing ore for the leasers The tramway, partially wrecked by the snowslide on Feb. 28, is repaired. Twelve parties have leases on different parts of the mine. The company may erect a cyanide plant to treat the tailings that have been accumulating in the basin below the mill for the past fifteen years. There is enough to keep a 100-ton plant running for several years.

Near Telluride, the crosscut tunnel at Liberty Bell mine is in 400 feet. It is the lowest tunnel ever projected in San Miguel county. It commences at the curve station of the tramway, one mile below the mine by trail, and when completed will be 3000 feet long, and intersect the Liberty Bell vein 900 feet below the main working level of the mine. Electric machine drills are used, from 3 to 6 feet are broken daily.

SUMMIT COUNTY.

At Robinson the new pyritic smelter is at work on the ores belonging to the company, which come from their Washington and Robinson mines. At present the smelter does not intend to do custom work.

Near Kokomo the Michigan mine, under the management of G. T. McDnnald, is shipping seventy-five tons per day.—— The Wilfley mine, operated by the Colorado Zinc Co., is daily shipping forty tons.

Near Breckenridge the Gold Pan Co., finding that the bank next to the river at their placer pit was giving way, flumed the river and turned the stream entirely away from the works in sixteen hours' time, grading and building woodwork of a flume 600 feet long and 6 feet wide.

The American Dredging Co., on the Swan, is doing well with dredger and hydraulics at the mouth of Galena gulch. Among the nuggets washed out was one worth $128 by weight. Manager Dyar is figuring on two more heavy dredgers.

TELLER COUNTY.

Manager Johnson has suspended work on the Longfellow, Murphy, Lucky Gus and Six Point properties of W. S. Stratton. He thinks work may be resumed in a few weeks. About 200 men are laid off.

President Roosevelt has referred to the Attorney-General papers in relation tn the Hull City placer mine, Cripple Creek district, with a request that he make an early report. The papers were filed with the President by J. A. Owenby of Colorado, who charges that fraud was practiced in obtaining title to the property. Several Government officials are implicated.

New machinery, on the way for the El Paso mine, on Beacon hill, will be in operation Sept. 1. The 2000-foot hoist will be in operation July 10. The company expects to run the mine under a full head of steam Sept. 10. A sampling department is being installed in the new ore house.

The Cripple Creek railway rate war ends July 1.

The Portland G. M. Co. will re-incorporate a new company under the laws of some other than the State of Iowa, transferring all the property nf the cnmpany to the new corporation. The object is to escape double taxatinn, practiced because it is incorpnrated under the laws of Iowa while its property is located in Colorado. The Iowa tax amounts to $52,500, and the Colorado tax about half that sum.

At Cripple creek, the Wishbone G. M. Co., owning the Faithful claim on Mineral hill, have given a ninety-day option to New York men for $25,000. The formation is phonnlyte quartz and is a contact vein.

After 300 feet barren ground the Blue Bird, on Bull hill, has in a crosscut driven from the 1100-foot station a body of ore that is rich. The Moose has ore in its 1100-foot drift, after having done a great amnunt of development wnrk. The fact that both of these properties have found splendid ore at depth has convinced people that it is a deep mining section.

IDAHO.

BOISE COUNTY.

(Special Correspondence).—The dredgers at Centerville are to be put in operation again this season, after being idle fnr nearly three years. One dredger is already at work and is doing well. The companies have been reorganized and are being run on a business basis. The ground is easily dug, the gold is not hard to save, the bedrock is a decomposed granite, and there are good values in the ground.

Prospectors are heading for Thunder Mountain. Supplies were selling in that camp at starvatinn prices until recently. A wagon rnad from here thence will permit heavy freighting by September. A 100-stamp mill is projected for the Dewey mine.

This spring has been a record one for shortness of the water for placer mining. Very little snow fell until the latter part of the winter, and consequently there has been little placer mining done in the Boise basin this season.

At Quartzburg a steam shovel and separate washing machine is up for Blaine & Nye. This shovel works nn bedrock and will handle a large amount of gravel with a minimum amount of water.

Centerville, June 13.

ELMORE COUNTY.

Manager D. Reber will resume work on the property of the P. M. Co., Dixie district, 25 miles north of Mountain Home.

KOOTENAI COUNTY.

Tyson, the new gold camp of southern Kootenai county, is 60 miles south of Cœur d'Alene, on the St. Maries river. The camp is reached by boat from Cœur d'Alene to St. Maries and then by stage 22 miles. The placer claims discovered by Tyson and Renfro are the Gold Nugget and Sixteen to One. With crude methods the discoverers took out $473 in ten days' work. The claims were then bonded to R. Neill, of Spokane, for $6000. The yield in gold has been from 10 to 60 cents a pan. Mr. Neill is now having a 4-mile ditch dug to increase the water supply. Considerable development work has been done on a number of quartz claims. The most important discovery has been in the tunnel now being run on the property of the Richmond G. M. & M. Co. On driving the tunnel 160 feet a quartz ledge was cut, from which specimens shnwing free gold were taken. Samples of this gold bearing ore indicate that it is a quartz porphyry. It is, from all appearances, a sedimentary formation, composed of thin layers nf various discolorations, and resembles a light brown sandstone. It is friable and when first taken frnm the tunnel can be cut like chalk. When exposed to the elements it slacks like lime. Tyson lies between the Cœur d'Alene and the Hoodoo districts. It is densely covered with timber and underbrush and has never been thoroughly prospected. The territory has been thoroughly explored by timber cruisers and rich specimens of float have been found in various parts. It is what prospectors call a "blind country," and fnr that reason it has been "passed up."

LEMHI COUNTY.

The new tunnel on the Tri-Metallic is to be driven 200 feet, 4½x7 in the clear. S. E. Bowler, general manager. The vein is visible on the surface as it cuts through the slate and serpentine formation. The claims are in El Dorado canyon, a mile above the El Dorado's 20-stamp mill.

OWYHEE COUNTY.

Near Silver City, the machinery for the Addie mine is in. The mill will be in

operation Aug. 1. The Wagener mill is crushing ore from the Never Sweat, which runs $100 in gold to the ton.

SHOSHONE COUNTY.

At Delta, the dredger company is ground sluicing for a place to set the dredger to work.

Wallace reports that the Nine Mile M. Co. has a 1600-foot tunnel cut into ore. Manager Flink does not expect to open up a large shoot until the tunnel is extended 125 feet farther.

The largest bridge built entirely of timber in the world is to be erected at Stephens peak for the Park M. Co. It had been decided to put in a new road to carry ore to either Wallace or Mullan, and it is necessary to build a big bridge, the longest bridge of timber in the world, one span of it to be 450 feet. It is to be of the cantilever style of construction, total length 900 feet. The bridge will be so high that no false work can be built. The bridge must be its own scaffolding in the course of construction. All the lumber will be sawed and fitted at the spot. The timber of the country is white cedar and Douglas fir. Cedar will be used for the piles and fir for the framework of the bridge.

WASHINGTON COUNTY.

Roosevelt, Thunder Mountain, reports little development work done yet. The Dewey mine is good property with a small amount of development; Fairview is the only other property which has more than a 10-foot hole to its credit. The reports that the camp is a failure are not based upon prospect work, for there is not a barren hole in the camp. The food supply is limited to immediate demands for necessaries. The roads are passable for horses, but the snow, mud and high waters interfere with traffic. The usual addition to outside prices is 20 cents per pound. Demand for liquid refreshments is fully met.

At Landore, E. C. Winchester, in the interest of Colorado properties, has bonded for $45,000 the Daisy group, adjoining the Salzer properties, and Mr. Winchester will do development work.

MONTANA.

FERGUS COUNTY.

W. D. Wrighter of Spokane has bought the Surprise group of mines for $30,000. The property is on the eastern slope of the Judith range, midway between Maiden and Gilt Edge.

In the sapphire mines of Yogo during the last year 100,000 carats of cuttable sapphires and 5000 ounces of stones sold for mechanical purposes, having an aggregate value of upwards of $60,000, were taken out. This year's output will be doubled. C. T. Durell, formerly of Gilt Edge, has been engaged as engineer. New machinery will be installed. Thirty men have been working at the mines, to be increased to fifty.

FLATHEAD COUNTY.

Snow is still deep in the West Fisher mining district. The Brannagan mill has been in operation all winter. The owners of the Black Tail mine have their mill finished.

GALLATIN COUNTY.

F. L. Klein says the vein of corundum, owned by the Montana Corumdum Co., on Elk creek, is 42 inches in the clear. Stoping will begin when the mill is ready.

GRANITE COUNTY.

The Montana G. M. Co. is operating near Princeton.

The Dorothy G. M. Co., South Boulder, projects a mill for treating the output.

D. Jankower is general manager American Gem M. Co., which operates on Rock creek upon sapphire properties.

The Howard Copper Co.'s properties are 10 miles north of Phillipsburg. The company will spend considerable money in opening up the property.

JEFFERSON COUNTY.

At Basin, W. Thompson is superintending the Buckeye mine. The vein is a contact between porphyry and granite. The concentrates net the operators from $25 per ton in gold and silver.

Gold ore is reported in the Grey Eagle mine, near Comet.

MADISON COUNTY.

Near Summit, E. D. Lewis has 3 feet of gold ore in the Montana Twister. Teal and Riddel are operating a 5-stamp mill on ore from the Shafter mine. The mill crushes twenty-five tons of ore per day. The rock averages $35 per ton.

F. R. Merk, owner Broadway mine at Silver Star, is working a small force; as soon as legal troubles are settled the number will be increased.

MISSOULA COUNTY.

The bond held by New York men on the Barnes-King mines and mill on north Moccasin mountain has expired. The Barnes-King people will operate it themselves. E. W. King says he will increase the capacity of the Barnes-King mill. When improvements are completed the mill will have a daily capacity of 225 tons.

PARK COUNTY.

Two mills will be crushing ore in the Bear Gulch district by August 1st. One belongs to the Revenue Co., and has forty stamps, the other the Bear Gulch Co.'s, will have forty stamps when completed. The two are 400 feet apart.

The St. Julien M. Co., at Emigrant, will resume work at the mill.

POWELL COUNTY.

At the new gold mining camp of Danielsville, at the head of Race Track creek, the Amazon group is the principal one. There are two veins, one showing 8 feet of ore, average value $16 in gold. The town lies upon a bench of the creek, with mountains of feldspathic granite 4000 feet high. There are fifty-two tents in the camp and two log buildings. A twenty-room hotel is being built. The Amazon Co. has thirty-five men employed and will put in a stamp mill and an aerial tramway. A road is being built from Race Track station to Danielsville, at a cost of $5000, and two miles of road will be built from the mine to the millsite. The Yellow Jacket mine has a 200-foot tunnel, with 1800 tons of ore on the dump that will average $16 to the ton.

SILVER BOW COUNTY.

Butte hears that W. A. Clark will shortly begin work on the erection of a new 2000-ton smelter near that city.

NEVADA.

EUREKA COUNTY.

Supt. C. Read of the Diamond & Excelsior M. Co. of Prospect mountain will start machine drills in the lower levels of the Excelsior mine.

LINCOLN COUNTY.

It is locally asserted that negotiations are practically closed for the purchase of the De Lamar mine by the Venture Corporation of London. The price will reach $5,000,000 cash. It is stated that eighteen months ago the property was offered for $2,500,000, recent development work warranting the latter higher valuation. The purchasing corporation will reorganize the holding into a British company and promote the shares on the London stock market. The Guggenheim Bros. are understood to be negotiating for a large block of the stock for sale in this country. S. Guggenheim is reported to be personally interested in the acquisition of several thousand shares of the stock of the reorganized company.

The Raymond-Ely West M. Co. has incorporated in Salt Lake, Utah. The company owns the Linevada, Linevada Nos. 2 and 3, Mother Lode and Mother Lode Nos. 2 and 3 claims, Ely mining district.

LYON COUNTY.

The sheriff of New York county, N. Y., has sold out the office furniture of the Carson River Placer M. & Dredging Co. at 18 Broadway for $82 on an execution for $27,346 in favor of P. Halstead.

NYE COUNTY.

(Special Correspondence). — Manager Leonard has gone to San Francisco to bring up a 20-stamp mill. He has promise of 20,000 tons to run through at $15 per ton.

Tonopah, June 21.

Tonopah men have agreed not to handle fireworks in any way on the coming 4th of July. That is a good idea. Patriotism is all well enough but one insignificant little firecracker or rocket can start a $100,000 fire in a dry mining camp.

The new town of Weepah contains thirty tents, an assay office, two saloons, two stores, a feed yard and a restaurant. Water is supplied from two springs at the south end of Lone mountain and from two wells 6 miles west of the camp. Wood is accessible. Free-milling ore can be hauled to Silver Peak stamp mills and a profit returned on $20 ore. Supt. F. M. Ish of the Fissure claim says ore hauled to Silver Peak, 9 miles, can be milled for $10 per ton.

The properties controlled by the Nevada Co. at Austin are to be opened up to leasers. The mines contain drifts aggregating 30 miles in length.

WASHOE COUNTY.

The Colorado-Nevada G. M. Co. at Wedekind have the main shaft at a depth of 150 feet in what appears to be the top of the ore shoot in the main Bell vein.

WHITE PINE COUNTY.

The shaft on the McKinley mine at Ely is down 300 feet; crosscutting commenced. In addition to the copper values, low-grade ore averaging $5 is found.

NEW MEXICO.

GRANT COUNTY.

J. G. Barton, superintendent of the Pacific Union Smelting Co., Lordsburg, will put in a furnace of 100 tons capacity, 42x 96 inches, to handle sulphide ore, making a high grade matte, or changed to handle oxides and carbonates and make black copper.

The Colorado Fuel & Iron Co. in the Fierro mining district has opened the Union Hill and Jim Fair properties, and has 125 men on the Union Hill mine and 250 on all the properties. Thirty cars of ore are being daily shipped to the company's plant at Pueblo.

The St. Louis mine, Fierro district, is being pumped out. A new level will be started 200 feet from the surface.

SANTA FE COUNTY.

The Bottom Dollar mine, near Cerrillos, is being worked steadily.

Supt. D W. Briel, of the North American M. Co., near Lordsburg, is developing the Cobra Negre.

OREGON.

BAKER COUNTY.

At Sumpter a contract has been let for 500,000 brick for the proposed smelter there.

Sumpter reports that W. B. Sargent has sold the Yellow Daisy group, Spokane hill, opposite the Red Boy, for $20,000.

GRANT COUNTY.

A chain, each link of which weighs 500 pounds, is a feature in the construction of the Pomeroy dredger, North Fork John Day river. There are 729 of these links. The chain is to carry twenty-seven buckets weighing 1000 pounds each; they carry 8 cubic yards of earth each, 96 cubic yards lifted each minute. The company has put over $100,000 in the dredger, of which $30,000 was wages. It will cost $100 a day to run the machine when finished, one item being twelve cords of wood required each day to run the plant. There are fifteen mechanics working on the dredger construction. August 1 the dredger will be ready to start.

SOUTH DAKOTA.

LAWRENCE COUNTY.

Near Deadwood the Uncle Sam mine, owned by the Clover Leaf Co., have reached the 500-foot level in the vertical shaft.

The Globe M. Co. of Lead will erect a stamp mill at Nahant, 10 miles south of Lead, on Rapid creek.

G. M. Nix of the Oro Hondo M. Co. has the necessary amount of money to develop 700 acres of ground south and adjoining the Homestake and Belt Development companies' properties.

UTAH.

BEAVER COUNTY.

At Milford, Manager E. T. Wolverton of the Cave mine says in two months he will send out 50 tons per day. The lease and bond on the Cave property calls for $135,000, and runs for eighteen months. The first payment of $5000 has been made. Mr. Wolverton is also operating the Blue Boy group, in the same vicinity, and has 35 men.

IRON COUNTY.

The mill at the Johnny Co.'s Stateline properties will be built by Dederichs & Burke, who guarantee its completion Nov. 1.

JUAB COUNTY.

The Tintic Miner says the Grand Central M. Co. has contracted to deliver to the smelter of the Bingham Con. G. & C. Co. 175 tons daily of its low-grade ores, of which there are 70,000 tons already on the surface. The new East Tintic railway, which runs to the Mammoth mine, will be extended to the mine of the Central, and within six weeks the company expects to begin shipping. The ore runs $12 to $14 per ton.

J. C. McChrystal, Supt. Godiva Co.'s property at Eureka, says that the Eagle & Blue Bell's second-class ore is shut out of the market on account of the railroads enforcing the $15 valuation on ores under the reduced rate. Two trial lots of Eagle & Blue Bell sampled $15.06 and $15.34—a few cents too high.

P. T. Farnsworth, manager Bullion-Beck mine, says that property will ship no more ore for the present, because the smelter people have raised the treatment charges 50 cents per ton. They also insist upon long-time contracts, running from three to ten years, with one-third of the value of the silver whenever it exceeds 60 cents an ounce. He seems to think that the smelter trust would insist upon extortionate treatment charges and long-time contracts, and that the only remedy was in withdrawing ores from market.

At the Uncle Sam mine it is the intention either to erect a concentrator or ship to the smelter.

The American Smelting Co., in its contracts for ore, now has a clause giving one-third of the silver values when the price reaches 60 cents per ounce or more.

SALT LAKE COUNTY.

The new Murray smelter has begun operations.

TOOELE COUNTY.

Mercur was swept by fire on the 25th. Forty stores were destroyed. So far as known no loss of life resulted. Total loss, $800,000; insurance, $350,000.

The crosscut in the new channel of gold-bearing ore at the Con. Mercur shows the entire mass has an average of $7 gold per ton.

The Honerine Extension M. Co., at Stockton, will develop its properties, the Vulcan group, that adjoin the Honerine on the east. The shaft on the Vulcan is 270 feet deep.

WASHINGTON COUNTY.

The Silver Reef M. & R. Co. has a contract to handle all the tailings at the three chief mines in the old camp of Silver Reef. T. Ferguson is manager. He will put in cyanide plants. The Silver Reef Co. has acquired the Christy, Barbee & Walker and Leeds Co.s' dumps of 300,000 tons, carrying six ounces of silver per ton.

WASHINGTON.

FERRY COUNTY.

H. B Ives, president Apollo G. M. Co., operating the California, 9 miles from Republic, has built a bin, capacity of 300 tons, on the line of the Great Northern and is shipping ore.

SNOHOMISH COUNTY.

Near Index R. H. Stretch has charge of the Nonpareil Co.'s thirty-six claims on Trout Creek.

SPOKANE COUNTY.

All mineral operations upon the Indian reservation are postponed until after the allotments have been completed, and the President has given public notice thereof through its proclamation. All attempted mining locations which have been made in this reservation on the face of this pending legislation are without any effect.

STEVENS COUNTY.

The mineral entries made by the First Thought Gold Mines, Ltd., of Bossburg, for the First Thought mine and other lodes have been approved for patenting by the Commissioner of the General Land Office. Owing to litigation, operations have not been conducted, and though the company won a recent suit, it did not want to start the mine until after the Land Office granted a patent. One patent applied for previously by the company has been decided adversely, but the company immediately made a strong application, which has been decided favorably.

WYOMING.

CARBON COUNTY.

Saratoga reports that the Mohawk gold mine, at Gold Hill, has been sold to Indiana and Illinois men for $20,000. Picked specimens from the vein have given assays of $56.

FOREIGN.

AUSTRALIA.

The gold exported from Western Australia during May amounted to 61,467 ounces; 102,750 ounces were received at the Perth Mint. The total for the month, after the refinement of the portion received at the Mint, was 141,116 ounces, valued at £599,426, compared with 144,087 ounces of crude gold in May, 1901.

The deepest shafts in South Australia are at Moonta, 2520 feet, and 1710 feet at Wallaroo, the principal seat of copper mining.

BRITISH COLUMBIA.

Vancouver reports that the Canadian Pacific Railroad has refused an offer from the U. S. Steel Co. of $1,000,000 for its iron deposits at Kitchener, Crow's Nest Pass. Details of an agreement are being arranged, however, looking to an allotment of territory in which the steel trust will have monopolistic privileges.

Near Nelson the Oyster and Imperial groups, Fish Creek, have been bonded to the Ophir Lode organization for $86,000. The purchase price includes a cash payment of $35,000, the balance in sixty days. The new company will build a mill and tramway.

The Rossland Mining Recorder's office contributed to the provincial treasury from 1895 to 1901 $408,623; $8,400,000 has been distributed in Rossland camp in the form of wages since mining first began there, seven years ago.

At Slough creek, near Ashcroft, Manager Jno. Hopp has tapped an ancient channel whose bedrock gravel lies 365 feet below the surface.

London stockholders have sent another committee to Rossland to examine the Le Roi mine conditions. They will reach there July 1. It includes A. J. McMillan, manager Snow Shoe mines, A. Morten, H. Tyler, C. W. Milne and B. Brown.

The Le Roi expects to get a rate of $6.50 a ton on coke for its smelter at Northport, on the completion of the Great Northern railway into the Crow's Nest Pass coal fields. The present rate is $9.50. The

Great Northern Co. has refused to reduce the rate of 40 cents a ton on hauling ore from the mine to the smelter.

The White Bear mine has been enjoined from interfering with the surface rights held by E. C. Finch, owner of the White Bear addition to the townsite of Rossland, before the Supreme Court in Victoria.

H. L. Frank of Butte, Mont., has sold a three-quarter interest in his coal mines at Frank, Alberta, to a French syndicate for $1,300,000. About $75,000 is said to have been paid down.

J. Beaver is working his claim, the Diamond B, near Similkameen. This is the property from which Baker & Co. of Newark, N. J., got platinum assays.

At Grand Forks Porter Bros. have a contract to quarry 100 000 tons of ore from the surface of the Granby gold-copper mines at Phœnix. Their plant comprises steam shovels, engines and derricks. If the contract is discharged to the mutual satisfaction of the contracting parties the Granby Co. has agreed to give Porter Bros. a supplementary contract for the extraction of 5,000,000 tons of ore from the surface quarries of the Knob Hill mine.

The National Hydraulic Mining Co. at Beaver river on the Quesnel, Cariboo, have finished 5.33 miles of ditch and flume and 2000 feet of pipe line. Pipe is 22 inches, reduced to 9; ditch capacity 2000 miner's inches. The company is busy sluicing.

Near Phœnix work is resumed on the Emma mine, Summit camp. A contract has been made with the Hall mines smelter of Nelson for two cars daily. The ore contains a large percentage of iron. W. T. Smith is in charge of the work.

KOREA.

H. F. Meserve, general manager L. S. J. Hunt mines in Korea, is in Seattle. The mines are 300 miles from Seoul, the capital of Korea. The concession from the government covers 25 square miles. The rock is gold-bearing quartz, some of it low grade and some of it very high grade. "Just at present we are operating 120 stamps on the properties, and two cyanide plants," says Mr. Meserve. "We are now building an 80-stamp mill, which is very near completion. This will give us 200 stamps in all. In addition we have our own retort works and assay offices. The product of the mines is shipped to Japan in the form of gold bars. We are now employing 7000 miners, including between 75 and 100 Americans. The others are Koreans, Japanese and Chinese. The Asiatics receive 25 cents in gold or 50 cents silver money per day, on which they live very well. They are excellent workmen."

MEXICO.

SONORA.

The Supreme Court of Mexico is reported to have made a decision which gives the Picacho gold mine to the Douglases of the Copper Queen Co. The mine is 10 miles west of Bacoachi.

E. H. Roberts, manager of the Henrietta M. Co., is developing an extensive placer mining enterprise at La Cienega, 45 miles southeast from Altar.

YUKON TERRITORY.

Since the finding of copper ore above Selkirk, Dawson talks of building a smelter. Whitehorse, the present terminus of the White Pass and Yukon railway, may get a smelter before Dawson.

Obituary.

CHARLES HEGARTY, a pioneer miner of Nevada county, Cal., died at Nevada on the 25th.

ALLAN G. CAMPBELL, a widely known Utah mining man, died at Riverside, Cal., of pneumonia, on the 18th inst.

CHAS. D. POSTON, prominent in Arizona mining affairs and a resident of Arizona since 1854, died at Phœnix on the 24th inst.

Trade Treatise.

Wire Rope: Macomber & Whyte Rope Co., 19–21 So. Canal St., Chicago; factories, Coal City, Ill.; 3½x6, 60 pages, paper. Illustrating and describing haulage and hoisting rope, depicting construction and showing uses; neat and condensed information on that and kindred appliances, with illustrated directions in detail for splicing. The Hallidie wire rope tramway and the Harkes safety gate also receive attention in the booklet.

Commercial Paragraphs.

THE Tom Boy Gold Mines, Pandora, Colo., are being equipped throughout for electrical power distribution. A recent purchase from the Westinghouse Electric & Mfg. Co. includes a number of induction motors, reducing transformers, low-equivalent lightning arresters with choke coils and high-tension circuit breakers.

Personal.

CHAS. BUTTERS has gone to London.

E. G. STOIBER is in Yellowstone Park.

D. G. JEWETT will have charge of the Victor, Arizona, mill.

C. F. CHAPIN is manager Montana G. M. Co. at Princeton, Mont.

F. KLEPETKO has returned from Salt Lake, Utah, to Butte, Mont.

J. M. CALDON is examining mining property at Lake City, Colo.

E. RICKARD of Denver is in San Francisco en route to Alaska.

F. RICHMOND, of the Salt Lake Hardware Co., is in San Francisco.

HERMAN WITTEBORG is superintendent Breckenridge, Colo., sampler.

J. H. MCCORMICK is appointed mill superintendent Gilt Edge, Montana.

A. F. LEVITT, of Placerville, Cal., is examining mining property in Mexico.

H. K. WHEELER has returned to Los Angeles, Cal., from Kingman, Arizona.

F. A. FARNUM, a Berlin, Nevada, mining superintendent, is in San Francisco.

F. D. BROWN is manager Sunrise group, on Flint creek, Granite county, Montana.

W. RAWSON has charge of work at the Crown Point mine, near Lake City, Colo.

JAS. SHERWIN is now manager Crystal Lake cyanide plant at Lundy, Mono Co., Cal.

L. C. TRENT has gone from San Francisco to examine an Alaska mining property.

MARK MURPHY is superintendent Hoyt M. Co., Lynx creek, near Prescott, Arizona.

R. H. POSTLETHWAITE has returned from Trinity Center, Cal., to San Francisco.

B. L. THANE goes from Berkeley, Cal., as superintendent Ebner mines, Juneau, Alaska.

J. P. POLIN is assistant superintendent Grand Central mine, Minas Prietas, Sonora, Mexico.

H. V. WALLACE is general manager Chanate group of mines, Veta Grande, Sonora, Mexico.

J. W. SIMPSON is general manager Kansas City & Sonora M. Co, Gabilan, Sonora, Mexico.

F. BOLSINGER is in charge of the new rapid-drop 25-stamp mill, Nevada Gulch, Gilpin Co, Colo.

E. H. BROWNE is elected consulting engineer Globe C. M. Co., 22 miles west of Cheyenne, Wyo.

GEO. W. KIMBLE has returned to Placerville, Cal., from a trip through Idaho and Montana.

MANAGER H. N. BOTSFORD, Wallapai M. Co., has returned to Chloride, Arizona, from San Francisco.

H. A. SHIPMAN will remain as general manager Stratton's Independence mine, Cripple Creek, Colo.

A. A. BROWN, president Mammoth Tunnel Co, has returned to Silverton, Colo., from the East.

GEO. MCCORNICK has gone from Salt Lake City, Utah, to the Jingo mines, Mountain Home, Idaho.

L. IRVINE, Supt. Plumbago, Cal., mills, is visiting Thousand Islands, N. Y., after an absence of fifty years.

WM. MCKINLEY has returned to San Francisco from an inspection of White Pine Co., Nevada, mines.

H. J. RANGER, furnace foreman Keswick, Cal., goes to Rio Tinto, Spain, to take similar charge there.

L. W. HILL has been elected president of the Spokane and Northern railway to succeed N. HILL, resigned.

R. J. MCCARTULY succeeds H. Starkweather as Supt. North Star mine, Sultan Mountain, near Silverton, Colo.

J. R. SEARS, former Supt. Arbona M. Co., Tuolumne county, Cal., has charge of the Dayton, Nev., mining property.

G. J. SIELAFF, of Virginia, Nev., goes to Costa Rica to take charge of a cyanide plant for a Boston mining company.

S. B. HARRIS, superintendent Quincy mine, Houghton, Mich., has resigned. His successor is his son, J. L. Harris.

G. B. WARREN, late of the Palace Hotel, San Francisco, Cal., has gone to Nome to oversee his mining interests there.

W. E. PASMORE, of Idaho Springs, Colo., has been appointed secretary State Mine Managers' Association, vice Dr. Coltman, resigned.

W. M. JAMES, former superintendent Sierra Buttes mine, Sierra City, Cal., expects to return to the United States from South Africa shortly.

S. B. ELBERT has gone to Rollinsville, Colo., where he will have charge of the business of the N. Colorado Ex. Co. and the G. Dirt M. & S. Co.

H. W. MCCRAY has resigned as engineer for the Kern, Cal., L. and W. Co. He is employed by the Southern Pacific Co. as manager of fuel and oil supplies.

PERCEY SHARPE is now general manager of El Verde Grande Copper Co., Magdalena district, 14 miles from Imuris, on the Sonora, Mexico, railroad.

C. A. LAWSON, of the J. Geo. Leyner Drill Co., has returned from San Francisco to Denver. J. H. Sanborn will represent the company in California.

W. H. LINNEY, superintendent DeLamar mines, DeLamar, Nevada, has returned there from Salt Lake City, Utah. He will continue under the new ownership.

T. H. OXNAM has resigned his position as general manager Palmarejo and Mexican Gold Fields, Ltd., on account of ill health. Mr. Oxnam is now at Avalon, Cal.

MESSRS. WILHELM AND HIBY, the former mining engineer for the German Government and the latter representing the Hilkenstock coke industry, are examining Utah mines.

WILLIAM Y. WILLIAMS, superintendent Granby mines, B. C., accompanied by the company's resident engineer, O. B. Smith, Jr., is visiting the Treadwell mine, Douglas island, Alaska.

J. R. BIBBINS has resigned as assistant electrical engineer of the Detroit United Railway to accept a position in the Westinghouse Companies' Publishing Department, Pittsburg and New York.

H. HEFFRON has resigned the management of the Sierra Pinta M. Co., Altar, Sonora, Mexico, and has been succeeded by E. Holland, proprietor of the mines at Quitovac, 7 miles from Sierra Pinta. Mr. Heffron will shortly return to California.

ON the 11th inst., Columbia University conferred the honorary degree of Doctor of Science on Prof. Samuel Benedict Christy, professor of mining and metallurgy, and dean of the faculty of the College of Mining of the University of California.

G. A. RICHARDS, manager Mt. Morgan, Australia, mine, who left last July on a tour, has returned, and complacently tells his local paper that "we in Australia are ahead of the Americans in regard to gold mines." He is also of the opinion that "we are in advance of them in the treatment of refractory ores; and if ever they get deep mines like Ballarat, they will have to go there to learn that business."

Latest Market Reports.

SAN FRANCISCO, June 27, 1902.

METALS.

SILVER.—Per oz., Troy: London, 24½d (standard ounce, 925 fine); New York, bar silver, 52¾c, refined (1000 fine); San Francisco, 53c; Mexican dollars, 44½c San Francisco, 42½c New York.

COPPER.—New York: Standard, $11.50@11.80; Lake, 1 to 3 casks, $12.25; carload lots, $12.00; Electrolytic, 1 to 3 casks, $12.00; carload lots, $11.75; Casting, 1 to 3 casks, $12.00; carload lots, $11.00. San Francisco: $14 00. Mill copper plates, $17.00; bars, 18@24c. London: £52 17s 6d spot, per ton.

LEAD.—New York, $4.12½; Salt Lake City, $3.60; St. Louis, $4.00; San Francisco $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, $4.75. London: £11 2s 6d per ton.

SPELTER.—New York, $4.87; St. Louis, $4.50; London, £18 12s 6d per ton; San Francisco, ton lots, 5¾c: 100-lb lots, 6¼c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8¼c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, $28.50: San Francisco, ton lots, 31½c; 1000 lbs., 31¾c; 500 lbs., 31¾c; 200 lbs., 32c; less, 32½c; bar tin, ℔ lb, 37½c.

PLATINUM.—San Francisco, crude, $17.50 ℔ oz.; New York, $19.50 per Troy oz

QUICKSILVER.—New York, $48.00 large lots; London, £8 15s; San Francisco, local, $46.00 ℔ flask of 76½ lbs.; Denver, $50.50. Export, $43.50.

BABBITT METAL.—San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER.—Half-and-half, 100-lb. lots, 20c; San Francisco, Plumbers', 100-lb. lots, 16½c.

NICKEL.—New York, 50@60c ℔ lb.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $20.50; gray forge, $20.00; San Francisco, bar, 2.75 ℔ lb.,3c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $33;34; open hearth billets, $35.00; San Francisco, har, 7c to 12c per lb.

CEMENT.—Germania, $2.65; K. B. & S., $2.65; Hewmoor, $2.50; Trowell, $2.50 per bbl.

LIME.—Santa Cruz, $1.60; Roche Harbor, $1 60 per bbl.

LUMBER.—(Retail): Pine, ordinary sizes, $18.00@19 50; extra sizes higher; redwood, $19.00@20.00; lath, 4 feet, $3.90 @4.00; pickets, $19.00; shingles, $2.00 for No. 1 and $1.75 for No. 2; shakes, $13.00 for split and $14.00 for sawed; rustic, $25.00 @31.00.

GENERAL SUPPLIES.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.50; Cut, $3.50; 10d to 16d, Wire, $3.55; Cut, $3.55; 8d, Wire, $3.60; Cut, $3.60; 6d and 7d, Wire, $3.70; Cut, $3.70; 4d and 5d, Wire, $3.80; Cut, $3.80; 3d, Wire, $3.95; Cut, $3.95; 2d. Wire, $4.20; Cut, $4.20. Special rates for carload lots.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ℔ set; 14 oz., 40s., 9c.

COAL.—San Francisco, coast, yard prices: Wellington, $9; Seattle, $6.50; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $9.56, long ton; Colorado Anthracite, $14.00. Coke, $15 per ton in bulk, $17 in sacks; Sunnyside, $11.75, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 27@28c ℔ lb.; carloads, 25@26c; in 10-lb. tins, 38c; sulphuric acid, in carboys, 66° B, 2c ℔ lb.; soda ash, $1.90 ℔ 100 lbs.; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5¾@6¼c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 5c; alum, $2.00@2.25; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.25 @1.50 ℔ 100 lbs.; sks, $1.05; chloride of lime, spot, $2.50@2.60; nitrate of potash, in bbls, 8c: caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, boiled, bbl., 73c; cs., 78c; raw, bbl., 71c; cs., 76c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 64c; cs, 70c; raw, bbl., 62c; cs, 67c. Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bbls., 19c; wooden bbls., 22½c; cs, 25c; Mineral Sperm, cs, 26½c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 21½c; 86° Gasoline, bulk, 20c; do., cs., 26½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14½c: do., in cs., 21c; Lard Oil, No. 1 bbl., 60c; cs., 65c; Neatsfoot Oil, hbl., 70c; cs., 75c; No. 1 bbl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6½c; 1 ton and less than 5 tons, per lb., 6¾c; 500 lbs. and less than 1 ton, per lb, 7c; less than 500 lbs., per lb, 7¼c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6c; do. in kegs, 6¾c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 7c; 500 lbs. and less than 1 ton, per lb., 7¼c; less than 500 lbs., 7¾c.

ASSAY LITHARGE.—Per lb, 8½c.

BISMUTH.—Subnitrate, per lb., $1.60.

BONE ASH.—4c ℔ lb.

BORAX.—Crystal, 7c: calcined, 25c.

CHROMIUM.—(90% and over) per lb., $1.25.

COPPER.—Carbonate, 20c; Red oxide, ℔ lb., 60c.

MAGNESIUM.—Per lb., $3.00.

MANGANESE.—(90% and over) ℔ lb., $1.25.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—25c. ℔ gramme; 1000 grammes=2¼ lbs.

PHOSPHORUS.—(American) ℔ lb., 80c.

SILVER.—Chloride, ℔ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ℔ lb., $1.00.

URANIUM.—Oxide, ℔ lb., $3 50.

ZINC.—Metallic, chemically pure, ℔ lb., 50c.

ZINC.—Dust, ℔ lb. 10c.

ZINC.—Sulphate, ℔ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

SIX YEARS' CONSTANT WEAR WITHOUT A BREAK.

1700 BELTS IN USE.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

JAS. S. BROWNELL, San Francieco, Cal.—DEAR SIR: THE EMPIRE MINES, GRASS VALLEY, NEVADA CO., CAL., Jnn. 29, 1901.

We have been nsing your "Pntent Lip" flange helt on our "Triumpb" Concentrntors since May, 1895, nnd find that they have given better wear tban any other belt made. Aleo the twelve 6-foot Frues witb "Patent Lip" flange bolte, lately put in here, are giving us every eatisfaction. Youre truly, G. W. STARR, Mannging Direotor.

JAS. S. BROWNELL, San Francisco, Cal.—DEAR SIR: PIONEER-LYNN MINING COMPANY, TOWLE, PLACER CO., CAL., Jnn. 12, 1901.

The eigbt "Patent Lip" flange helte purchased from you in December, 1895, have been in constant uee in tbe mill since that time, and have given the best of eatisfaction, and bave proved to be far euperior to the old plain flange belt wbicb we were ueing. The helte now in uee ehow bardly any wear, nnd eeem to be in ae good condition as wben firet put on tbe machines; one thing, they do not ehow nny tendenoy to orack nlong the edge of the belt. Youre truly, JERRY SULLIVAN, Superintendent.
